After Crassus' death (53 B.C.), Pompey drifted apart from C. He passed a law 'de jure magistratuum' (52 B.C.) which made it possible to call C. to account for unconstitutional acts. The quarrel between C. and Pompey subsequently ended in Pompey's defeat (48 B.C.). Having defeated S. of Mithradates at *Zela* (47 B.C.), C. returned to Italy. His victory of *Thapsus* (46 B.C.) was death-knell of Pompeian cause. In July he received the dictatorship for ten years. Next year he crushed a rising in Spain, and then returned to Rome and undertook reorganisation of Roman state. His measures were moderate and practical. He revived the Gracchan designs of transmarine colonisation, extended local self-government, encouraged agriculture, and reformed provincial administration, but his government gradually tended towards undisguised absolutism, and he was assassinated (March 15, 44 B.C.). A brilliant and original soldier, a forceful administrator and great statesman, C. founded the new monarchy at Rome. His assassination could not prevent the Empire. — See ROME (Ancient History).

Julius Cæsar, Hilary Hardinge (Jack, 1912); *Julius Cæsar,* Warde Fowler (1892); *History of Rome,* Mommsen and others.

CÆSAR, SIR JULIUS (1557–1636), Eng. judge; famed for his generosity.

CÆSAREA MAZACA (38° 40′ N., 35° 20′ E.), ancient city, Cappadocia, Asia Minor; modern Kaisarieh.

CÆSAREA PALÆSTINA (32° 30′ N., 34° 50′ E.), seaport, Palestine; founded by Herod I., 13 B.C.; now ruins.

CÆSAREA PHILIPPI, C. PANEAS (32° 12′ N., 35° 42′ E.), town, on Jordan, foot of Mount Hermon, Palestine; now Banias.

CÆSAREAN SECTION, the operation for removal of a fœtus from the womb by means of abdominal section, so called from a story of its being practised at the birth of Julius Cæsar.

CÆSARION (47–30 B.C.), Cæsar's putative son by Cleopatra; put to death by Augustus.

CÆSIUM (Cs = 132·9), alkali metal, similar to potassium, discovered by spectroscope in Dürkheim water; spectrum has two sky-blue lines (*Cæsius,* blue); occurs in mineral pollux; isolated by electrolysis of its fused cyanide.

CÆSTUS, boxing-glove used by the ancient athletes.

CÆSURA (lit. 'a cut'), in prosody, a pause usually in the middle of a line of verse, but variable, according to the form of stanza, thus:—

While fávour fed my hópe, || delight with hópe was brought;

or,

At once, || as far as ángel's ken, || he víews
The dísmal situátion || wáste and wíld.

CAFFEINE, THEINE ($C_8H_{10}N_4O_2.H_2O$), alkaloid obtainable from coffee, tea, guarana, Paraguay tea, kola nut, and cocoa (in small quantity); white, silky, crystalline substance; powerful heart stimulant.

CAFFIERI, JACQUES (1678–1755), Fr. metal-worker; the most famous craftsman of his period in metal-work, and largely patronised by Louis XV. and other eminent persons. The Wallace Collection contains fine examples of his work.

CAGLI (43° 32′ N., 12° 37′ E.), town, Italy; bp.'s see. Pop. 3300.

CAGLIARI (39° 13′ N., 9° 6′ E.), capital of Sardinia, on bay, S. coast; fortified; large harbour, dockyards; seat of univ.; residence of viceroy and abp.; old castle, cathedral; remains of Rom. amphitheatre; grain, wine. Pop. (1911) 61,013.

CAGLIARI, PAOLO, see VERONESE.

CAGLIOSTRO, ALESSANDRO, COUNT (1743–95), Ital. alchemist and charlatan; real name, Giuseppe Balsamo; travelled widely, making money by alchemy; d. in prison.

CAGNOLA, LUIGI (1762–1833), Ital. architect; designed the Arco della Pace, the Porta di Marengo, and the Chapel of Santa Marcellina, all at Milan, and numerous other architectural works.

CAGOTS, a scattered race found in Gascony, Brittany, and Basque provinces. During Middle Ages they were shunned as outcasts.

CAHER (52° 22′ N., 7° 55′ W.), market town, on Suir, Tipperary, Ireland.

CAHITA, N. Amer. Indian tribes living in Mexico.

CAHOKIA, tribe of N. Amer. Indians, near St. Louis.

CAHORS (44° 26′ N., 1° 27′ E.), city, Lot, France; on rocky peninsula, almost surrounded by river Lot; ancient bridge; univ. founded by Pope John XXII.; united with Toulouse Univ., 1751; native place of Gambetta and poet Marot; bp.'s see; wine, brandy. Pop. 14,000.

CAIATA (41° 10′ N., 14° 20′ E.), ancient city, Campania, Italy; bp.'s see; modern Caiazzo.

CAICOS ISLANDS, see TURKS AND CAICOS ISLANDS.

CAIETÆ PORTUS (41° 12′ N., 13° 35′ E.), ancient seaport, Formiæ, Italy; favourite Rom. resort; modern Gaeta.

CAILLIÉ, RENÉ AUGUSTE, CAILLÉ (1799–1838), Fr. traveller; penetrated to Timbuktu (1827–28); pub. *Journal of Travels through Central Africa.*

CAIMAN, see ALLIGATOR.

CAINE, THOMAS HENRY HALL (1853–), Eng. novelist and dramatist; b. Runcorn; ed. as architect, but turned to journalism and novel-writing; has pub. *The Shadow of a Crime* (1885), *A Son of Hagar, The Deemster,* and numerous other novels. He has also dramatised several of his stories, which have achieved immense popular success.

CAIQUE, pointed Turkish skiff used on Bosporus.

CAIRD, EDWARD (1835–1908), Scot. philosopher and theologian. His bro. **John** (1820–98) was noted preacher and neo-Hegelian philosopher.

CAIRD, SIR JAMES (1816–92), Scot. writer on agriculture, and Liberal politician.

CAIRN, rough chamber composed of unhewn stones, probably always constructed for burial purposes, and in the Brit. Isles and France of Iberian or Celtic origin; sometimes contained dolmens (*q.v.*).

CAIRNES, JOHN ELLIOT (1823–75), Irish

barrister and writer on political economy; ed. Trinity Coll., Dublin; was successively prof. of Political Economy at Dublin (1856), Queen's Coll., Galway (1861), and Univ. Coll., London (1866); wrote, besides essays, *Character and Logical Method of Political Economy* (1857); *The Slave Power* (1862); *Essays in Political Economy, Theoretical and Applied* (1873); and *Some Leading Principles of Political Economy, newly expounded* (1874).

CAIRNGORM, ornamental yellow stone, like topaz, found in fine granite of Cairngorm Mts., in Scot. High lands, and elsewhere.

CAIRNS (16° 54′ S., 145° 44′ E.), seaport, Trinity Bay, Queensland; minerals, sugar. Pop. 3600.

CAIRNS, HUGH M'CALMONT CAIRNS, 1ST EARL (1819–85), Brit. politician; b. Cuttra, County Down, Ireland; M.P., 1852; became Solicitor-General, Attorney-General, Lord Justice of Court of Appeals, Lord High Chancellor; continued in last office till 1880; became Viscount Garmoyle and Earl C., 1878; fine orator.

CAIRNS, JOHN (1818–92), Presbyterian theologian; moderator, United Presbyterian Synod, 1872.

CAIRO (30° 2′ N., 31° 15′ E.), capital, Egypt (*q.v.*), on right bank of Nile near Delta; built partly on hill-slope, surrounded by old walls on N. and E.; highest part occupied by citadel which contains viceregal palace, public offices, arsenal, and Mehemet Ali's magnificent mosque, and is commanded by forts on Mokattam Hills. Newer portion is European in style, with wide streets. Older part has narrow streets, but contains many beautiful mosques of which Gami'a Sultan Hassan and Gami'a-ibn-Tulun are finest examples of Arabic arch. Also in old C. is 'Granary of Joseph,' consisting of seven towers. C. has observatory, Arabic Museum, library, ancient gates, aqueduct connecting citadel with Nile; at Bulak is famous museum of antiquities; Khedival palace in centre of city; palace of Gesireh in N.W. is now hotel. C. is centre of Muhammadan learning, and has Muhammadan Univ. (founded, 988). Inhabitants include Turks, Berbers, Fellahin, Copts, Arabs, Abyssinians, Jews, Nubians. C. produces textiles. Old C. or Fostat founded by Sultan Amru, *c.* 642; new town, Al Kahirah, founded on present site, *c.* 973; citadel built by Saladin, 1176; conquered by Turkey, 1517; taken by French, 1798; passed to Turks, 1801, from whom it came to Mehemet Ali, ancestor of present Khedive. Pop. 654,476. Poole, *Cairo*.

CAIRO (37° N., 89° 10′ W.), city, Illinois, U.S.A., at junction of Mississippi and Ohio; important manufactures; lumber. Pop. (1910) 14,548.

CAISSON.—(1) in engineering, name given to large wooden or iron sort of box used in construction of piers of bridges; open at bottom, and is connected with surface of the water by a cylindrical shaft. In it excavation is carried on, and to prevent the water leaking in, compressed air is used. The c. is made to descend as work proceeds, and the pier is built on its upper platform. In some cases the c. actually contains the pier, the construction being carried on inside, and the c. removed when the pier is finished. **Caisson Disease**, effect of being exposed to high atmospheric pressures, *e.g.* in compressed air chamber of c., manifested by pains, embarrassment of breathing, paralysis, and other disagreeable symptoms. (2) military term applied to an ammunition chest, or a mine formed by burying powder in a case or an ammunition wagon. (3) a boat-shaped gate, used to close the entrance to a dry dock. The c. is placed in position and then filled with water, which causes it to fit tightly in its place.

CAITHNESS (58° 6′ to 58° 38′ N., 3° 1′ to 3° 53′ W.), county in extreme N.E. of Scotland; area, 686 sq. miles; bounded by Pentland Firth, Atlantic, North Sea, Sutherlandshire; surface hilly in S. and W.; highest peaks, Morven, Scaraben; watered by Wick, Forss, Thurso; has extensive moorlands and numerous lochs; chief towns, Wick (capital), Thurso; important fisheries off coast; produces blue flagstones; manufactures tweeds, rope, farm implements, machinery; exports farm produce, whisky, fish. Caithness belonged to Norwegian kings in Middle Ages. Pop. (1911) 32,008.

CAIUS, JOHN (1510–73), Eng. physician; b. Norwich; studied abroad; enlarged and refounded Gonville Hall, Cambridge (now Caius Coll.), 1557, and elected master (1559).

CAIVANO (40° 55′ N., 14° 19′ E.), town, S. Italy; glass. Pop. 11,460.

CAJAMARCA, CAXAMARCA (7° 6′ S., 78° 35′ W.), city (and department), Peru; ancient city of Incas; thermal baths; woollens. Pop. (town) 12,000; (department) 350,000.

CAJATAMBO, CAXATAMBO (10° 35′ S., 77° W.), town (and province), Peru. Pop. (province) 450,000.

CAJETAN, GAETANUS (1470–1534), cardinal, scholastic theologian; b. Gæta; protagonist of Luther, but believed in reform.

CALABAR (*c.* 4° 26′ N., 7° 13′ E.), district, Guinea Coast, Africa, between Kamerun and Niger delta; produces palm oil, rubber, ivory, ebony; extremely unhealthy; includes towns of C., formerly styled Old C., which stands on C. River and has Presbyterian mission, and New C., a port on New C. River.

CALABAR BEAN, seed of *Physostigma venenosum*; contains alkaloid (*physostigmine*) used medicinally; in tetanus, chorea, and as stimulant for increasing glandular secretion and peristaltic motions of intestine; also as local application for the eye, causing contraction of pupil, relieving ocular paralysis resulting from diphtheria, conjunctivitis of infants, corneal ulcers; formerly used by natives of C. in witchcraft.

CALABOZO (8° 58′ N., 67° 35′ W.), town, Venezuela; bp.'s see; cattle. Pop. 3700.

CALABRESELLA, Ital. card game, in which three persons take part, the eights, nines, tens being removed from the ordinary pack.

CALABRIA (39° N., 16° 30′ E.), compartment, Italy (area, 5819 sq. miles); between Tyrrhenian and Ionian Seas; surface mountainous, crossed by Apennines; large forests; grain, rice, fruits, flax; minerals include marble, salt, copper, gypsum; important fisheries; belonged to Rome in III. cent. B.C.; formed part of kingdom of Two Sicilies; long infested by brigands; subject to earthquakes. Pop. *c.* 1,400,000.

CALADIUM, genus of leafy tropical plants, suitable for hothouse cultivation.

CALAFAT (43° 59′ N., 22° 59′ E.), town, on Danube, Rumania; Turks defeated Russians, Jan. 1854. Pop. 7500.

CALAH, ancient city, Assyria, on peninsula formed by Tigris on W.; now ruins.

CALAHORRA (42° 17′ N., 1° 59′ W.), town, Logroño, Spain; bp.'s see; grain, tanneries; ancient *Calagurris*. Pop. 10,000.

CALAIS (50° 57′ N., 1° 50′ E.), seaport, Pas-de-Calais, France, on Strait of Dover; strong fortress; centre of passenger traffic with England and Continent; good harbour; chief buildings, Notre Dame Church, Hôtel de ville, old town hall; captured by English, 1347; retaken by French, 1558; fisheries. Pop. (1911) 72,322.

CALAIS (45° 9′ N., 67° 19′ W.), seaport, Maine, U.S.A.; lumber. Pop. (1910) 6116.

CALAMIANES (11° 35′ N., 119° 55′ E.), islands, Philippines; honey, timber. Pop. *c.* 18,000.

CALAMINE ($ZnCO_3$), mineral, zinc carbonate, rhombohedral grey, yellow, or buff-coloured crystals; used as a pigment in ceramic painting; name also applied to hydrous zinc silicate or smithsonite.

CALAMY, EDMUND, 'THE ELDER' (1600–66), Eng. Presbyterian theologian; member of Westminster Assembly; ejected, 1662; his s. **Edmund**, 'THE YOUNGER,' was f. of **Edmund** (1671–1732), Nonconformist historian.

CALAÑAS (37° 31′ N., 6° 54′ W.), town, Andalusia, Spain; copper. Pop. *c.* 8300.

CALARASHI (44° 12′ N., 27° 15′ E.), town, on Danube, Rumania; annual fair. Pop. 11,000.

CALASCIBETTA (37° 33′ N., 14° 18′ E.), town, Caltanisetta, Sicily; wine, silk, olive oil. Pop. 9100.

CALASIAO (16° N., 120° 15′ E.), town, Luzon, Philippine Islands; woven fabrics. Pop. 14,000.

CALATAFIMI (37° 54′ N., 12° 51′ E.), town, Sicily. Pop. 11,400.

CALATAYÚD (41° 25′ N., 1° 40′ W.), town, Saragossa, Spain. Pop. 11,500.

CALATIA, ancient town, Via Appia, Campania, Italy.

CALATRAVA (38° 40′ N., 4° 15′ W.), plain, New Castile, Spain. *C. la Vieja* ruined town and fortress, N.E. of Ciudad Real, Spain.

CALBAYOG (12° 5′ N., 124° 40′ E.), town, Philippine Islands; hemp. Pop. (1910) 15,900.

CALBE, KALBE (52° 39′ N., 11° 23′ E.), town, on Saale, Prussian Saxony; textiles, paper. Pop. 12,300.

CALCAREA, see under SPONGES.

CALCAREOUS ROCK, rock in which lime is predominant; generally of aqueous origin, they are remains of organic life; *e.g.* corals, foraminifera. C. SOIL produced by disintegration of c. rock; difficult of drainage owing to lime retaining water.

CALCHAS, famous soothsayer at the time of the Trojan War; after encountering Mopsus, who proved his superior in divination, he is said to have destroyed himself.

CALCIFEROUS FORMATION, one of the subdivisions of Lower Silurian system of N. America; contains c. sandstones, a subdivision of the carboniferous strata.

CALCINATION, CALCINING, process (now called *oxidation*) of heating various metallic ores in furnaces or heaps for the extraction of metals.

CALCITE, mineral, calcium carbonate ($CaCO_3$) crystallised in hexagonal form; occurs abundantly as limestone, marble, chalk, also as stalactites, stalagmites, talc spar, Iceland spar (purest form), nail-head and dog-tooth spar. C. is decomposed by heat into calcium oxide and carbon dioxide, effervesces when treated with acids, liberating carbon dioxide. Used in glass-working, iron-smelting, preparation of lime, and as building stone.

CALCIUM (Ca, 39·9), metallic chemical element; S.G. 1·58; light yellow, lustrous, ductile, and malleable; easily oxidises in air, burns brilliantly, forming calcium oxide or lime. Decomposes water with liberation of hydrogen. Abundant in nature combined with metallic bases as *carbonate*, $CaCO_3$ (limestone, chalk, marble), *phosphate*, $Ca_3(PO_4)_2$ (minerals apatite and phosphorite), *fluoride*, CaF_2 (fluor spar). Occurs dissolved in most natural waters as carbonate or sulphate (calcium phosphate), causing hardness in bones, egg-shells (carbonate). Metal is obtained by decomposing calcium chloride by electric current.

CALC-SINTER, CALCAREOUS TUFA, carbonate of lime found in stalagmites and stalactites (*q.v.*).

CALCULATING MACHINES, instruments designed to perform various calculations mechanically.

(i) **Addition machines.**—Practically all comprise a series of discs or cylinders marked with the numbers 0 to 9, all but one of which are covered with a plate. If a number (say 6) of such discs are arranged side by side, any number of 6 digits may appear. The rotation of the discs is effected by pressing certain keys, and the discs are so geared that a complete rotation of any one disc is made to move the next on its left through the space corresponding to 1 unit. Thus numbers may be added together. In money-addition machines the numbering of the discs and also the gearing is modified to suit the money system used. Addition machines may be adapted to effect multiplication, a key being so arranged that on pressing this key and those corresponding to the number to be multiplied, the number may be added any number of times.

(ii) **Multiplication machines.**—The Steiger-Egli machine is a true multiplication machine which will give the product of two 8-figure numbers, the quotient of one number by another, or square-roots.

(iii) **Difference machines.**—The elaborate difference machine of Babbage was designed to effect such operations as the calculation of values of functions such as $y=a+bx+cx^2+dx^3+ex^4$ for $x=1, 2, 3$, etc.

(iv) **Analytical machines** of various types have been invented for analysing periodic curves into their Fourier components. The first of these was that of Lord Kelvin, but many improvements have since been made, two of the best being that of Henrici and Coradi, and that of Michelson & Stratton.

Slide rules are designed for performing all kinds of logarithmic calculations. Essentially they consist of a fixed scale A, the graduations of which are proportional to the logarithms of the numbers from 1 to 10. By the use of an exactly similar sliding scale B, the logarithms of numbers may be added or subtracted.

Planimeters are instruments for determining mechanically the area of a given figure. A tracing point is guided round the figure, and the area can then be read off in appropriate units on the recording apparatus of the instrument. The simplest is that of Amsler. A bar A is fixed at one end by a needle point, and can turn about that point. A second bar B is hinged to A, and carries a wheel (with counting apparatus) near the hinge, and the tracing point at the other end, the axis of the wheel being parallel to B. As the tracing point is moved round the given figure, the wheel partly slips and partly rolls over the paper, and the total rotation is for a certain position of the figure proportional to the area of the figure; in other cases the value recorded by the instrument has to be added to or subtracted from a constant, depending on the dimensions of the instruments. Another type is the *Hatchet Planimeter* of Prytz. It consists simply of a curved knife-edge rigidly connected to a tracing point in the line of the knife-edge. It gives, with a little practice, very satisfactory results.

Integrators.—Various instruments have been designed to effect mechanically the integration of functions. If the pointer is guided along the curve $y=f(x)$, the instrument gives the curve $Y=\int y dx$.

CALCULUS OF VARIATIONS.—Object of this is to find maxima and minima values of expressions involving integrals, the expressions being supposed to vary by assigning different *forms* to the functions denoted by the dependent variables. The method of finding such max. and min. values is analogous to that of finding ordinary max. or min. values by the Differential Calculus. Let V denote a given function of x, y, $\frac{dy}{dx}, \frac{d^2y}{dx^2}, \ldots$ and let $U=\int_{x_0}^{x_1} V dx$, x_1 and x_0 being given limits. The value of U cannot be found without knowing what particular function y is of x; but without knowing this we can find δU, the increment of U by ascribing to y an arbitrary increment or *variation* δy, and from this we can deduce the conditions for a maximum or minimum value of U. The simplest problem to be so treated is to find the shortest line between two points.

Another, first proposed by John Bernoulli in 1696, which gave rise to the c. of v., is to find the curve of quickest descent from one given point to another. This problem is known as a *brachistochrone*. Another is to find the shape of a solid of revolution experiencing minimum resistance in moving through a fluid, the resistance being assumed to be a normal pressure proportional to the square of the cosine of the angle between the normal to the surface and the direction of motion. Problems of *relative* maxima and minima also are dealt with by the variation method; as, given the length of a curve, find its form so that the depth of the centre of gravity may be a maximum.

See *Calculus of Variations*, Jellett; *History of Progress of Calculus of Variations during Nineteenth Century*, Todhunter.

CALCUTTA (22° 35′ N., 88° 24′ E.), chief commercial centre and former capital of Brit. India; on left bank of Hugli (*q.v.*); capital of Bengal. Public buildings include Government House, Public Library, Univ. (founded 1857), and many schools; fine park—Maidan—with numerous statues and Marble Memorial to Queen Victoria; Fort William, nucleus of C., is near centre of town. C. dates from 1686; founded by Job Charnock; attacked and captured by Surajah Dowlah, nawab of Bengal, 1756, when 146 Europeans were imprisoned (June 20) in *Black Hole of C.*, from which only 23 emerged alive next day; retaken by Clive, Jan. 1757; capital of India, 1772–1912, when superseded by Delhi. A railway and canal centre, C. manufactures jute, cotton, iron; port has 45 % of Indian trade; graving docks; exports cotton, rice, spices, rubber, oils, seeds, tea, opium, hemp, jute. Pop. (1911) 1,222,313.

Blechenden, *Calcutta, Past and Present* (1906).

CALDECOTT, RANDOLPH (1846–86), Eng. artist and book-illustrator; attained fame by humorous drawings in *Graphic* and illustrations to Washington Irving's books, and of nursery stories.

CALDER (55° 52′ N., 3° 33′ W.), district, W. Midlothian, including Mid-Calder, West Calder.

CALDER, SIR ROBERT, Bart. (1745–1815). Brit. admiral; b. Elgin, Scotland; defeated Villeneuve, off Finisterre (1805); Commander of Portsmouth (1815).

CALDERON DE LA BARCA, PEDRO (1600–81), the greatest of Span. dramatists; b. Madrid; adopting the profession of arms, saw service in Flanders and elsewhere; wrote plays, and was patronised by Philip IV.; later entered the priesthood, but was eventually recalled to court, and continued his dramatic work for the remaining years of his life. A prolific writer (118 of his plays are still extant), he has been classed by Schlegel with Homer, Dante, and Shakespeare. Eng. trans. include *Six Dramas of Calderon*, by E. Fitzgerald (1853); *Six Plays of Calderon*, by Denis MacCarthy (1853); followed by further instalments in 1861, 1867, 1870, and 1873; and a fragment of *The Magician* by Shelley; later trans. being those by Norman Maccoll, 1888. See SPAIN (Literature).

Life, by Hasell; *Life-Work of C.*, by Merejkowski.

CALDERON, PHILIP HERMOGENES (1833–98), well-known Span. painter; keeper of Royal Academy (1887).

CALDERON, RODRIGO (d. 1621), Span. adventurer; b. Antwerp; became sec. to Duke of Lerma and subsequently to Philip III. (till 1611); cr. Count of Oliva, and in 1614 Marques De Las Siete Inglexias; incurred hatred from his insolence. When Uceda's cabal drove Lerma from court, C. was arrested, tortured, and afterwards executed.

CALDERWOOD, DAVID (1575–1650), Scot. divine; banished for resisting attempts of James VI. to establish episcopacy in Scotland; wrote *Altare Damascenum*, a criticism of claims of episcopacy.

CALDERWOOD, HENRY (1830–97), Scot. philosopher; prof. of Moral Philosophy at Edinburgh (1868); author of *The Philosophy of the Infinite* (1854), etc.

CALEDON (34° 12′ S., 19° 27′ E.), town, Cape Province, S. Africa; thermal springs.

CALEDON (29° 30′ S., 27° 20′ E.), river, S. Africa; rises near Mont aux Sources; flows S.W.; joins Orange River.

CALEDONIA, name given by the Romans to that part of Scotland which was to the N. of the Roman wall running between the Firths of Forth and Clyde. The name first occurs in Lucan (64 A.D.). It has been the habit of Scott, and other modern poets, to include the Lowlands also under the name.

CALEDONIAN CANAL (57° 5′ N., 4° 50′ W.), in counties Inverness and Argyll, joining Lochs Dochfour, Ness, Oich, Lochy, and connecting North Sea with Atlantic Ocean; opened, 1823; largely used by fishing fleets; favourite tourist route.

CALENBERG, KALENBERG (52° 30′ N., 9° 30′ E.), district, Prussia; former principality, Hanover.

CALENDAR, method of dividing time into hours, days, weeks, months, years, etc. Name is derived from Roman 'Kalends,' the first day of every month.

The periodical occurrence of certain terrestrial and celestial phenomena originated the first division of time, but this natural method of division has certain disadvantages which in certain cases, as with the month, have caused arbitrary divisions to be adopted. The alternations of light and darkness gave the *solar day*, the moon's cyclic changes gave the *lunar month*, and the periodic motion of the earth round the sun, evidenced by the seasons, gave the *solar year*. The division of the day into 24 hours, and the aggregation of 7 days to the week have no astronomical basis.

Day.—The day has been divided into 24 hours from the earliest times, but different nations have adopted different methods both as regards starting and the counting of the hours. Thus the Babylonians began the day at sunrise, the Jews at sunset, the Egyptians and Romans at midnight, a method adopted by most modern peoples. The civil day in most countries is divided into two portions, each of 12 hours, and so the abbreviations A.M. (*ante meridiem*) and P.M. (*post meridiem*) are required to denote hours before and after noon. In Italy afternoon hours (1, 2, 3, . . . 11 p.m.) are called 13, 14, 15, . . . 23 o'clock. For astronomical purposes, 24 hours are counted continuously from midnight (from midday, up to 1885). See DAY.

Week, a period of 7 days, and possibly due originally to the number of planets known to the ancients; but origin is very doubtful. English names of days of week are of Anglo-Saxon origin. The Latin names are preserved, with modifications, in the modern French names of the days of the week.

Month originally meant the time of one revolution of the moon, but has since become an arbitrary division of the year, on account of the difference of about 11 days between 12 lunations and the solar year.

Year.—The civil year is regarded as commencing at different times by different nations, but the European system is gradually extending. The astronomical year is the time of the earth's revolution round the sun—365 days 5 hours 48 min. 46 sec. mean solar time. See TIME.

The calendar now generally adopted is that due to the Romans. At the time of Julius Cæsar the difference between the civil and astronomical years was about two months, this being due to negligence in the observance of the somewhat complicated system in use before, which was adopted from the Greeks. Cæsar, taking the astronomical year as 365¼ days, adopted a simpler arrangement, fixing the number of days in the alternate months January, March, May, July, September, and November as 31, the other months, with the exception of February, each having 30 days. February was ordinarily to have 29 days, but 30 every fourth year. This was altered in the time of Augustus, the month Sextilis being called after him and given 31 days. So others were changed, and the present anomalous system arose. The *Julian calendar* continued in use till 1582, by which time the cumulative error of about 11¼ min. amounted to 10 days. The correction was made by Pope Gregory XIII., and hence we have the *Gregorian calendar*. Pope Gregory ordained that the years 1600, 1700, etc., should only be reckoned as leap-years when multiples of 4 after omitting the two cyphers, which amounts to counting three days in 400 years less than reckoned in the Julian calendar. If our present value of the solar year be correct, the error of the Gregorian calendar will only amount to 1 day in about 3320 years.

Calends (Lat. *Kalendæ*), first day of Rom. months. Greek C's, being non-existent, meant 'never.'

The *New Style* (n.s.; *i.e.* Gregorian) was adopted late by Prot. countries; in Britain by Calendar

Act, 1750, when day following Sep. 2 was made Sep. 14. Gk. Church (in Russia, Greece, etc.) still retains Julian calendar (*Old Style*: o.s.). Documents, etc., are sometimes doubly dated (old and new style), *e.g.* April 20 / May 3. In Fr. Revolution, National Convention decided to begin a new era with Sep. 22, 1792 (foundation of Republic). Year was to be of 12 months (viz. Vendémiaire, Brumaire, Frimaire, Nivose, Pluviose, Ventose, Germinal, Floréal, Prairial, Messidor, Thermidor, Fructidor) of 30 days each; there were to be 5 festival days at end—to Virtue, Genius, Labour, Opinion, Rewards; Revolution Day was to be added every fourth year. Napoleon restored the Gregorian calendar, 1806.

The *Jewish* year consists of 12 lunar months, an additional month being intercalated at intervals.

The *Muhammadan* year also has 12 lunar months, but, as they do not intercalate, there is no correspondence between months and seasons.

In *Hindu* calendar solar year regulates civil affairs in Bengal and part of Madras; lunar year is used for domestic and religious purposes over all India. Each of the 12 months begins with the sun's entering a sign of Hindu zodiac. First day of year is our April 12.

Ecclesiastical calendar.—Partly based on the solar year and partly on the lunar month; thus we get some feasts 'fixed,' others 'moveable.'

Easter is the most important feast, as it determines others. Method of fixing date very complicated, but tables (see Book of Common Prayer) are available, giving date for any year. Easter is Sunday next after the 14th day of the paschal moon, and must lie between March 22 and April 25. Other principal Church feasts depending on Easter are:—

Septuagesima Sunday	9 weeks	before Easter.
First Sunday in Lent	6 ,,	
Ash Wednesday	46 days	
Rogation Sunday	5 weeks	after Easter.
Ascension Day	40 days	
Whitsunday	7 weeks	
Trinity Sunday	8 ,,	

Dominical Letter.—Putting letters A, B, C, D, E, F, G, with the first seven days of January, the dominical or Sunday letter for the year is that corresponding to Sunday.

Golden Number.—19 Julian years are equal to 235 lunar months; so a table of the moon's phases for 19 years will serve for any year when its number in the cycle is known. This number is the *Golden Number.* To find the golden number, add 1 to the date, divide by 19; the remainder is the golden number, or, when no remainder, golden number is 19.

Epact.—Denotes age of moon at beginning of year—once of importance in computing Easter. See ANOMALY.

CALENDERING, smoothing or glazing of textile fabrics by rollers; the finishing by pressure of linen and cotton goods and paper.

CALGARY (51° N., 114° W.), oldest city, Alberta, N.W. Canada; founded, 1884; commercial centre. Pop. (1911) 43,736.

CALHOUN, JOHN CALDWELL (1782–1850), Amer. statesman; graduated at Yale (1804); admitted to Bar, and acquired large practice; entered Congress (1811) and soon became active supporter of the measures which led to the war with Great Britain; was Sec. of War under Pres. Monroe (1817–25); Vice-Pres. of U.S.A. (1825–32). C. was regarded as the mouthpiece of the Southern States in national affairs, and was a warm advocate of slavery. To his own slaves he was the most indulgent of masters. C. also held the State's right of nullification, *i.e.* preventing operation of a Federal law. His integrity of character and kindliness of disposition secured to him a large following of personal friends.

CALI (3° 25′ N., 76° 45′ W.), town, Colombia, S. America; commercial centre. Pop. 16,000.

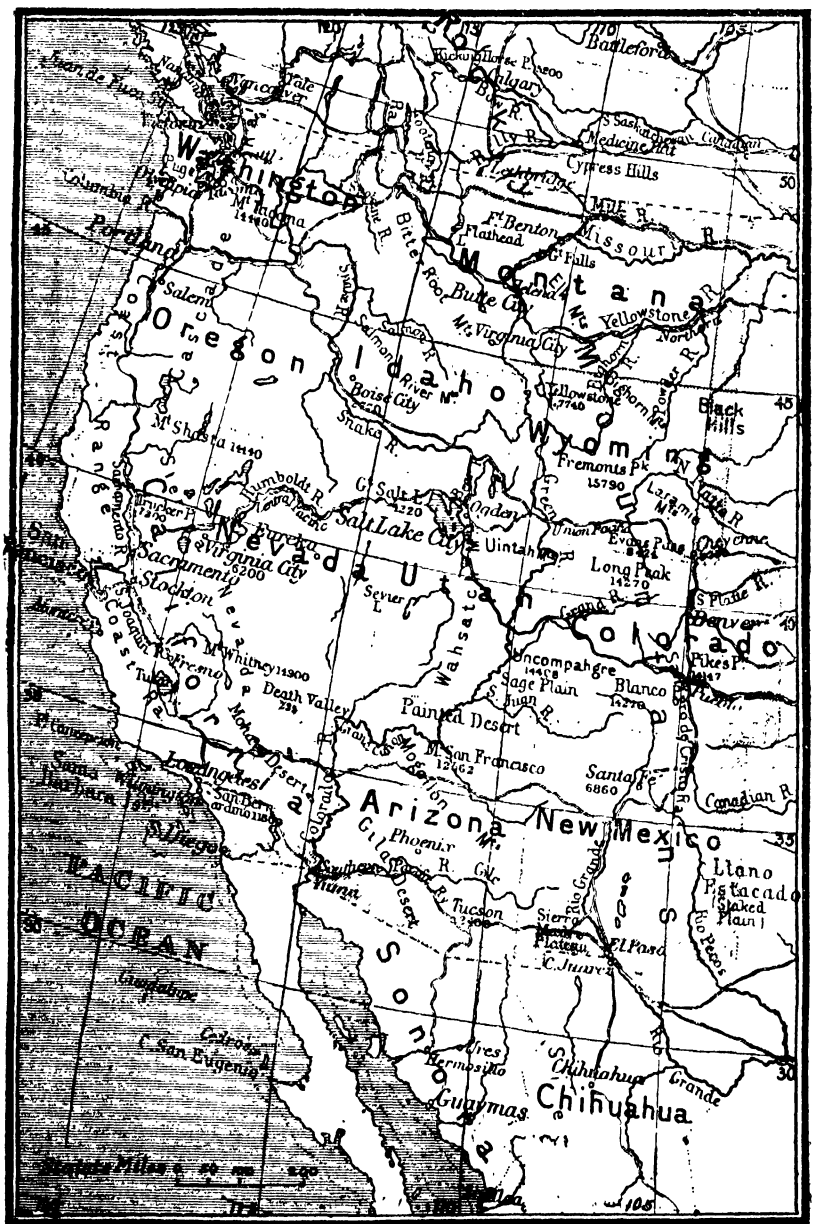
CALIBRATION, the process of ascertaining the place and amount of variation in a scientific instrument. If the bore of a thermometer tube varies in width, variation in bore will introduce an error. The process is also applied to burettes used in chemical analysis, stretched wires used in potentiometers and arrangements such as the Wheatstone Bridge, sets of weights used for balances of high accuracy, spectroscopes used for determination of length of light-waves, galvanometers intended to give the absolute measure of a current, etc.

Watson, *Text-Book of Practical Physics.*

CALICO, grey or bleached cotton cloth; c., when printed upon, is known technically as 'print'; name derived from town of Calicut (Madras), where cotton cloths were made, XVI. cent.

CALICUT (11° 15′ N., 75° 49′ E.), seaport town, Madras, Brit. India; first Ind. port visited by Europeans; anciently a flourishing city and trade centre; gave name to calico, a former important manufacture; ceded to British, 1792; chief exports, coffee, spices, and timber. Pop. (1911) 78,417.

CALIFORNIA (32° 20′ to 42° N., 114° 20′ to 124° 25′ W.), state, U.S.A., on Pacific coast; bounded N. by Oregon, E. by Nevada, Arizona, S. by Mexico, W. by Pacific; area, 158,360 sq. miles, of which 2188 are water. Surface generally consists of two great mountain systems running lengthwise through state, with a broad valley between them. These mountains are the Sierra Nevada in the E. and the Coast Range along the coast; chief peaks of former, Mt. Whitney, Fisherman Peak; of latter, San Bernardino, San Jacinto. In the S. is the Tehachapi range uniting the two great systems. The central valley is remarkable for beauty, and is called the Great Valley of C.; it is over 500 miles long and from 40 to 60 miles wide. It is drained by the Sacramento and the San Joaquin, which flow respectively through the N. and S., and, uniting in lat. 38° 3′ N., enter Suisin Bay to N. of San Francisco. Other rivers are the Feather and American R's, tributaries of Sacramento; the Merced, Stanislaus, and other tributaries of the San Joaquin; Eel R. in N.W., Salinas and Santa Maria in S.W. Chief lakes are Tulare, Owens, Mono, Tahoe, Honey, Goose, Klamath. In the S. are depressed desert regions. Chief towns are San Francisco Los Angeles, Oakland, Sacramento (capital), San Diego, Pasadena, San José, Alameda. Climate is cold and wet in N., but in S. dry and semi-tropical.



Sierra Nevada is chiefly of Archæan, Coast Range of Cretaceous, formation; while valley belongs to Tertiary and Quaternary periods. Flora includes redwood and mammoth trees, wild-oats, alfalfa, and great variety of flowering shrubs. Fauna includes grizzly bears, pumas, wolves, deer, lizards, woodpeckers, quails.

History.—The coast of C., or Upper C. as it was called in contradistinction to the Mexican territory of Lower C., was explored by Juan Cabrillo in 1542–43; it was visited by Drake in his voyage of 1579; and three years later an expedition under Sebastian Vizcaino explored Monterey and San Diego Bays, and anchored near Point Reyes in the old port of San Francisco. In XVIII. cent. various missionary settlements were established in the country by the Spaniards; they obtained no grants of land from the Span. government, but later acquired great wealth. The first missionary expedition arrived at San Diego in 1769, where a Franciscan mission was established; others were founded at Monterey in 1770, at San Francisco in 1776; and eventually there were twenty-one religious communities in the country, the last being that founded at Sonoma in 1823. Towns were also established, San José dating from 1777, Los Angeles from 1781.

The Indians were taught agricultural arts; no trade with foreigners was at first allowed, but in 1806 a Russ. official obtained commercial concessions, and in 1812 a Russ. trading station was founded at Ross; foreign trade became very extensive from about 1822, in which year Mexico attained independence; from this time till 1846 C. was subject to Mexican rule, although practically autonomous. From about 1831

patriotic party arose; and after fifteen years of discontent, political feuds, and jealousy against Mexico, a rising occurred in 1844; independence was declared in 1846 by some Amer. settlers, who captured Sonoma in that year. Subsequently Amer. forces seized Monterey and other places, ultimately conquering whole of C., which became a territory of U.S.A. in 1848. Gold was discovered in 1848, which resulted in great influx of men from all over the world. A constitution was formed in 1849, and C. was admitted to the Union in the following year. C. sent 1½ million dollars to Federalists at time of Civil War, and some volunteer forces. Since that time country has greatly developed; railways and canals have been extended and commerce has vastly increased. Great numbers of Chin. labourers immigrated here from about 1850; further immigration was prohibited by Anti-Chinese bill in 1891. In 1906 occurred terrible earthquake at San Francisco (*q.v.*). Most important recent events have been labour strikes and anti-Japanese legislation.

Executive is in hands of gov., assisted by lieut.-gov. and five ministers; legislative power vested in Senate of 40 members and Assembly of 80 members, former elected for four, latter for two, years. C. has woman suffrage. The State sends 2 Senators and 11 representatives to Congress. Among religions Rom. Catholicism has greatest following.

Hittell, *History of California* (San Francisco, 1885–95); Royce, *California* (New York, 1886); Greenhow, *History of Oregon and California* (1844).

CALIFORNIA, LOWER (30° N., 109° 53′ W.), peninsula, territory of Mexico, between Gulf of California and Pacific Ocean; mountainous; water and vegetation scarce, but valleys produce maize and wheat; horses and cattle reared; Spaniards settled here in XVII. cent.; gold and silver mining and pearl-oyster fishing. Pop. (1910) 52,244.

CALIGULA, see GAIUS CÆSAR.

CALIPH, name given to successors of Muhammad. The story of the Muhammadan chiefs who bore the name of caliph falls into three dynasties: (1) The four caliphs who severally succ. Muhammad; (2) the Omayyad caliphs; (3) the Abbasid caliphs.

Muhammad, dying without male issue, was succ. (632 A.D.) by ABU-BEKR (*q.v.*), f. of Ayesha, the prophet's wife; at his death (634) he nominated OMAR, another relative, as his successor; Omar was stabbed by a slave (644), and a select council app. OTHMAN, a high official, as third caliph, who was in turn succ. by ALI, s. of Abu Taleb, murdered by a fanatic in 661.

The reign of each of these four rulers had been largely occupied with warfare, and before the death of Ali a new competitor for the caliphate had entered the field in the person of Moawiya, gov. of Syria, who claimed to succeed his cousin Othman, and, having subdued Persia, Syria, Egypt, and Yeman, deposed Ali's s., Hassan, and seized the caliphate.

Omayyad Caliphs: MOAWIYA (661–80), who made the title of caliph hereditary, was their first ruler of the line of the Omayyads, and their capital was Damascus. This dynasty lasted until 750, when it was in turn overthrown by a powerful family (Abbasides) descended from Abbas, uncle of Muhammad.

Abbasid Dynasty: ABÛL ABBAS (750–54), the first caliph of the line, was followed by his bro., Abu Jaafar Almansôr (754–75), who established the seat of Empire at Bagdad; succ. by his s., Almahdi (775–85); Alhadi (785–86); followed in turn by Harun er Raschid, 'the Just' (786–809). Of all these potentates by far the most famous is the last mentioned, whose name has been made familiar throughout the world by means of the *Thousand and One Nights*.

CALIPPIC PERIOD, three Metonic cycles of 6940 days each and 6939 days in addition; suggested by astronomer Calippus; coincides with six Julian years. See CALENDAR.

CALIVER, XVI.-cent. firearm.

CALIXTINES, see HUSSITES.

CALIXTUS, name of three popes: CALIXTUS I. (217–22), said to have been a slave originally.—CALIXTUS II. (1119–24), a noble Burgundian, chosen Pope at Cluny, and displaced the Anti-Pope, Gregory VIII.—CALIXTUS III. (1455–58), a Spaniard (Alphonso de Borgia), owed his advancement in the Church to Alfonso V. of Aragon.

CALIXTUS, GEORG, CALLISEN (1586–1656), Ger. theologian; sought to broaden basis of Lutheranism.

CALLANDER (56° 14′ N., 4° 12′ W.), small town, on Teith, Perthshire, Scotland; tourist centre.

CALLAO (12° S., 77° 15′ W.), chief seaport of Peru; fine harbour; exports guano, chemicals, coffee, rice, cocaine, wool, salt, sugar, hides, tobacco; imports coal, machinery, flour, wheat, rice, etc. Old town was destroyed by earthquake, 1746. Notable buildings are old fortress (now custom house) and prefecture. Pop. 40,000.

CALLCOTT, SIR AUGUSTUS WALL (1779–1844), Eng. artist; famed for landscapes; R.A. (1810); knighted, 1827.

CALLCOTT, JOHN WALL (1766–1821), Eng. composer and musician; won reputation as composer of glees; his *Musical Grammar* (1806) was long regarded as a standard work.

CALLERNISH (58° 12′ N., 6° 42′ W.), village, Lewis, Scotland; in district are four stone circles.

CALLIAS, tyrant of Chalcis; friend of Demosthenes.

CALLIAS and HIPPONICUS, heads of an Athenian family who were hereditary torch-bearers at the Eleusinian mysteries.

CALLICHTHYS, see CAT-FISHES.

CALLIMACHUS (fl. 250 B.C.), Gk. poet; wrote large number of poems, his elegies being especially esteemed; app. librarian of Alexandrian library by Ptolemy Philadelphus.

CALLINUS (630–560 B.C.), earliest Gk. elegiac poet.

CALLIOPE, Muse of Epic poetry.

CALLIPHORA, see under HOUSE-FLY.

CALLIRRHOE (classical myth.), dau. of god Achelous; wife of Alcmæon.

CALLISTHENES (IV. cent. B.C.), Gk. historian; pupil of Aristotle; accompanied Alexander the Great into Asia, and wrote an account of the expedition; also histories of the wars of the period.

CALLISTO (classical myth.), a nymph; dau. of Lycaon; with her son, Arcas, transformed into a constellation.

CALLISTRATUS, name of (1) Grammarian (fl. II. cent. B.C.); (2) Athenian poet; (3) Gk. rhetorician (fl. *c.* III. cent.).

CALLOT, JACQUES (1592–1635), Fr. engraver; b. Nancy; left home at age of twelve to pursue his studies in Italy; patronised by Cosimo II. of Florence; executed designs for Louis XIII. of France, and other crowned heads.

CALLOVIAN, lowest section of Oxford Oolite rocks, called also Kellaway Rock, a calcareous sandstone with characteristic fossils (*Ammonites callovienses*).

CALMAR, see KALMAR.

CALMET, ANTOINE AUGUSTIN (1672–1757), Fr. Benedictine; wrote numerous commentaries on the Bible.

CALMUCKS, see KALMUCK.

CALNE (51° 27′ N., 2° W.), market town, Wiltshire, England; site of castle of kings of Wessex; bacon-curing is chief industry. Pop. (1911) 3539.

CALOMARDE, FRANCISCO TADEO, DUKE (1775–1842), Span. statesman who encouraged illiberal policy of Ferdinand VII.; supported Carlists.

CALOMEL (mercurous chloride), Hg_2Cl_2, found naturally as the mineral called horn-quicksilver, or prepared from a mixture of mercury and corrosive sublimate; a yellowish-white crystalline powder, heavy, and tasteless; used in med. as a purgative, being antiseptic and a bile stimulant.

CALONNE, CHARLES ALEXANDRE DE (1734–1802), Fr. statesman; after filling various legal appointments under Crown, was summoned (1783) to take charge of national finances, and endeavour to replenish royal treasury; met with ill success, and was dismissed and exiled by Louis XVI. (1787); returned to France (1802) by permission of Napoleon.

CALORESCENCE, term describing the optical phenomenon that, when invisible heat rays are focused by a lens upon charcoal, the latter is heated to incandescence, the heat rays being converted into visible rays.

CALORIE and **CALORIMETRY**, see HEAT.

CALOTTE (Fr.), cap worn over priestly tonsure, hence symbol of priest; Fr. association formed by men of high rank in XVII. cent. for merciless criticism of society, and named from the c., which they sent to objects of their criticism as symbolic covering for their exposed faults.

CALPE (36° 9′ N., 5° 21′ W.), promontory, Spain; now called Gibraltar (*q.v.*).

CALPURNIA, childless wife of Julius Cæsar; tradition records her pleading with Cæsar not to go abroad on fatal Ides of March.

CALPURNIUS, TITUS, Rom. poet; wrote eclogues in manner of Theocritus; lived about time of Nero.

CALTAGIRONE (37° 12′ N., 14° 33′ E.), city, Catania, Sicily; bp.'s see; manufactures pottery. Pop. (1911) 44,547.

CALTANISETTA (37° 27′ N., 14° 2′ E.), town,

Sicily; cathedral; is centre of sulphur industry; has mineral springs. Pop. (1911) 41,320.

CALTROP, small iron ball fitted with sharp spikes; strewn on ground before opposing force in battle to check cavalry charge.

CALUIRE-ET-CUIRE (45° 48′ N., 4° 52′ E.), town, on Saône, France; perfume and pottery. Pop. 10,800.

CALUMET, Fr. name for 'peace-pipe' of Amer. Indians; its being offered to strangers was signal mark of hospitality.

CALUMPIT (14° 48′ N., 120° 50′ W.), town, Luzon, Philippine Islands; important market; chief product is rice. Pop. 15,000.

CALVADOS (49° 5′ N., 0° 20′ W.), maritime department, N.W. France; principal rivers are Touques, Dives, Orne, and Vire; soil generally fertile, and provides pasturage for the cattle and horses raised; butter, cheese, and cider produced; textiles manufactured; fisheries productive; iron, coal, and granite found; capital, Caen; area, 2197 sq. miles. Pop. (1911) 396,318.

CALVAERT, DENIS, Dionisio Fiammingo (d. 1619), Dutch painter; master of Domenichino.

CALVARY ('place of skulls'), place where Christ was crucified; 'a Calvary,' representation of Crucifixion.

CALVÉ, EMMA (1866–), Fr. *prima donna*; principal parts in Carmen, Pêcheurs de Perles, Sapho.

CALVERLEY, CHARLES STUART (1833–84), Eng. poet and scholar; brilliant univ. career both at Oxford and Cambridge; pub. *Verses and Translations* (1862); *Verse Translation of Theocritus* (1869); *Fly-Leaves* (1872). As a writer of light verses and parodies he is unsurpassed.

CALVERT, GEORGE, see Baltimore.

CALVERT, SIR HARRY, Bart. (d. 1826), Eng. general; served under Cornwallis in Amer. War; adjutant-general (1799); received baronetcy (1818).

CALVES' HEAD CLUB, formed shortly after his execution to deride the memory of Charles I.; existed until 1734.

CALVI (42° 34′ N., 8° 44′ E.), fortified seaport, Gulf of Calvi, Corsica; captured by British (1794); retaken by Corsicans (1795).

CALVIN, JOHN (1509–64), Reformer; b. Noyon (Picardy), July 10; s. of Gérard C. Intended by his f. for the Church, he was app. (1521) to a chaplaincy in the cathedral of his native town. Later he continued his education in Paris, achieving brilliant success in his grammatical and philosophical studies. In 1527 he received the curacy of St. Martin de Marteville, and later that of Pont l'Évêque, near Noyon. A year later C. decided to withdraw himself from the Church, and went to Orleans to study law. In 1529 he removed to Bourges to pursue his studies under the noted Andrea Alciati. Here also he began the study of Greek under Melchior Wolmar, and first imbibed the doctrines of the Reformation. Though there is some uncertainty as to when C.'s conversion actually took place, it is believed that he began to preach in support of the 'new learning,' as it was called, while still at Bourges. In 1531 he was again in Paris, where, in the following year, he pub. his first book—a Latin commentary on Seneca's *De Clementia*.

C. appears by this time to have given up all thoughts of adopting the law as a profession, and as Paris had now become a centre of the reformed faith, he found much there to occupy his attention. But, before long, the persecution of the Protestants began, and C. and many others were compelled to seek safety in flight. Thereafter he led a wandering life for some years, devoting much time to study, and began the writing of his *Institutes of the Christian Religion*. Amongst other towns he visited Orleans and Poitiers, and at the latter place gathered around him many adherents of the new religion. C. at twenty-five had sacrificed all other interests for the reformed faith, and his influence became very great. In 1536 he was followed to Geneva by his chief supporters, and here they issued a Prot. Confession of Faith, through the influence of which a strict morality took the place of loose living. Within two years, however, owing to a reaction against his severe rule, Calvin again found himself a wanderer. But, after three years spent in theological study at Strassburg, he was recalled to Geneva, where, except for a brief interval, he lived for the rest of his life.

Though C.'s influence now increased year by year, he was continually engaged in fierce controversies with enemies of the new faith, one of the most notable being that with regard to Election and Predestination with Albert Pighius. Though C. formed his religion on Luther's theol. and that of other earlier reformers, it was he who systematised the doctrine of Protestantism, and established a proper basis of ecclesiastical discipline.

His exhausting labours could not but have their effect on his naturally frail constitution. Early in the year 1564 his health began rapidly to decline, and he died on May 27, in his fifty-seventh year. During his residence at Strassburg he had married Idelette, widow of Jean Stordeur, of Liége, to whom he was much devoted. She, however, predeceased him, and their only child, Jacques (b. in 1542), lived but a few days. C.'s attitude towards those who were opposed to his religious or doctrinal views was often marked by the greatest intolerance, and the relentless manner in which he procured the condemnation of Servetus must ever remain as a blot upon his memory.

Life, by Walker (1906); *Life and Times*, by Penning (Eng. trans., 1912).

CALVISIUS, SETHUS (1556–1615), Ger. chronologist; pub. *Opus Chronologicum* (Leipzig, 1605).

CALVO, CARLOS (1824–1906), Argentine historian; wrote number of books relating to history of the South Amer. republics; Minister at Berlin (1885).

CALW, Kalw (48° 41′ N., 8° 45′ E.), town, on Nagold, Württemberg, Germany; manufacture of textiles staple industry; trade in timber with Netherlands. Pop. 5250.

CALX, see Flower.

CALYDON, ancient town, Ætolia; legendary scene of hunting of Calydonian boar.

CALYDONIAN BOAR.—In Gk. myth. Calydon, capital of Ætolia, was wasted by boar sent by Artemis in revenge for sacrifice omitted by King Œneus; in one story, adopted by Swinburne, Atalanta (*q.v.*) took chief part in the chase.

CALYPSO (classical myth.), dau. of Oceanus; Odysseus, when shipwrecked on Ogygia, of which she was queen, stayed there seven years.

CALYPTOBLASTEA, see under Hydromedusæ.

CALYPTRÆA, see under Gastropoda.

CALYX, see Flower.

CAM, contrivance, generally a projecting part of a wheel, for converting rotary into rectilinear motion; used in petrol and gas engines to open inlet and exhaust valves.

CAM (52° 5′ N., 0° 10′ E.), river, Cambridgeshire, England; joins Ouse.

CAM, DIOGO, Cão, Portug. traveller; first European to explore the Congo (*c.* 1482).

CAMACHO, JUAN FRANCISCO (1824–96), Span. statesman; his drastic financial reforms made him unpopular.

CAMAGÜEY (21° 23′ N., 77° 56′ W.), city and province, both formerly Puerto Principe, Cuba. Pop. 30,000; (province) 140,000.

CAMALDOLESE, Camaldulians, order of Eremite monks, founded by St. Romuald (*c.* 950), at Camaldoli, in the Apennines. The monks, who wear a white habit, dwell in separate huts, and only meet together for divine service and for meals. C. monasteries still exist in Italy.

CAMARACUM, see Cambrai.

CAMARGO, MARIE ANNE (1710–70), Fr. ballet-dancer; made her début in Paris (1726), and took the public by storm; portrait in Wallace Collection.

CAMARGUE (43° 20′ N., 4° 41′ E.), island, Bouches-du-Rhône, S.E. France; region marshy and unhealthy.

CAMARILLA, body of unofficial councillors of sovereign; especially clique which swayed Ferdinand VII. of Spain, 1814–20.

CAMARINA, ancient town, S. coast of Sicily; founded from Syracuse, 599 B.C.; complete destruction dates from A.D. 853.

CAMBACÉRÈS, JEAN JACQUES RÉGIS DE, DUKE OF PARMA (1753–1824), Fr. statesman; leaned to side of mercy at trial of Louis XVI.; member of Committee of General Defence (1793); pres. of Committee of Public Safety (1795); Second Consul (1799); later made Arch-Chancellor of France.

CAMBALUC, old name of city of Peking, meaning 'City of the Emperor'; was for a short period an abp.'s see; sometimes spelt 'Cambalu'; thus Longfellow writes of 'the Golden City of Cambalu.'

CAMBAY (22° 18′ N., 72° 30′ E.), seaport, capital of small native state of C., Bombay, India, on Gulf of C.; formerly important commercial city; commerce fallen away owing to harbour silting; famed for manufacture of agate and carnelian ornaments. Pop. 31,780.

CAMBAY, GULF OF (22° N., 72° E.), inlet, W. coast Brit. India; rapid tides; sandbanks.

CAMBERT, ROBERT (1628–77), Fr. musician; bandmaster to Charles II. of England (1673); his opera, *Pomone*, was produced in London.

CAMBIASI, LUCA (1527–85), Genoese artist; accepted commission from Philip II. of Spain to paint series of frescoes in the Escorial.

CAMBODIA, CAMBODGE (12° N., 105° E.), Fr. protectorate, S.E. Asia, bordering on Gulf of Siam; area, 67,723 sq. miles. Surface generally is alluvial plain of Mekong R., with mountain ranges and detached peaks in N.E. and W.; one arm of Mekong flows to Tonle Sap, great lake in C. and Siam, subject to extraordinary fluctuations. Chief towns are Pnom-Penh, Kampot. Climate is warm, subject to monsoons; some districts malarial. C. produces rice, sugar-cane, betel, tobacco, indigo, pepper, maize, cinnamon, coffee, cotton, vanilla, mulberry, cacao. Industries include manufactures of silk, pottery, bricks, matting; cattle raised.

C. is ruled by native king under Fr. protection. Inhabitants include Khmers, Chinese, Annamese, Malays, and there are some uncivilised mountain tribes; chief religion, Buddhism. C. was powerful state under Khmers, attaining zenith in early mediæval period; various ruins remain of former greatness; Fr. protectorate formally established, 1867. Pop. 1,200,000.

CAMBON, JULES MARTIN (1845–), Fr. barrister and diplomat; gov.-gen. of Algeria (1891); ambassador at Washington (1897), Madrid (1902), and Berlin (1907).

CAMBON, PAUL (1843–), Fr. Ambassador to Court of St. James's since 1898; bro. of above; Grand Cross of the Legion of Honour; member of Fr. Academy of Science.

CAMBON, PIERRE JOSEPH (1756–1820), Fr. statesman; prominent figure at period of Revolution; voted for death of Louis XVI.; severely criticised certain actions of Marat and Danton, and incurred hatred of Robespierre; at Restoration was exiled, and d. in Belgium.

CAMBORNE (50° 13′ N., 5° 18′ W.), market town, Cornwall, England; tin and copper mines. Pop. (1911) 15,829.

CAMBRAI (50° 10′ N., 3° 12′ E.), fortified town (ancient *Camaracum*), on Scheldt, Nord, France; abp.'s seat; principal buildings, cathedral containing monument of Fénelon, town hall, theological seminary, library; celebrated for fine linen manufactures; name 'cambric' derived thence. Pop. 15,600.

CAMBRIA, ancient Lat. name of Wales, county of the Cymri.

CAMBRIAN SYSTEM, term applied to the earliest fossiliferous geological system overlying the Archæan or Pre-Cambrian system, the oldest of the Geological Record, and overlaid by the Silurian system. It derives its name from Cambria (*i.e.* Wales), where it is specially well developed, attaining in places a thickness of 12,000 ft. Outcrops also occur in Shropshire, Warwickshire, Malvern Hills, Cumberland, eastern Ireland, and north-western Scotland. It is met throughout Europe at intervals from Scandinavia to Bohemia, and occupies vast areas of eastern North America. The Cambrian rocks consist of grits, sandstones, greywackes, quartzites, and conglomerates, with thick groups of shales and slates. In Scotland limestones are prevalent, and in America limestones, greensands, and dolomites, with masses of volcanic rocks.

Fossils are numerous and, although the earliest discovered forms of life, they show an advanced development pointing to still lower, lost, or undiscovered ancestors. The most characteristic fossils are the Trilobites (Crustacea), Paradoxides, Olenus and Olenellus, and the Brachiopod *Lingula Davisii*, from the Port Madoc slates. The only discovered plants are regarded as Algæ (Eophyton). The system in Britain is subdivided as follows:—

Upper	Tremadoc slates.	
	Lingula flags	(Olenus zone).
Lower	Menevian series	(Paradoxides zone).
	Harlech series	(Olenellus zone).

Sir Archibald Geikie, *Text-Book of Geology*; Jukes-Brown, *Handbook of Historical Geology*.

CAMBRIC, fine linen cloth first manufactured at Cambrai, France.

CAMBRIDGE (52° 12′ N., 0° 7′ E.), town, Cambridgeshire, on Cam; famous as Univ. town. **Cambridge Univ.** is said to have been founded or restored by Sigebert of East Anglia and revived by Edward the Elder; became important early in XIII. cent.; obtained papal recognition, 1231. Colleges in order of foundation are: (1) *Peterhouse*, founded 1284 by Hugh de Balsham, bp. of Ely; (2) *Clare*, founded 1326 by Richard de Badew, refounded by Lady Elizabeth, sister of Gilbert, Earl of Clare; (3) *Pembroke*, founded as Valence-Mary Coll., 1347, by Mary de St. Paul, widow of Aylmer de Valence, Earl of Pembroke; Henry VI. was great benefactor to this college, and is called second Founder; (4) *Gonville and Caius*, founded 1348 by Edmund Gonville, rector of Terrington; name and situation changed by William Bateman, Bp. of Norwich, who was second Founder; third Founder was John Caius, M.D., who in 1558 obtained Royal Charter establishing his foundation; (5) *Trinity Hall*, founded 1350 by William Bateman, Bp. of Norwich; (6) *Corpus Christi*, founded 1352 by two societies, the Guilds of Corpus Christi and of Blessed Virgin Mary; (7) *King's*, founded 1441 by Henry VI.; (8) *Queens'*, founded 1448 by Margaret of Anjou, queen of Henry VI., refounded by Elizabeth Woodville, wife of Edward IV., 1465; (9) *St. Catharine's*, founded 1473 by Robert Wodelarke, D.D., Chancellor of Univ.; (10) *Jesus*, founded 1496 by John Alcock, Bp. of Ely; (11) *Christ's*, founded 1505 by Lady Margaret Countess of Richmond and Derby, mother of Henry VII.; (12) *St. John's*, founded 1511 by the same; (13) *Magdalene*, founded 1519 by Thomas Baron Audley of Walden; (14) *Trinity*, founded 1546 by Henry VIII., by combining and extending two earlier foundations, Michaelhouse (1324) and King's Hall (1337); (15) *Emmanuel*, founded 1584 by Sir Walter Mildmay, Chancellor of Exchequer; (16) *Sidney Sussex*, founded 1594 under will of Frances, Dowager Countess of Sussex; (17) *Downing*, founded 1800 by Sir George Downing. There are two women's colleges, *Girton* and *Newnham*. Pop. (1911) 40,028.

CAMBRIDGE (38° 31′ N., 76° 16′ W.), city on Choptank, Maryland, U.S.A.; trades in lumber;

canned fruits, and is shipping port for fish. Pop. (1910) 6407.

CAMBRIDGE (42° 22′ N., 71° 7′ W.), city, Massachusetts, U.S.A.; contains Harvard Univ., oldest univ. in U.S.A., founded 1636; has observatory, Archæological and Nat. Hist. Museums, botanic gardens; manufactures furniture, pianos, chemicals, soap, etc.; has printing presses, foundries; fine public parks. Americans encamped here in War of Independence while British held Boston. Pop. (1910) 104,839.

CAMBRIDGE (40° 3′ N., 81° 35′ W.), city, Ohio, U.S.A.; coal, iron, and oil found. Pop. (1910) 11,327.

CAMBRIDGE, EARLDOM AND DUKEDOM OF, title dates back to Norman times, and was almost invariably bestowed upon members of the reigning house. It lapsed in the person of George II., but was revived in 1801 and bestowed on **Adolphus Frederick**, Duke of Cambridge (1774–1850), 7th s. of George III., who was also Earl of Tipperary and Viceroy of Hanover; at his death was succ. by his s., **George William Frederick Charles** (1819–1904); served in Hanoverian and later in Brit. army; present at *Alma*, *Balaklava*, *Inkerman*, and *Sevastopol*; app. Commander-in-Chief in 1856, which position he held until 1895, being advanced to rank of Field-Marshal in 1862; m. Louisa Fairbrother, who took the name of Fitzgeorge.

CAMBRIDGE, RICHARD OWEN (1717–1802), Eng. poet; wrote mock-epic, the *Scribleriad* (1751).

CAMBRIDGESHIRE (52° 15′ N., 0° 10′ E.), inland county, England; bounded N. by Lincoln, E. by Norfolk, Suffolk, S. by Essex, Hertford, W. by Bedford, Huntingdon, Northampton; greatest length, 48 miles; breadth, c. 30 miles; area, 864 sq. miles; surface generally flat, fens in N. Chief rivers are Ouse, Cam, Nene, Lark; many canals. Capital is Cambridge. C. produces wheat, hemp, flax, corn, beans, and other crops; dairy produce; sheep and cattle raised; industries include brewing, malting, milling, brickmaking, potteries, lime burning, paper. In E. is Newmarket, famed for racing. C. was occupied by Romans, of whose occupation traces remain; suffered during civil wars of Stephen, John, and Henry III.'s reigns; supported Parliament in Civil War of Charles I.'s reign. Pop. (1911) 128,325.

CAMBUSLANG (55° 50′ N., 4° 10′ W.), town, on Clyde, Lanarkshire, Scotland; large steel and iron works. Pop. 15,000.

CAMBYSES, s. of Cyrus the Great, founder of Persian Empire; succ. his f. c. 529 B.C., conquered Egypt in 525, and after an unsuccessful attempt against Ethiopia, d. in Syria; the name has become associated with a bombastic style, thus Shakespeare speaks of 'in King Cambyses vein.'

CAMDEN (39° 53′ N., 75° 6′ W.), city, port of entry, on Delaware, New Jersey, U.S.A.; railway centre; has several dry docks and shipyards; manufactures iron wares, machinery, textiles, shoes. Pop. (1910) 94,538.

CAMDEN (34° 17′ N., 80° 27′ W.), town, on Wateree River, S. Carolina, U.S.A.; scene of two battles between Americans and British, 1780 and 1781; cotton, grain, rice produced. Pop. (1910) 3569.

CAMDEN, CHARLES PRATT, 1ST EARL (1714–94), Lord Chancellor of England; 3rd s. of Sir John Pratt, Chief Justice of King's Bench; through Pitt's influence made attorney-general; knighted (1762) and made Chief Justice of the Common Pleas; raised to peerage (1765); prominent figure at time of John Wilkes' prosecution.

CAMDEN, JOHN JEFFREYS PRATT, 1ST MARQUIS (1759–1840), only s. of 1st earl; under Pitt's ministry made Lord-Lieutenant of Ireland; Chancellor of Cambridge Univ.; K.G.

CAMDEN, WILLIAM (1551–1623), Eng. antiquary; ed. London and Oxford, afterwards spent considerable time travelling about England collecting materials for his *Britannia* (1586); headmaster, Westminster School (1593); Clarencieux King-at-Arms (1597). The famous *Britannia* is a survey of Brit. Isles, written in Latin; trans. into English, 1610. Camden Society founded, 1838.

CAMEL FAMILY (*Camelidæ*), includes Camels and Llamas, and forms by itself the group *Tylopoda* among even-toed Ungulates (*Artiodactyla*). They are long-necked, long-limbed, and large-bodied animals, with only the third and fourth digits persisting. The place of hoofs, which are poorly developed, is taken by thick pads of skin. Camels and their relatives ruminate, but the first and second compartments of the stomach are peculiar in having pouches in their walls, wherein fluid can be retained and used at will. They differ from all mammals and resemble the lower vertebrates in possessing oval instead of circular red blood corpuscles.

Only two species of *Camelus* exist—the two-humped Bactrian Camel (*C. bactrianus*), still found wild in the desert area of Central Asia, and the wholly domesticated Arabian Camel or Dromedary (*C. dromedarius*), with a single lump of fat, found throughout Africa and S.E. Asia. In S. America occur the Llamas (*Lama*), valuable on account of their wool, with two wild species, the larger Guanaco or Huanaco, and the smaller Vicunga; and the domesticated true Llama and Alpaca.

CAMEL-FLIES, see Snake-Flies.

CAMELFORD (50° 37′ N., 4° 40′ W.), town, Cornwall, England; traditionally associated with King Arthur. Pop. (1911, rural district) 7385.

CAMELLIA, order *Ternstræmiaceæ*, evergreens; includes greenhouse species *C. Japonica*, with numerous varieties: *C. reticulata* (introduced from China) and *C. oleifera*.

CAMELODUNUM, modern Colchester, Brit. town and later Rom. colony; destroyed in rising of Boadicea (61 A.D.), but rebuilt; walls remain.

CAMELOT, seat of King Arthur and the Round Table; supposed to be in Cornwall.

CAMEOS, see Gem.

CAMERA, word meaning an 'arched room,' and applied to private rooms in court, whence 'in camera,' the private hearing of a case; criminal cases may not be so heard, nor may adult persons be ordered out of court during a public hearing. See also Photography.

CAMERA LUCIDA, optical instrument used for perspective drawing.

CAMERA OBSCURA, darkened chamber, having aperture, furnished with lens and mirror, through which light enters and forms images of external objects on surface opposite; referred to in Bacon's *De Augmentis Scientiarum*. See also Photography.

CAMERARIUS, JOACHIM (1500–74), Ger. classical scholar.

CAMERARIUS, RUDOLF JAKOB (1665–1721), Ger. physician and botanist; prof. of Med. and head of botanic gardens at Tübingen (1687); investigated reproductive organs of plants.

CAMERINO (43° 8′ N., 13° 4′ E.), city, Italy; cathedral and univ. (1727). Pop. 12,000.

CAMERON, JOHN (1579–1623), Scot. theologian; Principal of Glasgow Univ. (1622); later lived chiefly at Saumur; founder of Calvinist sect known as 'Cameronites.'

CAMERON, SIMON (1799–1889), Amer. politician; Sec. for War under Lincoln (1860); Minister to Russia (1862); possessed great organising ability.

CAMERON, VERNEY LOVETT (1844–94), African traveller; pub. *Across Africa* (1877), and, with Sir Fredk. Burton, *To the Gold Coast for Gold* (1883).

CAMERON OF LOCHIEL, SIR EWEN (1629–1719), Highland chieftain; head of Clan Cameron; knighted (1681); served with Dundee at *Killiecrankie* (1689); man of vast strength and size (see Scott's *Lady of the Lake*, v.); grandson, Donald, shared in the '45 rebellion.

CAMERONIANS, sect of Scot. Covenanters, later known as Reformed Presbyterians, founded by Richard Cameron (1648–80); the Cameronian Regiment was formed from their body.

CAMEROON, see KAMERUN.

CAMILING (15° 40′ N., 120° 27′ E.), town, Luzon, Philippine Islands; sugar, rice, Ind. corn, and timber. Pop. 23,000.

CAMILLA, queen who led the Volsci against the Trojans in the *Æneid*.

CAMILLUS, MARCUS FURIUS (d. 365 B.C.), Rom. dictator and soldier; won victories over the Volsci and Etruscans; repelled Gaulish invasion (367).

CAMISARDS, Huguenot peasants of the Cevennes, who from 1702 onwards maintained an armed resistance against the *Dragonnades*. The persecution began as early as 1681, when Louis XIV. quartered dragoons in Prot. houses to compel them to renounce their faith. The name is derived from the smock (*camise*) worn over the armour in night attacks to distinguish friends from enemies.

Bray's *Revolt of the Protestants of the Cevennes* (1870).

CAMOENS, LUIS DE, CAMÕES (1524-80), Portugal's greatest poet; b. Lisbon, of noble descent; graduated at Coimbra Univ., of which he was an 'honourable poor student'; removed to Lisbon at age of eighteen, and became a tutor. In 1544 he made the chance acquaintance of Caterina de Ataide, a girl of thirteen, in attendance upon the queen. For Caterina C. conceived a violent passion, which she appears to have reciprocated, but her parents discouraged the affair, which ultimately led to the poet being banished from Lisbon. C. had already written a number of poems inspired by his love for Caterina, and others were produced during his absence. In 1547 he entered the army, and for over two years was at Ceuta, where he lost the use of his right eye in a skirmish.

He returned to Lisbon in 1550, and, finding no employment, he seems for three years to have led a disorderly life; was imprisoned for assault upon a royal servant, and was only released upon volunteering for service in India. After seeing Caterina for the last time, the poet shipped for Goa in 1553, and did not return to Portugal for sixteen years. During this period of foreign service C. wrote his masterpiece, *The Lusiads*, on the explorations of Vasco da Gama. It consists of ten cantos, written in hendecasyllabic *ottava rima*. On one occasion the soldier-poet was shipwrecked, and lost everything but his manuscript. The poem, with a dedication to King Ferdinand, appeared in 1572, and was an immediate success. But the remander of C.'s life was passed in poverty, and he died of plague, in a public hospital.

Burton, *Camoens: Life and his Lusiads* (1881).

CAMOMILE, see CHAMOMILE.

CAMORRA, see THEFT.

CAMORTA ISLAND (8° 15′ N., 93° 38′ E.), one of Nicobar Islands, Bay of Bengal.

CAMP (Lat. *campus*, plain), in modern use, applied to a temporary tented settlement, as opposed to bivouac; ancient Rom. c's (*castra*) were strong, permanent forts, usually built on an eminence. They were laid out in a symmetrical way like the Roman town, into which the permanent c's (*castra stativa*) often developed. The c. formed a great square of just over a mile, and was bounded by mound (*agger*), surmounted by palisade (*vallum*); the cavity left without by throwing up the mound was part of the fortification, viz. the ditch (*fossa*). The tents, separated from the fortifications by the *intervallum*, were divided into two parts by the *Via Principalis*, at either end of which were the principal issues from the fort; on one side were the officers' quarters, with the *Prætorium* in the centre, on the other side the legions; from the *Prætorium*, on the *Via Principalis*, the *Via Prætoria* traversed the soldiers' quarters (in the midst of which it was intersected by the *Via Quintana*) to the *Porta Prætoria*.

CAMPAGNA DI ROMA (42° N., 12° 10′ E.), low, undulating plain surrounding Rome, nearly corresponding to ancient Latium; uncultivated and unhealthy.

CAMPAN, JEANNE LOUISE HENRIETTE (1752–1822), confidante of Marie Antoinette; remained with queen until taken away at sacking of Tuileries; after the Terror established a school at St. Germain; wrote *Mémoires sur la vie privée de Marie Antoinette*; pioneer of training girls in domestic economy.

CAMPANELLA, TOMMASO (1568–1639), Ital. philosopher and poet; was for some time a Dominican; attempted reform of philosophy; opposed Scholasticism, relying rather upon ancient systems, and devoted to study of nature; imprisoned twenty-seven years as rebel against Span. tyranny in Naples, and detained by Inquisition; liberated in 1629; found a patron in the pope and later in Richelieu; sonnets trans. into English by J. A. Symonds (1878).

CAMPANHA (21° 53′ S., 45° 11′ W.), town, Minas Geraes, Brazil; thermal springs. Pop. 6500.

CAMPANIA (41° N., 14° 40′ E.), territorial division, Italy; includes provinces of Avellino, Benevento, Caserto, Naples, Salerno. C. borders on Tyrrhenian Sea; area, *c.* 6400 sq. miles; much of surface occupied by Apennines; highest peaks, Monte Cervato, Alburno, Montagna del Matese; Vesuvius; some fertile plains and valleys; drained by Volturno, Sele, etc.; noted for beautiful scenery and fertility; produces oranges, olives, chestnuts, wine, wheat, maize, pulse, hemp; sulphur found in large quantities, and petroleum; agricultural districts have dense population. C. was invaded in early times by Greeks, who founded Naples and Cumæ; conquered by Etruscans, who founded Capua and were subdued by Samnites; came under Rom. control, IV. cent. B.C.; favourite resort of rich Romans; belonged to kingdom of Naples till 1860; area, 6290 sq. miles. Pop. (1911) 3,347,925.

CAMPANI-ALIMENIS, MATTEO (*c.* 1678), Ital. mechanician; invented noiseless clock and illuminated dial-plate; wrote on horology and telescopes.

CAMPANILE (Lat. *campana*, a bell), large bell-tower belonging to, but usually detached from, church; they are found throughout Italy, the most noted being Giotto's Tower (Florence), St. Mark's (Venice), and the 'leaning tower' of Pisa. Giotto's campanile, built 1334, stands 275 ft. high, is in five storeys, the outer surface being encased in three colours of marble, and it was originally intended that a spire, 90 ft. high, should rise from the present summit. Still loftier (396 ft.) is Cremona c. The Pisa tower is an example of the round c.

CAMPANULA (Lat. *campana*, bell), genus of plants of family Campanulaceæ, having bell-shaped corolla; several species called *Canterbury Bell*.

CAMPASPE, renowned beauty, mistress of Alexander the Great; heroine of Lyly's *Alexander and C.*

CAMPBELL ISLAND (*c.* 55° S., 190° W.), desolate volcanic island, S. of New Zealand.

CAMPBELL, Scot. Highland clan; probably Celtic tribe. From Duncan, Lord C. (cr. 1445), have descended the Marquesses and Dukes of Argyle (*q.v.*), the Earls and Marquesses of Breadalbane (*q.v.*), and the Earls of Cawdor.

CAMPBELL, ALEXANDER (1788–1866), Amer. evangelist; pres. of Bethany Coll.; preached throughout England, Scotland, and U.S.A.

The **Campbellites**, or DISCIPLES OF CHRIST, are a sect formed (*c.* 1812) from the Baptists, giving more importance to immersion; they have *c.* 5000 members in Britain and *c.* 600,000 in U.S.A. Name also given to followers of John M'Leod C., of Row, Dumbartonshire, also called Rowites, who established church at Glasgow, 1833.

CAMPBELL, BEATRICE STELLA, MRS. PATRICK CAMPBELL (1865–), Eng. actress; first success at Adelphi Theatre (1892); created part of *Second Mrs. Tanqueray* (1893) at St. James's.

CAMPBELL, COLIN, BARON CLYDE (1792–1863), served in Peninsular War, America, Sikh War, 1848, Crimea, and Ind. Mutiny; relieved Lucknow and received a peerage and pension.

CAMPBELL, GEORGE (1719–96), Scot. philosopher; sometime pres., Marischal Coll., Aberdeen; author of *Dissertation on Miracles* (1763); *Philosophy of Rhetoric* (1776); *New Translation of the Gospels* (1778).

CAMPBELL, JOHN (1708-75), Scot. author; abandoned law for lit.; pub. *Lives of British Admirals* (1742-44), *Political Survey of Britain* (1744), and many other works; Hon. LL.D., Glasgow (1745).

CAMPBELL, JOHN CAMPBELL, BARON (1779-1861), Lord Chancellor of England; wrote *Lives of the Lord Chancellors of England*, 7 vols. (1849); also *Lives of the Chief Justices of England*.

CAMPBELL, JOHN FRANCIS (1822-85), Gaelic scholar; author of *Popular Tales of the West Highlands* (1860-62).

CAMPBELL, JOHN M'LEOD (1800-72), Scot. evangelist and author; wrote *Nature of the Atonement* (1856); *Thoughts on Revelation* (1862).

CAMPBELL, LEWIS (1830-1908), Scot. classical scholar; eminent for his trans. from Plato, Æschylus, and Sophocles.

CAMPBELL, REGINALD JOHN (1867-), Brit. Congregational minister; ed. for Church of England, but became Congregational minister; succ. Dr. Parker at City Temple, London (1903), where he championed the *New Theology*.

CAMPBELL, THOMAS (1777-1844), Scot. poet; b. Glasgow; went to Edinburgh, where Sir Walter Scott, Jeffrey, and John Leyden were amongst his contemporaries. His most ambitious poem, *The Pleasures of Hope*, appeared in 1799. Its success was immediate, but it is now forgotten. Campbell was a laborious writer. He will live by virtue of his patriotic lyrics, of which *Ye Mariners of England* and *The Battle of the Baltic* are amongst the finest in the language; *Life*, by Beattie (1849), Hadden (1899).

CAMPBELL-BANNERMAN, SIR HENRY (1836-1908), Brit. statesman; 2nd s. of Sir James Campbell, Bart., Lord Provost of Glasgow. He assumed the name of Bannerman on inheriting property from his maternal uncle, Henry Bannerman. Ed. at Glasgow Univ. and Trin. Coll., Cambridge, he entered Parliament as Liberal member for Stirling in 1868; Sec. to Admiralty (1882-84); Chief Sec. for Ireland (1884-85); Sec. for War in Mr. Gladstone's (1886) ministry, and filled same office (1892-95); knighted (1895). On the retirement of Sir William Harcourt from the leadership of the Opposition (1898), Sir Henry was chosen to take his place. Sir Henry was called upon to form a cabinet on Dec. 4, 1905; resigned the premiership owing to failing health in April 5, 1908, and d. on April 22. During his occupation of office there were passed the Trades Disputes Act, Small Holdings Act for England, and Deceased Wife's Sister Act (1907). Though by no means a brilliant statesman, by his personality he won the respect and esteem of all parties.

CAMPBELTOWN (55° 26′ N., 5° 36′ W.), seaport, Argyllshire, Scotland, on peninsula of Kintyre; whisky distilleries and fisheries. Pop. (1911) 7626.

CAMPECHE, CAMPEACHY (19° N., 90° W.), state, Mexico, occupying S.W. part of Yucatan peninsula; area, 18,000 sq. miles. Pop. (1910) 86,706.

CAMPECHE (19° 50′ N., 90° 33′ W.), seaport, on Bay of C., capital of C. state; shallow harbour; chief exports, logwood, hides, and wax; cigars manufactured. Pop. (1910) 16,864.

CAMPEGGIO, LORENZO (1464-1532), Ital. cardinal; made bp. of Salisbury by Henry VIII., and was also abp. of Bologna; chiefly notorious for his connection with the divorce of Catherine of Aragon. His private instructions from Rome were to defer a final settlement of the case, in following which he displeased the king; hence Henry's final rupture with the pope.

CAMPER, PETER (1722-89), Dutch anatomist, prof. of Med., Surgery, and Anat. at different univ's in Holland; later was engaged in politics.

CAMPERDOWN, town *c.* 30 miles N. of Amsterdam; off it Brit. fleet under Duncan gained victory over Dutch, 1797. The victor was cr. Viscount Duncan of C.; in 1831 his s., Robert Dundas, was cr. earl of C.

CAMPHAUSEN, OTTO VON (1812-96), Prussian statesman; Minister of Finance (1869); warm advocate of free trade principles; received order of Black Eagle (1895).

CAMPHAUSEN, WILHELM (1818-85), Ger. artist; famous for his battle pictures, many of his subjects being taken from XVII.-cent. history; also portraits of modern Ger. celebrities.

CAMPHENE, see TERPENES.

CAMPHORS, chemical compounds used medicinally as diaphoretics and antispasmodics. LAUREL CAMPHOR ($C_{10}H_{16}O$) is volatile, white, crystalline, semi-transparent; M.P. 175°, B.P. 204°; soluble in alcohol and ether; obtained from wood of *Laurus camphora* of China, Japan. BORNEO CAMPHOR ($C_{10}H_{18}O$), obtained from *Dryobalanops camphora*, has similar properties.

CAMPHUYSEN, DIRK RAFAELSZ (1586-1627), Dutch artist; his landscapes, though small, are much valued.

CAMPI, GIULIO (1500-72), Ital. artist and founder of a school; his principal works are to be found in the Church of St. Margaret, Cremona.

CAMPILLO, JOSÉ DEL (1695-1743), Span. statesman; rose from lowly origin to be Prime Minister; did much to reform collection of taxes.

CAMPINAS (22° 35′ S., 46° 48′ W.), city, São Paulo, Brazil; coffee and sugar plantations. Pop. 16,000.

CAMPION, EDMUND (1540-81), Eng. Jesuit; after taking deacon's orders in Church of England he joined the Society of Jesus; was sent with Robert Parsons to conduct a mission in England (1580), and led a hunted life in various parts of the country; executed at Tyburn; beatified, 1886.

CAMPION, THOMAS (1567-1620), Eng. poet and musician; his several *Bookes of Ayres* (words and music by himself) constitute his title to be considered in the front rank of Jacobean lyric poets; also wrote number of masques.

Songs and Masques, edit. by A. H. Bullen (1903); *Complete Works* (Clarendon Press, 1908).

CAMPISTRON, JEAN GALBERT DE (1656-1723), Fr. dramatist; wrote plays in manner of Racine, and the libretto of an opera, *Acis et Galathée*; held official post under Duc de Vendôme; member of Academy (1701).

CAMPO (2° 25′ N., 9° 58′ E.), trading station, Kamerun, Ger. W. Africa.

CAMPO FORMIO (46° 1′ N., 13° 11′ E.), town, N. Italy; treaty between Austria and France signed here, 1797.

CAMPO SANTO, consecrated burial-ground in Italy and Spain.

CAMPOAMOR Y CAMPOOSORIO, RAMON DE (1817-1901), Span. poet; secured reputation as a writer of epigrams under the name of *Doloras*, in which humour and philosophy are blended.

CAMPOBASSO (41° 33′ N., 14° 41′ E.), city (and province), Italy; famous for cutlery. Pop. 11,000.

CAMPOBELLO.—(1) (37° 38′ N., 12° 43′ E.) town, Trapani, Sicily; old quarries. Pop. 9000. (2) (37° 15′ N., 13° 56′ E.) town, Girgenti, Sicily; sulphur. Pop. 11,000.

CAMPOMANES, PEDRO RODRIGUEZ, COUNT (1723-1802), Span. statesman; sometime president of the Council of Castile; translated *Voyage of Hanno the Carthaginian*, and published several original works.

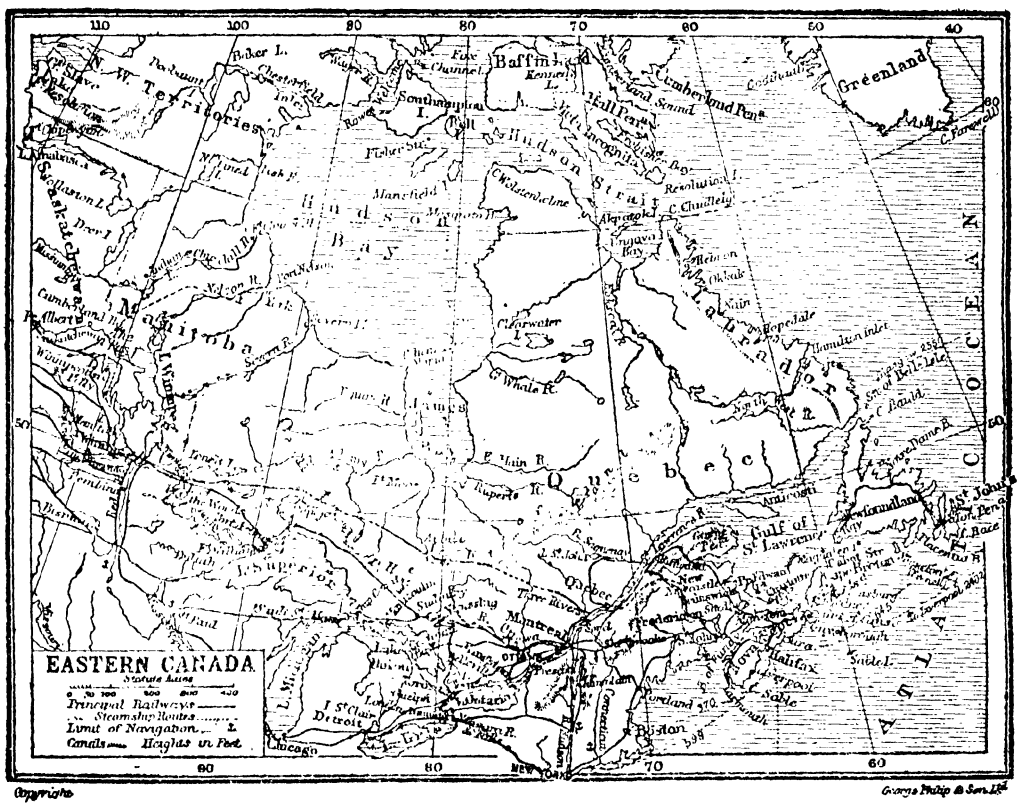
CAMPOS (21° 42′ S., 41° 20′ W.), city, on Parahyba, Rio de Janeiro, Brazil; has trade in sugar, coffee, brandy. Pop. 30,000.

CAMPOS, ARSENIO MARTINEZ DE (1831-1900), Span. general, through whose efforts Alfonso XII. was restored to Spanish throne.

CAMPULUNG (45° 15′ N., 24° 57′ E.), town, Rumania; summer resort; was first capital of Walachia in XIV. cent. Pop. 13,000.

CAMUCCINI, VINCENZO (1773-1844), Ital. artist; famous chiefly for hist. pictures, of which his *Assassination of Cæsar* and *Death of Virginia* may be instanced.

CAMUS, ARMAND GASTON (1740–1804), Fr. revolutionist; member of Council of the Five Hundred.



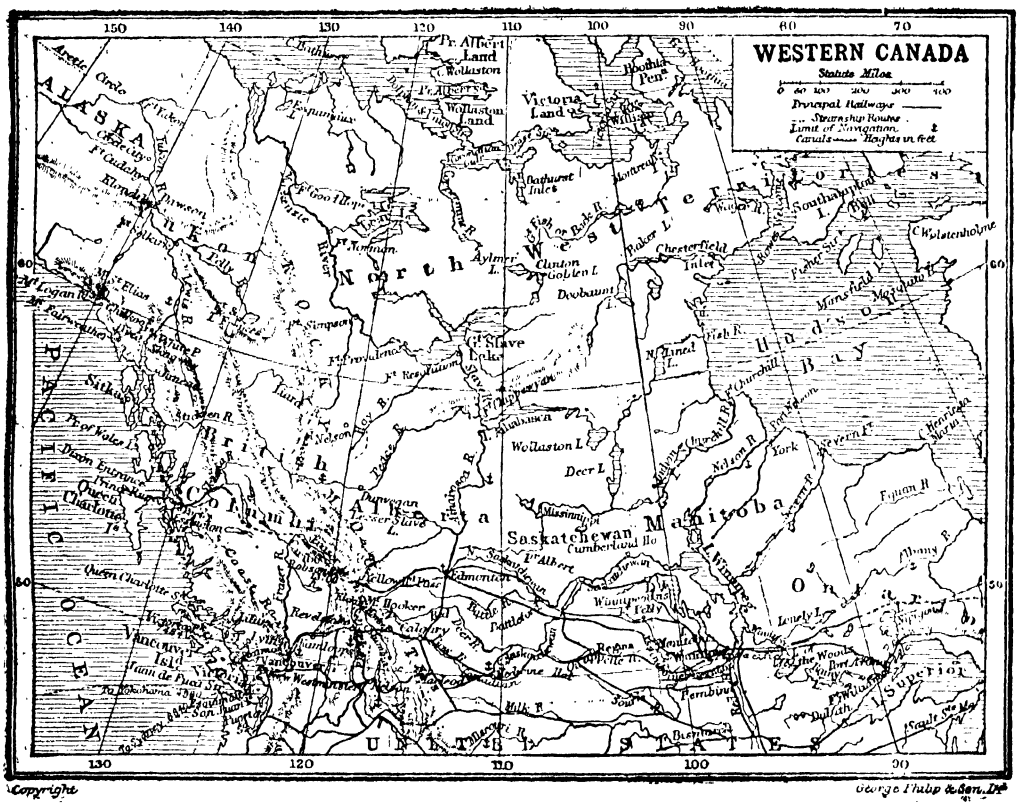
CANAAN, name applied first to coast regions of Palestine and district drained by Jordan, later given to whole of Palestine W. of Jordan.

CANAANITES, general term often applied in Old Testament to the heathen peoples dwelling between Jordan and Mediterranean; they worshipped Astarte and Baal, and sacrificed children in their heathen rites.

CANADA (41° to 72° N., 57° to 141° W.), Brit. overseas Dominion, covering all the northern half of N. America except Alaska and Newfoundland (*q.v.*); includes long fringe of islands in N. and N.E., stretching towards Pole; bounded N. by Arctic Ocean, E. by Atlantic and Newfoundland, S. by United States, W. by Alaska and Pacific Ocean.

The E. coast is broken up by Hudson Strait and Bay, James Bay, Gulf of St. Lawrence, Bay of Fundy; of Rockies, is enormous stretch of fertile prairie land, important for wheat-growing and stock-rearing; districts E. and W. of this are in many parts densely wooded. N. is partly plateau, partly plain, sloping to N. and valuable only for minerals and fur-bearing animals. Great northern and north-eastern stretch drained by Upper Yukon; Mackenzie, Coppermine, Great Fish or Back Rivers, flowing to Arctic; Churchill, Nelson, Albany, entering Hudson Bay; E., S., and centre drained by St. Lawrence and its tributaries (Ottawa, etc.), Red River, Assiniboine, Saskatchewan; S.W. by Fraser and upper waters of the Columbia. Climate varies greatly; is generally one of extremes. Temperature in centre ranges from 44° to 88° F.; rainfall sufficient everywhere. Extreme length is *c.* 2100 miles, width, 3600 miles; area, *c.* 3,730,000 sq. miles.

History.—About 1000 A.D. Norse explorers from Greenland established in C. a settlement whose situation



importance of first three as harbours lessened by ice in winter, of last by height of tides and strength of tidal currents; W. coast much broken, fringed with islands; N. coast commercially useless on account of latitude. S.E. is cut up by chain of great lakes—biggest fresh-water area in world; largest are Lakes Superior, Michigan, and Huron.

Along E. coast, by Labrador, Cape Breton Island, and Nova Scotia, are low hills; while S.E. of St. Lawrence basin is bounded by northern extension of Appalachians, with height of *c.* 4000 ft. Along N.W. of St. Lawrence basin, of Great Lakes, and of their northern feeders, stretch Laurentian Plateau and Laurentian Range, with heights of from 1000 to 3000 ft. From N.N.W. to S.S.E., towards Pacific coast, run Rocky Mountains and parallel Selkirk and Cascade Ranges, with great intervening valleys and with average height of *c.* 8000 ft.; highest peaks, Mts. Hooker (15,700 ft.), Murchison (15,789), Brown (16,000). Between Laurentian Range, N. of Lake Superior, and foothills is unknown; but they were soon overwhelmed and their settlement destroyed by Indians, who remained in undisputed possession until coming of European explorers late in XV. cent. John Cabot was first to reach E. coast of Canada in 1497, and his son Sebastian afterwards carried out further explorations. First settlements, however, were made by French; great part of coast was explored by corsair Verrazano in 1524, and ten years later Cartier formally annexed country in name of Fr. king, exploring St. Lawrence R. in 1535. The colony he tried to establish, with aid of Lieut.-Gen. Roberval, proved a failure, as also were later settlements made by Marquis de la Roche in 1598 and by Chauvin and Pontgravé in 1599. In 1603 Samuel de Champlain received royal charter, and in 1604 he with Sieur de Monts established settlement at St. Croix, afterwards removed to Port Royal in Acadia; in 1608 he founded Quebec, and later a trading centre at Montreal, and discovered several lakes. His support of Hurons against Iroquois in 1609

and 1615 excited hostility of latter to France, so that when, later on, war broke out with England they supported Eng. arms.

In 1613 Port Royal was plundered and burnt by the Eng. seaman, Argall, but was later rebuilt. In 1621 English made attempt at settlement in Acadia, calling it Nova Scotia. In 1625 first Jesuit missionaries came to C., and for some time exercised great influence in conduct of affairs. Richelieu established Company of New France in 1627, to which management of affairs in C. was entrusted. English took Port Royal in 1628, Quebec in 1629; but in 1632, by Treaty of St. Germain-en-Laye, these, with whole of Acadia, were restored to France. Champlain, who had been taken prisoner by English, returned to C. in 1633, acting as gov. until his death in 1635. Permanent settlement was made at Montreal in 1642, one of founders, Laval, becoming bp. of C. and head of Church. In 1654

suspecting which, Frontenac sent parties of Indians and French to attack Eng. settlements; several massacres occurred, and Eng. colonists determined on war. War lasted, except for short truce in 1697, until 1713, when it ended with Treaty of Utrecht, whereby Canada, Isle Royal, and St. John's Island remained to France, and Britain obtained Nova Scotia, Newfoundland, and Hudson Bay Territory. Formal establishment of Brit. government took place, 1719. Period of peace ensued, during which French fortified Cape Breton. After outbreak of war between France and Britain this was taken by British in 1745, but was restored to France in 1748, by Peace of Aix-la-Chapelle. Before long relations again became strained, and in 1755 all Fr. Canadians were expelled from Nova Scotia by Brit. gov., Lawrence. War broke out soon afterwards, and lasted till 1763. French under Montcalm had most success in first two years, took Oswego and Fort William Henry; but later tide turned in favour of British, who took Louisburg in 1758 and afterwards captured Prince Edward Island. In 1759 Quebec (*q.v.*) fell to Brit. force commanded by Wolfe, who was killed in action; soon afterwards Montreal surrendered; and in 1763 peace was concluded by Treaty of Paris, whereby whole of C. was ceded to Great Britain; declared Brit. province, Murray becoming governor.

Acadia was again captured by British, but it was restored to France by Treaty of Breda, 1667. Meantime management of Company of New France came to an end, their charter being cancelled by Louis XIV. in 1663, when C. became a Crown Colony. Administration was now carried out by Gov., assisted by Intendant and Supreme Council. First gov., De Mézy, came to loggerheads with Bp. Laval, and was ordered to France, but died suddenly. For a time De Tracy acted as Viceroy, and reduced Mohawks to submission. Frontenac, who became gov. in 1672, was unrivalled in his treatment of the Indians; during his administration Mississippi was explored, and English made further settlements in Hudson's Bay and other districts. He was recalled in 1681; his successor, Denonville, was guilty of treachery towards the Iroquois, who in revenge organised terrible massacre of La Chine, 1689. The recall of Denonville followed, and Frontenac returned once more.

Meantime English made an alliance with Iroquois;

C. and Nova Scotia did not join in rising of Amer. colonies against mother country in 1776, and had no share in War of Amer. Independence. In 1791 the Constitutional Act was passed, dividing old province of Quebec into Upper and Lower Canada, each with its own governor. Discontent broke out in Lower C., and friction between Fr. and Brit. inhabitants. In 1812 occurred war with U.S.A., which lasted till 1814. In 1837 Fr. rising in Lower C. was repressed, and in 1841 Upper and Lower C. were reunited, while Nova Scotia and other maritime provinces still had separate governments. In 1867 federal union was formed by Upper

and Lower C., Nova Scotia, and New Brunswick, as Dominion of Canada, which was joined in 1871 by Brit. Columbia, and in 1873 by Prince Edward Island; Hudson Bay Territory had been acquired in 1869.

In 1869–70, and again in 1885, occurred risings among French half-breeds, causes of which were partly racial, partly religious, the mutineers fearing that the French language and R.C. religion would be superseded; leader was Louis Riel, who after suppression of second rising was tried and executed. Dispute with U.S.A. concerning fishery rights was settled by treaty, 1888, and in 1892 a treaty was arranged between Canada, U.S., and Great Britain concerning sealing in Bering Sea; further disputes on this subject were settled by award in 1897, in which year also occurred the great rush to Klondike consequent on discovery there of gold. In 1896 Manitoba was agitated by religious education disputes, which were settled by arrangement; and in this year Laurier became first R.C. premier. In 1898 a Conference met at Quebec on question of Alaskan boundary, which was finally defined by treaty with U.S.A. in 1903. Pacific cable to Australia was completed, 1902. New provinces Alberta and Saskatchewan were created out of N.W. Territories in 1905; in 1912 Ungava was assigned to Quebec, and N.W. Territories S. of 60° N. were divided between Ontario and Manitoba.

There are many sources of wealth. Central district is one of great wheat areas of world; 200,000,000 bushels were produced from 10,000,000 acres, 1912; cattle-rearing, fruit-growing, dairying are important industries; great quantities of timber; extensive fisheries—lobster, salmon, herring, cod, mackerel; mineral deposits are valuable, including gold, coal, copper, nickel, silver, petroleum, asbestos, lead, iron. Exports include lumber, cheese, cattle, wheat, flour, bacon, fish, apples, skins, furs, sheep, butter, eggs, beef, paper, wood pulp, leather, etc.; imports—textiles, machinery, iron and steel manufactures, clothing, salt, coal, chemical products, etc. Canada has system of protection, but there is a preferential tariff in favour of U.K. and some of her colonies. Railway mileage in 1912 was *c.* 26,000 and is rapidly extending; Canadian Pacific Railway, running from Montreal to Vancouver, not counting innumerable branches, has a length of 2906 miles, and was opened in 1885; other leading lines are Canadian, Northern, and Grand Trunk Pacific from Moncton, New Brunswick, to Prince Rupert on Pacific coast (begun, 1904, with Government aid). Besides navigable rivers and great lakes, there is fine system of canals; shipping is of great importance. Telegraphic and postal communications are good.

The Dominion was formed by confederation between 1867 and 1873 of all Brit. N. Amer. colonial possessions, except Newfoundland, and coast strip of Labrador between Hudson Strait and Gulf of St. Lawrence forming part of that colony. Executive consists of Gov.-Gen., representing Brit. Crown, and Privy Council; legislative vested in Parliament of two houses, Senate and House of Commons, former having 87 and latter 221 members. Senators are nominated for life by Gov.; Commons elected for five years by popular vote. The nine provinces, Ontario, Quebec, British Columbia, Nova Scotia, New Brunswick, Manitoba, Alberta, Saskatchewan, and Prince Edward Island have each a lieut.-gov. and parliament, and administer their own local affairs (see FEDERATION). The chief religion is Roman Catholicism, but Methodism, Presbyterianism, and Anglicanism have large followings. Education (which is under provincial control) is free and compulsory, and there are twenty universities, one or more in each province (see UNIVERSITIES). Militia service is compulsory between ages of 18 and 60. The Canadian Government offered 3 Dreadnoughts to mother-country in 1912. A Royal Canadian Navy will probably be organised in the near future to guard Atlantic and Pacific coasts.

Inhabitants include Brit., Fr., and other European nationalities, Indians, and Chinese. Immigration continues with great rapidity; in 1910–11, 311,084 settlers arrived, the greatest numbers of whom came from U.S.A. and the U.K. There are some 1,600,000 French-speaking Canadians, and over 110,000 Indians. The total pop. (1911) was 7,204,838.

Bramley-Moore, *Canada and her Colonies* (1911); Griffith, *Dominion of Canada* (1911).

CANAL, artificial waterway for navigation purposes, drainage, or irrigation, the term usually being restricted to channels for navigation. C's were used by the Egyptians, Chinese, and other Eastern nations long before Christian Era, these early c's being mostly all at one level. The progress of the c. was slow until the introduction, in the XIV. or XV. cent., of the *lock*. A lock consists of a water-tight chamber closed at each end by gates, and separating two reaches of a c. By means of sluices this chamber can be filled to the level of the upper reach, or emptied to the level of the lower, so that barges can be admitted from either reach and raised or lowered to the level of the other. The time and water expended in passing through locks has caused them to be replaced on many c's by other devices, such as two iron chambers filled with water and exactly balancing one another. One chamber rises as the other descends, thus raising or lowering a vessel as required. The water-supply of a c. is kept up by natural or artificial reservoirs, water-weirs being provided to take any excess. Stop-gates divide the c. into sections which can be emptied separately for repairs.

Among famous c's are the *Bridgewater C.* (Worsley to Manchester), opened 1761, the first great c. in England; *Manchester Ship C.* (Manchester to Eastham on the Mersey, 35½ miles, cost nearly 13½ millions sterling), opened, 1894, by Queen Victoria; vessels can enter or leave it at half-tide; has minimum bottom width of 120 ft., depth of 26 ft.; Eastham locks have 20 ft. on sill at low water, rising to 36 ft.; crossed in a swing aqueduct (opened for passage of masted vessels) by Bridgewater C.; *Kaiser Wilhelm C.* (Kiel to Baltic, 70 miles); width being increased to 144 ft. and depth to 36 ft. for latest battleships; *Amsterdam Ship C.* (Amsterdam to N. Sea, 16½ miles); *Sues C.* (q.v.); *Panama Canal* (q.v.).

CANAL DOVER (40° 33′ N., 81° 28′ W.), city, Ohio, U.S.A.; foundries, flour-mills. Pop. (1910) 6621.

CANALE, ANTONIO, CANALETTO (1697–1768), Ital. artist; National Gallery, London, contains examples of his work.

CANANDAIGUA (42° 52′ N., 77° 18′ W.), town, on Canandaigua Lake, New York State, U.S.A.; summer resort; agricultural implements. Pop. (1910) 7217.

CAÑAR (*c.* 3° S., 78° 30′ W.), province, Ecuador; silver. Pop. 64,000.

CANARY ISLANDS (27° 45′ to 29° 15′ N., 13° 30′ to 18° W.), group of volcanic islands, belonging to Spain, off N.W. coast of Africa, 62 miles from mainland. There are seven large islands, La Palma, Hierro, Gomera, Teneriffe, Grand Canary, Fuerteventura, Lanzarote; area, *c.* 2808 sq. miles. Climate is delightful; lowest temperature, 48°, highest, 95° F.; rainfall moderate. Islands produce onions, fruits (bananas, etc.), cochineal, wine, tobacco, vegetables; all exported. Imports include cottons, woollens, coal, flour, machinery, timber, hardware, etc. Chief town is Las Palmas, Grand Canary. Great conical peak of Teneriffe (12,198 ft.) is visible 140 miles off. C. Islands discovered by European explorers in XIV. cent.; were then inhabited by Berber people. Various Span. expeditions were sent from time to time, whole archipelago being ultimately annexed by Spain. Pop. (1910) 419,809.

Brown, *Madeira and Canary Islands* (1901); Pitard and Proust, *Îles Canaries* (1909).

CANCALE (48° 51′ N., 1° 50′ E.), watering-place, France; extensive oyster-fishing. Pop. 7000.

CANCELLARIA, see under GASTEROPODA.

CANCER (*Carcinoma*), a malignant growth originating from epithelium, *i.e.* the cellular tissue covering

a surface or lining a tube or cavity of the body; it is most frequently found in the skin, in various parts of the alimentary canal, in the breast or the womb, and the uro-genital system generally. A c. has no definite limits, and may infiltrate all the tissues in its vicinity, while it is also liable to spread by the lymphatic vessels and veins and cause so-called secondary growths in different parts of the body.

Since 1792, when the first c. wards were established at the Middlesex Hospital, London, investigation of the causes and cure of c. has made great progress, and numerous institutions in various parts of the world are devoted to this work, prominent among them the Cancer Research Institute, London, directed by Dr. Bashford. Yet, although several theories have been put forward, the cause of c. is not yet exactly known; one authority considers that c. cells are embryonic cells accidentally shut off, another that they are fragments of reproductive tissue, another that the connective tissue has lost its ability to hold the proliferation of the c. cells in check, another that their growth is caused by a parasite, but none of these theories has been proved beyond doubt. The only treatment is to remove by surgical operation the growth and the tissues around, lymphatic vessels in connection with it, and all lymphatic glands in the vicinity, it being safer to cut away too much rather than too little. It is believed that cancer is increasing, for reasons which are not fully understood, although the eating of meat, and particularly tinned meats, is suggested as a cause.

The chief varieties of c. are: *scirrhus*, a hard and very fibrous type of c.; *encephaloid*, a soft, cellular c., which grows rapidly; *squamous epithelial* c., growing from surfaces, such as the skin and mucous membrane of the mouth and œsophagus, which have a particular type of covering cell-layer; *columnar epithelial* c., growing from a different type of covering cell, *e.g.* of stomach; *rodent* c., originating in the glands of the skin.

CANCER, a northern (and the 4th zodiacal) constellation, chiefly noted for containing the cluster *Præsepe* (or the 'Beehive'), which, next to the Pleiades, is the most conspicuous star cluster in the heavens.

CANCIONERO, name given to collection of songs made in Spain and Portugal in Middle Ages, Portug. name being *cancioneiro*.

CANDA GALLI, Esopus Grit, occurs in lower strata of Ulsterian epoch—part of Devonian middle division, in N. America.

CANDAHAR, see Kandahar.

CANDELABRUM, originally a stand on which lamps were placed; oldest known is the bronze one to bear the Minerva lamp at the Erechtheum, Athens; term now often applied to a collection of hanging lights.

CANDIA (35° 20′ N., 25° 9′ E.).—(1) old name for Crete (*q.v.*). (2) seaport city, Crete; formerly capital; oil and soap. Pop. (1911) 26,185.

CANDIDO, PETER, name assumed by **Peter de Witte** (1548–1628), Flemish architect and painter.

CANDLE, rod of tallow, wax, or like matter surrounding a wick, and used for lighting purposes; tallow seems to have been the earliest substance used, and c's made from it are mentioned by Apuleius; wax c's were used by the Romans; in the Middle Ages, both in London and Paris, the business of c.-making gave rise to two distinct guilds—the Wax chandlers and the Tallow chandlers.

CANDLE FISH, see under Salmon Family.

CANDLEMAS, festival held Feb. 2 to commemorate the Presentation of Christ in the Temple and the Purification of the Blessed Virgin. In the R.C. Church it has been the custom at Mass to bless the candles on that day for use during the whole year.

CANDLISH, ROBERT SMITH (1806–73), Scot. theologian; minister of St. George's, Edinburgh; occupied chair of divinity at New College, and was some time principal; one of leaders of the party which, after 1843 Disruption, became known as the Free Church of Scotland.

CANDOLLE, AUGUSTIN PYRAME DE (1778–1841), Swiss botanist; b. Geneva; prof. of Bot., Montpellier (1810), and Nat. Hist., Paris (1816); promulgated natural system of plant classification.

CANDON (17° 7′ N., 120° 28′ E.), town, Luzon, Philippine Islands; rice, tobacco, indigo grown; cotton, silk, etc., manufactured. Pop. 20,000.

CANDY, see Kandy.

CANEA (35° 30′ N., 24° E.), fortified seaport, capital (1841), and chief commercial town of Crete; small but good harbour; exports soap, oil, and wax; ancient *Cydonia*. Pop. (1911) 24,399.

CANELONES (34° 29′ S., 56° 8′ W.), department, Uruguay; area, 1833 sq. miles. Pop. 92,000.

CANEPHORUS (Gr. *kanephoros*, basket-carrier), Gk. woman who carried the elements of religious sacrifices; seen in sculptured reliefs.

CANGA-ARGUELLES, JOSÉ (1770–1843), Span. statesman; Minister of Finance, 1820.

CANGAS DE ONIS (43° 2′ N., 5° 5′ W.), town, Oviedo, Spain; coal-fields, copper mines. Pop. 9000.

CANGAS DE TINEO (43° 14′ N., 6° 32′ W.), town, Oviedo, Spain; woollen goods. Pop. (1910) 23,104.

CANGUE, Cang, wooden collar in which Chinese offenders have to sit in the streets.

CANICATTI (37° 20′ N., 13° 52′ E.), town, Sicily; sulphur. Pop. 24,700.

CANICULA, see Canis Major for *Sirius* (the dog-star); **Canicular days**, the *dog-days*, days in hottest period of year when Sirius used to rise just before sun; but this conjunction does not, owing to precession of the equinoxes, now come in dog-days.

CANIDÆ, see Dog Family.

CANINI, GIOVANNI AGNOLO (1617–66), Ital. artist and designer; representative works in church of San Martino a' Monti, Rome.

CANIS MAJOR (Lat. 'Greater Dog'), constellation visible in S. sky during winter; supposed to be one of the dogs of Orion the Huntsman, the other being *Canis Minor*. C. M. is chiefly remarkable because it contains Sirius, the dog-star, the brightest star visible from the northern hemisphere, whose distance is calculated to be about 47 billions of miles.

CANITZ, FRIEDRICH RUDOLF LUDWIG, FREIHERR VON (1654–99), Ger. diplomatist; P.C. under Elector Frederick III.

CANKER WORMS, caterpillars of two species of Geometer Moths (*Anisopteryx*), which do much harm to the leaves of fruit and other trees in U.S.A.

CANNA (57° 5′ N., 6° 30′ W.), island, Hebrides, Scotland.

CANNÆ (41° 18′ N., 16° 7′ E.), ancient town, Apulia, Italy; here Hannibal defeated Romans with great loss, 216 B.C.

CANNANORE, Kananore (11° 51′ N., 75° 25′ E.), seaport, Madras, India; headquarters of military division. Pop. 27,800.

CANNES (43° 32′ N., 6° 56′ E.), watering-place, Alpes-Maritimes, France; salubrious climate; fashionable winter resort; has extensive flower farms for distillation of perfumes. Pop. 30,000.

CANNIBALISM, Anthropophagy, custom of eating human flesh; held by some writers to have been habit of primitive man, but on this point there is much divergence of opinion. So advanced a race as the Aztecs of Mexico were addicted to c.; and in modern times the New Guineans, the Battas of Sumatra, and the Maoris of New Zealand were much given to the practice. In the Polynesian Islands the custom was rampant, but has been practically stamped out by the efforts of missionaries.

CANNING, preserving meat, fish, fruit, etc., in tins heated to expel air and kill bacteria, and then hermetically sealed; U.S.A. is chief centre.

CANNING, CHARLES JOHN, EARL (1812–62), Brit. statesman; Conservative member for Warwick (1836); Under-Sec. for Foreign Affairs (1841); Postmaster-General (1853); Gov.-Gen. of India (1856) during period of Mutiny.

CANNING, GEORGE (1770–1827), Eng. statesman, whose f. claimed descent from the famous Bristol merchant, William Canynge; ed. Eton and Oxford; entered Parliament as member for Newport [I. of W.] (1794); Under-Sec. of State (1796); made reputation as orator (1798) by his speeches in support of abolition of slave trade; Treasurer of Navy (1804); Minister for Foreign Affairs (1807); Ambassador to Lisbon (1814); Pres. of Board of Control (1816); Prime Minister, in succession to Lord Liverpool (1827); one of the most brilliant and witty orators of his time; see *Canning and his Times*, by Marriott (1903).

CANNING, SIR STRATFORD, see STRATFORD DE REDCLIFFE.

CANNIZARO, STANISLAO (1826–1910), Ital. chemist; b. Palermo; prof. of Chem., Alessandria (1851), Genoa (1855), Palermo (1861), Rome (1871); confirmed Avogadro's law of gaseous molecules.

CANNOCK (52° 42′ N., 2° 2′ W.), market town, Staffordshire, England; coal-fields. Pop. (1911) 28,588.

CANNON, name now almost obsolete, but used until recent times for heavy ordnance (*q.v.*); during XVI. cent. name was only applied to largest pieces of field artillery, of which the Cannon-Royal was chief.

CANNON, JOSEPH GURNEY (1836–), Amer. Congressman; barrister, 1858; Republican member of Congress, 1873–91, 1893–1903, 1903–13; Speaker, House of Representatives (1903–11).

CANNSTATT, KANNSTATT (48° 47′ N., 9° 14′ E.), town, Württemberg, Germany; has warm mineral springs; iron and cotton industries. Pop. 33,000.

CANO, ALONZO (1601–67), Span. painter, sculptor, and architect; court-painter to Philip IV.; many of his pictures are to be seen in Madrid.

CAÑO, JUAN SEBASTIAN DEL (d. 1526), Span. circumnavigator of the globe; commanded Magellan's expedition from Philippines home, 1521–22.

CANO, MELCHIOR (1525–60), Span. Dominican bp.; exercised great influence over Philip II., whom he advised to resist the temporal papal encroachments; writer of famous book on Apologetics.

CANOE, name, of Carib origin, for light boat pointed at each end. The early British c's were 'dug-outs,' and made from single trees. The N. Amer. Indians' c. is made of a frame of light wood, covered with birch-bark, stitched with fibre, and gummed; other c's have been made with canvas outer cover.

CANON, Church dignitary, holding prebend in a cathedral, the presentation being usually vested in the crown, abp., or bp. There are also honorary c's, who receive no revenue from the chapter's fund; and minor c's, who are required chiefly to sing the cathedral service. During the monastic period in England the c's lived together in religious houses. One such order was the Canons Regular, or Augustinian Canons.

CAÑON, deep gorge cut out by river. Most famous is that of Colorado River, U.S.A.

CANON, in music, composition in which the parts take up melody in succession; decision of Church Councils (see CANON LAW); ecclesiastical payment; rule of logic.

CANON LAW, body of ecclesiastical law, the canon being a decision of an ecclesiastical council or synod confirmed by the pope or the sovereign power in a state. The early C. L. of R.C. Church, the *jus antiquum*, was composed of the so-called Apostolical Canons, the canons of the Fathers of the Church, of the seven universally recognised œcumenical councils, and of the chief synods. The first collections, made IX.–XII. cent., were followed by the *Decretum Gratiani* (pub. 1144), a private collection, a true copy of other decrees, encyclical letters, etc. It was written by the Benedictine monk Gratian as a *Concordia discordantium canonum*, which obtained papal approval though not official acceptance. It circulated the Donation of Constantine and the rest of the False Decretals. The expression *jus canonicum* is first found at this time.

The decretals from the time of Gratian to the last decade of the XII. cent. were collected by Bernardo Circa, bp. of Faenza, but the *jus novum* or *corpus canonicum* begins with the Decretals of Pope Gregory IX. (*c.* 1233), five books drawn up by his chaplain, the Dominican, St. Raymund of Pennaforte (*b. c.* 1175), with papal sanction. There followed a sixth book of Decretals (*Sextus Decretalium*, or *the Sext*), drawn up, 1298, under Boniface VIII.; the *Constitutiones Clementinæ*, pub. by Pope Clement V. at the Council of Vienna (1308), and by John XXII., 1317, the latter adding chapters known as *Extravagantes*. *Extravagantes Communes* emanated from succeeding pontiffs before the XVI. cent. and are included in the *Corpus* as appendices. The decrees of the Council of Trent and later o's stand outside the *Corpus* and are known as *jus novissimum*, by which the C. L. has been greatly modified.

The early functions of the Eng. Clerical Convocations (which meet for provinces of Canterbury and York, in upper and lower houses, whenever Parliament assembles) have been matter of controversy; their pre-Reformation decrees were known as provincial constitutions and formed part of the provincial C. L. In 1536 Parliament decreed that, until revision of the C. L., canons not opposed to the king's prerogative or the law of the land should continue in force. The Hampton Court Conference (1604) drew up a new code, accepted by James I. and revised with additions, 1640, but never ratified by Parliament. An important member of the Eng. *Corpus* is the *Book of Common Prayer* as finally issued (1661).

Phillimore, *Ecclesiastical Law*; Laurin, *Introductio in Corpus Juris Canonici*.

CANONESS, an order (instituted VIII. cent.) of female devotees living together in religious houses. They took vows of obedience and chastity, but their rules were somewhat less strict than those of nuns.

CANONISATION, see SAINT.

CANONS, BOOK OF, book of injunctions for the Scot. Church drawn up by Scot. bp's (1636) under Anglican influence; caused Presbyterian discontent.

CANOPUS (astron.), see ARGO.

CANOPY, covering, such as that borne over crowned heads; in arch., the carved stone projections over tombs or monuments.

CANOSA (41° 13′ N., 16° 4′ E.), town, S. Italy; cathedral; occupies site of ancient *Canusium*, one of chief commercial towns of Italy.

CANOSSA (44° 34′ N., 10° 27′ E.), village, Italy; the ancient ruined castle is scene of Emperor Henry IV.'s humiliation before Pope Gregory VII. in 1077.

CANOVA, ANTONIO (1757–1822), Ital. sculptor; b. Passagno, near Venice; ancestors for several generations had been stone-cutters. At age of eight he executed two marble shrines, and displayed such remarkable promise that he was taken under the patronage of a Venetian senator, Falieri, who placed him in the care of Torretto, a well-known sculptor, with whom he remained several years. In 1779 C. went to Rome and found a new patron in the Venetian ambassador, Zuliano. Here, amongst other works, he produced his great statues of 'Apollo,' 'Theseus vanquishing the Minotaur,' 'Cupid and Psyche,' and the colossal cenotaph to Clement VIII. C.'s fame was now well established throughout Europe, and wealth and honours were thrust upon him. Judged by the severe standard of the ancients the work of C. is marked by a certain amount of artificiality, but this very defect, if such it be, was the chief factor in his success. His personal character exhibited many attractive qualities, and the vast sums he acquired by his art were chiefly expended in acts of benevolence. See SCULPTURE.

CANOVAS DEL CASTILLO, ANTONIO (1828–97), Span. statesman; filled many offices of state, and became Premier (1874); in earlier life pub. hist. novel, *Las Campanas de Huesca*; assassinated by anarchist.

CANROBERT, FRANÇOIS CERTAIN (1809–95), Fr. marshal; saw much foreign service in early life; commanded division at *Alma*, and was present at *Inkerman* and *Sevastopol*; commanded 4th army corps in Franco-Ger. War, distinguishing himself at *Gravelotte*.

CANSO, GUT OF (45° 35′ N., 61° 20′ W.), channel, between Cape Breton Island and Nova Scotia.

CANT, ANDREW (*c.* 1590–1663), Scot. priest, prominent in stirring Scotland up against Eng. Service Book.

CANTABILE, in music, evenly and at moderate pace.

CANTABRI, pre-Aryan race of N. Spain; found 25 B.C., when they fought with Romans.

CANTABRIAN MOUNTAINS (43° N., 6° W.), in N. of Spain, extending eastwards from Pyrenees to Atlantic coast; highest peak, Peña Vieja (8745 ft.); forests; rich coal-fields.

CANTACUZINO, celebrated Rumanian family of noble Byzantine origin, of which Gheorge C. (b. 1837) is the descendant; Prime Minister (1905–7).

CANTAGALLO (22° S., 42° 28′ W.), town, Rio de Janeiro, Brazil; staple industry is coffee-growing.

CANTAL (45° N., 3° E.), department, Central France, formed from S. part of old province Auvergne; surface mountainous; centre occupied by volcanic group, highest point, Plomb du C. (*c.* 6093 ft.); chief rivers, Alagon, Truyère, and Cère; numerous hot mineral springs; rich pasturage for cattle-rearing; coal and antimony found; butter and cheese made; area, 2231 sq. miles. Pop. (1911) 223,361.

CANTARINI, SIMONE (1612–48), Ital. painter of devotional school.

CANTATA (Ital.), story with musical setting, usually opening with chorus, followed by arias and recitatives, and ending with a chorale; examples by Bach, Carissimi, Mendelssohn, Weber, Brahms, and others.

CANTEEN, military refreshment house in barrack, where beer, provisions, and small-wares are served to soldiers—bread and meat being supplied direct.

CANTERBURY (51° 16′ N., 1° 4′ E.), town, on Stour, Kent, England; archiepiscopal and metropolitical see, abp. being primate of all England, owing to Augustine's settling in C., the capital of Æthelbert's kingdom; long a place of pilgrimage (cf. Chaucer's *Canterbury Tales*). Magnificent cathedral shows all architectural styles from Early Norman to Perpendicular; founded as Christchurch by St. Augustine, late VI. cent.; several times injured by Danes; enlarged and rebuilt at various dates; burnt in 1067; present building begun by Lanfranc (1070); choir burned (1174); restoration supervised by William de Sens; completed in present form by 1495; has crypt with vaulted roof, which contained tomb of St. Thomas and was used as place of worship by Huguenot refugees in XVI. cent.; consists of nave, choir, central and choir transepts with chapels, presbytery with apsidal chapels, eastern ambulatory, main apsidal chapel, Becket's tower, central and two western towers, south porch; has gorgeous shrine of Thomas Becket; some beautiful old stained glass; buildings attached to cathedral are deanery, chapter-house, baptistery, treasury, cloisters. C. has also some old churches; manufactures damask. Pop. (1911) 24,628.

Withers, *Cathedral Church of C.* (1901).

CANTERBURY (43° 47′ S., 40° 45′ E.), district, New Zealand; area, 14,040 sq. miles; cereals, cheese, butter, wool, hides, frozen meat. Pop. (not including Maoris, 1911) 173,185.

CANTERBURY, CHARLES MANNERS-SUTTON, 1ST VISCOUNT (1780–1845), Speaker of House of Commons (1817).

CANTHARIDEA, Spanish Flies, Blister Beetles, iridescent greenish malodorous insects of S. Europe, containing an irritating principle, *cantharidin*; are collected from the branches of lilac, privet, elder, etc., to be used medicinally for raising blisters and as a hair wash, and they act as a violent poison when taken internally. The green colour of the insect is due to chlorophyll.

CANTICLES, short songs or hymns, such as the *Benedicite, Magnificat, Nunc Dimittis,* etc. The name is more particularly applied to the *Song of Solomon* (*Song of Songs*). The title is derived from the first line of the book ('The Song of Songs, which is Solomon's'), but it is not to be assumed that the C's were written by Solomon. Rather it is held that the collection was the work of a scribe who had chosen a selection of the songs such as are used (to this day in N. Syria) during the several days given up to wedding festivities, and, the authorship being unknown, a great name was added, as the Hebrews disliked anonymity.

The earliest opinion held with regard to the character of the book was that it was an allegory dealing with the spiritual marriage between God and His bride, the faithful Israel (or, later, the Church). From the days of Origen onwards, this was the interpretation put upon the *Song of Songs.* Amongst mediæval writers it may be noted that St. Bernard devoted eighty-six sermons to the consideration of this aspect of the work; and, in later times, John Wesley held that the book could not possibly apply to a human love, or physical marriage, but that it must be considered allegorically.

A later development was the idea held that the *Song* was an example of the Hebrew drama, or a poem of purely natural affection. Viewed in this light, the interpretation put upon it was that Solomon had carried away a maiden, beloved of a shepherd, to his harem in Jerusalem, and that in the opening of the book he is seeking to prevail upon the girl to forget her rustic lover and yield to his advances. Another interpretation is that the songs were addressed by the maiden to her absent lover, and that her singing so works upon the king's feelings that he sets her free, and the book is supposed to end with the celebration of the lovers' reunion.

Proverbs, Ecclesiastes, and Song of Solomon (The Century Bible, Jack), by Rev. Prof. G. Currie Martin.

CANTILEVER, bracket for supporting balcony; pier in bridge-building; in both uses the length is much greater than the depth. See Bridge.

CANTILUPE, THOMAS DE, ST. (1218–82), Eng. prelate; Chancellor of England (1265); bp. of Hereford (1275); advice much valued by Edward I.; canonised, 1330.

CANTILUPE, WALTER DE (d. 1265), bp. of Worcester; supporter of Simon de Montfort.

CANTON, heraldic term for rectangular division less than quarter of shield, placed at either corner.

CANTON (23° 12′ N., 113° 15′ E.), city, China; capital of Kwang-Tung province; port on C. River; surrounded by walls; has inner wall dividing it into old town on N. and new town on S.; great number of natives live in boats; educational centre; has two remarkable pagodas, one 1300, other 1000 years old, and great number of temples; manufactures silk, hardware, cotton, porcelain, glass, paper, ivory carving, etc.; exports silk, sugar, tobacco, matting, glass bangles, buttons, eggs, tea, cassia, camphor, silverware, etc.; imports opium, paraffin, metals, flour, general goods; taken by British, 1857; held by Brit. and Fr. allies till 1861. Pop. (1910) 900,000.

CANTON (40° 33′ N., 90° W.), city, Illinois, U.S.A.; agricultural implements. Pop. (1910) 10,435.

CANTON (40° 35′ N., 75° 12′ W.), town, on Grasse river, New York; seat of St. Lawrence Univ.; has flour- and saw-mills. Pop. (1910) 2701.

CANTON (40° 50′ N., 81° 27′ W.), city, Ohio, U.S.A.; extensive industries in steel and iron. Pop. (1910) 50,217.

CANTON, term for division or district, as in France and Switzerland.

CANTON, JOHN (1718–72), Eng. natural philosopher; F.R.S.; made important electrical discoveries.

CANTONMENT, distribution of troops in villages, or buildings when engaged in active operations, under the surveillance of guards and sentries; in India, the c. system has led to the establishment of permanent military settlements, with barracks, officers' houses, bazaars, etc.

CANTÙ, CESARE (1804–95), Ital. historian; commissioned by a Turin publisher to write a universal

history, he completed it in six years, in 72 vol's; during a term of imprisonment he wrote a novel, his only writing materials being toothpick, candle-smoke, and pieces of rag.

CANUSIUM (41° 13′ N., 16° 4′ E.), ancient city, Apulia, Italy; became subject to Rome, 318 B.C.; modern Canosa.

CANUTE THE GREAT, CNUT, KNUT (995–1035), king of England; s. of Sweyn Forkbeard of Denmark. His f. had driven Ethelred the Unready into exile, and had compelled the English to accept him as king, but on the death of Sweyn (1014) the English restored Ethelred, and Harold, Sweyn's elder s., having been proclaimed king of Denmark, C. became a landless adventurer. He at once made war upon the Eng. king, who died 1016, and continued the struggle against Edmund Ironside, his successor. After C.'s victory at Assandun Edmund agreed to a treaty at Olney, by which he kept the south and C. received the north of the country. Upon Edmund's death (1017) C. was accepted as king of all England. He became ruler of a small empire in 1028 by succeeding to the thrones of Norway and Denmark, and the popular idea of his greatness is illustrated by the tale of his ordering the waves to retire, with the purpose of rebuking his courtiers' flattery. The king of Scotland did him homage (1031). He ruled England as a native ruler, by Edgar's laws. The four earldoms, Wessex, Mercia, East Anglia, Northumbria, were formed by him (1017).

Larson, *Canute the Great.*

CANUTE VI. (1163–1202), king of Denmark; s. of Valdemar I.; did much to extend Dan. territory.

CANVAS, coarse unbleached cloth made from hemp or flax, used for tents, sails, and art purposes; manufacture of Eng. sailcloth began, 1590.

CANYNGE, WILLIAM (1399–1474), Eng. merchant; mayor and M.P. for Bristol; entertained Edward IV.; restored the Church of St. Mary Redcliffe.

CANZONE, Ital. verse form, of which the chief masters were Petrarch and Leopardi; employed also by Drummond of Hawthornden and Schlegel.

CÃO, DIOGO, see CAM.

CAOUTCHOUC, see RUBBER.

CAP, head-covering; C. OF LIBERTY is the *bonnet phrygien* of the Fr. republic; C. AND BELLS were insignia of the professional fool, and school children formerly had to wear a FOOL'S C. as punishment; the judge wears a BLACK C. when pronouncing death sentence. C.-À-PIE (*c. à pied*), 'from head to foot.'

CAP HAITIEN (19° 45′ N., 72° 14′ W.), seaport town, and former capital of Haiti (*q.v.*), West Indies; exports coffee. Pop. 30,000.

CAPACITY, legal term; an infant, lunatic, or intoxicated person is incapable of making legal agreement.

CAPE, piece of land jutting out into the sea; Cape of Good Hope is called 'The Cape'; short armless outer covering fastening in front.

CAPE BRETON ISLAND (45° 28′ to 47° 3′ N., 59° 41′ to 61° 36′ W.), Nova Scotia, Canada; separated from mainland by Gut of Canso; cut in two by Bras d'Or Lake and a ship-canal; length, 100 miles; breadth, 85 miles; area, 3975 sq. miles; produces grain, timber, coal, salt, marble, limestone, granite; important fisheries; shipbuilding; connected with mainland by Intercolonial Railway; first colonised by French, 1712; ceded to Britain, 1763. Pop. (1911) 122,084.

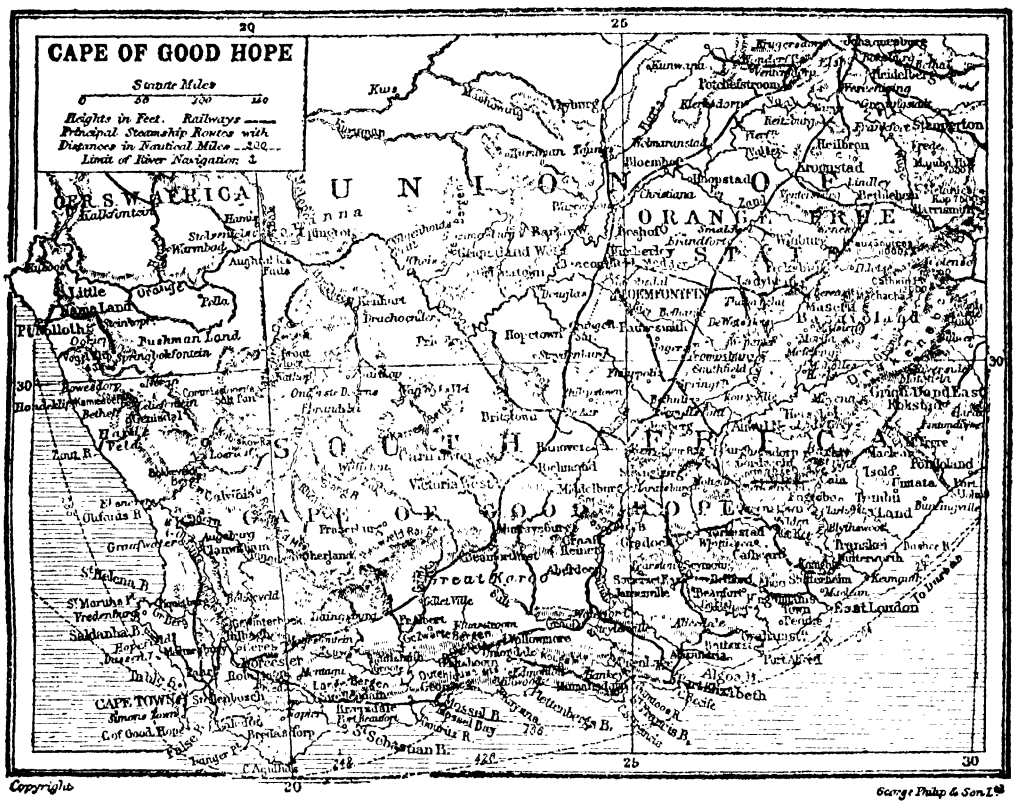
CAPE COAST CASTLE (5° 15′ N., 0° 30′ W.), seaport town and fort, Gold Coast, Brit. W. Africa; formerly capital; under Brit. Government since 1843; exports gold-dust, palm-oil. Pop. (1911) 11,269.

CAPE COD (42° 5′ N., 70° 10′ W.), peninsula, Massachusetts, between C. C. Bay and Atlantic.

CAPE COLONY, see CAPE OF GOOD HOPE.

CAPE OF GOOD HOPE, PROVINCE OF THE, formerly Cape Colony (23° 40′ to 34° 51′ S., 16° 24′ to 30° 15′ E.), part of Brit. empire forming extreme S. of Brit. S. Africa and of African continent; bounded N. by Ger. S.W. Africa and Bechuanaland protectorate, N.E. by Transvaal, Orange Free State, Basutoland, Natal, S.E. and S. by Southern Ocean, W. by Atlantic Ocean. Running parallel with coast, and about 150 miles distant from it, is series of mountains known by various names of Drakensberg, Stormberg, Sneeuwberg, Nieuwveld, Roggeveld, and Kamiesberg Mountains, with elevations of 11,000 to 6000 ft. From coast to these surface rises by three terraces divided by subsidiary mountain ranges, large part of third terrace being occupied by Great Karroo, a long treeless plateau, with bare table-topped hills, sloping from 4000 ft. on W. to 3000 on E., and covered with scrubby karroo bush. Southern Karroo or second terrace resembles Great Karroo, and both have great fertility under irrigation.

Coast terrace and hilly country in E. have grassy plains and woodlands. To N. of great range of mountains surface slopes to valley of Orange River, and plateau of interior beyond. Eastern part of province has rainfall of 28 to 25 in., centre, S. coast, and Karroo, 25 to 9 in., Great Karroo and country N. and N.W. of it, 9 in. or less. No large river except Orange, which rises in mountains in E. Western districts have winter, and eastern summer, rains. Mean temperature ranges from 51° to 79° F. Greatest length of province, *c.* 800 miles; breadth, *c.* 860 miles; area, 277,151 sq. miles.



Purely provincial affairs are in hands of Provincial Council, which is subject to the Parliament of the Union of South Africa; chief executive officer—Administrator.

History.—Cape of Good Hope was first discovered by Portug. navigator, Bartholomew Diaz, in 1486, and was again doubled by Vasco da Gama in 1497–99. No Portug. colonies, however, were established here, and first European nation to make settlement were the Dutch, who in 1652 under Van Riebeck established a fort on coast of Table Bay. They used it only as calling station for their ships going to East Indies, and colonists were not encouraged to settle.

In 1685 the revocation of the Edict of Nantes had the result of sending about three hundred Huguenots to seek refuge at the Cape. The country was then governed by the Dutch East India Co., whose rule was so severe that the settlers gradually removed as far as possible into the interior in order to avoid taxation and tyrannical regulations. Great numbers of Hottentots were killed and their lands annexed. During administration of William Adrian van der Stel, gov. from 1699 to 1704, discontent arose among the burghers and complaints were made, with result that those implicated were persecuted by Van der Stel, some being banished or sent back to Holland. In 1707 discontent was still rife, and various efforts at pacifying the burghers were made by Dutch government; but their instructions were not carried out by Dutch East India Co., who continued their policy of oppressive taxation and exclusion of burghers from foreign trade. Hence the latter continued to move farther away from centre of government. Dutch control of Cape lasted for nearly a cent. and a half. In 1780, however, Britain, having declared war against Holland, who was allied with France, arranged to send fleet against Cape; this was carried out next year, when the British were defeated by a Fr. fleet before reaching their destination. Fifteen years later the British made another and successful invasion and captured Cape in 1795; ruled by Britain until 1803, when it was restored to Holland, the Dutch East India Co. being now superseded by the Batavian republic, who governed for three years; when, war having again broken out, British once more took Cape Colony, which was formally surrendered to her by treaty in 1815.

The British then began the systematic colonisation of country. Several struggles with Kaffirs had already taken place, and for some time hostilities continued, wars breaking out from time to time. One occurred in 1817–19, when Kaffirs were defeated by

Graham; and in 1834 another broke out; great massacres followed, and many Hottentots were killed; ultimately the Kaffirs were defeated by Sir Harry Smith, and peace was concluded in 1835. Meantime all slaves had been emancipated in 1834, which roused discontent among the Boers; and in 1835 many of the latter set off on what is called the *Great Trek*, crossed Orange River, and eventually established the Transvaal Republic and Orange Free State. In 1846 occurred another war with Kaffirs, who were defeated by British, and acknowledged that country west of Kei River was British by right of conquest. In 1847 Brit. right to district between Kei and Keiskamma was proclaimed by Sir Harry Smith, now gov. Hostilities again broke out in 1850, when some British settlers were massacred by Kaffirs in Chumie Valley; gov. was for time cut off from his friends in Fort Cox, but made a dash for it, and rode to King William's heralding an age of bliss; result was that starvation and famine ensued, and in spite of Brit. attempts at relief, many thousands succumbed, and many more left the country. Brit. Kaffraria was annexed to Cape in 1865, Basutoland in 1871; latter was afterwards taken under direct control of Brit. crown. Griqualand West was also annexed in 1871, and subsequently incorporated with Cape Colony, its diamond mines forming great source of wealth. Discovery of diamonds in various districts resulted in further development of country from 1867 onwards. During administration of Sir Bartle Frere, gov. 1877–80, occurred another Kaffir war, which was soon suppressed. War in Basutoland in 1880 led ultimately to establishment of that country as crown colony. Walfish Bay was annexed in 1884; Port of St. John's in same year was incorporated with Cape Colony; and in 1885 Tembuland, Bomvanaland, and Gcaleka-

Town under fire. War continued till 1853, when it was ended by General Sir George Cathcart, who succ. Sir Harry Smith as gov. in 1852. Meantime great discontent had been caused by Earl Grey's proposal in 1848 to establish a penal settlement at the Cape; agitation was so pronounced that idea was abandoned in 1850; this led to desire on part of colonists for representative government, and in 1854 constitution was established, with two elective chambers, first parliament being opened by Gov. Darling in that year.

Under Sir George Grey, gov. 1854–61, various improvements were carried out; he ameliorated the conditions by which land was held by natives, supported missions, and began opening up the country by roads and construction of railway. During his administration occurred an extraordinary political movement among Kaffirs; a seer prophesied that if they killed all their herds and refrained from cultivating crops, all white men would on a given day disappear from the country and all dead Kaffirs reappear, land became integral parts of colony. Meantime the first Boer War had occurred in 1881; this resulted in foundation of Afrikander Bond, which aimed at establishing Afrikander nation and removing Brit. control. Pondoland was added to Cape Colony in 1894, and in 1895 occurred annexation of British Bechuanaland. Cecil Rhodes was Prime Minister in 1890–96, and had great share in development of colony. In 1899–1902 the great Boer War occurred, and for a time Cape Colony was invaded. Cape Colony was united with Natal, Transvaal, and Orange River Colony in 1910, as the Union of S. Africa; and became the Province of the Cape of Good Hope.

Resources.—Chief source of wealth is diamond mines, centre being at Kimberley in Griqualand W.; rich copper deposits in Namaqualand; coal in E., manganese and tin near Cape Town; iron, zinc, lead. Sheep and Angora goats are reared in large numbers, producing great quantities of wool and mohair; cattle, horses, mules, donkeys bred; lucrative ostrich-farming carried

on. Maize, millet, wheat, barley are cultivated; grapes, peaches, apricots, nectarines, figs, oranges, olives, pine-apples, bananas, tomatoes, and other fruits and vegetables grown; wine, brandy, and raisins produced; manufactures unimportant; exports include diamonds, wool, mohair, ostrich feathers, copper ore, regulus, and precipitate, raw hides, sheep and goat skins, maize; imports, clothing, iron, coal, textiles, leather, carriages, books, furniture, paper, tobacco, grain, hardware, cutlery, tools, provisions, liquors, etc. Railway mileage is c. 3500.

INHABITANTS include Dutch, English, and other European nationalities; in western districts are greatest number of Dutch, in eastern of English. The Boers are descended from early Dutch colonists and Huguenot exiles from France. Natives include Bantus, or Kaffirs, Hottentots, Bushmen, Griquas, etc. Many of Bantus are people of fine physique; Hottentots are short, and Bushmen are lowest S. African race. There are also numbers of Indians and Malays, and of 'coloured' people (*i.e.* half-castes). Chief religion of whites is Protestantism (Dutch Reformed Church, Anglican, Presbyterian, etc.). Education is obligatory for European children. Cape Town is provincial capital and seat of Union Parliament. Pop. (1911) 2,563,024, of whom 583,000 are white. See SOUTH AFRICA.

Burton, *Cape Colony To-day* (1907); Colvin, *The Cape of Adventure* (1911).

CAPE OF GOOD HOPE (34° 24′ S., 18° 29′ E.), promontory, S. Africa, first sighted by Diaz, 1486, and called 'Cape of Storms'; rechristened by king of Portugal; lighthouse.

CAPE MAY (39° 5′ N., 74° 52′ W.), watering-place, on Atlantic, Cape May County, New Jersey, U.S.A.; lighthouse, sea-bathing, fishing. Pop. (1910) 2471.

CAPE PENINSULA (34° 56′ S., 18° 27′ E.), peninsula, S. Africa, on N. of which stands Cape Town.

CAPE RACE (46° 40′ N., 53° 5′ W.), cape, S.E. Newfoundland.

CAPE TOWN (34° 56′ S., 18° 28′ E.), Mother City of South Africa; capital of Province of Cape of Good Hope, and seat of Legislature of Union of South Africa; beautifully situated on Table Bay at foot of Table Mountain; many fine suburbs; excellent harbour and docks. Notable buildings include old Dutch Castle, Government House, Houses of Parliament, Museum, Library, several colleges; mosques; observatory; seat of R.C. and Anglican bp's, and of univ.; exports wool, diamonds, ostrich feathers, gold, wine, ivory, hides, skins; imports textiles, hardware, general goods; founded by Dutch, 1652; taken by British, 1806. Inhabitants include Europeans, natives, coloured people (half-castes), Malays, and Indians. Pop., without suburbs (1911), 67,170.

CAPE VERDE (14° 48′ N., 17° 33′ W.), most westerly cape, Africa, between Gambia and Senegal River.

CAPE VERDE ISLANDS (16° 30′ N., 24° W.), group of fourteen islands belonging to Portugal, W. of Cape Verde, off W. African coast; area, 1480 sq. miles. Largest, Santiago; capital, Praia. Surface is mountainous; generally volcanic, Fogo being composed of single volcano, occasionally active; little water except in ponds and wells; climate hot; rainy season, Aug. to Oct.; vegetation abundant in spite of severe droughts; produce coffee, cinchona, sugar, tobacco, indigo, maize, oranges, grapes, jams, orchil, millet; cattle, pigs, goats, mules and asses raised; salt, amber, turtles; administered by gov., resident at Praia. Inhabitants are Portuguese, negroes, half-breeds. C. V. Islands were discovered in 1456 by Portuguese, who established colony here, 1499; granted to Prince Ferdinand, 1562; long used as penal settlement. Pop. 150,000.

CAPEFIGUE, JEAN-BAPTISTE HONORÉ RAYMOND (1801–72), Fr. historian; wrote history of France, and of the Jews; and numerous biographies of many famous women.

CAPEL, ARTHUR CAPEL, BARON, Eng. loyalist; strong supporter of Charles I; beheaded, 1649; wrote *Daily Observations, or Meditations.*

CAPEL CURIG (53° 6′ N., 3° 50′ W.), hamlet, E. Carnarvonshire, Wales, near Bettws-y-Coed; resort of tourists and anglers.

CAPELIN FISH, see under SALMON FAMILY.

CAPELL, EDWARD (1713–81), Eng. Shakespearean commentator; pub. his critical edition of the poet in 10 vol's (1768); associated with Garrick in adapting *Antony and Cleopatra* for stage.

CAPELLA, ALPHA AURIGÆ, first magnitude star in constellation of Auriga; of pearly hue, C. has been found by spectroscope to be a close double star.

CAPELLA, MARTIANUS MINEUS FELIX (fl. V. cent.), author of mediæval scientific compendium, *Satyricon.*

CAPENA, ancient town, Etruria; founded from Veii; afterwards subject to Rome.

CAPERCAILZIE, COCK-OF-THE-WOODS, *Tetrao urogallus,* large species of grouse (*q.v.*) inhabiting pine woods. The beautifully plumed male is larger than the female, and is noted for its song and fighting proclivities during courtship in spring. The fowl provides sport in Scotland, Sweden, Germany, and Austria.

CAPERNAUM, city of Galilee; home of Christ's manhood; location undecided.

CAPERS, flower-buds of *Capparis spinosa,* plant of bramble tribe, grown in Sicily and Southern France; prepared as pickle.

CAPET, 3rd Frankish dynasty, founded by Hugh Capet (987), who made Paris the Fr. capital. The throne passed to the female line, the house of Valois, in the person of Philip VI. (1328), but the inheritors of the Fr. throne were always considered C's, and after the Fr. Revolution Queen Marie Antoinette (*q.v.*) was addressed as Madame C. The different houses are distinguished as *Capétiens* (987–1328), *Capétiens Valois* (1328–1589), *Capétiens Bourbons* (1589–1848). See FRANCE (*History*).

CAPGRAVE, JOHN (1393–1464), Eng. priest and chronicler; his *Nova legenda Angliæ* was printed by Wynkyn de Worde (1516).

CAPILLARITY.—The particles forming the surface layer are in a condition different from those in the interior of a liquid; this layer is in a state of tension, and its action resembles that of a thin elastic membrane stretched tightly over the surface. In the interior of the liquid, a molecule is subject to attractive forces exerted by all the molecules immediately surrounding it. On the average these forces are in equilibrium and have no sensible effect on the motion of the molecule. But a molecule in, or very close to, the surface is acted on only by forces which attract it downwards. Hence, the free surface of a liquid tends to reduce itself to the least possible area, *e.g.* a raindrop tends to assume the form of a sphere, because a sphere is the form in which a given volume has the least possible superficial area. This tendency of the surface of a liquid to assume the minimum area possible means that it is in a state of tension, and the force acting is termed SURFACE TENSION. It is measured by the number of units of force which it exerts across unit length of a line drawn across the surface of the liquid; *e.g.* the surface tension of pure water is c. 75 dynes per centimetre, or about 3 grains weight per inch.

The behaviour of liquids in tubes of very fine bore is said to be due to capillarity, but is an effect of surface tension. Place a drop of olive oil on a surface of water. The surface tension of olive oil exposed to air is 35 dynes per centimetre; that between olive oil and water is 20·6, between water and air, 75; the tension of the water-air surface is therefore greater than the other two combined, and the oil is drawn out over the water surface. On the other hand, if a water drop be placed on a surface of chloroform, the tension of the water-air surface is greater than the others; and in consequence the water does not spread,

but is gathered into a flat drop. Consider the case of a glass tube of fine bore, both ends open, with its lower end dipped vertically below the surface of water. The water rises in the tube to a height which depends on the internal radius of the tube. At the surface layer of water inside the tube, three tensions are acting: water-air, water-glass, and glass-air, and these must be in equilibrium when the water has reached its highest point. The result is that the water in the tube stands so that the angle between its surface and that of the glass is nearly zero (*i.e.* when the glass is clean and the water is pure). Consequently, the water in the tube assumes a surface which is concave upwards. Owing to this concavity, there must be a greater pressure on the concave than on the convex side, and hence the water immediately under the surface films must be under a lower pressure than the atmospheric pressure on the concave side. The water in the tube must therefore stand at a higher level than the water outside the tube. With tubes of narrower bore the concavity and the difference of pressure are greater, hence the height the water reaches is greater; *e.g.* in a tube of internal diameter $\frac{1}{10}$ inch, the water rises about half an inch: if the diameter is $\frac{1}{100}$ inch, the rise is over 50 inches. With mercury, the tensions are such that the surface makes an angle of *c.* 130°, consequently the surface inside the tube is convex upwards. Hence there is a greater pressure under the convex surface, and therefore the inside level is below that outside the tube. These principles explain capillary phenomena generally, *e.g.* the entry of water through the micropyle of a seed, the absorption of water by a lump of sugar or a piece of blotting-paper, the rise of oil in a lamp-wick, etc. The ascent of sap in trees or plants is not due to capillary forces, as commonly supposed, but to osmosis.

CAPISTRANO, GIOVANNI DA (1385–1456), Ital. friar who preached crusades against infidels; relieved Belgrade, besieged by Turks, 1456.

CAPITAL is wealth employed to make profit. Its economic functions are to assist the labourer with tools and materials, and to enable the capitalist to accumulate wealth which he can dispose of to his own advantage. Thus the function of c. is not to maintain the labourer, for wages are not paid out of c., but out of the wealth which the labourer has been employed to create. **Fixed c.** is term applied to wealth not exhausted by the single act of production, *e.g.* railways, machinery, buildings, etc.; circulating c. is term applied to raw material in use for other purposes. Both definitions are unsound though in common use. **Capitalism** is the commercial system which makes labour dependent on c.

CAPITAL, in architecture, the head of a column, which supports the abacus.

CAPITAL PUNISHMENT, infliction of the death penalty, practically confined now, in England, to punishment of the crimes of murder, or high treason. The method of execution amongst the ancient Greeks and Romans was by the axe or sword. The first recorded instance of beheading in Britain took place in 1076, and the last person so executed was Lord Lovat (April 9, 1747). In the case of persons of common rank the sentence was usually carried out with disgusting barbarities. Disembowelling was not abolished until 1814; nor drawing and quartering until 1870. Decapitation is still employed in Germany, France, Sweden, Denmark, and China. The present method of execution in Britain is by hanging. The report of a royal commission, app. in 1864, resulted in the abolition of public executions. Formerly in Great Britain, and particularly in the XVIII. cent., the death penalty was adjudged for the most trifling crimes, such as stealing goods of the value of five shillings, or rifling a rabbit-warren. Of recent years it has been virtually abolished in cases of infanticide.

The reform of the criminal laws has been largely due to the strenuous efforts of such men as Sir Samuel Romilly and Sir James Mackintosh. In the Eng. army and navy the death sentence (theoretically) may still be given for such offences as desertion, gross neglect of duty, cowardice before an enemy, or violence to a superior officer. In some of the United States of America (as in Italy, Switzerland, Portugal, Holland, and certain other European States) the death penalty has been abolished altogether; in others it is inflicted for murder, train wrecking, arson, and rape. It is carried out in New York, Ohio, and Massachusetts by electrocution, in the other States by hanging.

CAPITALS, chief towns and seats of government of countries or states. Principal capital cities of world are: **Abyssinia**, Adis Abeba; **Afghanistan**, Kabul; **Algiers**, Algiers; **Argentina**, Buenos Aires; **Australia** (Commonwealth), on site of Yass Canberra (temporarily at Melbourne); **Austria**, Vienna; **Bavaria**, Munich; **Belgium**, Brussels; **Bolivia**, La Paz; **Brazil**, Rio de Janeiro; **British Columbia**, Vancouver; **Bulgaria**, Sofia; **Canada**, Ottawa; **Ceylon**, Colombo; **Chile**, Santiago; **China**, Peking; **Colombia**, Bogota; **Costa Rica**, San José; **Cuba**, Havana; **Denmark**, Copenhagen; **Ecuador**, Quito; **Egypt**, Cairo; **England**, London; **France**, Paris; **Germany**, Berlin; **Great Britain**, London; **Greece**, Athens; **Guatemala**, Guatemala la Nueva; **Haiti**, Port-au-Prince; **Holland**, Amsterdam; **Honduras**, Tegucigalpa; **Hungary**, Buda-Pesth; **India**, Delhi; **Ireland**, Dublin; **Italy**, Rome; **Japan**, Tokio; **Liberia**, Monrovia; **Luxembourg**, Luxembourg; **Mexico**, Mexico; **Montenegro**, Cettinje; **Morocco**, Fez; **Newfoundland**, St. John's; **New South Wales**, Sydney; **New Zealand**, Wellington; **Nicaragua**, Managua; **Norway**, Christiania; **Ontario**, Toronto; **Panama**, Panama; **Paraguay**, Asuncion; **Persia**, Teheran; **Peru**, Lima; **Portugal**, Lisbon; **Prussia**, Berlin; **Quebec**, Montreal; **Queensland**, Brisbane; **Rhodesia**, Salisbury; **Rumania**, Bucharest; **Russia**, St. Petersburg; **Salvador**, San Salvador; **Santo Domingo**, Santo Domingo; **Saxony**, Dresden; **Scotland**, Edinburgh; **Servia**, Belgrade; **Siam**, Bangkok; **South Africa** (Union of), Pretoria (administrative seat), Cape Town (legislative seat); **South Australia**, Adelaide; **Spain**, Madrid; **Sweden**, Stockholm; **Switzerland**, Bern; **Tasmania**, Hobart; **Turkey**, Constantinople; **United States**, Washington; **Uruguay**, Montevideo; **Venezuela**, Caracas; **Victoria**, Melbourne; **Western Australia**, Perth; **Württemberg**, Stuttgart.

CAPITO, WOLFGANG (1478–1541), Ger. reformer; was a Benedictine, but, influenced by Luther, became a leader of reformed faith in Strassburg.

CAPITOL.—(1) the citadel of ancient Rome on the summit of one of the Seven Hills, the Capitoline; contained temples of Jupiter, Juno, and Minerva. The present C. was designed by Michael Angelo. (2) seat of U.S.A. National Congress, Washington.

CAPITULARY (*capitulaire*), name given to the laws emanating from the Carolingian kings of the Franks, the most famous being those of Charlemagne and Louis I.; of great importance in history of law and philologically.

CAPITULATION, in military use, act of surrender under conditions stipulated of a town or fortress to an enemy, the leader of the latter having, by international law, power to make terms except in case of political demands of the defeated; also provision by which Christians in Muhammadan countries enjoy legal independence of the State in which they reside, being subject to consular courts.

CAPIZ (11° 40′ N., 122° 50′ E.), town and province, N. coast, Panay, Philippine Islands; exports rice, sugar, cotton, and tobacco. Pop. 14,000. Area (prov.), 1631 sq. miles. Pop. 224,000.

CAPO D'ISTRIA (45° 33′ N., 13° 44′ E.), fortified town on rocky island, Gulf of Trieste, Austria; cathedral; salt-works. Pop. 8300.

CAPO D'ISTRIA, GIOVANNI ANTONIO, COUNT (1776–1831), Russ. statesman; b. Corfu; after treaty of Tilsit (1807), when Ionian republic

passed into the hands of Napoleon, he refused offers made by France, and entered service of Russia; elected Pres. of Gk. Republic (1827); murdered by fanatic tribesmen.

CAPPADOCIA (*c.* 39° 20′ N., 36° E.), district in Asia Minor, to W. of Armenia, extending from Taurus to Black Sea. C. was province of Persia, when it included the region which afterwards became kingdom of Pontus; the remainder was an independent kingdom under Gk. kings for about 300 years, and became a Rom. province after the death of last king, Archelaus, in 17 A.D. It was early converted to Christianity. Chief town was Mazaca, later called Cæsarea.

CAPPEL, KAPPEL (47° 13′ N., 8° 31′ E.), small town, Zürich, Switzerland. R.C. force defeated Protestants, 1731.

CAPPEL, LOUIS (1585–1658), Fr. Huguenot divine; member of distinguished family; studied at Saumur and Oxford; prof. of Hebrew at Saumur, and later of Theol.; pub. *Critica Sacra*, 1650.

CAPPELLO, BIANCA (1548–87), Grand-Duchess of Tuscany; of noble birth, and famed for beauty, she married a clerk at age of fifteen; later became mistress, and afterwards wife, of Grand-Duke Francesco.

CAPPONI, GINO, MARCHESE (1792–1876), Ital. statesman and writer; Prime Minister under Grand-Duke Leopold II. of Tuscany; made Senator by King Victor Emmanuel (1860); became blind, 1844, but continued work on his great history of Florence (pub. 1875).

CAPPONI, PIERO (1447–96), Florentine statesman and soldier; employed by Lorenzo de' Medici, after whose death he became leader of the republic; killed (1496) during war with Pisans.

CAPRAIA (43° 2′ N., 9° 50′ E.), island of volcanic origin, N.W. coast of Italy; belongs to Genoa province; centre of anchovy fisheries.

CAPRELLIDÆ, see MALACOSTRACA.

CAPRERA (41° 12′ N., 9° 28′ E.), island, Strait of Bonifacio, N.E. coast of Sardinia; residence and burial-place of Garibaldi.

CAPRI (40° 32′ N., 14° 15′ E.), rocky island at entrance to Bay of Naples; ancient *Capreæ*; area, *c.* 6 sq. miles; highest point, Mont Solari (1920 ft.); contains two towns, Capri and Anacapri, which till 1876 were separated by a rock-hewn flight of stairs; a road has since been made; W. of Capri is the celebrated 'Blue Grotto'—limestone cavern; Rom. antiquities are found; wine and olives exported. Pop. 7000.

CAPRIC ACID ($C_{10}H_{20}O_2$), a fatty acid, B.P. 268° C., S.G. 0·911, with odour suggesting goats (*Capræ*), found in butter, etc.

CAPRICCIO (Ital. 'caprice'), impressionist musical composition.

CAPRICORNUS, THE GOAT, tenth zodiacal constellation; alpha Capricorni is a third magnitude double star.

CAPRIVI, GEORG LEO VON, COUNT (1831–99), Ger. soldier and statesman; brilliant service before Metz and in Orleans campaign; app. Chancellor and Foreign Minister, 1890.

CAPSTAN, appliance used on board ship for moving heavy weights, or winding cables. C. works on principle of wheel and axle, consisting in simplest—now obsolete—form, of timber column like truncated cone revolving on a spindle fixed in deck and worked by bars fixed in upper end; now, generally, steel or iron, driven by steam or electricity, or replaced by steam winches.

CAPTAL, feudal title of the noble heads of Epernon, Trene, Puychagut, and Buch; thus, Jean de Grailly, friend of Black Prince, was 'Captal de Buch.'

CAPUA (41° 6′ N., 14° 12′ E.), fortified town, Caserta, Italy; seat of abp.; has cathedral erected IX. cent.; partly built on site of ancient city, Casilinum, traditionally founded by Etruscans and united with Rome *c.* 340 B.C. Ancient C. was important city in III. cent. B.C., rivalling Rome and Carthage in luxury. During 2nd Punic War C. went over to enemy and was wintered in by Hannibal, 216–15; recaptured by Rome in 211 B.C.; afterwards became favourite resort; ruined by Arabs, 840; ruins include part of large amphitheatre, theatre, baths, and thermæ. Pop. 11,000.

CAPUCHIN, or SAPAJOU MONKEYS (*Cebus*), a genus of New World monkeys of family Cebidæ (*q.v.* under PRIMATES); found from Central America to south of Brazil, and often in menageries.

CAPUCHIN FRIARS (from *capuche*, cowl), an offshoot from the Franciscans (officially styled 'Friars Minor of the Order of St. Francis, Capuchin'), founded in early part of XVI. cent. by Matteo di Bassi, who adopted a pyramidal hood, grew a beard, went barefoot, and generally reverted to a more rigid system of living than was then observed by the Franciscans. The religious authorities attempted to suppress these innovations, but they were eventually ratified by Clement VII. (1528). The Capuchins wear a brown habit, and are still a flourishing body in many parts of the world.

CAPULETS AND MONTAGUES, Veronese families unknown to history. Their story as told in Shakespeare's *Romeo and Juliet* is taken from Bandello, whose account of the Cappelletti and Montecchi was trans. into Eng. verse (1562) by Brooke.

CAPUS, ALFRED (1858–), Fr. novelist and dramatist; prolific writer both of stories and plays.

CAPUT MORTUUM (Lat. 'dead head'), name given by early chemists to residue of substance after escape of all gases; later, spiritless object.

CAR NICOBAR (9° 21′ N., 92° 56′ E.), one of Nicobar Islands, Bay of Bengal.

CARABIDÆ, see under CARABOIDEA.

CARABINEERS, CARBINEERS, name, of Fr. derivation, originally borne by 6th Dragoon Guards, armed with carbine, 1692, and known as 'the King's Carabineers.'

CARABOBO (10° 10′ N., 67° 30′ W.), state, Venezuela, S. America, bordering Caribbean Sea; fertile soil; produces coffee, fruit, sugar, and maize; capital, Valencia. Area, 1794 sq. miles. Pop. 169,313.

CARABIDEA, or ADEPHAGA, a suborder of beetles, distinguished by their five-jointed tarsi, their filiform antennæ, and their carnivorous habits. They are speedy of movement and have well-developed jaws. Amongst them are the huge and beautiful Ground Beetles (*Carabidæ*), including the Bombardier (*Brachinus*), so called because when irritated it ejects an unpleasant fluid which, immediately volatilising, resembles a puff of smoke; Tiger Beetles (*Cicindelidæ*), found all the world over, which run down their insect prey by speed of foot; Carnivorous Water-Beetles (*Dytiscidæ*), with flattened, oar-like hind-legs, common in most ponds and ditches.

CARACAL (44° 8′ N., 24° 21′ E.), town, Rumania. Pop. 12,000.

CARACAL, see under CAT FAMILY.

CARACALLA, MARCUS AURELIUS ANTONINUS (186–217), Rom. emperor; s. of Septimius Severus; noted for his cruelties and extravagance; made war on Dacian Goths and the Alamanni; built arch of S. Severus in forum.

CARACAS (10° 31′ N., 67° 5′ W.), city, capital of Venezuela, built on S. slope of Avila, surrounded by mountains by which it is separated from its port, La Guaira, 6 miles N.; healthy climate; abp.'s seat; has a cathedral and univ.; subject to earthquakes; centre of export trade in cacao and coffee. Pop. 75,000.

CARACCI, see CARRACCI.

CARACCIOLI, Neapolitan family, prominent XV. cent. onwards. **Prince Francesco C.** (1752–99) was admiral of the Parthenopeian Republic.

CARACCIOLO, FRANCESCO, PRINCE (1732–99), Neapolitan admiral; learned seamanship under Rodney and Hotham; became commander of Ferdinand IV.'s navy; later turned revolutionist, fell into hands of Nelson, condemned aboard *Foudroyant*, and hanged from yardarm of *Minerva*.

CARACTACUS (*c.* 48–51 A.D.), Brit. chieftain who

held Roman invaders at bay, but was later taken prisoner and sent to Rome.

CARADOC SERIES, geological term; series of sandstones, shales, and grits, thickness 4000 ft.; subdivision of Lower Silurian system occurring in Shropshire.

CARAFFA, ANTONIO (1539–91), cardinal; prominent at Council of Trent.

CARAFFA, GIOVANNI PIETRO (1476–1559), of noble Neapolitan family, became Pope Paul IV. (1555), quarrelled with Philip II. of Spain for tolerance of Protestants, and afforded a glaring example of nepotism.

CARALES (39° 8′ N., 9° 5′ E.), ancient town, S. Sardinia; modern Cagliari; has remains of Rom. amphitheatre, baths, aqueduct; Carthaginian-Rom. necropolis with Rom. and Punic rock tombs; founded by Phœnicians; became stronghold of Carthaginians; taken by Romans, III. cent. B.C.; conquered by Goths, V. cent. A.D., by Saracens, VIII. cent.

CARAMEL, substance formed when sugar is heated to 212°.

CARAN D'ACHE (1858–1909), pseudonym of EMMANUEL POIRÉ, Fr. caricaturist and book illustrator.

CARAPACE, a protecting shell, as that of crabs, of Limulus (the King Crab), of tortoises, or of armadillo.

CARAPEQUA (25° 56′ S., 57° W.), town, Paraguay, S. America; cotton, sugar-cane, and tobacco chief products. Pop. 15,000.

CARAT.—(1) weight of 4 grains troy, used in weighing precious stones. (2) $\frac{1}{24}$th part of any weight of gold alloy; an object said to be 18 c. gold, contains 18 parts pure gold to 6 parts alloy.

CARAUSIUS, MARCUS AURELIUS (250–293 A.D.), native of Belgic Gaul who entered Rom. service, and finally set up as independent ruler in Britain.

CARAVACA (38° 4′ N., 1° 53′ W.), town, Murcia, Spain; celebrated for sacred cross with marvellous healing power, which is preserved in church; has ruined castle; ironworks. Pop. 15,800.

CARAVAGGIO, MICHELANGELO AMERIGHI DA (1569–1609), Ital. artist; *b.* Caravaggio; treated religious subjects with coarse realism.

CARAVAGGIO, POLIDORO CALDARA DA (1492–1543), Ital. artist; friezes in Vatican.

CARAVAN, band of traders travelling together on camels for mutual protection against predatory Bedouins and others; number of camels varies from about 30 to 1000; file is often preceded by an unladen ass, and first camel is gaily decorated.

CARAVANSERAI, public quadrangular building, for shelter of caravans and travellers generally, in parts of Asia; central court, with fountain, is open to the sky; entered by single large gateway, protected by strong doors and chains.

CARAVEL (or carvel), name of the 'great ships,' with high castellated sterns, used by Spaniards and Portuguese in XV. and XVI. cent's.

CARAVELLAS (17° 40′ S., 39° 14′ W.), seaport town, state of Bahia, Brazil; exports coffee, cocoa-nuts, and fish oil. Pop. 4000.

CARBALLO (43° 14′ N., 8° 43′ W.), town, Corunna, Spain; hot sulphur springs in district. Pop. 13,000.

CARBERRY HILL, ridge *c.* 7 miles S.E. of Edinburgh; occupied by Eng. left wing before battle of Pinkie, 1547; scene of surrender of Mary, Queen of Scots, to nobles before her imprisonment at Lochleven, 1567.

CARBIDE, carbon and metal compound; calcium c. and lithium c. generate acetylene (*q.v.*) gas used for lighting purposes.

CARBINE, name of XVI.-cent. firearm, somewhat shorter than musket, and used chiefly by cavalry; still survives as name of a weapon shorter than rifle.

CARBOLIC ACID, PHENOL (C_6H_5OH), colourless, crystalline solid of characteristic smell and caustic taste, S.G. 1·09, M.P. 42°, B.P. 183°. Extracted from coal-tar, first as sodium phenate by mixing with soda, the phenol next separated by sulphuric acid and purified by fractional distillation. Used in med. as a disinfectant and antiseptic, as a spray, lotion, ointment, or dressing, also internally (in weak doses) for arresting fermentation in alimentary tract; also used for preparation of salicylic acid and for preparation of picric acid (*Trinitrophenol*), from which the explosive *Lyddite* is prepared.

CARBON (C, 12), chemical element existing in various conditions distinguished by different properties or qualities. These include the diamond, graphite, and amorphous charcoal. The *diamond* is the hardest known solid, S.G. 3·5, occurring in transparent, highly refractive, octahedral crystals, used as a gem and for cutting glass. *Graphite* (plumbago or black lead), S.G. 2·6, is found in the form of solid grey-black, lustrous, six-sided plates, and used as a lubricant, for polishing iron and for pencils. There are several varieties of *amorphous carbon*, obtained by combustion in a limited air supply of animal and vegetable tissues, comprising charcoal (wood and bone), a black, soft, porous solid, S.G. 1·6—2, a good absorbent of gases, hence used as deodorant, while bone charcoal also removes colours and is used in sugar refining; coke, the residue of gas coal; lampblack, deposited from burning oils. Coal is an impure natural form of c. All forms of c. agree physically in being tasteless, inodorous, infusible, and insoluble in any known liquid, and chemically in that the same weight of any one form yields the same weight of c. dioxide gas when burnt in oxygen or air.

Oxides.—C. burned in excess of oxygen gives the gas c. dioxide, CO_2; in deficiency of oxygen the gas c. monoxide, CO. CO_2 is poisonous to animals, but is main food of plants; used for aerating waters.

CARBON BISULPHIDE (CS_2), chemical product; heavy, colourless, volatile liquid; S.G. 1·292, B.P. 46; poisonous; inflammable; disagreeable smell; prepared by passing sulphur vapour over red-hot charcoal; used as solvent for gums, caoutchouc, sulphur, iodine.

CARBON PAPER, thin paper coated on one side with pigment; used for duplicating written or typewritten matter.

CARBON PROCESS, one of most permanent of photographic printing processes; based on fact that gelatine, when impregnated with bichromate of potash, becomes insoluble in hot water after exposure to light. By mixing pigments with the gelatine, prints in any colour are obtained.

CARBONARI, THE ('charcoal-burners'), members of secret revolutionary societies in Italy, Spain and Portugal, and France, where they were known as the *charbonniers*, during early XIX. cent. Amongst members of the Ital. branch were Mazzini, Silvio Pellico, and Lord Byron. Their aims were republican in France, nationalist in Italy; every effort was made by the Austrians to stamp them out in Italy, where they greatly contributed to winning of Ital. freedom.

CARBONATES (salts of carbonic acid), widely distributed in nature, commonest being calcium carbonate ($CaCO_3$), *e.g.* limestone, chalk, marble; all insoluble except those of alkali metals; decomposed by heat into carbon dioxide and the metallic oxide. **Bicarbonate** is a salt in which only one of the hydrogen atoms of the acid is displaced (*e.g.* $NaHCO_3$), an acid c.

CARBONDALE (41° 31′ N., 75° 36′ W.), city, Pennsylvania, U.S.A.; rich anthracite coal-fields. Pop. (1911) 17,040.

CARBONEAR (47° 52′ N., 53° 9′ W.), seaport, Newfoundland. Pop. 3540.

CARBONIFEROUS SYSTEM is the term applied to the great division of geological strata which contains the Coal Measures. It overlies the Devonian (Old Red Sandstone) and is overlaid by the Permian system, and attains sometimes a thickness of 20,000 ft. It is represented in Europe by the coal-fields of Britain,

Belgium, Westphalia, North and Central France, Bohemia, and S. Russia, and occupies vast tracts of N. America, Australia, and New Zealand. It presents two well-marked subdivisions—a lower mainly of marine formation, and an upper of freshwater origin, the order of succession and constitution of the sections in Great Britain being shown as follows (from the surface downwards): 1. *Coal Measures*—Sandstones, shales, ironstones, fire-clays with interstratified workable coal-seams (this is called UPPER C.); 2. *Millstone Grit*—Grits, flagstones, sandstones, shales with thin coal-seams; 3. *Carboniferous Limestone*—Limestones, shales, sandstones with thin coal-seams (these are called LOWER C.).

FOSSILS fall under two types, viz.: 1. *Marine* (of the Limestone section) include corals, crinoids, molluscs, crustacea, fish (shark order); 2. *Freshwater and Terrestrial* (of Coal Measures)—*Plants*: Tree ferns, giant equisetums, lycopods, conifers. *Animals*: Molluscs, scorpions, insects, ganoid fishes, and giant amphibians (Labyrinthodonts).

The characters and disposition of the Carboniferous strata suggest their formation during periods of subsidence alternating with rest, while the vegetable remains indicate a warm, moist, and equable climate.

Sir A. Geikie, *Text-Book of Geology* (1898); A. J. Jukes Brown, *Handbook of Historical Geology* (1686).

CARBONITE, an explosive; 25 % nitroglycerine and 75 % wood meal, alkali nitrates, and sulphur.

CARBORUNDUM (SiC), silicide of carbon; crystalline solid, colourless when pure, commercially brown to black from impurities, very hard, prepared by heating sand with coke in electric furnace; used for polishing metals, jewels, and glass.

CARBOXYL, see ACID.

CARBOY, large glass bottle used by drysalters for holding corrosive liquids.

CARBUNCLE, in med., a spreading inflammation of the deeper layers of the skin, followed by suppuration and sloughing, and the c. may burst upon the surface. The patient is often feverish, cannot sleep, and quite ill for some weeks. The treatment is to relieve the pain with opium, and excise the c., swabbing the wound with carbolic acid, and packing with gauze.

CARBURETTOR, part of internal combustion engine using liquid as fuel; converts liquid into gas, mixes with it air making it explosive, and supplies this gas to the engine.

CARCAGENTE (39° 8′ N., 0° 29′ W.), town, on Júcar, Valencia, Spain; linen and silk manufactured. Pop. 12,800.

CARCANET.—(1) a necklace; (2) neck chain by which prisoners were attached until abolition of penalty, 1832.

CÁRCAR (10° 5′ N., 123° 35′ E.), town, Cebú, Philippine Islands; sugar. Pop. (1910) 32,000.

CARCASSONNE (43° 13′ N., 2° 20′ E.), town, Aude, France; on Aude; splendidly preserved and complete mediæval rampart; fortress restored by Napoleon III.; Church of St. Lazarus contains tomb of Simon de Montfort; scene of massacre of Albigenses, 1210; bp.'s see; cathedral (XIII. cent.); celebrated for manufacture of woollen cloth; wine. Pop. (1910) 30,689.

CARCHARIAS, see SHARKS and DOG FISHES.

CARDAN, CARDANUS, HIERONIMO, CARDONO (1501–76), Ital. physician, mathematician, and astrologer; studied med. at Pavia and Padua, and while a physician at Milan and afterwards prof. of Med. at Padua he wrote important works on math's, as well as a well-known work on astrology which brought him European fame. He visited Scotland and England in 1551, writing an account of the court of Edward VI. Banished from Milan, he became a prof. at Bologna, but was deprived of his chair by the Pope on the ground of heresy, and spent the rest of his life in Rome, writing his autobiography, *De Vita Propria*, which is considered one of the most valuable and interesting works of its kind.

CARDBOARD, stiff paper or pasteboard formed by pasting together several layers of paper; BRISTOL BOARD is used for pen-and-ink sketches, wash drawings, etc.

CARDENAS (23 N., 81° 12′ W.), town and port, Cuba; chief export, sugar. Pop. (1910) 28,576.

CARDIFF (51° 28′ N., 3° 10′ W.), city, seaport, on Taff, Glamorgan, Wales; has XII.-cent. castle, which was besieged by Cromwell in 1648, now residence of Lord Bute; town was almost destroyed during siege by Owen Glendower in 1404. Among outstanding features are South Wales Univ. Coll.; free library, museum, Baptist theological college, hospital, etc.; several parks, including Cathay Park, where are magnificent new town hall, municipal buildings, and law courts, and Univ. of Wales offices; suburb is Llandaff. Great manufacturing and trading centre; exports enormous quantities of coal, also iron, tinplate, etc.; industries include shipbuilding, smelting, iron and steel works, brewing, manufacture of chemicals, etc.; imports ores, provisions, live cattle, esparto; has large cold-storage accommodation and magnificent docks. Pop. (1911) 182,280.

CARDIGAN (52° 5′ N., 4° 39′ W.), seaport, market town, on Teifi, Cardiganshire, Wales; has ancient church of St. Mary, and remains of XII.-cent. castle; has coasting trade; fishing is important industry; exports bricks, tiles, earthenware, etc. Pop. (1911) 3578.

CARDIGAN, JAMES THOMAS BRUDENELL, 7TH EARL OF (1797–1868), Brit. lieut.-general; commanded 15th, and later 11th, Hussars; was of a brutal and overbearing temper, and generally unpopular, but spent immense sums of money on his regiment; led the famous charge of the 'Light Brigade' at *Balaclava*.

CARDIGANSHIRE (52° 5′ N., 4° 36′ W.), maritime county, S. Wales; bounded by Merioneth, Montgomery, Radnor, Brecknock, Carmarthen, Pembroke, and Cardigan Bay; area, 692 sq. miles; surface generally mountainous, except along coast; highest peak, Plinlimmon; chief rivers, Teifi, Aeron, Towy, Rheidol, Ystwith. Soil is chiefly clay, loam, or peat; produces wheat, barley, oats, and other crops; cattle, sheep, and horses raised; minerals include lead, zinc, silver, copper, slate; manufactures gloves, woollens; chief towns, Cardigan, Aberystwith, Lampeter. C. was occupied by Romans; invaded by Danes in X. and XI. cent's; by Normans in 1092; annexed to England by Edward I., 1284. Pop. (1911) 59,877.

CARDINAL, of chief importance. **C. numbers** are 1, 2, 3, etc., distinguished from the ordinals (*i.e.* the 'ranked' numbers), 1st, 2nd, 3rd, etc. The **c. points** of the compass are N., S., E., and W.; of the heavens, zenith (*q.v.*) and nadir. The **c. signs** are Aries, Cancer, Capricornus, and Libra.

Cardinal Virtues, prudence, fortitude, justice, temperance; the theological virtues, faith, hope, and charity, are sometimes added.

CARDINAL BIRD, a name applied to several scarlet birds on account of their plumage; but probably originally to the North American bunting (*Cardinalis virginianus*), a common cage-bird.

CARDINAL FISHES (*Apogonidæ*), small, brightly-coloured, perch-like bony fishes; common in warm seas, venturing even into fresh water.

CARDINALS, R.C. dignitaries, next in rank to the Pope. The Sacred College of C's, since the time of Sixtus V., consists of a number of members not exceeding seventy, viz.: six c.-bp's, of which the Bp. of Ostia is dean; fifty c.-priests; and fourteen c.-deacons. All cardinals are chosen by the Pope, and the c's themselves choose the Pope, taking control of the affairs of the Church during any temporary vacancy of the Holy See. A c.'s hat is conferred personally by the Pope, who also bestows upon the c., at the same time, the sapphire ring of his office. A consistory of c's usually meets fortnightly, under the presidency of the Pope.

CARDING, process in cotton-spinning, performed by card-room operatives, and consisting of combing or 'carding' the fibres in parallel lines preparatory to further treatment. Improvements were introduced by Peel, Arkwright, and others.

CARDONA (41° 57′ N., 1° 40′ E.), town, Barcelona, Spain; celebrated mountain of rock-salt near C. Pop. 3900.

CARDS, PLAYING, the origin of card-games is obscure, and their invention has been ascribed to the Egyptians, Arabs, Chinese, and Hindus. Cards were manufactured in England, Germany, and Italy in the early part of the XV. cent.; importation was forbidden by Edward IV.; and a tax was first imposed by James I.

CARDUCCI, BARTOLOMMEO (1560–1610), Ital. artist; worked in Spain, and patronised by Philip III.

CARDUCCI, GIOSUÉ (1836–1907), one of greatest Ital. poets; prof. of Lit., Bologna; followed classic tradition; his *Hymn to Satan* marks his intellectual leadership of revolt against Romanticism.

CARDWELL (18° 15′ S., 146° 5′ E.), seaport, Rockingham Bay, Queensland, Australia; dugong-fishing.

CARDWELL, EDWARD (1787–1861), Eng. theologian; b. Blackburn, Lancs; ed. Oxford; Camden prof. of Ancient History (1825); rector of Stoke Bruern (1828); pub. *Lectures on the Greek and Roman Coinage* (1833), *Documentary Annals of the Reformed Church of England* (1839), *Reformatio Legum Ecclesiasticarum* (1850), etc.

CARDWELL, EDWARD CARDWELL, VISCOUNT (1813–86), Eng. statesman; s. of Liverpool merchant; member for Clitheroe (1842); Sec. for Colonies (1864); Sec. for War (1868); instituted short-service system and army reserve; raised to peerage (1874).

CAREENING, to turn a ship on its side, usually for cleaning or repairing; hence to clean or repair.

CARÊME, Fr. form of *Quadragesima*, Lent.

CAREW, BAMFYLDE MOORE (1693–*c.* 1770), Eng. vagabond, 'the king of the gipsies.'

CAREW, GEORGE (d. 1613), Eng. diplomatist; ambassador to Poland and to France; wrote *Relation of the State of France* (Henry IV.).

CAREW, RICHARD (1555–1620), Eng. antiquary and translator; b. St. Antony, Cornwall; trans. first five cantos of Tasso's *Jerusalem Delivered* (1594); best known for his *Survey of Cornwall* (1602), interesting, apart from its intrinsic value, as a compendium of country life in Elizabethan age.

CAREW, THOMAS (1595–1645), Eng. poet; b. West Wickham, Kent; ed. Oxford; abandoned law for court employment, and was much favoured by Charles I.; one of most brilliant of Cavalier poets, he will live by virtue of a few incomparable lyrics.

Carew's *Poems*, edit. by Arthur Vincent (1899).

CAREY, HENRY (d. 1743), Eng. poet and musician; reputed s. of Marquis of Halifax; chiefly remembered for his songs, of which *Sally in Our Alley* is best known; also wrote innumerable burlesques, farces, and musical pieces; there is no evidence that *God Save the King* was written by him, though he is often said to have been the author.

CAREY, HENRY CHARLES (1793–1879), Amer. economist; s. of Matthew Carey, also writer on political economy; pub. *Principles of Political Economy* (1837–40); *Principles of Social Science* (1858–59); originally 'free trader,' but later favoured 'protection.'

CAREY, ROBERT, 1st Earl of Monmouth (*c.* 1560–1639), Eng. soldier; younger s. of Henry, 1st Lord Hunsdon; *Memoirs* (pub. 1759).

CAREY, WILLIAM (1761–1834), Eng. Orientalist and missionary; b. Paulerspury, Northamptonshire; worked in early life as shoemaker; became Baptist minister at Leicester; one of founders of the Baptist Missionary Society; went as missionary to India; studied Sanskrit, Punjabi, Bengali, and other languages and dialects, into which he trans. the Bible, and of which he compiled dictionaries.

CARGADOS ISLANDS, St. Brandon Islands (16° 20′ to 16° 50′ S., 56° 26′ to 59° 41′ E.), in Indian Ocean; dependency of Mauritius (*q.v.*).

CARGILL, DONALD (1610–81), Scot. Covenanter; wounded at *Bothwell Bridge*; beheaded at Edinburgh.

CARIA (*c.* 37° 20′ N., 28° 30′ E.), in ancient geog., district bordering on Ægean, S.W. Asia Minor; much of surface mountainous; watered by Mæander; belonged to Lydia, subsequently to Persia; conquered by Alexander of Macedon, 334 B.C.; later became Rom. province; chief towns were Miletus, Halicarnassus, Cnidus; noted for pirates in Rom. times.

CARIACAS, see under Deer Family.

CARIACO (10° 30′ N., 63° 41′ W.), town, Venezuela, near head of Gulf of C.; cotton. Pop. 7000.

CARIBA, or CARIBE FISHES (*Serrasalmo*), small deep-bodied fishes found in the warm rivers of tropical and sub-tropical America; they have sharp chisel-teeth, and are exceedingly bloodthirsty, attacking in crowds any living thing that ventures near their haunts; on this account they have been called Dogs-of-the-Water.

CARIBBEAN SEA (15° N., 73° W.), between Antilles and Central and S. America; connected by Strait of Yucatan with Gulf of Mexico; formed by subsidence of earth's crust, of which depression forming Mediterranean basin is regarded as continuation.

CARIBBEE ISLANDS, Lesser Antilles (16° N., 61° 30′ W.), chain of islands, eastern side of Caribbean Sea, forming portion of West Indies.

CARIBE, see Cariba.

CARIBS, natives of West Indies and Spanish Main, now chiefly settled in Nicaragua and Honduras; name given by Columbus.

CARICATURE (Ital. *caricatura*), drawing, painting, or description in which individual characteristics are so exaggerated, or distorted, as to appear ridiculous. The word was first employed in English in *Christian Morals*, a posthumous book by Sir Thomas Browne. It is also to be found in its Ital. form in *The Spectator* (1712). There is evidence in carvings and papyri that the art of c. was employed to a limited extent by the Greeks, Romans, and Egyptians. It was not, however, until the Middle Ages that its use became widespread throughout Europe; it was then usually expressed in the form of gargoyles and grotesque decorations in ecclesiastical architecture. Its most notable early exponent was Hans Holbein (1498–1554), in his *Dance of Death*.

C. was practised to some extent in England during the Tudor and Stuart periods, but it was not until the XVIII. cent. was well advanced that the art may be said to have flourished. This period saw the rise of William Hogarth (1697–1764); James Gillray (1757–1815); and Thomas Rowlandson (1756–1827); later came George Cruikshank (1792–1878)—all giants in their particular medium of social satire. The later development of the art may be said to have begun with the founding of *Punch* (1841), which produced a number of brilliantly clever caricaturists. The familiar cover was designed by Richard Doyle (1824–83), and other artists associated with the early days of the paper were John Leech, Tenniel, Keene, and Du Maurier. To these have succeeded on the staff of *Punch*, and other illustrated journals, Linley Sambourne, E. T. Reed, Raven Hill, Sir F. C. Gould, Phil May, Leslie Ward ('Spy'), Tom Browne, Harry Furniss, Max Beerbohm, and numerous others of brilliant accomplishments.

C. began to flourish in France about 1830, when the journal, *La Caricature*, was founded, and the most notable workers in this genre have been Daumier, Grandville, Monnier, Garvani, Decamps, Charlet, Traviès, Raffet, Isabey, Giraud, 'Caran d'Ache' (Emmanuel Poiré), and others. In America the art has been largely developed in the journal called *Puck*. In Germany the caricatures contained in the *Fliegende Blätter*, *Simplicissimus*, and *J[illegible]*

Thomas Wright, *History of Caricature* (1865); M. H.

Spielmann, *History of Punch* (1895); Paston, *C. in XVIII. Century.*

CARIGARA (11° 20′ N., 124° 35′ E.), town and port, N. coast, Leyte, Philippine Islands; cotton manufactures. Pop. 14,000.

CARIGNANO, PRINCES OF, younger branch of house of Savoy; Charles Albert, prince of C., succ. as king of Sardinia, 1830, and was f. of Victor Emmanuel II., king of Italy (1860).

CARIGNANO (44° 55′ N., 7° 40′ E.), town, on Po, Turin, Italy; silk. Pop. 4500.

CARILLON, series of bells tuned to a scale.

CARIMATA, KARIMATA.—(1) (*c.* 1° 34′ S., 109° E.) islands, Malay Archipelago, W. of Borneo; area, 57 sq. miles. (2) chief island of C. group. (3) strait between Borneo and Billiton.

CARINA, see ARGO.

CARINARIA, see under GASTROPODS.

CARINI (38° 8′ N., 13° 11′ E.), town, Palermo, Sicily; near ruins of ancient Hyccara. Pop. 12,907.

CARINTHIA (46° 45′ N., 14° E.), Austrian duchy and crown land; area, *c.* 4000 sq. miles; surface mountainous; watered by Drave; capital, Klagenfurt; produces lead and iron ores; manufactures iron and steel goods, machinery, rails; rye, oats, and wheat grown; horses, cattle, and sheep raised; has belonged to Austrian royal house since 1335. Pop. (1910) 396,200.

CARINUS, MARCUS AURELIUS (*c.* 283 A.D.), Rom. emperor; was a man of dissolute habits, and his life was stained with many crimes.

CARIPE (10° 15′ N., 63° 25′ W.), town, Bermúdez, Venezuela; has remarkable caverns, which are inhabited by the guacharo bird, the young of which are killed for their oil.

CARISBROOKE (50° 42′ N., 1° 20′ W.), town, Isle of Wight, formerly capital; mediæval stronghold; ruined castle was prison of Charles I., 1647–48.

CARISSIMI, GIACOMO (1604–74), Ital. composer; writer of numerous oratorios; believed to be originator of Chamber Cantata; *Jephthah* is regarded as his masterpiece.

CARLÉN, EMILIE (1807–92), Swed. novelist; Eng. trans's of her works are common; her dau., Rosa C. (1836–83), was also a well-known writer.

CARLETON PLACE (45° 16′ N., 76° 12′ W.), town and port, Ontario, Canada; woollens. Pop. 4000.

CARLETON, WILLIAM (1794–1869), Irish novelist; s. of a small farmer in Co. Tyrone. He is chiefly remembered by his *Traits and Stories of the Irish Peasantry* (1830–33), but also wrote many novels of Irish life and character.

CARLILE, RICHARD (1790–1843), Eng. freethinker; b. Ashburton; s. of a shoemaker, and by trade a tinsmith; was greatly influenced by reading Thomas Paine's *Rights of Man,* and thereafter devoted himself to the publication and dissemination of freethinking lit., for which he was condemned to various terms (altogether nine years) of imprisonment.

CARLILE, WILSON, Anglican clergyman who founded mission known as Church Army, 1882.

CARLING SUNDAY, 5th Sunday in Lent, so called from dish of fried carlings (dried peas) eaten on that day; old line, 'Carling, Palming, Paste Egg Day,' was remembrancer of three consecutive Sundays.

CARLINGFORD (54° 2′ N., 6° 12′ W.), seaport and market town, County Louth, Ireland; oyster-fishing.

CARLINGFORD, CHICHESTER SAMUEL FORTESCUE, BARON (1823–98), Brit. statesman; Pres. Board of Trade (1871); Lord Privy Seal (1881); Pres. of Council (1883); title extinct.

CARLISLE (54° 53′ N., 2° 50′ W.), town, Cumberland, England; seat of bp.; has fine cathedral founded by William Rufus, who also built the castle; grammar school founded by Henry VIII.; iron foundries; manufactures textiles, tinplate, shoes; belonged to Romans, many traces of whose occupation remain; sacked by Danes, 875; added to England by William Rufus; many times besieged by Scots; besieged by Bruce, 1315; by Leslie, 1644–45. Pop. (1911) 46,432.

CARLISLE (40° 10′ N., 77° 17′ W.), county seat, Cumberland Co., Pennsylvania, U.S.A.; seat of Dickinson Methodist College (1783); bombarded by Confederates, July 1863; manufactures boots and shoes; railway cars. Pop. (1910) 10,303.

CARLISLE, EARLDOM OF, title which has been held by two different Eng. families. JAMES HAY (d. 1636), cr. Earl of C., 1622, a favourite of James VI. of Scotland and I. of England, acted as English envoy on several diplomatic missions abroad. His second wife, Lucy, Countess of C. (1599–1660), was a famous beauty and political intriguer in the reign of Charles I. The first Earl of C. was succ. by his s., JAMES, who d. without issue (1660), the peerage thus becoming extinct.

It was revived by Charles II. and conferred (in 1661) upon CHARLES HOWARD (1629–85), who had been a prominent supporter of Cromwell, but used his influence in support of the royal restoration. The title descended to his s., EDWARD (1646–92), who was succ. by his s., CHARLES (1674–1738), succ. by his s., HENRY (1694–1758). FREDERICK HOWARD (1748–1825), Earl of C., s. of Henry, the 4th earl, was a noted politician, app. viceroy of Ireland (1780–82); known as author of poems and of two highly esteemed tragedies. He was guardian of Lord Byron, the poet. GEORGE HOWARD (1773–1848), Earl of C., s. s. of 5th earl, was, as Lord Morpeth, a prominent member of the House of Commons, and, after he had succ. to the peerage, was in the cabinet under Canning and Grey. GEORGE WILLIAM FREDERICK HOWARD (1802–64), Earl of C., s. s. of 6th earl, was a politician of note, a member of the cabinet under Melbourne and Russell, and twice viceroy of Ireland (1855–58 and 1859–64). He was the author of poems and other works, and a popular lecturer on literary subjects. He was succ. in the title by his brother, Rev. WILLIAM GEORGE HOWARD (d. 1889). GEORGE JAMES HOWARD (1843–1911), 9th Earl of C., grandson of 6th earl, was a Liberal politician, an artist, and a well-known art patron.

CARLISTS, adherents of **Don Carlos** of Spain (1788–1855), bro. of Ferdinand VII., whose infant dau. Isabella, despite the Salic Law, was proclaimed queen after his death; civil war ended with defeat of the C., 1840; the grandson of Don Carlos, Carlos VII., revived claim, but an attempt to enforce it was defeated, 1876.

CARLOFORTE (39° 12′ N., 8° 18′ E.), town, island of San Pietro, west coast Sardinia; fisheries. Pop. 8000.

CARLOMAN, name of three Frankish rulers.—(1) s. of Charles Martel, bro. of Pippin the Short (d. 754); (2) king of Franks, s. of Pippin the Short, bro. of Charlemagne (751–71); (3) king of France (d. 884), s. of Louis II. (the Stammerer).

CARLOS I. (1863–1908), king of Portugal (3rd ruler of the Braganza-Coburg line), succ. 1889; determined to assert the power of the crown and put an end to the tyranny of party leaders like Castro and Ribeiro; he therefore suspended the constitution (1907) and app. Señor Franco dictator; for this step he was assassinated in Lisbon, together with his e. s., Louis (Feb. 1, 1908). He was succ. by his younger s., **Manuel II.** (b. 1889), who was dethroned by the republican party (1910), and sought refuge in England.

CARLOS, DON (1545–68), Prince of Asturias; s. of King Philip II. of Spain and his first wife, Maria, dau. of John III. of Portugal. He grew up indolent and vicious, and developed signs of insanity. He was placed in confinement by his f., and died mysteriously during his period of incarceration. He was betrothed (1559) to Elizabeth, dau. of Henry II. of France, but she shortly afterwards became his f.'s third wife.

Prescott, *History of the Reign of Philip II.*

CARLOS, DON (1788–1855), 1st Carlist claimant to Span. throne; s. of King Charles IV.; held prisoner in France by Napoleon (1808–14); d. at Trieste.

CARLOS, DON (1848–1909), claimed Span. throne

as Don Carlos VII.; s. of Don John of Bourbon, grandson of above; lived a wandering life in various countries; lack of decision was fatal to his pretensions, and the throne continued to be held by Alfonso XII. and XIII.

CARLOW (52° 45′ N., 6° 50′ W.), inland county, Ireland; area, 346 sq. miles; soil fertile; stock raising carried on; surface flat or slightly undulating; produces limestone, marble; drained by Barrow with tributary Burren, and Slaney with tributary Derreen; capital, Carlow. Pop. (1911) 36,151.

CARLOW (52° 50′ N., 6° 55′ W.), county town, Carlow County, Ireland, at confluence of Burren and Barrow; R.C. cathedral; ruined XII.-cent. castle; flour mills. Pop. 6500.

CARLSBAD, KAISER-KARLSBAD (50° 13′ N., 12° 53′ E.), town, Bohemia; fashionable watering-place, noted for mineral springs of which most remarkable is Sprudel; this has numerous orifices, and temperature of 164° F.; mineral waters and C. salts are largely exported; named after Charles IV. (1347-78). Conference of Ger. ministers and officials held here, 1819, at which resolutions (*Carlsbad decrees*) for the suppression of Liberal agitation were passed. Pop. 14,640.

CARLSCRONA, see KARLSKRONA.

CARLSKAMN (56° 10′ N., 14° 52′ E.), fortified town, Sweden. Pop. 7200.

CARLSRUHE, see KARLSRUHE.

CARLSTADT, ANDREAS RUDOLF BODENSTEIN (1480–1541), Ger. reformer; was preacher and prof. of Theol. at Wittenberg, and became one of the leading Reformers. His extreme views and drastic methods, however, brought him into conflict with Luther and the Elector Frederick, and he was compelled to leave Saxony; eventually became prof. of Theol. at Basel (1534).

CARLTON (53° 10′ N., 0° 50′ W.), town, Nottinghamshire, England. Pop. (1911) 15,585.

CARLTON CLUB, Conservative Club founded by Duke of Wellington, 1832; present premises, 94 Pall Mall, London.

CARLUKE (55° 44′ N., 3° 51′ W.), parish, Lanarkshire, Scotland; coal and iron. Pop. (1911) 9619.

CARLYLE, ALEXANDER (1722–1805), Scot. preacher; minister at Inveresk (Midlothian) from 1748; moderator of General Assembly (1770). He witnessed the battle of *Prestonpans* (1745), and his *Autobiography* (pub. 1860) is valuable as a commentary on the Scot. life of his period; friend of many notable men; called 'Jupiter Carlyle' owing to impressive appearance.

CARLYLE, THOMAS (1795–1881), Scot. historian, essayist, and philosopher; b. Ecclefechan, Dumfriesshire; second s. in a family of ten children of James Carlyle, stonemason, and later small farmer. He was ed. at the parish school, Annan Academy, and, in 1809, became a student of Edinburgh Univ. Here he acquired little beyond a slender knowledge of the classics and a moderate success in math's. He had intended entering the ministry, but this idea was abandoned, and he was app. mathematical master at Annan Academy, exchanging later to a school at Kirkcaldy, where he met and formed a lasting friendship with Edward Irving, master of a rival school.

By 1818 C. was back in Edinburgh, where he studied law and took private pupils. Law, in its turn, was abandoned, but the teaching was continued for some years. Next he embarked upon a literary career, was engaged by Dr. Brewster to write articles for the *Edinburgh Encyclopædia*, and received £50 for a trans. of Legendre's *Geometry*. At this period he also wrote his *Life of Schiller*, translated Goethe's *Wilhelm Meister*, visited London and Paris, making the acquaintance of Coleridge, Hazlitt, and others, and received the first of a series of encouraging letters from Goethe. In 1826 he m. Jane Baillie Welsh, and they set up housekeeping at Comely Bank, Edinburgh. Here C. wrote *Specimens of German Romance* (4 vol's), and became a contributor to the *Edinburgh Review*. Two years later C. moved to his wife's property at Craigenputtock, where he wrote *Sartor Resartus*, and maintained the household for six years by his contributions to the reviews.

In 1834 the Carlyles settled at Cheyne Row, Chelsea, which remained their home for the rest of their lives. His masterly *French Revolution* was pub. in 1837; *Sartor Resartus*, 1838; *Chartism*, 1839; *Heroes and Hero-Worship*, 1841; *Past and Present*, 1843; *Oliver Cromwell*, 1845; *Latter-Day Pamphlets*, 1850; *Frederick the Great*, 1858–65. In 1865 C. was elected Lord Rector of Edinburgh Univ., delivering a Rectorial Address the following year, but the gratification which this brought him was shattered immediately after by the sudden death of his wife. Thenceforth his output of work was small, and he lived more or less in retirement. C. exercised a more powerful influence upon the lit. and the religious, ethical, and political views of his time than any contemporary Eng. writer. His work is remarkable for its qualities of humour, sarcasm, and profound insight, and his vivid and picturesque style is distinctly characteristic of the man. In his disposition C. was often irritable, hasty, and inconsiderate, afflicted as he was by chronic dyspepsia, yet these defects scarcely served to hide a noble and tender nature; and it embittered his later years to learn, after his wife's death, how much she had suffered from his lack of sympathy and appreciation.

Froude's *Thomas Carlyle: a History of the First Forty Years of his Life* (1882); *Thomas Carlyle: History of his Life in London* (1884); *Carlyle's Reminiscences*, edit. by Froude (1881); Maclean Watt, *Thomas Carlyle* (Jack, 1912); Ireland, *Life of Jane Welsh Carlyle* (1891).

CARMAGNOLA (44° 51′ N., 7° 42′ E.), town, Turin, Italy; with cathedral; silk. Pop. 12,000.

CARMAGNOLA, FRANCESCO BUSSONE, COUNT OF (1390–1432), Ital. adventurer; entered military service as a boy under Gian Galeazzo Visconti, Duke of Milan; slighted by Gian's successor, Filippo Maria Visconti, he transferred his services to the Venetian Republic; later, being suspected of treacherous dealings with Visconti, he was tried, found guilty, and beheaded.

CARMAGNOLE.—(1) form of vest worn by the revolutionaries who, in 1792, came to Paris from South of France to assist in the Revolution. (2) song and dance indulged in by the Republicans at popular gatherings.

CARMARTHEN (51° 52′ N., 4° 19′ W.), county town and port, on Towy, Carmarthenshire, Wales; ancient *Maridunum*; old castle now forms county gaol; grammar school; Presbyterian coll.; iron foundries; salmon fisheries. Pop. (1911) 10,221.

CARMARTHENSHIRE (51° 55′ N., 4° 10′ W.), maritime county, S. Wales; bounded N. by Cardigan, E. by Brecknock, S.E. by Glamorgan, S. by Carmarthen Bay, W. by Pembroke; area, 918 sq. miles. Surface generally is mountainous, marshy round coast; highest peak, Carmarthen Van; chief rivers, Towy, Teifi, Amman; produces oats, wheat, barley; dairying carried on; horses, sheep, and cattle raised; minerals include coal, lead, copper, iron, slate; manufactures leather, woollens; county town, Carmarthen; has Druidical and Roman remains; suffered from Dan. invasions; opposed Normans; conquered by Edward I. Pop. (1911) 160,430.

CARMATHIANS, militant Muhammadan sect of X. cent.

CARMAUX (44° 3′ N., 2° 7′ E.), town, Tarn, France; extensive coal-fields. Pop. 11,000.

CARMEL, MT. (32° 45′ N., 35° 2′ E.), mountain ridge, Palestine, stretching 14 miles S.E. to N.W. and terminating abruptly in rocky headland, Mediterranean coast; highest point, 1742 ft.; richly wooded slopes; numerous caves; scene of deeds of prophets Elijah and Elisha.

CARMELITES ('White Friars'), mendicant order, founded on Mount Carmel (whence the convents are called 'Carmels') in XII. cent.; dress, brown habit with white cloak and scapular; C. nuns instituted during XV. cent.; there were about forty friaries of the order in England at time of dissolution of monasteries.

Gasquet, *English Monastic Life.*

CARMEN SYLVA, see ELIZABETH, of Rumania.

CARMONA (37° 29′ N., 5° 41′ W.), ancient town, Andalusia, Spain; many Moorish and Rom. antiquities. Pop. 18,000.

CARMONTELLE, name given to LOUIS CARROGIS (1717–1806), Fr. portrait painter, engraver, dramatist, and author of two books of witty *Proverbes.*

CARNAC (47° 36′ N., 3° 4′ W.), village, Morbihan, France; remarkable on account of number of monolithic alignments in its neighbourhood, one group from Ménec extending towards Kermario, reappearing at Kermario and possibly previously stretching as far as the alignment at Kerlescant. The monoliths, of granite, are arranged in avenues and vary in height from 18 to 3 ft. The Scottish archæologist, JAMES MILN, undertook excavations in this district (1874–80), and discovered evidences of Roman and pre-Roman settlements. See STANDING STONES.

CARNARVON (53° 9′ N., 4° 16′ W.), seaport, watering-place, capital of Carnarvonshire, N. Wales; castle founded by Edward I. (1284); birthplace of Edward II.; Princes of Wales were formerly invested here, the ceremony being revived in 1911 when the investiture of Edward, Prince of Wales, took place; exports slate and copper ore. Pop. (1911) 9119.

CARNARVON, EARLDOM OF.—The earldom was cr. and conferred upon Robert, Baron Dormer of Wyng (1628), who was killed at *Newbury* (1643), and it became extinct on the death of his s. Charles (1709). It was held by the family of Brydges, Dukes of Chandos (1714–89), and was conferred in 1793 upon Henry Herbert, Baron Porchester, by whose descendants it is still held.

CARNARVONSHIRE (53° 2′ N., 4° 10′ W.), maritime county, N. Wales; bounded by Irish Sea, Denbigh, Merioneth, Cardigan Bay, Carnarvon Bay, Menai Strait; area, 572 sq. miles; surface mountainous; in centre is Snowdon, 3560 ft.; watered by Conway and smaller streams; produces oats, barley; cattle and sheep raised; minerals, slate, lead, zinc; belonged to Romans; resisted Saxons, Normans, English. Pop. (1911) 125,049.

CARNATIC, KARNATAK (8° 10′ to 16° N., 77° 20′ to 80° 17′ E.), old subdivision of India, on Coromandel coast; now part of Madras presidency; was scene of great struggle for supremacy in India between France and Britain in XVIII. cent.; it formed dominions of Nawabs of Arcot, and was conquered by Britain in 1783, being formally annexed to Brit. empire in 1801; climate extremely hot; crossed by Western Ghats; watered by Penner, Kaveri, and other streams; chief towns, Madras, Pondicherry.

CARNATION (*Dianthus caryophyllus*), herbaceous perennial; flower bright-coloured (originally flesh-coloured), fragrant; requires rich, light, well-prepared soil; sown in April in pans in cold frame, but propagated preferably by cuttings or 'layering'; planted out in Sep.; *Malmaison* variety has handsomest flowers; Tree or Perpetual-blooming c's are greenhouse favourites; pests—blight and rust, c. maggot, wireworm.

Carnations and Pinks, by Cook, etc. (Present-day Gardening).

CARNAVALET, L'HÔTEL, museum, Paris; so called by corruption of name of Mme de Kernevenoy, who purchased it, 1578; acquired by the state, 1866.

CARNEADES (214–129 B.C.), Gk. sceptic philosopher; pupil of Diogenes; the gist of his system of reasoning is that all matter is the result of natural forces; there is no finality in truth, since all experience is relative, and we do not see things as they are, but rather according to the impressions which they make upon us.

CARNEGIE (40° 25′ N., 80° 7′ W.), borough, Allegheny County, Pennsylvania, U.S.A.; steel and iron works. Pop. (1910) 10,009.

CARNEGIE, ANDREW (1837–), Scot.-Amer. millionaire philanthropist; b. Dunfermline, Scotland, whence his f. emigrated to Allegheny, Pennsylvania, U.S.A. Through his business ability in the iron and steel industries, oil, railways, etc., he rose from poverty to great wealth and power. He has applied his wealth to useful purposes, including gifts of public libraries throughout Britain and America; church organs to numerous Scot. churches; swimming-baths; £2,000,000 (1901) to pay fees of Scot. students and endow research at the Scot. Univ's; £3,000,000 (1905) to provide pensions for univ. and college prof's in the U.S.A., Canada, and Newfoundland (*The C. Foundation*); £2,000,000 (1901) to found the *Carnegie Institute*, Pittsburgh, U.S.A., and the same sum (1902) for foundation of *C. Institution*, Washington; 'Hero Funds' in the U.S.A., Britain, and France, for the pecuniary assistance of persons injured (or, when killed, for the assistance of their dependants) in saving life; a palace at The Hague for the Court of Arbitration; £2,000,000 (1910) to hasten abolition of international war (*C. Peace Fund*); in addition to numerous minor benefactions in America and in his native town of Dunfermline.

Alderson, *From Telegraph Boy to Millionaire* (1902).

CARNELIAN, a translucent red variety of chalcedony; chiefly found in India.

CARNESECCHI, PIETRO (1508–67), Ital. scholar; enjoyed the patronage of Clement VII. and other influential members of the Medici family, but later, becoming a convert to some of Luther's doctrines, he fell a victim to the Inquisition, and was beheaded.

CARNIC ALPS (46° 42′ N., 12° 30′ E.), S.E. continuation of Alps, between Venetia, Italy, and Tyrol and Carinthia, Austria.

CARNIOLA (46° N., 14° 30′ E.), hilly province of S.W. Austria-Hungary, among Alps and along Upper Save; area, 3856 sq. miles; has valuable forests. C.'s wealth lies in minerals; quicksilver mines important; iron, lead, zinc, lignite found; ironworks, linen manufactures; sends twelve representatives to Reichsrath. Pop. (1910) 525,995.

CARNIVAL (Lat. *carni vale*, farewell to flesh), festival held in R.C. countries during several days preceding Lent. In S. of France and Italy, processions, masques, and 'battles of flowers' take place; a notable c. is held at Rome; there is a striking change to religious solemnity on Ash Wednesday, first day of Lent; relic of c. in Eng. Shrove Tuesday.

CARNIVORA, the CARNIVORES, or FLESH-EATERS (Lat. *caro, carnis*, flesh; *vorus*, devouring), perhaps the most interesting of the orders of mammals (*q.v.* for general relationship), containing, as it does, lions, tigers, and leopards, wolves and dogs, bears, badgers, otters, seals, and many other creatures attractive on account of their elegance, beauty, and swiftness, and even of their very ferocity.

To their habit of feeding upon flesh—a habit all but universal in the order—can be traced their most characteristic features. Teeth are well developed; especially large and strong are the curved, pointed eye-teeth, or *canines*, adapted for fixing on and retaining hold of living prey, and the sharp, cutting 'carnassial' back teeth. The toes, which are four or five in number, are tipped with sharp, curved claws, sometimes retractile and obviously fitted for fixing and tearing. To prevent danger of slipping, the lower jaw of carnivores can move only directly up and down, without any sideways motion, owing to the elongated hinge which connects it with the skull; and evidence of the powerful jaw motion is given by the wide bony (*zygomatic*) arch which bridges the skull from cheek almost to ear, and gives room for the passage of the large muscle which works the lower jaw. Shoulder-bones are absent or incomplete; and the upper surface of the brain is well convoluted, an indication of mental power.

The habits of carnivores are familiar. They are mainly terrestrial, living in forest trees, in the thick scrub and underwood, or burrowing in the earth, but some are amphibious, as the otters; and seals and walruses are predominantly aquatic.

Carnivores are generally nocturnal animals, and lie

in wait for their prey or follow it by stealth. The greater number hunt singly or in couples, but some, such as dogs and wolves, congregate in packs to pursue and run down their quarry. Mammals, from the largest to the smallest, supply them with food; many catch birds, and oddities of diet are presented by the fish-eating otters and seals, the latter feeding also upon crustaceans and molluscs, and, in the case of Antarctic species, on penguins. Not all carnivores are confirmed flesh-eaters, however, for in summer many of the bears limit their diet to fruits and honey.

Carnivores have colonised the whole world from the snows of the Arctic circle to the border of the Antarctic continent; only in Australia and New Zealand are they absent. They are most numerous and often of larger size in the jungles of the tropics, but the largest living carnivore is the almost extinct long-snouted elephant seal, or 'sea-elephant' (*macrorhinus*), of the South Pacific, which may reach a length of about 20 feet.

Carnivores are of considerable value to man, for, apart from their indirect uses in destroying vermin, they furnish the greater part of the world's fur supply. A few have been tamed and kept as pets or as man's assistants, especially dogs, but their fierce nature usually offers an insurmountable barrier to complete domestication.

The Order **Carnivora** is divided into two sub-orders:—

Sub-Order I., FISSIPEDIA.—Carnivora with digits separate and distinct, with free limbs; adapted to terrestrial life; including the cat, civet, aardwolf, hyæna, dog, bear, raccoon, and weasel families (*qq.v.*).

Sub-Order II., PINNIPEDIA.—Carnivora with digits united by a web of skin into a fin-like paddle, hind limbs directed backwards and placed close to body; adapted to aquatic life; including seals and walruses (*qq.v.*).

Lydekker, *Handbook to Carnivora.*

CARNOT, LAZARE HIPPOLYTE (1801–88), Fr. statesman; s. of L. N. M. Carnot; elected deputy for Paris (1839), and became principal leader of the party against Louis Philippe; declared in favour of the Republic, and, under Lamartine, became Minister of Education; was made life senator by the National Assembly, 1875.

CARNOT, LAZARE NICOLAS MARGUERITE (1753–1823), Fr. general; of republican views, he voted for the death of Louis XVI.; member of Committee of Public Safety; app. Minister of War (1800); Minister of the Interior during the Hundred Days; spent his later years in scientific study.

CARNOT, MARIE FRANÇOIS SADI (1837–94), Pres. of Fr. Republic; s. of L. H. Carnot (*q.v.*); ed. as civil engineer, but later entered National Assembly; held positions of Minister of Public Works (1880), Minister of Finance (1885), elected Pres. (1887). His term of office, which included the opening of the Paris Exhibition (1889), proved very popular. He was assassinated by an Ital. anarchist, at Lyons.

CARNOUSTIE (56° 31′ N., 2° 41′ W.), watering-place, Forfarshire, Scotland. Pop. (1911) 5358.

CARNUNTUM, ancient Pannonian town, near Vienna; ruins remain; Rom. military centre during wars against Germans, and important trading station; demolished by Magyars, IX. cent.

CARNUTES, Celtic people who lived in Central Gaul, between the Loire and the Seine, whose capital was Orleans (*Genabum*).

CARO, ANNIBALE (1507–66), Ital. poet; employed by the Gaddi and Farnese families; trans. the *Æniad* (1581); also wrote a comedy, canzoni, sonnets, and some light verse.

CARO, ELME MARIE (1826–87), Fr. philosopher; opposed to Positivism; pub. *L'Idée de Dieu* (1864), *Le Matérialisme et la Science* (1868), and numerous other works of a philosophical and literary character.

CAROL, a religious song, originally accompanied by dancing. For this reason most of the old c's were set to dance tunes. Such songs came into vogue when it was usual at Christmastide to give a representation, with lay figures, in churches and private houses, of the stable-birth of the child Jesus, which the religious accompanied with singing and dancing. The earliest collection of c's was printed by Wynkyn de Worde (1521), and contained the famous Boar's Head Carol, *Caput apri defero.*

Songs and Carols, ed. by T. Wright (1847); A. H. Bullen, *Carols and Poems* (1885).

CAROLINA, CAROLINAS, old Brit. Colony in N. America, now forming States of North and South Carolina.

North Carolina (35° 40′ N., 79° W.), a S.E. Atlantic state of U.S.A.; bounded N. by Virginia, W. by Tennessee, S. and S.W. by South Carolina and Georgia, E. and S.E. by Atlantic; length (E. to W.), *c.* 500 miles; breadth, *c.* 200 miles; total area, 52,250 sq. miles; area of water surface, 3670 sq. miles. Coast is fringed with sand reefs, with three outstanding capes—Hatteras, Fear, and Lookout; water shallow in Pamlico, Currituck, Albemarle Sounds, etc., which makes navigation very dangerous. Surface is mountainous in W. and S.E.; Great Smoky Mt's, Black Mt's, Bald Mt's, Blue Ridge, etc.; highest peaks, Black Dome or Mount Mitchell (6711 ft.), Clingman Dome (6619 ft.), Mt. Love (6443 ft.), Mt. Buckley (6599 ft.), Balsam Cone (6671 ft.), and others. Coastal plain region is level and swampy; central part undulating.

Chief rivers are: Broad, Cape Fear, Roanoke, Neuse, Chowan, Tar, Yadkin, Pamlico, Hiawassee, Catawba (many navigable); shallow lakes in coastal districts; several small swamps (Great and Little Dismal, Angola, Alligator, etc.). Climate of mountain region is exceptionally fine, central part healthy; fever near swamps in coastal region; mean annual temperature in mountain region, 56° F., central region, 60° F., coast region, 61° F.; mean annual rainfall, *c.* 53 in.

Fauna includes deer, racoons, opossums, wolf; numerous reptiles (rattlesnake, moccasin, cotton-mouth, etc.); flora varied: many subtropical species, and also those of milder regions; extensive forests, especially pine, in E.; trees include elm, cypress, cedar, oak, birch, beech, hemlock; large fields of rhododendrons.

History.—Settlements were made by Raleigh on Roanoke Island, 1585, 1587; territory between lat. 30° and 36° granted by Charles I. to Sir Robert Heath, 1629; same territory with some extension given to Earl of Clarendon and several favourites of Charles II., 1663; permanent settlement made by Virginians, *c.* 1660; famous 'Fundamental Constitution' drafted by John Locke for proprietary government, 1669; N. C. became a royal province, and N. and S. Carolina were divided, 1729; N. C. played a leading part in the War of Independence (1775–83) and Civil War (1861–65); one of original 13 states of Union.

N. C. is administered by gov. and General Assembly consisting of Senate (50 members) and House of Representatives (120 members), elected for two years; sends 10 Representatives and 2 Senators to Congress. N. C. is divided into 98 counties. Principal towns, Raleigh (capital), Wilmington (principal port), Charlotte, Ashville, Greensboro, Winston, Newbern. Methodists predominate; then Baptists. Elementary education is compulsory in some counties; Univ. of N. C., State Agricultural and Mechanical Colleges, Trinity Coll. at Durham; Shaw Univ. at Raleigh, Biddle Univ. (Charlotte), Agricultural and Mechanical Colleges (Greensboro), etc., for coloured students.

Agriculture is main occupation; principal products, cereals, cotton, tobacco, cotton-seed oil, potatoes, timber; industries of cotton goods, furniture, flour, lumber, etc.; minerals unimportant; valuable fisheries (shad, oyster, etc.). Pop. (1910) 2,206,287 (including *c.* 700,000 negroes).

Ashe, *History of North Carolina* (1908).

South Carolina (32° 3′ to 35° 13′ N., 78° 30′ to 83° 15′ W.), S.E. state, U.S.A.; bounded N. and N.E. by

North Carolina, S.E. by Atlantic, W. by Georgia; area, 30,570 sq. miles. Surface is level in E., where a low-lying plain extends a considerable distance inland from the coast; undulating in centre, and mountainous in W., reaching an extreme height of *c.* 3550 ft. in Mt. Sassafras, on boundary between N. and S. Carolina, drained by Great Peedee (with Little Peedee and Lynches), Santee (with Saluda, Broad, Wateree), and Edisto R's. The W. part is of Archæan formation, the middle Secondary and Tertiary, and the E. recent. The climate is healthy and temperate, but the coast regions suffer at times from cyclones.

S. C. is said to have been discovered by Span. explorers early in XVI. cent., and was first permanently colonised by English in 1670; in 1729 it was separated from N. Carolina, and became a royal province; took an active part in Amer. War of Independence; was the first state to secede from the Union before the Civil War in 1860; was readmitted to Union in 1865. The enfranchisement of negroes led to many abuses, and caused much disaffection among the whites; but in 1895 new regulations were passed, which had the effect of disqualifying many negroes, thus securing political supremacy of the whites.

Administration is carried out by a gov., assisted by a lieut.-gov. and six ministers; legislative power is vested in a Senate of 42 members (elected for four years by popular vote), and a House of Representatives of 124 members (elected for two years in same way). The state sends two Senators and seven Representatives to the Federal Congress.

Chief towns are Columbia (capital), Charleston (chief port), Greenville, and Spartanburg. Principal industry is agriculture; produces wheat, maize, oats, rice; live stock extensively raised; cotton and tobacco grown in large quantities. Minerals include phosphate rock, clay products, granite, gold, silver. There are excellent fisheries, and lumbering is carried on. Manufactures include cottons, timber, and lumber products, fertilisers, cotton-seed oil, etc. Education is free but not obligatory; Columbia is seat of State Univ. Chief religious denominations are Methodist and Baptist. Pop. (1910) 1,515,400.

Ravenel, *Charleston: the Place and the People* (1906); Weber, *History of South Carolina.*

CAROLINE ISLANDS (0° to 10° N., 136° to 164° E.), archipelago, Pacific Ocean, consisting of about 680 small islands, of which Babelthouap, Yap, Rouk, and Ponape are most important; these are volcanic, most of others coral; climate temperate; produce copra, sugar-cane, cocoa-nuts, bread-fruit; belonged to Spain till 1899, when ceded to Germany; area, *c.* 400 sq. miles. Pop. *c.* 39,000. See Christian, *C. Islands* (1899).

CAROLINE POETS, Eng. poets of time of Charles I. and Charles II. Term usually applied to lyrists, Carew, Crashaw, Herrick, Marvell, Lovelace, Suckling.

CAROLINE, AMELIA AUGUSTA (1768–1821), queen of George IV., m. George, then Prince of Wales, 1795; Princess Charlotte born following year. After his accession, George attempted to procure a divorce on the ground of adultery, but failed; he directed that her name should be omitted from the liturgy, and she was excluded from the coronation ceremony. She died nineteen days later.

CAROLINE, WILHELMINA, OF ANSPACH (1683–1737), George II.'s queen; supported Walpole against the 'Patriots' and 'Boys.'

CAROLINGIANS, Carlovingians, family, descended from Charlemagne, which ruled France, 751–987 A.D., when it was overthrown by Hugh Capet (*q.v.*). See France (*History*).

CAROLUS-DURAN, CHARLES DURAND (1837–), most prominent Fr. portrait painter; influenced by Manet (*q.v.*).

CARORA (9° 50′ N., 70° W.), town, Venezuela; exports hides, leather, and rubber. Pop. 8000.

CAROUGE.—(1) (46° 37′ N., 6° 47′ E.) town, Vaud, Switzerland. (2) (46° 11′ N., 6° 8′ E.) town, Geneva, Switzerland. Pop. 7437.

CARPACCIO, VITTORIO (*c.* 1490), Ital. artist; pupil of Lazzaro Bastiani of Venice; painted series of pictures illustrating lives of the Virgin, St. Ursula, and St. Stephen.

CARPATHIAN MOUNTAINS (*c.* 46° 40′ to 49° 30′ N., 17° 20′ to 26° E.), great mountain range of S.E. Europe, curving round E. Hungary and Transylvania; length, *c.* 800 miles; form watershed between Black Sea and Baltic; chief ranges are Transylvanian Alps, Central and Little C., White Mountains, Beskids; highest peak, Gerlsdorfspitze, in Central C. (*c.* 8700 ft.); covered with timber—oak, beech, fir—up to 4000 ft.; rich in minerals—coal, silver, copper, lead, iron, salt, petroleum; geological formation chiefly granite, crystallines, and sandstone; numerous small tarns in Central C.; crossed by many passes, including Iablunka and Roteturm passes.

CARPEAUX, JEAN BAPTISTE (1827–75), Fr. sculptor; b. Valenciennes; studied at Rome; executed group (*Dancing*) for Paris Opera-House; statue of Watteau; numerous busts; and fountain in Avenue de l'Observatoire, Paris.

CARPELS, see Flower.

CARPENTARIA (15° S., 140° E.), large gulf, N. Australia, between Capes Arnheim and York.

CARPENTER BEES (*Xylocopa*), solitary bees which burrow and build rows of cells in solid wood, an egg being deposited in each.

CARPENTER, EDWARD (1844–) Eng. author; ed. Cambridge; took Orders, but relinquished them (1874); devoted himself to Socialist movement; wrote *Towards Democracy, Days with Walt Whitman.*

CARPENTER, MARY (1807–77), Eng. social reformer; founder of reformatory schools in England; devoted her life to the service of destitute children, and was largely instrumental in improving the administration in regard to elementary education.

CARPENTER, WILLIAM BENJAMIN (1813–85), Eng. physiologist and naturalist; b. Exeter; M.D. (1839), F.R.S. (1844), Fullerian prof. of Physiology, Royal Institution (1856); pres. of Brit. Assoc. (1872); promoted deep-sea exploration and microscopic studies.

CARPENTRAS (44° 3′ N., 5° 3′ E.), town, on Auzon, Vaucluse, France; Rom. arch; has fragments of ancient fortifications; cathedral (1405); silk spinning, cottons and woollens. Pop. 10,443.

CARPENTRY, the trade of one who constructs the wooden framework of buildings as distinct from joiner's work, which is of a lighter character, *i.e.* doors, windows, etc. In shipbuilding c. includes joinery. In theatres the stage carpenter constructs the wooden framework of scenery.

See Tredgold, *Carpentry*; Tarbuck, *Encyclopædia of Practical Carpentry and Joinery.*

CARPET SNAKE, see under Snakes.

CARPETS, textile floor-coverings, of which the principal styles are Persian, Turkey, Kidderminster, Brussels, Wilton, Tapestry, and 'royal' and 'patent' Axminster. When c's were first used cannot be exactly ascertained, but it is clear, from fragments which have been discovered, that they were in use amongst the Egyptians at a very early period, and they were most certainly used by the early Greeks and Romans.

Persian and Turkey 'pile' c's are of very ancient manufacture, and are made upon primitive looms by a process of knotting on warp threads tufts of woollen yarn which are held together by the weft. As the c. in a Persian palace or dwelling was the principal article of furniture, and was used for table, chair, and bed, it naturally followed that, apart from its decorative use, it should be made as soft and comfortable as possible. Hence the wonderful pile c's which came from these Eastern looms, remarkable also for their durability. C's are to be found in Persian palaces at the present time which have been in constant use for 300 years. Indian pile c's are made by same process as those of Persia, and the early ones have similar designs; modern Indian carpets are less beautiful owing to Western influence, which has debased the patterns.

In regard to c's of Brit. make, reference must first be made to *Kidderminster* c's, which were the first machine-made c's. They have no pile, and are reversible, the yarn threads lying flat upon the surface. *Brussels* c. is made by a process of interweaving worsted threads in the warp with a linen network; *Wilton*, or 'velvet pile,' is made in a similar manner, but the loops are cut and so form a yielding surface; *Tapestry* carpet, invented at Edinburgh (1832), is similar to Brussels in that its surface is composed of looped worsted yarn; and the two makes of *Axminster* are produced by the use of wool chenille upon a basement of hemp, linen, or cotton.

F. R. Martin, *History of Oriental Carpets before 1800*; *Oriental Carpets*, pub. by Austrian Commercial Museum (Eng. ed. by Clarke); Bevan (edit. by), *British Manufacturing Industries* ('*Carpets*,' by C. Chesser).

CARPI.—(1) (44° 46′ N., 10° 52′ E.) town, Modena, Italy; cathedral; manufactures silk, straw hats. Pop. 7400. (2) village, near Verona, Italy, where Prince Eugene defeated French, 1701.

CARPI, GIROLAMO DA (1501–56), Ital. artist; close student of Correggio, whose style he reproduced; best pictures to be found at Bologna, Ferrara, and Rovigo.

CARPINI, JOANNES DE PLANO (d. 1252), Ital. friar; companion of St. Francis of Assisi; explored the Mongol Empire, and wrote an account of his travels.

C. R. Beazley, *Dawn of Modern Geography*.

CARPOCRATES, II.-cent. Gnostic; member of a licentious sect who claimed to have the only true knowledge of religion; personal actions, good or bad, were matters of indifference, according to their creed, and the cultivation of the passions was to be commended; said to have been a Jew of Alexandria.

CARPS (*Cyprinidæ*), an important family containing about 1300 species, many of them game-fishes. They have toothless mouths, but specialised teeth on the lower pharyngeals, small barbels or none; are generally of small size, with large scales, and are exceedingly prolific; found in rivers and ponds all over the world, except Australian region, Madagascar, and S. America. In Britain there are 16 species, some being favourite angling fishes; the Roach, absent from Ireland; the Rudd or Red-eye, which replaces it there as a sporting fish, though it is less common in Great Britain; gregarious Minnow—all species of Leuciscus, as are also the Chub and Dace (*qq.v.*). Others are the Bream (*Abramis brama*)—a familiar 'coarse fish' which may weigh 12 lb.; the Bleak (*Alburnus lucidus*), absent from Scotland and Ireland, from the scales of which artificial pearls are made; the minute 4-inch-long shy Loach (*Nemachilus barbatulus*); and the Carp, Goldfish, Barbel, and Tench. One of the largest of the family is the Mahaseer, or Mahseer (*Barbus mosal*), an Ind. food and game-fish, which may be 6 ft. in length and bear 'scales as large as the palm of the hand.'

CARPUS, the wrist. See SKELETON.

CARPZOV, name of burgher family of Saxony whose members held important positions in XVII. and XVIII. cent's; two members were distinguished legists, two prominent theologians, and one an important statesman.

CARRACCI, LUDOVICO (1555 ?–1619), and his nephews. AGOSTINO (1557 ?–1602) and ANNIBALE (1560 ?–1609), Bolognese artists, founders of Eclectic school, which looked to Michelangelo for movement, Raphael for composition, the Venetians for colour, and Correggio for light and shade; nine works in National Gallery.

CARRANZA, BARTOLOMÉ (1503–76), Span. theologian; accompanied Philip of Spain to England on the occasion of his marriage to Queen Mary, and made strenuous efforts to revive the old religion; later, because of his attempts at Church reform, fell under the ban of heresy and was twice imprisoned.

CARRARA (CARRARESI), tyrants of Padua in XIV. cent.; JACOPO DA CARRARA (a village near Padua), elected lord (1318); Cangrande della Scala took Padua from Jacopo's nephew, who recovered it, 1336; his nephew UBERTINO, great patron of arts; FRANCESCO (lord, 1350–92), unsuccessful in war, d. a Milanese prisoner; his s. recovered Padua, 1390, but he and house fell before Venetians.

CARRARA (44° 5′ N., 10° 5′ E.), cathedral town, Tuscany, Italy; famous for white marble (*q.v.*) quarries since Roman times. Pop. 18,126.

CARREL, JEAN BAPTISTE NICOLAS ARMAND (1800–36), Fr. soldier and journalist; became sole edit. of *Le National*, the democratic mouthpiece; killed in duel.

CARREÑO, DON JUAN, DE MIRANDA (1614–85), Span. court painter; imitator of Velasquez in portraiture.

CARRERA, JOSÉ MIGUEL (1785–1821), leader on nationalist side at beginning of Chile revolution.

CARRIACOU, largest of the Grenadines, W. Indies; area, 6913 acres. Pop. (1911) 6886.

CARRIAGE, vehicle, for carrying goods or persons, usually on wheels, and employed from the earliest historic times; anciently called chariot, or car. A famous example was the funeral car designed by Hieronymus to convey the body of Alexander from Babylon to Alexandria. It occupied two years in building; was 18 ft. long by 12 ft. wide, mounted on massive wheels, and drawn by 64 mules. The Roman chariots, closed in front and open behind, were often profusely ornamented with gold and precious stones. The war chariots of the ancient Britons, open in front and closed behind, had scythes bound to the axle-trees. Although some sort of vehicle was in use in England in mediæval times, and carriages were known in Europe at least at the beginning of the XV. cent., the earliest coach in England was built for the Earl of Rutland in 1555. By 1601 these vehicles were so commonly used as to provoke complaints from the Thames watermen, and early in the XVII. cent. there were over 6000 in the neighbourhood of London. Hackney coaches were instituted in London in 1625. Steel springs were first used about 1670, before which time the body of the carriage was suspended from straps, while indiarubber tyres were introduced in 1852.

C's with four or more wheels, for two or more horses or mules, require an annual *licence* costing £2, 2s.; if fitted for one horse only, the licence is £1, 1s.; if one horse and fewer than four wheels, the cost is 15s., and this is the licence for hackney c's, *i.e.*, c's plying for hire. Wagons or carts for trade purposes *only*, if solely constructed and *adapted* for such purposes, and bearing name and address of owner in letters at least 1 inch in length, require no licence. Armorial bearings on a c. require licence (£2, 2s.); motor cars not exceeding 6½ horse-power, £2, 2s.; not exceeding 12, £3, 3s.; not exceeding 16, £4, 4s.; and increasing to £42 for 60 and over.

Thrupp's *History of Coaches* (1877).

CARRICK (55° 10′ N., 4° 40′ W.), southerly district, Ayrshire, Scotland; Prince of Wales is Earl of C.

CARRICKFERGUS (54° 43′ N., 5° 48′ W.), seaport, N. side Belfast Lough, County Antrim, Ireland; formerly a walled town; has XII.-cent. castle; landing-place of William III., 1690; flax spinning, and oyster fisheries. Pop. 4200.

CARRICKMACROSS (53° 58′ N., 6° 43′ W.), market town, County Monaghan, Ireland; lace.

CARRICK-ON-SHANNON (53° 57′ N., 8° 5′ W.), town, on Shannon, capital County Leitrim, Ireland.

CARRICK-ON-SUIR (52° 21′ N., 7° 24′ W.), town, Tipperary, Ireland; ruins of XIV.-cent. castle; manufactures woollens and linens; slate quarries. Pop. 5400.

CARRIER, term for any persons or company conveying goods for hire by land or by water; subject to the conditions of various parliamentary enactments, beginning with the Carriers Act, 1830.

CARRIER, JEAN BAPTISTE (1756–94), Fr. politician; one of most bloodthirsty leaders in the Terror.

CARRIÈRE, EUGÈNE (1849–1906), Fr. artist; mass-impressionist; great portrait painter.

CARRIÈRE, MORITZ (1817–95), Ger. philosopher; advocate of Christian truths, free-will, and the immutability of natural laws.

CARRINGTON, 1ST EARL, see LINCOLNSHIRE, 1ST MARQUESS OF.

CARRION BEETLES, see under POLYMORPHA.

CARROLL, CHARLES, 'of Carrollton' (1737–1832), Amer. statesman; educ. in France; adopted description 'of Carrollton' from family estate; one of delegates sent to persuade Canadians to join war, 1776; signed Declaration, Aug. 2, 1776; U.S. Senator, 1789; one of Md. and Va. boundary commission, 1799.

CARROLL, JOHN (1735–1817), abp. of Baltimore; prominent and influential figure in R.C. body in U.S.A.

CARROLL, LEWIS, see DODGSON.

CARRON (56° 2′ N., 3° 48′ W.), village, Stirlingshire, Scotland; site of well-known ironworks.

CARRONADE, heavy ship's gun, designed by General Melville in 1759, and called a 'smasher.' Though not used in the Brit. navy until 1779, it had been manufactured for some time at the Carron Ironworks, in Stirlingshire, whence it got its later name; calibre from 12 to 68 lb.; mounted on a carriage without trunnions, moved on a slide; as naval weapon long obsolete.

CARROT (*Daucus carota*), vegetable; order *Umbelliferæ*; its reddish roots used as vegetable and cattle food; also for poultices, being slightly stimulating.

CARROUSEL, PLACE DU, Parisian square with monument to Gambetta; named from fête given by Louis XIV. (1662).

CARSE, Scot. geographical term for low-lying fertile regions, generally in river beds: *e.g.* C. of Gowrie in Perthshire and Forfarshire, and C. of Stirlingshire in valley of Forth.

CARSEBRECK (*c.* 56° 16′ N., 3° 50′ W.), curling-pond, Perthshire, Scotland, between Dunblane and Auchterarder.

CARSIOLI (*c.* 42° 10′ N., 13° E.), ancient city, Via Valeria, Italy.

CARSON CITY (39° 20′ N., 119° 46′ W.), capital of Nevada, U.S.A.; gold and silver mines. Pop. 2466.

CARSON, SIR EDWARD HENRY (1854–), Irish Unionist politician; Solicitor-Gen. (for Ireland, 1886–92; England, 1900–5); prominent in Ulster Anti-Home Rule Campaign, 1912–13.

CARSON, KIT (1809–68), Amer. hunter and scout; b. Kentucky; from youth inured to wild frontier life; accompanied Frémont as guide on exploring expeditions (1842–46); during Civil War served as chief scout for the Federals. If all the stories of his prowess are true, he must have been a modern Bayard. Carson City is named after him. *Life*, by Burdett.

CARSTARES, WILLIAM (1649–1715), Scot. preacher; confidant of William of Orange and court chaplain; later principal of Edinburgh Univ.; successively minister of Greyfriars' and St. Giles'; several times moderator of General Assembly.

CARSTENS, ASMUS JACOB (1754–98), Ger. artist; chief exponent of modern Ger. historical school of painting.

CARTAGENA, CARTHAGENA (37° 35′ N., 0° 56′ W.), fortified port and great naval arsenal, S.E. Spain, on Mediterranean; large harbour; exports metals and metal ores, fruits, wine, etc. 'New Carthage' was founded by Hasdrubal (*q.v.*), 242 B.C.; episcopal see; XIII.-cent. cathedral, old castle, observatory; besieged, 1873–74. Pop. (1910) 102,519.

CARTAGENA, CARTHAGENA (10° 22′ N., 75° 32′ W.), fortified seaport city, capital of Bolivar, Colombia, S. America; on sandy island, connected with mainland by bridges; has good harbour, but since rise of Sabanilla commercial importance has declined; canal to Calamar reopened, and return of prosperity is probable; cathedral and univ. founded, 1533; burned by Drake, 1585; exports cattle, tobacco, sugar. Pop. 37,000.

CARTAGO (9° 54′ N., 83° 41′ W.), capital of C. province, Costa Rica, Cent. America, at foot of volcano Irazu; produces coffee and bananas. Pop. 6000.

CARTE BLANCHE (Fr. 'blank card'), card signed by person permitting recipient to inscribe upon it his own conditions; hence, a free hand.

CARTE, THOMAS (1686–1754), Eng. historian; pub. *Life of the Duke of Ormonde* (1736); *History of the Revolutions of Portugal* (1740); *History of England*, 4 vols. (1747–55). His writings are careful, learned, and dull.

CARTEL, written agreement as to exchange of prisoners; challenge to fight.

CARTER, ELIZABETH (1717–1806), Eng. poetess and miscellaneous writer; probably the most learned woman of her time; she was proficient in Greek, Latin, Hebrew, Arabic, and all modern European languages; pub. *Poems on Particular Occasions* (1739); *Poems on Several Occasions* (1762); trans. Epictetus (1758); was friend of Dr. Johnson, Walpole, Richardson, and Burke.

CARTERET, SIR GEORGE (1610–80), Eng. Royalist; b. Jersey; s. of Helier de Carteret; was made Lieut.-Gov. of Jersey by Charles I.; later the island became the refuge of Prince Charles, after his flight from Scilly, and of many other Royalists. C. was compelled to surrender to Parliament after a long siege in 1651. He then sought refuge in France, but, after the Restoration, held various offices under Charles.

CARTERET, JOHN, see GRANVILLE.

CARTERET, PHILIP (d. 1796), Eng. explorer who discovered several Pacific islands, one of which is named after him.

CARTESIAN PHILOSOPHY, see DESCARTES.

CARTHAGE (36° 53′ N., 10° 5′ E.), famous ancient city, N. Africa, situated N. of Tunis on peninsula jutting into Mediterranean. C. was first established as trading station by Phœnicians *c.* IX. cent. B.C.; became great commercial centre; engaged in struggle in Sicily in V. cent. B.C.; many of Sicilian cities were then centres of Gk. civilisation; Gelo of Syracuse defeated Carthaginians, 480 B.C. Towards end of cent., C. made another attempt on Sicily; eventually driven back by Dionysius the Elder; again defeated by Timoleon of Corinth, 343 B.C.; later renewed attempt; in III. cent. B.C. captured considerable dominions in island. C. came into conflict with Rome *c.* 264 B.C., when first Punic War broke out; this began in Sicily and became contest for possession of that island; war ended 241, when C. was utterly defeated and had to cede Sicily to Rome. City was greatly injured by insurrection soon afterwards.

Second Punic War broke out, 219; Hannibal (*q.v.*) inflicted terrible defeats on Rome; Carthaginians eventually defeated by Scipio at *Zama*, 201 B.C.; C. became dependent state; had to give up all European territories, also had to pay annual tribute to Rome for fifty years, and to agree to wage no war without Rome's consent. C. continued to prosper, thus exciting jealousy in Rome, which in 149 B.C. seized opportunity given by the fact that C. had taken up arms against Numidia to declare war. Third Punic War ended in 146 B.C., when C. was utterly destroyed by Romans, and became Rom. province; later city on site, important Rom. city; ruined by Arabs, 647 A.D.

Church and Gilman, *Carthage* (1886); Davis, *C. and her Remains* (1861); Moore, *C. of the Phœnicians* (1905).

CARTHAGE (37° 12′ N., 94° 19′ W.), city, Missouri, U.S.A.; extensive manufactures; lead and zinc mines. Pop. (1910) 9483.

CARTHAGENA, NEW CARTHAGE, Spain. See CARTAGENA.

CARTHUSIANS, monastic order (white habit), founded by St. Bruno (b. 1030, Cologne; d. 1101) at La Grande Chartreuse, near Grenoble, France, in 1086. The rules of the order are very severe; meat is never eaten; fasting is frequent; and the monks spend the greater part of their time in the solitude of their separate hermitages. At the period of the Fr. Revolution the property of the C's was confiscated, but upon their return to France in 1816 as a means of subsistence they commenced the manufacture of the famous

liqueur with which their name is associated. They were again expelled from France in 1903.—The name C. is also given to a schoolboy at the Charterhouse (*q.v.*) School.

The Carthusians, anon. trans., from Fr. (1902).

CARTIER, SIR GEORGES ÉTIENNE, Bart. (1814–73), Canadian statesman; from 1858–62 was, with Sir John Macdonald, joint-Premier of Canada; had much to do with the promotion of the Grand Trunk and Canadian Pacific Railways.

CARTIER, JACQUES (1491–1557), Fr. navigator; made three voyages to America, and discovered the St. Lawrence River. See CANADA.

CARTILAGINOUS FISHES, see under FISHES.

CARTOGRAPHY, see MAP.

CARTOON (Ital. *cartone*, pasteboard).—In painting, study or design, drawn in full size upon strong paper, to serve as model for transferring or copying, and used in the making of mosaics and tapestries, and in fresco-painting. For the last-named purpose the figures were formerly cut out and fixed upon the wall-space, and their outlines traced in the plaster with a pointed instrument. Notable examples by the old masters are those by Raphael (in South Kensington Museum), and others by Leonardo da Vinci and Michelangelo, which now only survive in engravings. In modern times the term is generally applied to political and satirical drawings in such journals as *Punch*.

CARTOUCHE (Fr.), roll of paper or other material containing charge of powder and shot for hand firearms; the later word 'cartridge' is a corruption of the foregoing; also, in arch., the volute of Ionic capital.

CARTRIDGE, cylindrical case containing explosive charge and ball for small-arms; case containing explosive only for cannon. See AMMUNITION.

CARTWRIGHT, EDMUND (1743–1823), Eng. inventor; bro. of John Cartwright (*q.v.*); poet, rector of Goadby-Marwood, and prebendary of Lincoln; later entered commerce, and invented the power-loom, for which Parliament voted him £10,000.

CARTWRIGHT, JOHN (1740–1824), Eng. political reformer; entered navy, and served under Hawke, Byron, and Palliser; major of Nottinghamshire Militia for seventeen years; worked for universal suffrage and annual parliaments.

CARTWRIGHT, THOMAS (1535–1603), Eng. Puritan; Lady Margaret prof. of Divinity, and Fellow of Trinity Coll., Cambridge, both of which offices he was deprived of by John Whitgift (vice-chancellor) because of his opinions regarding the Anglican Church; several times imprisoned for religious opinions.

CARTWRIGHT, WILLIAM (1611–43), Eng. dramatist; ed. Oxford, and took orders; junior proctor (1643); was intimate with Ben Jonson; wrote *The Royal Slave* (music by Lawes), acted at Christ Church before King and Queen (1636); *The Lady Errant*; *The Siege*; and *The Ordinary*.

CARUCAGE (Lat. *caruca*, 'plough'), mediæval tax (first assessed, 1198) based upon the CARUCATE, a multiple of the bovate; 8 to 12 carucates, according to the nature of the soil, made a knight's fee, the unit of taxation.

CARUPANO (10° 36′ N., 63° 16′ W.), seaport town, state Bermúdez, Venezuela; coffee, sugar. Pop. 10,000.

CARUS, KARL GUSTAV (1789–1869), Ger. anatomist, physiologist, and psychologist; lecturer on comparative anatomy at Leipzig (1811), director of a military hospital (1813), and prof. in coll. of med. at Dresden (1814); author of numerous works, and an authority on art, etc.

CARUS, MARCUS AURELIUS (282–83 A.D.), Rom. emperor; prefect of Prætorian guards; succ. Probus as emperor; undertook an expedition against Persians; conquered Mesopotamia.

CARUSO, ENRICO (1874–), Neapolitan operatic singer; foremost tenor early XX. cent.; among chief rôles—Canio (*Pagliacci*), Mario (*Tosca*), Rodolfo (*Bohème*); C. is also a caricaturist.

CARVAJAL, ANTONIO FERNANDEZ (d. 1659), Portug. Jew; settled in England during reign of Charles I. He was the first naturalised Eng. Jew, and was often employed by Cromwell in political matters.

CARVAJAL, LUISA DE (1568–1614), Span. lady who conducted a R.C. propaganda in England; owing to friction with England was recalled (but d. in London before she could return).

CARVER, JOHN (d. 1621), was one of the 'Pilgrim Fathers,' and first gov. of their colony.

CARVER, JONATHAN (d. 1780), Amer. traveller; pub. in London *Travels through the Interior Parts of North America in the Years 1766–68*, which was trans. into German, French, and Dutch.

CARVIN (50° 28′ N., 2° 56′ E.), town, Pas-de-Calais, France. Pop. 7000.

CARY, ALICE (1820–71) and **PHŒBE** (1824–71), Amer. poets; contemporary with Poe and Greeley.

Poetical Works of A. and P. Cary (Boston, 1886).

CARY, ANNIE LOUISE (1842–), MRS. C. M. RAYMOND, Amer. contralto; sang chief mezzo-soprano and contralto rôles in grand opera, Europe and U.S.A.; her 'Amneris' (*Aïda*) extraordinary success; m. 1882 and retired.

CARY, HENRY FRANCIS (1772–1844), Eng. author and translator; b. Gibraltar; ed. Oxford; famous for trans. of Dante's *Divina Commedia* (1805–14), highly praised by Coleridge; trans. also Aristophanes' *Birds* and Pindar's *Odes*; wrote lives of poets.

CARYATIDES, draped female Gk. figures, executed in early times by Praxiteles and others, and used in arch. to support an entablature; in later times such figures were employed as supports of ship's poop and quarter-deck. Male figures are called 'Atlantes.'

CARYOPHYLLACEÆ, order of dicotyledonous plants; herbaceous; stems swollen at joints; sepals, petals; stamens 5, ovary 1, free central placenta, stigmas 2–5; includes genera: *Dianthus* (Pink), *Lychnis* (Campion), *Saponaria* (Soapwort), *Cerastium* (Chickweed), *Stellaria* (Stitchwort); many favourite garden varieties, *e.g.* Carnation, Sweet William.

CASABIANCA, RAPHAEL, COMTE DE (1738–1825), Fr. general; served under the revolutionary government in Italy (1794–98); made count (1806); rejoined Napoleon during the Hundred Days.—**Casabianca, Louis** (1752–98), nephew of above, succ. Admiral Brueys in command of the *Orient* at battle of *the Nile*. His s., Giacomo, aged ten, was hero of Mrs. Hemans' *The Boy stood on the Burning Deck*.

CASABLANCA (33° 37′ N., 7° 34′ W.), seaport, Morocco, on Atlantic coast; Arab. Dar-el-Baida; exports, wool, wax, maize, goat-skins; imports, sugar, cotton, calico; bombarded and occupied by French, 1907. Pop. 35,000.

CASALE MONTFERRATO (45° 7′ N., 8° 27′ E.), town, Piedmont, Italy; fine cathedral (founded VIII. cent.); manufactures silk.

CASALPUSTERLANGO (45° 11′ N., 9° 38′ E.), town, N. Italy; Parmesan cheese. Pop. 6500.

CASAMICCIOLA (40° 44′ N., 13° 55′ E.), spa, Ischia, Italy; thermal mineral springs; ruined by earthquake, 1883; since rebuilt. Pop. 3750.

CASANOVA, GIOVANNI JACOPO (1725–98), Venetian adventurer; of good birth and brilliant parts; actor in early life, later abbé, journalist, diplomatist. He travelled widely in Europe, and was decorated with the order of the Golden Spur by the pope.

Casanova's *Mémoires*, 8 vols. (Paris, 1885).

CASAS GRANDES (30° 5′ N., 108° 3′ W.), town, Mexico; ancient Ind. settlement; extensive ruins.

CASAUBON, FLORENCE MÉRIC (1599–1671), Eng. scholar; s. of Isaac C. (*q.v.*); declined Cromwell's invitation to write history of Civil War; edit. *Meditations* of Marcus Aurelius, and wrote several original works.

CASAUBON, ISAAC (1559–1614), Fr. scholar; b. Geneva, of Huguenot parentage; prof. of Greek at Geneva, and later at Montpellier; royal librarian in Paris to Henry IV. (1598), but after assassination of king came to London, and was made Prebendary of Canterbury (1610). C. possessed little originality as a

writer, but had amassed a wonderful store of learning, and his merits as a commentator are very great. He edited Aristotle, Diogenes, Laertius, Theophrastus, Strabo, Theocritus, Polybius, Persius, and Suetonius.

Mark Pattison, *Life* (1875 and 1892).

CASCADE MOUNTAINS (45° N., 121° W.), mountain range, extending northwards through Oregon and Washington into Brit. Columbia; principal peaks about 14,000 ft.; numerous extinct volcanoes; heavily and extensively wooded; name derived from cascades formed by Columbia River in cutting way through range.

CASE, JOHN (d. 1600), Eng. physician and philosopher; authority on Aristotle and on music; author of several works.

CASEÏN, organic compound, one of constituents of milk (*q.v.*).

CASELLI, GIOVANNI (1815–91), Ital. scientist who invented pantelegraphy.

CASEMATE (military), bomb-proof chamber; (arch.) moulding in cornice.

CASERTA (41° 3′ N., 14° 22′ E.), town (and province), Campania, Italy; magnificent palace, founded by Charles III., 1752, and old cathedral; large silk works in vicinity. Pop. (1911) 33,455. Province, area, 2033 sq. miles. Pop. (1911) 788,370.

CASE-SHOT, military projectile, consisting of light metal case containing bullets; originally called 'canister-shot.'

CASHEL (52° 31′ N., 7° 53′ W.), city, Tipperary, Ireland; seat of R.C. abp. and Prot. bp.; many interesting ruins, comprising XII.-cent. cathedral, castle, chapel, round tower, ancient cross, exist on 'Rock of Cashel'; famous 'Synod of Cashel' held here in 1172; Henry II. received homage of king of Limerick at C.

CASHMERE, see KASHMIR.

CASILINUM (41° 7′ N., 14° 13′ E.), ancient city, Campania, Italy; modern Capua (*q.v.*).

CASIMIR III., THE GREAT (1310–70), king of Poland; s. of Wladislaus Lokietek; after a somewhat licentious youth he became a beneficent ruler, and a firm and wise political and social reformer. He was the founder of Cracow Univ. (1364).

CASIMIR IV. (1427–92), king of Poland; member of the Jagiello family, and distinguished for his moderation and political sagacity; one of the greatest rulers of his period, his private life was marked by great austerity, while his unbounded generosity to his dependants was proverbial.

CASIMIR-PÉRIER, see PÉRIER.

CASIMIR-PÉRIER, JEAN PAUL PIERRE (1847–1907), 5th Fr. pres.; elected (1894) after assassination of Pres. Carnot, but resigned after six months.

CASINO (Ital.), pleasure-house; now usually applied to a gaming-saloon, as that at Monte Carlo; name of a card-game.

CASINUM, ancient town, Via Latina, Italy.

CASKET LETTERS, see MARY, QUEEN OF SCOTS.

CASORIA.—(1) (40° 53′ N., 14° 17′ E.) town, Naples, Italy. Pop. 12,725. (2) (41° 20′ N., 14° 6′ E.) town, Torre de Lavoro, Italy.

CASPARI, KARL PAUL (1814–92), Ger. theologian and scholar; best known as author of an *Arabic Grammar*; also wrote commentaries on Old Testament, etc.

CASPE (41° 14′ N., 0° 4′ W.), town, Spain; sulphur baths. Pop. 8000.

CASPIAN SEA (43° N., 49° 30′ E.), on borders of Europe and Asia, and surrounded E., W., and N. by Russia and S. by Persia, is largest inland sea in world; length, over 700 miles; breadth, 130 to 300 miles; area, 170,000 sq. miles. It is 90 ft. below sea-level, is tideless, has no outlet; shallow in N. (3 to 12 fathoms), deeper in S. (420 to 516 fathoms); northern part frozen in winter; receives waters of Volga, Ural, Emba, Kur, Terek, Atrek, Gürgen, Sefid-Rud, Aras, and other rivers; is believed to have been formerly connected with Sea of Aral; valuable fisheries—sturgeon, salmon, perch, carp, etc.; canals connecting upper waters of Volga with Lake Ladoga and the Düna give through communication to Baltic Sea; seal-hunting is carried on in N.; navigated by various lines of steamers. Chief port, Astrakhan.

CASQUETS (49° 44′ N., 2° 24′ W.), group of granite rocks, N.W. of Alderney, Channel Islands; have light-houses with revolving lights. Here *White Ship* was wrecked, 1119.

CASS, LEWIS (1782–1866), Amer. soldier and statesman; served in war of 1812; Sec. of War (1831–36); Sec. of State (1857); wrote *History of U.S. Indians* (1823).

CASSABA (38° 25′ N., 28° 4′ E.), town, vilayet Smyrna, Asia Minor; exports cotton, melons.

CASSAGNAC, ADOLPHE GRANIER DE (1806–80), Fr. journalist; first an Orleanist, he later became a supporter of the Empire, and his vehement style frequently involved him in duels and lawsuits.

CASSANDRA (classical myth.), dau. of Priam and Hecuba; loved by Apollo, who promised her any gift if she would yield to his desires. She asked for the gift of prophecy, but, having received it, she refused to fulfil her promise, and Apollo, by way of revenge, ordained that all her predictions should be disbelieved. She became the spoil of Agamemnon after the sack of Troy.

CASSANO (45° 21′ N., 9° 31′ E.), town, Milano, Italy; here French defeated Austrians, 1705; Austrian and Russians defeated French, 1799. Pop. 9000.

CASSANO ALL' IONIO (39° 47′ N., 16° 17′ E.), town, Calabria, Italy, with warm sulphur springs. Pop. 6700.

CASSATION, COURT OF, Fr. court of appeal; formed by the *Chambre des requêtes*, *Chambre Civile*, and *Chambre criminelle*, which unite to form the supreme court of appeal, the *Conseil supérieur de la magistrature*.

CASSEL (50° 47′ N., 2° 27′ E.), town, Nord, France; machinery, hosiery. Pop. 3222.

CASSEL, KASSEL (51° 19′ N., 9° 31′ E.), city, Hesse-Nassau, Germany, on Fulda; has old palace of electoral princes, and museum built 1769, which has fine library; newer part of town regularly laid out, with wide streets; important industrial centre, manufactures machinery, mathematical instruments; textiles, iron ware, etc. Pop. (1910) 153,196.

CASSELL, JOHN (1817–65), Eng. publisher; s. of a Manchester tavern-keeper; self-educated; apprenticed to a joiner; went to London (1836) to follow his trade; became active temperance worker; set up as tea and coffee merchant (1847); and later turned publisher; founder of firm, Messrs. Cassell, Petter, & Galpin, now Messrs. Cassell & Co. Ltd.

CASSIA, VIA (42° 40′ N., 12° E.), ancient high-road, Italy, between Florence and Rome.

CASSIANUS, JOANNES EREMITA (360–448), religious recluse; one of earliest founders of conventual establishments; spent several years amongst the ascetics in the Egyptian deserts; was ordained deacon by St. Chrysostom at Constantinople (403); founded at Marseilles the abbey of St. Victor and a convent for nuns; wrote *Collationes Patrum Sceticorum*.

CASSICUS, see CASSIQUE.

CASSIDARIA, see under GASTROPODA.

CASSINI, Ital. family of astronomers, chief of whom were: (1) GIOVANNI DOMENICO (1625–1712), prof. of Astron., Bologna (1650), astronomer-royal, France (1671–1711); (2) JACQUES C. (1677–1756), s. of above, and successor to his appointments; F.R.S. (1696).

CASSIODORUS, FLAVIUS MAGNUS AURELIUS (*c.* 490–585 A.D.), Syrian author; founded two monasteries at Squillace for the advancement of learning; wrote on history, politics, theology, and grammar. His *Variæ* is a chief source of knowledge regarding the Ostrogothic rule in Italy.

CASSIOPEIA (classical myth.), wife of Cepheus, king of Ethiopia, and mother of Andromeda; in astronomy, a northern constellation, the chief stars of

which outline letter W. C. is in the Milky Way, and in it the famous temporary star, *Tycho's Star*, was discovered n August 1572.

CASSIQUE (*Cassicus*), perching birds which take the place of the Old World starlings in America. They are characterised by a shield at the base of the bill.

CASSIS, see under GASTROPODA.

CASSITERIDES ('Tin Islands'), name given by Phœnicians, Greeks, and Romans to group of islands generally identified as the Scilly Isles.

CASSITERITE (SnO_2), tinstone or stannic oxide, commonest tin ore, containing 79 % metal; found in Cornwall, Borneo, Mexico, Australia; used for extraction of metal; also for preparation of mordants employed in calico printing.

CASSIUS, GAIUS (d. 42 B.C.), Rom. prætor; member of plebeian family, which had once held patrician rank; one of the murderers of Julius Cæsar; in the war which followed he was routed at *Philippi*, and, giving up all hope, he commanded his freedman to slay him.

CASSIUS, SPURIUS, VISCELLINUS, Rom. consul disliked by nobles as demagogue; introduced first *Lex agraria* (486 B.C.).

CASSIVELLAUNUS, Brit. king, who offered a valiant defence to Julius Cæsar during his second invasion (54 B.C.), but was compelled to capitulate, and promised tribute to the conqueror.

CASSOCK (Fr. *casaque*), originally a long, loose robe worn by soldiers and horsemen; nowadays a black variety is used by priests.

CASTAGNO, ANDREA DEL (1390–1457), Ital. painter, the secret of whose colouring is lost and has given rise to many legends.

CASTALIA, famous spring which rises on Mount Parnassus, near Delphi; sacred to Apollo and the Muses.

CASTANETS, percussion musical instruments, consisting of small hollow shells of hardwood or other substance, bound together with loop fitting on thumb and forefinger; much used in dances from times of the Early Greeks and Romans, and introduced into Europe by the Moors.

CASTAÑOS, FRANÇOIS XAVIER DE (1756–1852), Span. general who forced French to make humiliating capitulation of Baylen, 1808.

CASTE (Lat. *castus*, pure), term now usually associated with classes of Hindu society. A development of Brahmanism, c. had originally four chief divisions—the Brahmans, a sacerdotal class; Kshatriyas, military; Vaisyas, agricultural; and the Sûdras, who were servants of the three preceding classes. Out of these have grown many other sub-classes. C. in modern India has proved a serious obstacle to civil progress and religious reform by the restrictions and limitations it imposes upon marriage, trade, or profession, and the amenities of social intercourse. Time, however, is gradually breaking down these restrictions.

Sherring's *Hindu Tribes and Castes* (1872).

CASTELAR Y RIPOLI, EMILIO (1832–99), Span. statesman; prof. of History and Philosophy in univ. of Madrid (1856); removed from his professorship for his attacks on the government (1865); took part in the rising of 1866, was condemned to death, but made his escape to France, returning to Spain in 1868, on the success of the Revolution. In 1873 C. was app. dictator by the Cortes, but a year later he was compelled to resign, and when the Spaniards declared in favour of Alfonso XII. he found safety in flight. He returned in 1876, and again took part in political life, but finally retired in 1893. C. was a brilliant orator, but ineffectual as a politician.

CASTELBUONO (37° 53′ N., 14° 6′ E.), town, Palermo, Sicily; site of former monastery. Pop. 10,761.

CASTELFIDARDO (43° 29′ N., 13° 31′ E.), town, Ancona, Italy. Pop. 9100.

CASTELFRANCO DELL' EMILIA (44° 36′ N., 11° 3′ E.), town, Emilia, Italy; silk trade. Pop. 14,000.

CASTELFRANCO VENETO (45° 40′ N., 11° 57′ E.), fortified town, Venetia, Italy; birthplace of Giorgione; scene of Austrian defeat by French, 1805. Pop. 3700.

CASTELL, EDMUND (1606–85), Eng. Oriental scholar; ed. Cambridge; spent eighteen years in compiling his *Lexicon of the Seven Tongues*; became Prebendary of Canterbury and prof. of Arabic at Cambridge.

CASTELLAMARE DEL GOLFO (38° 5′ N., 12° 55° E.), town, Trapani, Sicily; olive oil, anchovies, wine. Pop. 21,000.

CASTELLAMMARE DI STABIA (40° 40′ N., 14° 25′ E.), fortified seaport, Campania, Italy, on Bay of Naples; ancient *Stabiæ*; bp.'s see; mineral springs; popular resort. Pop. 36,500.

CASTELLANA (40° 52′ N., 17° 12′ E.), town, Bari, Italy. Pop. 11,500.

CASTELLANETA (40° 38′ N., 16° 57′ E.), town, Lecce, Italy; seat of bishopric. Pop. 11,000.

CASTELLIO, SEBASTIANUS (1515–63), Swiss Biblical critic; trans. Bible into Lat. and Fr.

CASTELLO BRANCO (39° 52′ N., 7° 30′ W.), walled town, Beira, Portugal; seat of bp.; has ruined castle and Rom. antiquities; trade in marble; woollens, wine, and oil. Pop. 7292.

CASTELLO DE VIDE (39° 24′ N., 7° 27′ W.), town, Alemtejo, Portugal; textiles. Pop. 5150.

CASTELLO, BERNARDO (1557–1629), Ital. artist; b. Genoa; intimate with poet Tasso; was employed by the Duke of Savoy, and at Rome, but much of his work is to be found at Genoa.

CASTELLO, GIOVANNI BATTISTA (d. *c.* 1569), Ital. artist, architect, and soulptor; painted *Martyrdom of St. Sebastian, Christ as Judge of the World*, etc.; at invitation of Philip II. went to Madrid (where he died), and was app. architect of the king's palaces.

CASTELLO, VALERIO (1625–59), Ital. artist; s. of Bernardo C.; excelled as a painter of battle-scenes; his *Rape of the Sabines* is in the Palazzo Brignole at Genoa.

CASTELLO BRANCO, CAMILLO (1825–90), Portug. novelist; produced upwards of 200 vol's in several departments of lit., but chiefly remarkable for his novels; made viscount, and received government pension.

CASTELLÓN DE LA PLANA (40° 7′ N., 0° 20′ W.), province, E. Spain; occupies strip of Mediterranean coast; surface mountainous; principal exports, fruit and fish; area, 2495 sq. miles. Pop. (1910) 322,210.

CASTELLÓN DE LA PLANA (37° 59′ N., 0° 5′ W.), town and port, capital of C. province; manufactures brandy, sailcloth, and linen; is centre for exports of oranges, wine, etc. Pop. (1910) 33,296.

CASTELNAU, MICHEL DE (1520–92), Fr. diplomatist and soldier; accompanied Mary Stewart to Scotland, and used every endeavour to effect a reconciliation between the Scots queen and Elizabeth; performed brilliant military services in France; was ten years ambassador to court of Queen Elizabeth, and sought to bring about a marriage with the Duke of Alençon.

CASTELSARRASIN (44° 3′ N., 1° 5′ E.), town, Tarn-et-Garonne, France; foundries. Pop. 7000.

CASTELTERMINI (37° 15′ N., 13° 30′ E.), town, Girgenti, Sicily; sulphur and salt mines. Pop. 13,050.

CASTELVETRANO (37° 41′ N., 12° 46′ E.), town, Trapani, Sicily; wine, oil, silk. Pop. 24,510.

CASTIGLIONE DELLE STIVIERE (45° 23′ N., 10° 29′ E.), town, Lombardy, Italy; at C. French defeated Austrians, 1796. Pop. 3542.

CASTIGLIONE OLONA (*c.* 45° 46′ N., 9° 6′ E.), town, Lombardy, Italy.

CASTIGLIONE, BALDASSARE (1478–1529), Ital. diplomatist and author; known as 'the perfect courtier'; was attached to the court of Guidobaldo Malatesta, Duke of Urbino, by whom he was sent on a mission to Henry VII. of England. He wrote Latin

and Ital. poems of rare quality, and a prose treatise, *Il Cortegiano* (1528). His portrait, by Raphael, is in the Louvre.

CASTIGLIONE, GIOVANNI BENDETTO (1616–70), Ital. artist; painted portraits, hist. scenes, and landscapes; many of his works are to be found in Rome, Genoa, Venice, Florence, and Naples; the Louvre contains eight examples.

CASTILE, Castille (42° N., 4° W.), old kingdom, Spain, consisting of plateau region, and divided into provinces of Old and New C.; watered by Douro, Tagus, Guadiana; surrounded by mountain ranges; became kingdom, XI. cent., later united with Leon; united with Aragon in 1479. See Spain: *History*.

CASTILHO, ANTONIO FELICIANO DE (1800–75), Portug. poet, etc.; blind from his sixth year; pub. *Primavera* (1822), *Amor e Melancholia* (1823), *A noite de Castello* (1836), *Cuimes do bardo* (1838)—volumes of bucolic and romantic poetry.

CASTILLO SOLÓRZANO, ALONSO DE (1584–1647), Span. novelist, poet, and dramatist; distinguished for versatility and graceful style; pub. several picaresque novels, vol's of humorous verse, and dramas.

CASTILLON (44° 52′ N., 0° 1′ W.), town, Gironde, France; French defeated English, 1453. Pop. 3300.

CASTLE (Lat. *castellum*, fortress), word introduced into England by the Normans to describe a stone defensive building, which took the place of the Saxon *burh*, a timber palisade encircling the top of a mound, which was the only kind of fortification then known in Britain. William I. introduced the square stone keep of which the 'White Tower' in the Tower of London is a notable example. Upwards of 100 ft. square, with walls of rubble and mortar, 15 ft. in thickness, such a structure was practically impregnable against the battering weapons of that day. A more common type of the Norman c., however, was the 'shell-keep,' an encircling stone wall, in place of the wooden palisade. Living apartments and offices were afterwards built against the inner sides of these walls, while from the large central space sprang the keep, or *donjon*, square or round; this, being very strongly built, and usually containing the well, served as the last defence of the garrison if the outer defences were carried.

G. T. Clark, *Mediæval Military Architecture in England*.

CASTLE, EGERTON (1858–), Eng. author; on staff of *Saturday Review*, 1885–94; author of *The Jerningham Letters*, *The Secret Orchard*, and with Agnes Castle of *Incomparable Bellairs*, *French Nan*, etc.

CASTLE DONINGTON (52° 52′ N., 1° 22′ W.), town, Leicestershire, England; manufactures hosiery and silk; breweries.

CASTLE DOUGLAS (54° 57′ N., 3° 56′ W.), market town, Kirkcudbright, Scotland; manufactures agricultural implements, and has large sheep and cattle marts. Pop. (1911) 3016.

CASTLE RISING (52° 48′ N., 0° 28′ E.), village, Norfolk, England; remains of famous Norman castle of XII. cent.

CASTLEBAR (53° 52′ N., 9° 17′ W.), town, capital of County Mayo, Ireland; market for agricultural produce; scene of massacre of Eng. garrison by Irish, 1641. Pop. 4000.

CASTLECARY.—(1) (51° 0′ N., 2° 31′ W.) town, Somerset, England. Pop. (1911) 5233. (2) (55° 58′ N., 3° 58′ W.) old castle near Falkirk, Stirlingshire.

CASTLECONNEL (52° 43′ N., 8° 29′ W.), town, on Shannon, County Limerick, Ireland; good salmon-fishing centre.

CASTLEFORD (53° 44′ N., 1° 21′ W.), town, on Aire, West Riding, Yorkshire, England; glass-works. Pop. (1911) 23,101.

CASTLE-GUARD, in feudal times the great barons were required to provide knights to guard royal castles, but eventually a money payment was imposed upon them, known as 'castle-guard rent.'

CASTLEMAINE (37° 4′ S., 144° 14′ E.), town, Victoria, Australia; gold-mines were among first discovered in Australia. Pop. 5704.

CASTLEREAGH, VISCOUNT, see Londonderry, 2nd Marquess of

CASTLETON (53° 21′ N., 1° 47′ W.), village, Peak district, Derbyshire, England; ruined 'Castle of the Peak' built by William Peveril; fluor-spar mines.

CASTLETOWN, Bally Cashtel (54° 4′ N., 4° 40′ W.), town (former capital), Isle of Man; Castle Rushin (X. cent.) now a prison; seat of King William's College.

CASTOR AND POLLUX (classical myth.), also called 'The Dioscuri,' twin sons of Zeus and Leda; presided over games; patrons of hospitality; protectors of sailors, who sacrificed to them when they came to the masthead as a fire (St. Elmo's Fire). C. and P. names of two bright stars in constellation *Gemini*; C. is a double star, but P. is brighter.

CASTOR OIL, oil obtained from the seeds of a plant, *Ricinus communis*, belonging to the order Euphorbiaceæ, grown in most tropical and sub-tropical countries. The seeds are very poisonous, and the oil is obtained from them by crushing or by decoction, and purified. It is viscid, colourless, with slight characteristic smell and taste, and is used medicinally as a purgative.

CASTORIDÆ, Beaver Family, see Beaver.

CASTRÉN, MATTHIAS ALEXANDER (1813–53), Finnish philologist; undertook adventurous journeys through Lapland and Siberia; pub. several valuable works on philology.

CASTRES (43° 36′ N., 2° 14′ E.), town, on Agout, Tarn, France; interesting buildings; fine promenades; XVI.-cent. Huguenot stronghold; woollen fabrics. Pop. 19,800.

CASTRIES (13° 45′ N., 61° W.), port, capital, St. Lucia, W. Indies; exports sugar. Pop. (1911) 6266.

CASTRO, Kastro.—(1) (39° N., 26° 45′ E.) capital of Mitylene (Lesbos), Ægean Sea. Pop. 20,000. (2) (39° 53′ N., 25° 2′ E.) town, Lemnos, Ægean Sea.

C. is name of towns in other Ægean islands.

CASTRO DEL RIO (37° 43′ N., 4° 31′ W.), town, S. Spain; textiles. Pop. 11,821.

CASTRO URDIALES (42° 35′ N., 3° 18′ W.), seaport, Santander, Spain; old castle; sardine fisheries and iron-mining are chief industries. Pop. 14,191.

CASTRO Y BELLVIS, GUILLÉN DE (1569–1631), Span. dramatist; wrote *Las Mocedades del Cid*, *Fuerza de la Costumbre*, *El Prodigio de los Montes*; his *Comedias* were pub. 1618–21.

CASTRO, CIPRIANO (1863–), ex-Pres. of Venezuelan Republic after deposing Andrade, 1899–1906; his aggressive foreign policy led to futile Ger. and Brit. naval demonstration, 1903.

CASTRO, INEZ DE (d. 1355), alleged wife of Peter I. of Portugal, who, while still known as the Infante Dom Pedro, became enamoured of her. The growing influence of her family incurred the hatred of other nobles, and by a party of these (or by the Infante's f.) she was stabbed to death in the palace at Coimbra.

CASTRO, JOÃO DE (1500–48), Portug. Viceroy of the Indies; notable voyageur and soldier; friend of St. Francis Xavier, in whose arms he died at Goa.

CASTRO, VACA DE (d. 1558), Span. governor of Peru (1538), from which he extorted much wealth for Spain.

CASTRO-GIOVANNI (37° 32′ N., 14° 18′ E.), town, Caltanissetta, Sicily; ancient *Enna*; cathedral (1307); ruined fortress; produces rock salt. Pop. 23,500.

CASTROVILLARI (39° 47′ N., 16° 13′ E.), town, S. Italy; wine. Pop. 9000.

CASTRUCCIO-CASTRACANI (1281–1328), duke of Lucca (1327); Ital. mercenary captain who served with the Hapsburgs against the Papacy.

CASTS, replicas of an object; obtained by forming a mould of plaster or wax and filling it with the material desired (plaster or metal); when this hardens the mould is chipped off; founding (*q.v.*) is casting of large metal objects.

CASTUERA (38° 41′ N., 5° 36′ W.), town, Badajoz, Spain. Pop. 7000.

CASUAL WARDS, see POOR LAW.

CASUARINA, genus of trees, chiefly Australian, with long, leafless, jointed branches; yields hard, valuable timber, used chiefly for inlaying, and known as beef-wood.

CASUISTRY, ecclesiastical case law or moral science; sprang up in the R.C. Church with the system of confession, made obligatory by Lateran Council, 1215. C. has taken sinister meaning from ingenuity displayod in arguing away ambiguous acts.

CASUS BELLI, term in international law for offence which makes war justifiable.

CAT, name for a family of carnivora (*Felidæ*), comprising lion, tiger, leopard, puma (for all of which see below under CAT FAMILY), wild cat, etc., but usually restricted to the latter species (*Felis catus*), the domestic cat (*F. domestica*) and other small forms, such as the Nubian gloved cat (*F. maniculata*). The domestic cat, of which the tabby (usually grey, with light stripes), tortoise-shell, Angora, Manx, Maltese, Persian (with green eyes and silverish fur), Blue Persian (slate-grey with amber eyes), and Spanish are among the better-known varieties, has been a companion of man since the dawn of society, and figured largely in the folk-lore of Aryan and other nations, and was associated with magic and religion. Although the domestic c. when running wild assumes the habits and colouring of the wild c., evidence tends to show that the former is a distinct species.

C. shows, inaugurated in London, 1871, are still held annually. There are also shows in Scotland in connection with the Scot. C. Club, and in the provinces.

Simpson, *Book of the Cat* (1903); Rule, *The Cat*.

CAT FAMILY (*Felidæ*), a family of carnivores (sub-order, *Fissipedia*), with about 85 species scattered all over the world, except in Australia, New Zealand, and Madagascar. They are characterised by their completely retractile claws, their short faces, and the reduced number of their cheek teeth, which typically number 4 in the upper and 3 in the lower jaw. Among the cats the best known is the **Lion** (*Felis leo*), characterised by its uniform tawny colour, and by the shaggy mane that ornaments the head and neck of the male. The lion sleeps by day in thickets or dense reeds, and prowls at night in search of the large animals —antelopes, giraffes, camels, buffaloes, and such-like— that form its prey. Although now confined to Africa, Persia, and North-West India, lions were formerly found, in historic times, throughout southern Asia and south-eastern Europe, and fossil remains (Pleistocene) have been found even in Britain.

Closely related to the lion, but differing in its striped coat and lack of mane, is the **Tiger** (*Felis tigeris*), which is found only in Asia—but there from the snows of Manchuria to the south of India. The individuals inhabiting the colder regions have long, thick coats, very different from that of their tropical brethren.

The **Leopard** (*Felis pardus*), also known as PARD and PANTHER, is less numerous than the preceding species and is spotted with dark brown and black, the spots often arranged in circles. It occurs throughout Africa and the greater part of Asia, and its bones have been found in British caves.

The **Snow Leopard** or OUNCE (*F. uncia*), with longer and paler fur than the last, inhabits the lofty plateaus and mountains of Central Asia, 9000 to 18,000 feet above sea-level.

Less important and less imposing Old World cats are the smaller TIGER CATS of tropical Asia and Africa; the South African SERVAL (*F. serval*), short tailed, large eared, black spotted; the CLOUDED LEOPARD, HUNTING LEOPARD, or CHEETAH, and common WILD CAT (*qq.v.*); the CARACAL or PERSIAN LYNX (*Lynx caracal*), with bright yellow-brown unspotted fur and black-tipped tail, found in Western Asia and Africa; and the true LYNXES (*Lynx*), with long limbs, short tail, and ears with a tuft of hairs at the tip, some of which occur both in Europe and Asia.

The New World cat fauna also includes true lynxes, confined to North America, but its most important members are the leopard-like **Jaguar** (*Felis onca*), fond of climbing and feeding upon monkeys, and the smaller PUMA or COUGAR (*F. concolor*), known to Americans as the 'panther.' The two last occur from Patagonia to the U.S.A., but while the northern boundary of the former is limited by N. Mexico, the former extends to New England. Smaller arboreal species roam the woods of tropical America, passing, on account of their spotted fur, under the name of ocelot cats, or sometimes 'tiger cats'; examples are *Felis jaguarundi* and *F. eyra*, respectively rather larger and rather smaller than the domestic cat.

The remains of more than 80 species of the cat family have been found as fossils in Tertiary deposits. The most interesting is the extinct SABRE-TOOTHED TIGER (*Machærodus*), which had compressed, saw-edged teeth, 7 inches in length, and has been traced in the Argentine and Brazil.

Elliot, *Felidæ* (1883); Lydekker, *Cats*.

CAT ISLAND.—(1) (30° 11′ N., 89° 1′ W.) island, Mississippi. (2) (24° 30′ N., 75° 30′ W.) island, one of Bahamas, W. Indies. Once wrongly supposed to be first landing-place of Columbus in America.

CATACHRESIS, term of rhetoric for misplacement of words, *e.g.* mixed metaphor and 'Malapropism.'

CATACOMBS, Rom. subterranean burial-places, consisting of galleries with recesses for tombs, closed after burial with an inscribed stone; the most famous is that under the Appian Way, used also as a place of refuge by the early Christians. The c's of Paris were originally stone quarries, but in 1787 the authorities began to transfer to this receptacle the bones from the cemeteries.

CATAFALQUE (Ital. *catafalco*, scaffold), temporary structure used in funerals either as a canopy when a body is laid in state, or a similar covering for a funeral car.

CATALANI, ANGELICA (1780–1849), Ital. prima donna; first appearance in London (1806), where she reigned as public favourite for about seven years; met with great success in all the European capitals; noted for her charity and kindness; founded free singing school at Florence.

CATALAUNUM, see CHÂLONS-SUR-MARNE.

CATALEPSY, see TRANCE.

CATALEXIS, term in prosody for omission of syllable required for full feet of verse.

CATALONIA (*c.* 41° 35′ N., 2° E.), former principality and province, N.E. Spain, now comprising Barcelona, Tarragona, Lerida, and Gerona; surface mountainous and wooded; watered by numerous streams; these, together with a good system of artificial irrigation, render C. chief manufacturing and agricultural region of Spain; called the 'Lancashire of Spain'; produces cereals; cotton, silk, and woollen goods manufactured; conquered by Philip V., 1714; held by France, 1808–13. See SPAIN.

CATALYSIS.—In chem. a substance which initiates or accelerates chemical interaction between other substances, without itself undergoing change, is termed a *catalytic* agent, or said to act by catalysis; thus manganese dioxide, in preparation of oxygen from potassium chlorate, causes oxygen to be liberated more rapidly and at much lower temperature.

CATAMARAN (word of Tamil origin: *catta*, to tie, *maram*, wood), name of a surf-boat, propelled by sails or oars, consisting of two or more logs of wood lashed together, much used in E. and W. Indies and S. America; also used erroneously to describe a scolding woman.

CATAMARCA (*c.* 28° S., 67° W.), province, Ar
ine Republic; surface mountainous, with fertile va'
rich in minerals, gold, silver; area, 47,531 sq.
Pop. estimated (1910) 110,317.

CATAMARCA (27° 59′ S., 67° 7′ W.), town, capital

of C. province, Argentine Republic; exports flour and wine. Pop. 7400.

CATAMOUNT, CATAMOUNTAIN, properly 'cat of the mountains'; applied to the Common Wild Cat, the Puma, and the Lynx.

CATANIA (37° 28′ N., 15° 5′ E.), town, E. coast of Sicily; has cathedral dating from Norman times; rebuilt in 1693 after earthquake; observatory, univ., remains of Rom. amphitheatre, aqueducts, theatres, baths; former Benedictine monastery has library and museum of antiquities; manufactures textiles; has frequently suffered from earthquakes and eruptions of Etna. Pop. (1911) 211,699. Province, area, 1917 sq. miles. Pop. (1911) 783,862.

CATANZARO (38° 55′ N., 16° 37′ E.), city, Calabria, Italy; has cathedral and ruined castle; manufactures silk, velvet, and woollen goods. Pop. (1911) 34,340; (province) 484,616.

CATAPHRYGIANS, nickname of followers of Phrygian zealot Montanus. See MONTANISM.

CATAPULT (Lat. *catapulta*), military weapon, somewhat like a huge crossbow, but mounted on a stand, used by Greeks and Romans to discharge arrows, stones, etc.; forked stick, provided with elastic, used by boys for throwing stones.

CATARACT, see EYE.

CATARGIN, LASCAR (1823–99), Rumanian statesman; was twice pres. of the Council, and promoted many useful administrative reforms.

CATARRH, inflammation of a mucous membrane, accompanied by swelling, congestion, and an increase of the secretion. The term is commonly applied to such inflammation in the respiratory and nasal passages, or 'common cold.' This is treated by taking a purgative, *e.g.* calomel, then hot bath and bed. Dover's powder is sometimes recommended. A tonic and change of air complete the cure.

CATARRHINI, CATARRHINE APES, see under PRIMATES.

CATASTASIS (Greek), division of the classical drama which consists of protasis, epistasis, c., and catastrophe; in rhetoric, part of a speech giving outline of matter in hand.

CATAUXI, cannibal Indian tribe of W. Brazil.

CATAWBAS, nearly extinct tribe of Indians, dwelling in neighbourhood of Catawba river, S. Carolina; 'Catawba Wine,' made from grapes from near river, has been praised by Longfellow.

CATEAU, LE, LE CATEAU CAMBRÉSIS (50° 4′ N., 3° 22′ E.), town, Nord, France; textiles, beer, sugar. Treaty concluded here between England, France, and Spain, 1559. Pop. 10,700.

CATECHISM, a book of instruction, in the form of questions and answers; not necessarily of a religious character, but generally used in that application. Amongst Church catechisms may be mentioned that of Luther (1529); the Anglican, contained in the Book of Common Prayer, and the Heidelberg, used by the Dutch Church; Longer and Shorter Catechisms by Peter Canisius, S.J., 'The Penny Catechism' (England), used by Roman Catholics; and the famous Presbyterian *Shorter Catechism.*

CATECHU, CUTCH, extract from acacia plants, is of two kinds: (1) pale cutch, from *Uncaria gambier*; and (2) black cutch, from *Acacia catechu.* Both are bitter and astringent, and used in tanning and dyeing.

CATECHUMENS, name given in the early Christian Church to converted Jews and heathens who were undergoing instruction preparatory to receiving the rite of baptism.

CATEGORY (Gk. *katēgoria*, accusation, assertion), Aristotle's ten categories are an attempt to classify the possible assertions (*predicates*) about anything (*subject*). Such assertions may tell us what the subject is (*Substance*), what it is like (*Quality*), how much or how many (*Quantity*), how it is related to something else (*Relation*), where (*Place*) or when (*Time*) it is, its *Condition* (a more permanent) or *State* (a more transient), whether and how it is acting (*Action*), and whether anything and what is being done to it (*Passivity*). See ARISTOTLE.

CATEL, CHARLES SIMON (1773–1830), Fr. composer; helped to found the *Conservatoire* (1795).

CATERAN, old collective term for Highland cattle-raiders.

CATERHAM (51° 17′ N., 0° 6′ W.), town, Surrey, England; large barracks in vicinity. Pop. (1911) 10,841.

CATESBY, ROBERT (1573–1605), Eng. conspirator; descended from C., instrument of Richard III.; of good family and abilities; suffered much as R.C. recusant under Queen Elizabeth, and, when James I. would not restore Roman Catholicism, organised the Gunpowder Plot (*q.v.*); fled and was shot.

CAT-FISHES, SILUROIDS, large group of over 1000 fishes, so named on account of numbers of feelers round the mouth; found almost wholly in the fresh waters of temperate and tropical regions. One of the most interesting is the mail-coated S. Amer. (*Callichthys*), which in the dry season moves overland in search of water, or burrows in the mud. Both sexes are said to guard the nest and eggs until the young are hatched.

CATGUT, tough material used for strings of violins, guitars, etc., and made principally from sheep's intestines, which, after being thoroughly cleansed, scraped, and exposed to antiseptic fumes, are twisted into cords.

CATHARI, CATHARS, CATHARISTS (Gk. *katharos*, pure), religious sect (persecuted as heretics), spread over E. and W. Europe during the Middle Ages. In the E. they were called *Bogomili* and *Paulicians*, in the W., *Albanenes Bulgari*, and, in S. France, *Albigenses.* The C. all held a more or less modified Manichæanism. Holding the essential sinfulness of the flesh and the material world, they denounced marriage and property, kept long fasts, and of animal food ate only that which was supposed not to have been produced sexually (*i.e.* fish). C. were distinguished as *credentes*, believers; and *perfecti*, perfect. The latter formed the governing part of the sect, a priesthood which is thought to have included women as well as men. The Perfect had received the *Consolamentum*, the Baptism of the Spirit, which removed original sin.

Döllinger, *Beiträge zur Sektengeschichte* (1890); Lea, *History of the Inquisition* (1888).

CATHAY, name by which China was known in mediæval times.

CATHCART (55° 50′ N., 4° 16′ W.), town, Renfrewshire, Scotland; has sandstone quarries; near site of battle of *Langside* (1568). Pop. (1911) 15,205.

CATHCART, SIR GEORGE (1794–1854), Eng. soldier; s. of Earl Cathcart; Wellington's aide-de-camp at *Quatre Bras* and *Waterloo*; served in Crimea and was killed at *Inkerman*; buried where he fell, a spot which was called in his honour, 'Cathcart's Hill.'

CATHCART, WILLIAM SCHAW, 1ST EARL CATHCART (1755–1843), Brit. general; commander-in-chief in Ireland (1803); commanded land forces at *Copenhagen* (1807), for which services received title of viscount; ambassador to Russia (1813–14); accompanied Tsar Alexander during campaigns (1813–14); cr. earl (1814).

CATHEDRAL (Gk. *cathedra*, chair), church containing a bp.'s throne. The c. is under the control of the dean (*q.v.*) and a chapter of canons or prebendaries; by them, after the issue of a *congé d'élire* from the Crown, the bp. is chosen. The bp. is visitor of the c., of which there are forty in England and Wales. In mediæval documents the c. is translated *ecclesia episcopalis*; the generic name for a church, *domus dei*, contracted to *dom* (still Ger. name for c.), became for a time special name of a c.

Atkinson, *Eng. and Welsh Cathedrals* (1912); Butler, *Scot. Cathedrals* (1901).

CATHERINE, the name of six saints in R.C. hagiology, the most famous being (1) **St. Catherine of**

Alexandria, who upbraided the Emperor Maximinus for his cruelties and worship of false gods, for which she was scourged and cast into prison. The legend runs that she converted the empress and all who approached her; was eventually beheaded, and buried on Mount Sinai, upon which site Justinian I. built a monastery to commemorate her martyrdom She frequently appears in art, accompanied by the wheel (*St. C.'s wheel*) on which she was broken, and receiving the ring of espousal from the Child Jesus. Her memory is preserved in England in the C. wheels (fireworks) of Nov. 5. In France she is the patron of young girls; her feast-day is Nov. 25, and at the age of 25 the *jeune fille* 'coiffs' St. C.; an old maid being said to have '*coiffé* St. C.' (2) **St. Catherine of Siena** (1347–80), youngest of 25 children of a dyer named Giacomo di Benincasa; dedicated herself to the religious life from her seventh year; she took a prominent part in the religious polemics of her day, and it was entirely through her exertions that Gregory XI. was induced to return to Rome from Avignon; she nursed the plague-stricken, and was venerated for her gentleness. She has been described by a noted writer as 'one of the most wonderful women that have ever lived.'

Gardner, *Saint Catherine of Siena* (1907).

CATHERINE I. (1683–1727), empress of Russia; dau. of a peasant; m. a Swedish dragoon; subsequently became mistress of Prince Menshikov, at whose house she was seen by Peter the Great, who made her his mistress, and later, his wife. She changed her name from Martha to Catherine on being received into the Greek Church; was crowned with solemn state, and declared Peter's successor. Like Peter, she was a barbarian of genius, gave him valuable aid in his reforms, and enjoyed wide popularity with the Russian people. After his death (1525), she lived a life of great excess, but with Menshikov's aid maintained the prosperity of the country.

CATHERINE II. (1729–96), empress of Russia; b. Stettin, of which her f., the Prince of Anhalt-Zerbst, was gov.; m. Arch-Duke Peter of Russia (1745), an ignorant sensualist, who frequently ill-treated her. Thus mated and living in the vile court of the Empress Elizabeth, C.'s immoralities soon became as flagrant as those of her husband. The latter succ. Elizabeth as Peter III. (*q.v.*) in 1761, and one of his first actions was to declare their s., Paul, illegitimate. Peter was murdered (1762), and C., who was supposed to have had a hand in the business, was declared empress. Notwithstanding her entire lack of morality, C. was a woman of great ability, and governed her country very successfully.

Catherine's *Memoirs* (Eng. trans., 1859); *Romance of an Empress*, by Waliszewski (1894).

CATHERINE DE' MEDICI (1519–89), queen of France; dau. of Lorenzo de' M.; wife of Henry II., and mother of Francis II., Charles IX., and Henry III. C. exercised no influence during the reign of her husband, who was dominated by his mistress, Diane of Poitiers, but during the rule of her three sons she was all-powerful. The inveterate foe of the Protestants, she was directly responsible for the murder of Admiral de Coligny and the wholesale Massacre of St. Bartholomew. C. introduced the ballet into France, and loved sumptuousness and magnificence; at the same time she was fearless, treacherous, and relentless in character, loved by none and feared by all.

Sichel, *C. de' Medici* (1905); *Later Years* (1908).

CATHERINE OF ARAGON (1485–1536), queen-consort of Henry VIII.; his first wife; dau. of Ferdinand and Isabella of Castile and Aragon; m., when 16, Arthur, Prince of Wales, who died 2nd April 1502; subsequently m. his bro., Henry VIII. (1509), to whom she bore six children, Queen Mary I. (*q.v.*) being the only one who survived. Henry having obtained a divorce (1533), C. passed into retirement, and died at Kimbolton Castle, Huntingdonshire. Outside the four years 1529–33, C. is anything but a prominent figure in history; she seems to have been popular in the country, but to have done nothing for the chroniclers to record. In 1529, however, she became the central figure in a tragedy poignantly narrated by Cavendish in his *Life of Wolsey*; there appears the speech in which she vainly implored Henry to pity 'a woman and a stranger born out of your dominion.' This part of *Henry VIII.* is generally allowed to be in the Shakespearean canon.

Froude, *Divorce of Catherine of Aragon* (1891).

CATHERINE OF BRAGANZA (1638–1705), queen-consort of Charles II. of England; dau. of John IV. of Portugal, who settled Bombay upon her at her marriage. She bore no children, and there were suggestions of divorce, but the country was pleased with the Portuguese alliance as a pledge of enmity to Spain. She remained loyal and devoted to the gay monarch, and felt much grief at his death; still living in England at the time of the Revolution, she returned later to her own country, where she died.

CATHERINE OF VALOIS (1401–37), queen-consort of Henry V. of England; dau. of Charles VI. of France; she m. Henry (1420), and bore a s. (Henry VI.) in the following year. After Henry's death (1422) she m. Owen Tudor, a Welsh gentleman, by whom she had three sons, one of whom, Edmund, Earl of Richmond, was the f. of Henry VII.

CATHODE, see ELECTRICITY (ELECTROLYSIS).

CATHOLIC APOSTOLIC CHURCH, religious sect due to preaching of Edward Irving, though not constituted by him; formed, 1831, and reconstituted, 1835; it has a central church in Gordon Square, London, W.C., and other churches in Britain and U.S.A. Its type of worship is Catholic rather than Protestant, and it recognises Rom., Gk., and Anglican Orders.

CATHOLIC CHURCH, term used in the early cent's to indicate the Christian Church as a whole. Its application in modern times is a matter of dispute, for while Roman Catholics hold that they alone are C's, an influential section of the Church of England, claiming an essential unity with the pre-Reformation Church, for this reason claims also the title C. See ROMAN CATHOLICISM.

CATHOLIC EPISTLES (or GENERAL E.), applied to *James*, 1 and 2 *Peter*, *Jude*, and 1, 2, and 3 *John*; title first found at end of II. cent., due, probably, to their being addressed to Christians in general (except 2 and 3 *John*, which are included because of close connection with 1 *John*).

CATHOLIC LEAGUE, formed 1609 under the influence of the Counter-Reformation; counterblast to Prot. Evangelical Union, founded 1608; both associations played prominent part in Thirty Years War (*q.v.*).

CATHOLICS, OLD, see OLD CATHOLICS.

CATILINA, LUCIUS SERGIUS, CATILINE (*c.* 108–62 B.C.), Rom. conspirator; of poor patrician family; having held all lower public offices, he was an unsuccessful candidate for the consulship (65 B.C.). Two years later he organised a revolutionary plot, but his designs were frustrated by the vigilance of the Consul Cicero, in a conflict with whose troops C. was killed; noted for his bravery and military talents. His life was the subject of tragedies by Ben Jonson and Crébillon.

CATINAT, NICOLAS (1637–1712), marshal of France; served in the Flanders campaign (1676–78); conquered Savoy (1690); during War of Span. Succession was placed in command of the Ital. operations, but, after a reverse at *Carpi* (1701), was superseded by Villeroy.

CATION, see ELECTRICITY (ELECTROLYSIS).

CATLIN, GEORGE (1796–1872), Amer. student of the Indians, whom he carefully portrayed with brush and pen.

CATO STREET CONSPIRACY, 1820; plot to murder Lord Castlereagh; considered responsible for

Tory repressive measures, the conspirators meeting in Cato St., London; conspirators hanged or transported.

CATO, DIONYSIUS, supposed author of the *Catonis Disticha de Moribus*, who is believed to have lived during the III. or IV. cent. A.D., though nothing is known of his life. The work consists of aphorisms, written in dactylic hexameters, which enjoyed considerable vogue during the Middle Ages. Caxton pub. an Eng. translation by Benedict Burgh.

CATO, MARCUS PORCIUS, THE CENSOR (234–149 B.C.), Rom. statesman; distinguished himself at the capture of Tarentum (209), and in the second Punic War; elected Censor (184), and Consul (195). He was severe in his habits of life, strove hard to stem the tide of luxury, and earnestly desired a return to the primitive ways of a pastoral life. Of his many writings *De Re Rustica* is alone extant.

CATO, MARCUS PORCIUS, OF UTICA (95–46 B.C.), Rom. philosopher, known as *Uticensis* to distinguish him from his great-grandfather, 'the Censor'; belonged to the Stoic school, and was distinguished by his morality in a very corrupt age. In the war between Cæsar and Pompey he attached himself to the cause of the latter, and stabbed himself in Utica rather than fall into the hands of the conqueror. C. is the subject of a tragedy by Addison.

CATO, PUBLIUS VALERIUS (b. 100 B.C.), Rom. grammarian and poet of the Alexandrian school. Besides grammatical works, he wrote a number of poems, but, above all, is noteworthy for influence he exercised upon public opinion in regard to the lit. of his day.

CATORCE (23° 50′ N., 101° 2′ W.), town, Mexico; tin and silver mines. Pop. 10,000.

CATS, JACOB (1577–1660), Dutch poet; familiarly known as 'Father Cats'; b. Brouwershaven (Zeeland), where a statue was erected to his memory in 1829; ed. for law; ambassador to London, 1627; was knighted by Charles I. He was author of several vol's of poetry of a didactic and humorous character, which were immensely popular in Holland. He also wrote his autobiography (pub. at Leyden, 1734).

CATSKILL (42° 43′ N., 73° 53′ W.), town, New York State, U.S.A., on Hudson River; summer resort; manufactures woollens. Pop. (1911) 5296.

CATSKILL MOUNTAINS (42° 12′ N., 74° 20′ W.), group of mt's, state of New York; highest summits about 4000 ft.

CATTARO (42° 23′ N., 18° 33′ E.), fortified seaport, Dalmatia, Austria, at head of bay of C., enclosed by Montenegrin mountains; has spacious harbour; seat of R.C. bp.; formerly capital of small republic; joined Venice, 1420; finally ceded to Austria, 1814. Pop. 3100.

CATTEGAT, KATTEGAT (56° 50′ N., 11° E.), arm of N. Sea, separating Jutland from Sweden.

CATTERMOLE, GEORGE (1800–68), Eng. artist; b. Dickleburgh, Norfolk; chiefly known as a water-colour artist and book illustrator, but after 1850 he painted numerous pictures in oils; he excelled in treatment of hist. and military subjects; illustrated Waverley Novels.

CATTI, CHATTI, Germanic tribe of Rhine district, mentioned by Romans in III. cent.

CATTLE, a name applied to domesticated members of the ox family (*q.v.* for discussion of wild relatives). These include only the humped cattle, or Zebus (*Bos indicus*), of India, and the many varieties of straight-backed cattle referable to the single species *Bos taurus*. It is impossible to deal with the many races of the latter which have arisen through peculiarities of habitat, or more often through the efforts of breeders, but a few typical examples may be mentioned. Throughout the hilly districts of Wales and Scotland occur rather small-bodied, active cattle, with shaggy coats and generally well-developed horns. They are particularly suited for existence in cold climates and on hard, coarse food. Welsh cattle belong to the Anglesea, Merioneth, Glamorgan, and Pembroke races; the Highland cattle of Scotland are known also as Kyloes; and Shetland has a hardy and peculiarly diminutive race of its own.

The most common of pure-bred Scottish cattle are the black polled or hornless varieties known as Aberdeen-Angus and Galloway, the absence of horns in which appears to be entirely due to selective breeding. Well-known English races are the Herefords, the North Devons, and the Shorthorn, Durham, or Teeswater cattle. Famous for the quality of their milk are the smaller Jersey, Suffolk, and Ayrshire breeds. Between these pure breeds there are innumerable crosses, those in which Shorthorns take part being especially common and popular on account of their combined feeding and milking qualities.

CATTOLICA ERACLEA (37° 26′ N., 13° 23′ E.), town, Girgenti, Sicily; sulphur, salt. Pop. 8150.

CATULLUS, GAIUS VALERIUS (*c.* 87–54 B.C.), the greatest of Rom. lyric poets; his works consist of 116 poems, varying in length from a few lines to upwards of four hundred lines, some written in hexameter and elegiac measure, the greater number being brief lyrics. Perhaps most perfect of his poems are the series, covering a period of several years, addressed to Clodia, sister of Publius Clodius Pulcher, whom he has immortalised under the appellation of 'Lesbia.'

Eng. trans. by Sir T. Martin (1863), Ellis (1871), Munro (1878 and 1905); Davies, *Catullus, Tibullus, and Propertius*.

CAUB, KAUB (50° 5′ N., 7° 46′ E.), town, on Rhine, Pruss. province of Hesse-Nassau, Germany; exports wine; Blucher and his army crossed Rhine at C., Jan. 1, 1814.

CAUCA (*c.* 5° N., 77° W.), department, Colombia, S. America; rich in minerals; has most productive platinum mine in America; capital, Popayán; area, 20,403 sq. miles. Pop. 215,000.

CAUCASIA, CAUCASUS (38° to 46° N., 38° to 50° E.), part of Russia; bounded N. by series of lakes and depressions connecting Kuma and Manyoh rivers, E. by Caspian Sea, S.E. by Persia, S.W. by Asia Minor, W. by Black Sea; area, 182,500 sq. miles; includes Georgia, Circassia, part of Armenia, Akkhasia, Mingrelia, Shirvan, Daghestan. Surface consists of steppes and prairies in N., mountainous district in centre, with the valley of the Rion and Kur rivers separating the Great from the Little Caucasus, and the Trans-Caucasian highlands in the S. Chief rivers are Kur, flowing to Caspian, Rion to Black Sea, Kuban, Terek, and Kuma in N.; chief lake, Gokcha; chief towns, Tiflis, Kars, Batum, Achalzich, Baku, Poti; highest peaks, Mts. Elbrux and Kasbek.

History.—C. belonged in part to Romans and subsequently to the Byzantine Empire. Later it was invaded in succession by various barbarian tribes. Repeated attempts at conquest were made by Russia in the XIX. cent., by whom most of it was annexed or subdued by 1864.

In N. corn is largely grown; cattle raised, and vines cultivated. Central region is well wooded, with forests on the mountain slopes; and in valleys cereals, vines, mulberries, and many fruit trees are cultivated. Trans-Caucasia produces cotton trees, wheat and barley, and on coast, fruits, tobacco, cereals. Minerals include coal, naphtha, sulphur, copper, lead, salt, manganese. There are some mineral springs. Industries include shipping, silk and cotton manufactures, distilling, production of sugar; exports silk, cereals, timber, metal, carpets, etc.

C. is a general government, administered by a gov.-gen. who represents the Tsar; it is subdivided into five governments. The people are of many different races; in northern prairies are Russians, in central mountainous district Circassians, in Trans-Caucasia Georgians, Armenians, Kurds, Turks, Tatars, and other nationalities. Pop. (1910) 11,735,100.

Baddeley, *Russian Conquest of the Caucasus* (1908).

CAUCASUS (42° 30′ N., 45° E.), mountain range, Russia, extending from Taman peninsula, between

Azov and Black Sea, to Caspian; total length, *c.* 940 miles; forms boundary between Europe and Asia. At point equidistant from both seas range is divided by Darial Pass into two sections; immediately to W. is highest part of system, sometimes known as Central C., which extends as far as Mt. Elbrux; from Mt. Elbruz to Sea of Azov is Western C. To E. of Darial Pass is Eastern C., broadest part of system, which extends to Caspian; here peaks are lower and range is more broken by valleys. Highest peaks are Mt. Elbruz (*c.* 18,400 ft.), Dikhtan (*c.* 17,000 ft.), Koshtantau (16,900 ft.), Kasbek (*c.* 16,550 ft.).

Main chain is composed chiefly of granites and crystallines with sandstone and limestone deposits; some of highest peaks volcanic in origin, but range has no active volcanoes though earthquakes are frequent, and there are hot springs. Height of snowline is *c.* 9800 ft. in W., 12,200 in E.; many large glaciers; largest, Devdorak, Bezingi; no lakes. Climate and vegetation differ on N. and S. slopes; S. slopes have splendid forests, produce European fruits, figs, pomegranates, almonds, etc., in central and lower reaches. Fauna includes wolf, bear, jackal, fox, ibex. Minerals are iron, copper, manganese, lead, silver, coal, sulphur, naphtha. Rivers are Kuban, Terek, Kur. Broad valley separates Great from Little C. in Armenia, where highest peak is Alagoz.

Freshfield, *Exploration of Caucasus*; A Wanderer, *Notes on Caucasus*.

CAUCHON, PIERRE (d. 1442), Fr. ecclesiastic; bp. of Beauvais (1420); driven from his see (1429) owing to his overbearing manners, he attached himself to the interests of Henry VI. of England. He bears the inglorious distinction of having been the accuser and judge of the Maid of Orleans, whom he afterwards handed over to the secular authorities. He was excommunicated after death by Calixtus IV. and his body thrown into a ditch.

CAUCHY, AUGUSTIN LOUIS, BARON (1789–1857), Fr. mathematician, prof. of Math's, École Polytechnique (1815), Collège de France, and Univ. of Paris; prof. Mathematical Astron. (1848).

CAUDEBEC LES ELBEUF (49° 15′ N., 1° 4′ E.), town, Seine Inférieure, France; woollens; Rom. remains. Pop. *c.* 11,300.

CAUDEBEC-EN-CAUX (49° 31′ N., 0° 41′ E.), town, Seine-Inférieure, France; interesting early XV.-cent. church and other antiquities; tanneries.

CAUDINE FORKS, FURCULÆ CAUDINÆ (*c.* 41° N., 14° 30′ E.), two mountain gorges in ancient Samnium, Italy, leading to and from plain surrounded by mountains; here Samnites forced Romans to surrender, by barring both exits against them after they entered the valley, 321 B.C.

CAUDLE (O. Fr.), a hot drink consisting of gruel, wine, and spice.

CAUL, a close-fitting woman's cap, often of gold net, worn from XIV. to XVI. cent's; a portion of the membrane enveloping the fœtus, and sometimes covering the child's head at birth; such children are supposed to have a very fortunate future; these cauls are also held to be a safeguard against drowning, and they have often been sold for high prices. The fringe beneath the head of a halberd was also known as a 'caul.'

CAULAINCOURT, ARMAND AUGUSTIN LOUIS, MARQUIS DE (1773–1827), Fr. general and statesman; as an aristocrat he was imprisoned during the Revolution, but escaped, and eventually rose to eminence under Napoleon, who made him Duke of Vicenza, of which title he was afterwards deprived. He accompanied the Emperor in the Russ. campaign. During the 'Hundred Days' he acted as Foreign Minister.

Souvenirs du Duc de Vicence (1837–40).

CAUSATION, conception of operation of causes throughout universe. In metaphysics, sequence of cause and effect leads back to infinite series, whence Problem of First Cause; in psychology, the problem of the origin and validity of the notion. According to Locke, causation implies power, due to reflection on ourselves as causes; Hume affirms causation subjective, expectation due to custom; Mill, the invariable and unconditional sequence between phenomena.

CAUSEWAY (old form, 'causey'), mound or embankment across marshy ground; paved highway; cobbled pathway.

CAUSSADE (44° 9′ N., 1° 32′ E.), town, Tarn-et-Garonne, France.

CAUSSES (44° 30′ N., 3° 20′ E.), series of limestone plateaus, near head-waters of Tarn, southern France.

CAUSTIC is the term applied to a powerful irritant drug which, when applied locally to a part of the body, kills the part to which it is immediately applied, and causes dilatation of the blood-vessels in the area surrounding; *e.g.* nitric acid (concentrated), silver nitrate, arsenious acid, zinc chloride.

CAUSTICS, the envelope of luminous rays after reflection or refraction. Reflection c's may be observed on the surface of milk in a tumbler placed in direct sunlight.

CAUTERETS (42° 54′ N., 0° 7′ W.), town, France; mineral spring.

CAUTIN (39° S., 72° 30′ W.), province, S. Chile, S. America; capital, Temuco; produces wheat and cattle; area, 6377 sq. miles. Pop. 165,000.

CAUTION, Scot. legal term for warrantor, bail, and proviso in deed.

CAUTIONARY TOWNS, Briel, Flushing, Rammekins, and Walcheren, towns pledged by the Dutch in 1585 to Queen Elizabeth in return for loans for Span. War; freed, 1616.

CAUVERY, KAVERI (12° 20′ N., 75° 34′ E.), river, S. India; rises in W. Ghats, flows S.E. through Mysore and Madras, enters Bay of Bengal; forms extensive delta; total length, *c.* 472 miles; ancient *Chaberis*.

CAUX (45° 45′ N., 0° 35′ E.), district, Seine-Inférieure, France.

CAVA DEI TIRRENI (40° 42′ N., 14° 42′ E.), town, Salerno, Campania, Italy; cathedral; manufactures silks, woollens, linens. Pop. 5300.

CAVÆDIUM (Lat.), central court in a Roman house.

CAVAGNARI, SIR PIERRE LOUIS NAPOLEON (1841–79), Brit. military administrator; s. of Fr. and Irish parents; b. Stenay (France), became naturalised as Englishman, and entered East India Co.'s service; served in Oudh campaign; deputy-commissioner of Peshawar (1877); app. government-resident at Kabul, where he was murdered by mutinous Afghans, Sept. 3, 1879. He received the Star of India, and was made K.C.B.

CAVAIGNAC, JEAN BAPTISTE (1762–1829), Fr. politician; f. of Louis Eugène C.; voted in Convention for death of Louis XVI.; held several smaller administrative offices; was prefect of the Somme during the 'Hundred Days'; proscribed as a regicide at restoration, and spent later years at Brussels.

CAVAIGNAC, LOUIS EUGÈNE (1802–57), Fr. general; won distinction in Algeria, where he spent 16 years, being app. gov.-gen. of Algeria in 1848. Returning to Paris in same year, having been elected to the National Assembly, he quelled formidable insurrection (June 23–26). He was a candidate for the presidency of the republic, but was defeated by Louis Napoleon.

CAVAILLON (43° 51′ N., 5° E.), town, on Durance, Vaucluse, France; with XII.-cent. church and Rom. remains; ancient *Cabellio*; silkworms are reared, and silk is important item in trade. Pop. 5750.

CAVALCANTI, GUIDO (1250–1300), Ital. poet; m. Beatrice Uberti, and was head of the Ghibelline faction; was a friend of Dante, who praised his sonnets and *Canzone d' Amore*.

CAVALIER, term used in Shakespeare's day for a swaggering gallant, and in this sense applied by the Puritans of the XVII. cent. to the adherents of Charles I. It was, however, adopted as a title of honour by the Royalists, who dubbed their opponents 'Roundheads.'

CAVALIER, JEAN (1681–1740), Fr. Camisard

leader; b. Ribaute; s. of a peasant; ed. secretly by his mother as a Prot.; joined the Camisards (July 1702), and soon became their leader. When peace was established he came to England, later taking service under Peterborough in Spain. In 1726 he pub. his *Memoirs*; made Lt.-Gov. of Jersey (1738).

CAVALIERE, EMILIO DEL (b. 1550), Ital. composer; employed at court of Francis I. of Tuscany (1588–97); first composer of sacred musical dramas, or 'oratorios,' as they came to be called later.

CAVALIERI, FRANÇOIS-BONAVENTURE, Ital. scientist associated with Galileo.

CAVALLI, FRANCESCO (d. 1676), Ital. composer; as a youth he became a singer at St. Mark's, Venice, was later organist there, and subsequently *mæstro di cappella*; was first Italian to popularise opera, upwards of twenty of his own compositions in this kind being preserved in the library of St. Mark's.

CAVALLINI, PIETRO (1279–1364), Ital. artist; b. Rome; studied under Giotto; executed a large Crucifixion fresco at Assisi; some of his best work is to be found in Santa Cecilia in Trastevere, Rome.

CAVALLOTTI, FELICE (1842–98), Ital. democratic reformer and poet; fought in Garibaldian troops (1860 and 1866); pub. lampoons against monarchy in Milanese newspapers (1866–72); twelve years leader of reform party; fought over thirty duels, in the last of which, with Count Macola, he was killed.

CAVALRY, general name for mounted troops, whose employment in warfare dates back to very early times. To Sesostris, who flourished in Egypt sixteen cent's B.C., is attributed the earliest formation of a regular army. There is no evidence to show that he employed horse-soldiers, and from his time to rise of Persian Empire there was little development in military science. The Persians, however, who introduced the system of mass formation, included squares of c.; and the Greeks made considerable use of mounted soldiers.

In mediæval times the mounted division of an army was provided by the knights and their followers, armed with lance, sword, or battle-axe; but when, later, firearms came into use, it was the custom of the mounted men to gallop forward, and, having fired their pistols, either retreat for the purpose of reloading, or follow up the attack with swords or other arms. The dragoon was evolved from this method of fighting, for the value of mounted soldiers able to act as infantry was quickly recognised, and consequently dragoons armed with the musket were largely employed down to recent times.

At the present day c. forms a large proportion of the Brit. army, of which the regiments of Life Guards, Horse Guards, Dragoon Guards, and Lancers are classed as *heavy* c., while the Hussar regiments are known as *light* c.; all armed with magazine rifles and swords; there is also a very large native force of light Indian C., armed with lances, or sabres, and carrying magazine rifles.

U.S.A. c. is largest of any great army relative to infantry; organised in 15 regiments, each of 866 total peace strength, armed with rifle, sabre, and automatic revolver.

See TACTICS; also *Cavalry in Action in Wars of the Future*, H. Rees; *Cavalry on Service*, Rees; *Cavalry, its History, Management, and Uses*, Roemer (New York).

CAVAN (54° N., 7° 21′ W.), county, Ulster, Ireland; bounded by Fermanagh, Monaghan, Meath, Westmeath, Longford, Leitrim; area, 746 sq. miles; surface undulating; N.W. mountainous; watered by Annalee, Blackwater, Erne, Woodford; mineral springs; soil poor; agriculture chief industry; distilling, linen-bleaching; chief town, Cavan. Pop. (1911) 91,071.

CAVAN (53° 59′ N., 7° 22′ W.), market town, capital of C. County, Ireland; has remains of XIV.-cent. abbey.

CAVANILLES, ANTONIO JOSÉ (1745–1804), Span. ecclesiastic and botanist.

CAVATINA (Ital.), a simple melody as distinguished from the *aria* in operas or oratorio.

CAVE, EDWARD (1691–1754), Eng. publisher; founded (1731) and edited (as 'Sylvanus Urban, Gent.') the *Gentleman's Magazine*, which brought him a large fortune. He gave Dr. Johnson his first literary employment as parliamentary reporter for the magazine.

CAVE, WILLIAM (1637–1713), Eng. ecclesiastic; made canon of Windsor (1684), and was chaplain to Charles II.; he pub. (1677) *Apostolici* (Lives of the Fathers) and *Scriptorum Ecclesiasticorum Historia Literaria* (1688).

CAVEAT (Lat.), 'let him beware'—as to file a *caveat* in a probate court opposing the proving of a will; to enter a *caveat* against the granting, or renewal, of a patent. *C. emptor*, a legal maxim which means that a purchaser (*emptor*) must look after himself, the seller not being bound to disclose secret faults, though he may not conceal them.

CAVENDISH, LORD FREDERICK (1836–82), Brit. statesman; younger s. of Duke of Devonshire; became Chief Sec. for Ireland, 1882; assassinated in Phœnix Park, Dublin.

CAVENDISH, GEORGE (1500–62), Eng. historian; famous for his *Life* of Cardinal Wolsey, whom he served as gentleman-usher, and attended up to the time of his death. The work was not pub. until 1641, but it was freely circulated in MS. during C.'s lifetime, and was used by Shakespeare in *Henry VIII.*

CAVENDISH, HENRY (1731–1810), Eng. chemist and physicist; b. Nice; discovered hydrogen (1766), described its properties (1781), demonstrated composition of water and of nitric acid; determined density of the earth by 'Cavendish Experiment'; became member of Royal Soc., 1760; pub. researches in its *Philosophical Transactions.*

CAVENDISH, THOMAS, CANDISH (1555–92), navigator; b. Trimley, near Ipswich; sailed with Grenville to Virginia (1585); sailed from Plymouth (1586) with three ships, and, with John Davis, he was third circumnavigator of the globe, completing the voyage in little over two years.

CAVENDISH, SIR WILLIAM (1505–57), ancestor of Dukes of Devonshire; enriched from spoils of the monasteries; husband of celebrated 'Bess of Hardwicke,' afterwards Countess of Shrewsbury.

CAVIARE (now pronounced in three syllables), the salted roe of the sturgeon, prepared in Russia as a table delicacy, and known in Western Europe certainly as early as the XVI. cent., as is evidenced in the reference to it in Shakespeare's *Hamlet.*

CAVITE (14° 35′ N., 120° 50′ E.), fortified seaport, capital of C. province, Luzon, Philippine Islands; naval station; large tobacco factory. Pop. port, 5000; province, 136,000

CAVOUR (44° 46′ N., 7° 23′ E.), town, Piedmont, Italy. Pop. 6817.

CAVOUR, CAMILLO BENSO, COUNT (1810–61), Ital. statesman; b. Turin, of noble descent; ed. for army, but his liberal opinions proved incompatible with a military career, and he retired, 1831; took up agriculture and did much to improve economic conditions of Piedmontese; travelled in France and England, and closely studied the Brit. constitution, which he greatly admired; entered political arena, 1848, and was successively Minister of Agriculture, Commerce, Marine, and Finance; became Premier, 1852. In 1858 he entered into a secret treaty with Napoleon with a view to driving the Austrians out of Italy; he encouraged the efforts of Garibaldi; and the dream and struggle of his life was to found a united Italy, which he lived to see an accomplished fact. C. was one of the greatest statesmen of modern times.

Cadogan, *Cavour* (1907).

CAVY FAMILY (*Caviidæ*), a New World family of Rodents, with about 20 species. They are generally less than a hare in size and resemble in appearance the GUINEA-PIG (*Cavia*), which is a domesticated species;

but the S. American CAPYBARA (*Hydrochœrus capybara*) is the largest living rodent, reaching a length of 4 ft.

CAWDOR (57° 32′ N., 3° 55′ W.), village, Nairnshire, Scotland; C. castle is supposed scene of traditional murder of King Duncan by Macbeth, 1040.

CAWNPORE, KANPUR (26° 28′ N., 80° 24′ E.), chief town, district of C., United Provinces, Brit. India, on Ganges; important railway centre; military station; memorial gardens and church commemorate massacre of Europeans by Nana Sahib, July 1857; manufactures leather goods, and has large trade in grain. Pop. (1911) 178,557.

CAXIAS (5° 7′ S., 42° 50′ W.), town, Maranhão, Brazil. Pop. 25,000.

CAXTON, WILLIAM (1422–91), first Eng. printer; b. in the Weald of Kent; apprenticed to a London mercer, after whose death he went to Bruges to complete his apprenticeship, was successful in business, and became gov. of the Company of Merchant Adventurers in the Low Countries. Afterwards he entered the service of Margaret, Duchess of Burgundy, sister of Edward IV., and about this time he learned the art of printing. Returning to England in 1476, he set up his printing-press at the Red Pale in the Almonry of Westminster. His first book known to have been printed in England was the *Dictes and Sayings of the Philosophers* (1477); but he had already printed in English at Bruges the *Recuyell of the Historyes of Troye* (1474), and the *Game and Playe of Chesse*. He printed, among other books, the principal works of Chaucer, Gower, Lydgate, and Sir Thomas Malory's *Morte d'Arthur*, and was himself the translator of numerous works.

Blades, *Biography and Typography of C.*

CAYENNE (4° 56′ N., 52° 20′ W.), fortified seaport, capital of Fr. Guiana, on C. Island, at mouth of C. River; exports gold, woods, spices; gives name to well-known pepper; formerly Fr. penal settlement. Pop. 12,600.

CAYENNE PEPPER, preparation from species of capsicum (principally *Capsicum fastigatum*), the fruits being known as chillies. C. is hot and pungent, due to presence of alkaloid *capsicine*; used as spice and stimulant in medicine.

CAYES, LES (18° 12′ N., 73° 30′ W.), port, Haiti, W. Indies; coffee. Pop. 12,000.

CAYEY (18° N., 66° 24′ W.), town, Porto Rico; summer resort; produces coffee and tobacco. Pop. 4000.

CAYLEY, ARTHUR (1821–95), Eng. mathematician; b. Richmond (Surrey); senior wrangler and Fellow of Trinity Coll., Cambridge (1842); Sadlerian prof. of Math's (1863); delivered famous address, Brit. Association (1883); wrote extensively on mathematical subjects.

CAYLUS, ANNE CLAUDE PHILIPPE, COMTE DE (1692–1765), Fr. archæologist; b. Paris; served in Span. War of Succession; travelled in Greece, Italy, England, and Germany, collecting antiquities; was a noted engraver; his chief publication was *Recueil d'Antiquités égyptiennes, étrusques, grecques, romaines, et gauloises* (7 vols., 1752–67).

CAYLUS, MARIE MARGUERITE, MARQUISE DE (1673–1729), Fr. writer; mother of Mme de Maintenon, and author of scandalous *Souvenirs*.

CAYMAN, see ALLIGATOR.

CAYMAN ISLANDS (19° 44′ N., 79° 44′ and 80° 26′ W.), three islands, Caribbean Sea, N.W. of and under government of Jamaica; discovered by Columbus; staple production, turtles.

CAZALLA DE LA SIERRA (37° 56′ N., 5° 51′ W.), town, Seville, Spain. Pop. 9000.

CAZEMBE, hereditary name of African chief originally occupying territory between the Mweru and Bangweulu lakes. From the XVIII. cent. onwards the C. was a ruler of great power and influence. David Livingstone visited the C. in 1868. The country now forms part of Rhodesia and the Belgian Congo, and the latter division is the centre of a thriving copper industry.

CAZIN, JEAN CHARLES (1840–1901), Fr. landscape artist; spent some time in England, and his earlier pictures were influenced by Pre-Raphaelite movement; later successes, *Souvenir de fête* (1881) and *Journée faite* (1888); officer of Legion of Honour.

CAZORLA (37° 55′ N., 2° 57′ W.), town, Jaen, Spain. Pop. 6000.

CAZOTTE, JACQUES (1719–92), Fr. author; held official appointments until middle life, when he turned his attention to authorship; wrote romances, Oriental tales, and narrative poems; was best known as author of a fantastic romance, *Diable amoureux* (1772).

CEARÁ (5° S., 39° W.), maritime state, N. Brazil area, 40,247 sq. miles; has Serra Grande and Serra Araripe in W.; drained by Jaguaribe, Acarahu; capital, Fortaleza; climate healthy, but hot; droughts occur; produces coffee, cotton, medicinal plants, sugar, fruits, wax, rubber; cattle raised; minerals include iron, copper, salt. Pop. 890,000.

CEAWLIN (d. 593), king of West Saxons; obtained many victories over the Brit. kings; destroyed Uriconium (near Wrekin) and Pengwyrn (Shrewsbury); was himself finally overcome, and d. in obscurity.

CÉBÈS (fl. V. cent. B.C.), disciple of Socrates in Plato's *Dialogues*.

CEBIDÆ, family of Primates (*q.v.*).

CEBÚ (10° 20′ N., 123° 57′ E.), port of entry, Cebú Island, Philippines; chief commercial city; cathedral; exports hemp, tobacco, sugar. Pop. 31,500.

CECCANO (43° 33′ N., 13° 21′ E.), town, Rome, Italy. Pop. 10,000.

CECCO D'ASCOLI (1257–1327), Ital. encyclopædist and poet; is chiefly known as author of the *Acerba*, an encyclopædic poem in four books covering the entire gamut of the then known arts and sciences, morals, etc. (numerous editions); tried for impiety at Florence, found guilty, and burned at the stake.

CECIL, noble Eng. family, of which there are two distinct branches. WILLIAM CECIL, Lord Burghley, Queen Elizabeth's great minister; b. Bourne (Lincoln); belonged to the Stamford Cecils; he m. (1) Mary Cheke, by whom he had a s., Thomas, cr. by James I. 1st Earl of Exeter; m. (2) Mildred Cooke, who bore him a s., Robert, cr. by James I. Lord C. of Essendene, Viscount Cranborne, and Earl of Salisbury (1605). Thus the Hatfield Cecils are a younger branch of the family. A marquessate was given to the 10th Earl of Exeter (*i.e.* the Stamford line) in 1801, who m. Sarah Hoggins, a Shropshire farmer's dau.; their story has been celebrated in song by Tennyson. This elder branch of the family is still established at Burghley.

CECILIA, ST., Christian martyr; festival, Nov. 22; patron of music and blind persons. According to Fortunatus, bp. of Poitiers, she suffered martyrdom in Sicily, under Marcus Aurelius, some time between 176 and 180. A church to perpetuate her fame existed at Rome in the IV. cent., and has been several times rebuilt. She has been the theme of many artists, and Dryden's famous ode, and others of less note, were written to celebrate her festival.

CECROPS, mythical founder of Athens and teacher of arts of civilisation to Attica.

CEDAR, tree of order Coniferæ; *Cedrus libani* (cedar of Lebanon), *Cedrus deodara* (sacred deodar of India), *C. atlanticus* (N. Africa), furnish excellent timber; that of *C. libani* was used in building of Solomon's temple; *C. deodara* supplies a turpentine beneficial for skin diseases; *Juniperus Bermudiana* and *Cedrela toona* (a West Indian species) yield cedar wood which is used for pencils, etc.

CEDAR CREEK (39° 5′ N., 78° 26′ W.), stream, Virginia, U.S.A.; flows E. into N. fork of Shenandoah; scene of defeat of Confederates by Federals, Oct. 19, 1864.

CEDAR FALLS (42° 32′ N., 92° 27′ W.), city, on Cedar, Iowa, U.S.A.; cereals produced. Pop. (1910) 5012.

CEDAR RAPIDS (41° 57′ N., 91° 40′ W.), city, on Cedar, Iowa, U.S.A.; railway and manufacturing centre; extensive flour-mills. Pop. (1910) 32,811.

CEDILLA, mark ¸ placed under letter c (soft) in French.

CEFALU (38° 1′ N., 14° 3′ E.), seaport, Palermo, Sicily; ancient *Cephalœdium*; cathedral and ruined castle; chief industries, marble-quarrying and fishing. Pop. 11,788.

CEGLIE (40° 40′ N., 17° 31′ E.), town, Italy. Pop. 17,000.

CEHEGIN (38° 5′ N., 1° 48′ W.), town, Murcia, Spain; wine, olive oil, and hemp chief products; fine black marble quarries in vicinity. Pop. 10,000.

CELÆNÆ (38° 5′ N., 30° 20′ E.), ancient city, Phrygia; residence of Xerxes.

CELANO (42° 7′ N., 13° 35′ E.), town, Aquila, Italy; birthplace of Thomas of Celano, Latin poet. Pop. 7600.

CELAYA (20° 34′ N., 100° 28′ W.), town, Mexico; carpets, textiles. Pop. (1910) 23,112.

CELEBES (2° 20′ S., 120° 20′ E.), island of Great Sunda group, Dutch East Indies, on equator; separated from Borneo by Strait of Macassar, and bounded N.E. and S. by Celebes Sea, Molucca Sea, and Sunda Sea respectively; area, 71,470 sq. miles; curiously shaped, four long finger-like peninsulas radiating N.E., E., S.E., and S., with mountain ranges running down each; highest peaks, Bonthain, Donda; drained by Sadang and other streams; chief lake, Paso; climate healthy except along coast; rainfall not excessive. C. produces sago palms, cocoa-nuts, coffee, nutmegs, tobacco, sugar-cane, cotton; exports also rubber, gums, pearls, trepang, tortoiseshell, edible birds'-nests, sandalwood, ebony, teak; coal, iron, copper, tin, and sulphur found. Portuguese founded settlement at Macassar, 1525; expelled in 1660 by Dutch, whose authority has been recognised by native princes since early XIX. cent. Pop. *c.* 800,000. See MALAY ARCHIPELAGO.

CÉLESTE, MADAME (1815–82), Fr. dancer and actress; managed Adelphi and Lyceum.

CELESTINA, LA, alternative title of the *Comedia de Calisto y Melibea*, an anonymous Span. dramatic romance which was popular in Europe during XVI. cent. (Eng. trans. by James Mabbe, 1631).

CELESTINE, name of five popes.—CELESTINE I., pope, 422–32, sent Palladius and St. Patrick to preach in Ireland. CELESTINE V., pope in 1294, abdicated same year; imprisoned by Boniface VII.; canonised, 1313; founded *Celestines*, ascetic order of Benedictines; they wore white robe with black hood, scapular, and mantle; are now almost extinct.

CELESTINE ($SrSO_4$), native sulphate of strontium; occurs in Sicilian sulphur mines; transparent and finely crystalline; bright blue, red, and yellow; used in manufacture of fireworks.

CELIBACY, the unmarried state, is in several religions held to be necessary to the highest human perfection. Before Christianity it had taken root in Buddhism, and the Essenes, a Palestinian monastic order, also practised it. In the Jewish Church priests were bound to continence at certain times only. Christ commended voluntary c., and St. Paul, while insisting on the excellence of virginity, assumed the right of bp's and priests to marriage. By the II. cent. the taking of vows of chastity had become a pious custom. In the IV. cent. Pope Damasus insisted on the c. of bp's, priests, and deacons of the Western Church; but for some cent's the papal decretals were ignored. In the XII. cent., however, the marriage of those in Holy orders was declared null and void, and this was confirmed by the Council of Trent. In the Eastern Church c. has never been adopted, and the practice of the modern Gk. Church is to allow candidates for Holy orders to get married, if they wish, before ordination. Marriage after ordination is not permitted, and bp's are recruited from the unmarried clergy.

H. C. Lea, *History of Sacerdotal Clergy* (1907).

CELL, a unit mass of living matter usually containing a nucleus. All plants and animals are built up of cells and their products, the simplest organisms (*Protozoa* and *Protophyta*) and the male and female elements (*gametes*) being single cells. In size cells may vary from structures only discernible through high power lenses to large eggs distended with yolk. The simplest form of cell is a sphere, but under varying conditions it may be oval, polygonal, star-shaped, or assume thread-like or other shapes.

A cell essentially consists of the *cytoplasm* (cell-substance) which is composed of foam-like or fibrillar living matter (protoplasm (*q.v.*)), and carbohydrates, yolk globules, fats, or pigments (*metaplasm*); the *nucleus*, which plays an important part in the metabolism (*q.v.*) of the cell, especially in reproduction, usually consists of a network of strands, a coiled thread, or bodies (*chromatin*) which are stainable with certain dyes, and a less stainable substance (*achromatin*). In many nuclei one or more round bodies or vacuoles (*nucleoli*) have been observed, which seem to collect the waste matter produced by the metabolism of the cell; the *centrosome*, a 'center of energy,' seems to direct the division of the cell. The *cell-wall* is a less essential structure, composed of cellulose in most plant cells, while certain animal cells may form a cuticle or secrete a sheath usually consisting of chitin.

In a growing cell the mass increases proportionately more than the surface, so that the latter is unable sufficiently to absorb oxygen or nutriment, and to get rid of the waste matter, therefore cells generally divide at a definite limit of growth. In some cases the division is merely a cleavage of the nucleus (*amitosis*) followed by that of the cytoplasm, but generally a complicated process known as *mitosis* or *karyokinesis* takes place. The following are the principal stages: (1) Nucleus 'resting'; chromatin is scattered, two centrosomes being surrounded by a *centrosphere*. (2) Chromatin arranged in a coil which breaks up into *chromosomes* (each species of plants and animals having a definite number); centrosomes form 'diasters' connected by a 'spindle.' (3) Chromosomes become attached to fibres of the spindle. (4) Centrosomes move to lie opposite to one another; chromosomes arranged in the equator of the spindle. (5) Each chromosome splits in two. (6) Daughter chromosomes separate and move towards the spindle poles; the latter divide in readiness for the next karyokinesis. (7) Spindle and asters are disappearing; chromosomes grouped at spindle poles; constriction of cell body. (8) Division complete; nuclei resting as in stage (1). See CYTOLOGY, EMBRYOLOGY, TISSUE.

E. B. Wilson, *The Cell in Development and Inheritance* (2nd ed., 1900); O. Hertwig, *Allgemeine Biologie* (Jena, 1906).

CELLE (52° 38′ N., 10° 3′ E.), town, on Aller, Hanover, Prussia; manufactures tobacco, woollen yarn, etc. Pop. 22,000.

CELLIER, ALFRED (1844–91), Eng. composer; b. Hackney; was conductor at Princes Theatre, Manchester (1871–75), where in 1874 he produced his popular *Sultan of Mocha*. His greatest success was *Dorothy*, produced at the Gaiety Theatre, London, in 1886. His other operas, *Doris* (1889) and *The Mountebanks* (1892), were comparative failures.

CELLINI, BENVENUTO (1500–71), Ital. artist, metal-worker, sculptor, and flautist. Nothing but his famous and inimitable *Autobiography* can do justice to his many-sidedness. He was b. at Florence; s. of musical instrument maker; apprenticed to a goldsmith; then took up flute-playing, and became one of the Pope's court musicians. He enjoyed considerable patronage as a metal-worker under Clement VII., but his penchant for brawling led to his constant change of domicile, and he lived at Siena, Pisa, Rome, and Florence, changing his profession as often as his place of residence. Amongst other exploits he claimed to have shot the Constable

de Bourbon with his own hand during the attack on Rome, 1527. Perhaps his greatest work as sculptor is the bronze group, *Perseus holding the head of Medusa*, in the Loggia dei Lanzi, Florence.

Trans. of *Autobiography* by J. A. Symonds (1887), by Roscoe (1904).

CELLULOID, dried solution of gun cotton (pyroxylin) and oil; obtained by treating cellulose with nitric and sulphuric acids; first made by Parkes of Birmingham (*c.* 1856); not acted upon by atmosphere or water; can be coloured and, when plastic, at 175° F., moulded; when hard can be carved and turned; highly inflammable; used for collars, combs, buttons, billiard balls, etc.

CELLULOSE forms the chief component of vegetable cell wall and hence of all vegetable tissues, and is the product of the vital activity of plants in building up their structure from carbon dioxide and water. It is, in chemical constitution, a carbohydrate representable by the formula $(C_6H_{10}O_5)^n$, and is obtainable pure from cotton or linen fibre by boiling out impurities with alkali, alcohol, or ether. Cotton, wool, and ordinary filter paper are nearly pure forms of C. It is a white opaque substance appearing under microscope as a fretwork of thin flattened tubes, is insoluble in water, alcohol, ether, and dissolves in an ammoniacal solution of copper hydroxide. It yields a blue colour when treated with dilute sulphuric acid and iodine, becomes viscous when treated with strong sulphuric acid, and if then diluted with water and boiled is converted into dextrose (grape-sugar). Unsized paper dipped into strong sulphuric acid is converted into 'parchment paper' or 'vegetable parchment.' Strong nitric or preferably nitro-sulphuric acid converts it, after being dried, into an inflammable nitrate or nitric ether used for explosives as *gun-cotton* and *pyroxylene*.

C. is soluble in alkaline thiocarbonates, the solution, called *viscose*, being used for spreading on cloth or paper, a coating of c. being deposited by its evaporation. Besides being the source of valuable derivatives c. itself is used in the fibrous state as cotton, linen, hemp, and jute in textile industries, and as a pulp, obtained from wood or esparto grass, in the manufacture of paper.

Cross and Bevan, *Researches on Cellulose*.

CELSIUS, ANDERS (1701–44), Swed. physicist; prof. of Astronomy, Upsala, 1730–44; measured arc of the meridian in Lapland; devised the centigrade thermometer.

CELSUS (II. cent. A.D.), Platonic philosopher and opponent of Christianity, which he attacks in his *True Word*; see J. A. Froude, *Short Studies*, iv.

CELSUS, AULUS CORNELIUS, see ANATOMY, MEDICINE, SURGERY.

CELTIBERIA, name given by Greeks and Romans to large district in N.E. Spain, peopled by the Celtiberi tribes who were formed by intermixture of Celtic invaders with Iberians in Spain (*q.v.*).

CELTS was the name given by classical writers to all people living north of the Alps. In British history it is applied to the tall, fair-haired, blue-eyed race that invaded Britain from Gaul about the VI. cent. B.C., dominated and coalesced with the Iberian people it found there (to whom it taught the use of iron), founded the states overthrown by the Romans, and finally after the Anglo-Saxon invasions in the V. cent. is popularly supposed to have been exterminated in England and survived only in Ireland, Wales, Man, the Scottish Highlands, and Cornwall, while a section crossed from the south to France and founded the Celtic State of Brittany (Armorica).

Celtic Languages.—These comprise Irish, Welsh, Manx, Gaelic, Cornish, and Breton, all members of a common Indo-European linguistic family, but dividing themselves into two groups called Goidelic and Brythonic, closely related and having many similarities in vocabulary and grammatical construction, especially in inflectional forms and initial mutation, but differing essentially in changing prehistoric initial *qv* into *c* and *p* respectively. Irish (Erse) is the parent of the Goidelic group, which comprises also Gaelic and Manx. In the Brythonic group, but not so closely related, are Welsh, Breton, Cornish, very alike in their oldest forms, but diverging later under the influence of neighbouring tongues. All with the exception of Cornish are living languages. Over half a million people speak Breton only, and in one of the four dialects of which *Léon* is the purest and *Cornouaillais* the most widely spread. (Grammar and Lexicon by Le Gonidec.)

Celtic Literature.—Cornish, Manx, and Gaelic have but a small literature. In the first, apart from lists of words and proper names, we have the Bodmin Gospels and a few religious plays or interludes dating from the XV. to the XVII. cent. Manx likewise can claim chiefly ballads and carols of a semi-religious type. Scottish Gaelic literature was purely Irish literature until the XVIII. cent., when the Jacobite invasions and the loss of Gaelic independence caused the growth of an independent literature having Jacobitism, religion, and a melancholy sentiment of love and lament for the Highlands and their fortunes as its chief themes. The most prominent authors were Mary Macleod (1558–1693), Alexander Macdonald (d. 1710), and especially James Macpherson (1736–96), who published Gaelic poems falsely purporting to be by the enigmatical Ossian and dragging the true work into undeserved disrepute and fiercely prolonged contention. The two most important pieces of old Breton are the mystery plays, *The Mystery of St. Nonna* and *The Great Mystery of Jesus*, which come (at latest) from XIV. cent. But there are collections of ballads (*gwerzion*) and songs (*sonion*), pub. in XIX. cent. by La Villemarqué and Luzel.

Irish Literature in the early and middle periods is the most prolific of all Celtic literatures. The earliest survivals date from the V. to the XI. cent., and consist of glosses upon the Gospels and Fathers, hymns, services of the Mass, homilies, and calendars. They are collected in the *Thesaurus Palæohibernicus* of Stokes and Strachan. Middle Irish literature is particularly rich. We have annalistic works such as *Tigernach*, *Loch Ke*, the *Annals of Ulster*, *Chronicon Scotorum*, and the *Book of the Four Masters*, in collections dating from the XI. to the XVII. cent. Other historical prose is the saga called *Cogad Gœdil re Gallaib*, describing the triumph of Brian Borumha over the Norsemen at Clontarf, the *Triumph of Turlough O'Brien* (1459), by John MacCraith, dealing with the history of Munster, and the famous *History of Ireland to the Norman Conquest*, by Geoffrey Keeting (1570–1646).

But Middle Irish is most famous for its epic literature, both prose and verse, which is found in the *Book of the Dun Cow* (*Lebor nah-Uidre*, XII. cent.), the *Book of Leinster* (XII. cent.), the *Yellow Book of Leccan* (XIV. cent.), the *Book of Ballymote* (XV. cent.), and the *Leabhar Breac* (*Speckled Book*, XVI. cent.). These are all transcriptions of much older matter, and contain miscellaneous historical, genealogical, and legendary lore, many breezy short stories like the 'Tale of the Three Young Clerics,' and especially the stories of the 'Ulster Cycle,' of which the most important is the great *Tain Bo Cualnge*, or the 'Raid of the Dun Cow.' This relates how the king and queen of Connaught invaded the lands of Conchobar, king of Ulster, when the whole of the Ulstermen were stricken by a periodical sickness caused by enchantment, and how they were repelled by the single might of the demi-god Cuchulinn, the central hero of the cycle, who from his youth had performed superhuman feats, running down deer on foot and killing opponents by the shock of his club on the earth, or paralysing them by horrible physical contortions such as contracting his eye to a pin point or expanding it to the size of a lake. The tale is long, but written with spirit and humour, and its barbaric splendour and pagan sentiments are little softened by the Christianised versions that have come down to us.

The cycle is formed by other tales that have gathered round it as amplifications of its prominent persons and events, of which the most dramatic is the 'Tale of Bricriu's Feast,' the most beautiful the *Tain Bo Fraech*, and the 'Tale of the Life and Death of Deidre.' The *Yellow Book* and the *Dun Cow* also contain versions of the mythical story of the voyage of Bran and his companions in search of beauty, happiness, and immortality.

In the XII. cent. there originates a Fenian or Ossianic Cycle around the personalities of the poets Finn and Ossian, which eventually superseded the Ulster Cycle, although it was really inspired by it. The most famous of the Ossianic ballads is in the *Book of the Dean of Lismore*, by James Macgregor and his brother Duncan (1512–26), which is a Scottish compilation.

Middle Irish verse, apart from the poems of the Ulster and Ossianic Cycles, is still under investigation, but much matter of a lyrical nature has been collected and published by Kuno Meyer and Douglas Hyde, such as Meyer's *Four Irish Songs of Summer and Winter* and Hyde's *Around the Fire*. Much of it is heroic and bardic, in praise or lament of patrons, and written in highly elaborate and artificial metrical forms. But by the XVII. cent. this slowly vanishes, and a line of poets appears using vowel rhyme and accent and adopting modern topics, until the Gaelic League in recent years revived an interest in past literature, attempting to stop the deterioration that set in through the corrupting influence of English.

Welsh Literature, like the Irish, has early specimens of glosses of the IX. and X. cent's. It has also the remains of exceedingly ancient epic verse in the productions of the cynfeirdd, Aneurin Taliessin, and Myrddin or Merlin, and Llywarch Hen, whose works are probably in part an agglomeration of the works of many forgotten bards singing of the British heroes who opposed the advance of the Anglo-Saxons in the V. cent. onwards. It is all said to date before the X. cent. The resistance to the Normans in the XII. cent. caused a national revival, expressing itself in a literary revival. Of this the poems of Meilir and his descendants, Gwalchmai, Einion, and Meilir, and of the musical Cynddelw and the princely Owen Cyfeiliog and Howel ap Owen were the signal. Its prose monument was the lively and graphic *Life of Gruffydd ap Cynan*, the patron of the movement. The XIII. cent. maintained the traditions of the XII., inspired by the successes of the Llewelyns against the English, and ended with the touching eulogy written by Gruffydd yr Ynad Coch upon the last of the Welsh princes. All of this verse is bardic, and written in a rigid artificial elaborate framework of alliteration, assonance, and internal rhyme.

Until the end of the XIV. cent. Wales was voiceless, and then the Renascence found and the influence of French and Provençal verse produced in *Dafydd ap Gwilym* a poet of the very first rank, who brought his favourite form of the cowydd (rhyming couplets in seven syllables) to its perfection in his voluptuous but infinitely artistic and tender verses. This represented a movement to modify the cramping effects of earlier styles, but by the middle of the century a reaction set in, stimulated perhaps by a revival of the old-fashioned type of poems of war and patronage during the palmy days of Owen Glendower. This produced poets of the pure bardic type writing in the closed metres, among whom David ap Edmund was prominent as the sponsor of the restored style. Gutyn Owen, a popular favourite Tudur Aled, Robin Ddu O Fon, and Lewis Glyn Cothi and Gruffydd Hiraethog. Middle Welsh, like Irish, has its cycle of romances in the 'Tales of the Mabinogion,' preserved for us in the *White Book* and in the *Red Book of Hergest*. Part of these are later versions of very ancient compositions betraying a pagan origin and part a Welsh contribution to the mediæval tales of chivalry. In the latter the central hero is King Arthur, whose renown had been revived in the XII. cent. by Geoffrey of Monmouth. Research has shown that Irish and French influences have affected both classes of stories, but their perfection of style and their artistic treatment are unique.

Welsh literature has shown greater vigour, versatility, and purity than any other Celtic literature, continually increasing its scope and resisting the corroding influence of English to modern times. It was aided by the revival of prose literature in the XVI. cent., when Salesbury translated the New Testament in 1567 and Bishop Morgan (d. 1604) translated the Bible into Welsh, and thus standardised the language and led the way in a series of translations and adaptations of English religious works like Kyffin's *Deffyniad Y Ffydd*, Morgan Llwydd's *Llyfr Y Tri Aderyn*, Theophilus Evans's *Drych Y Prif Œsœdd*, and Ellis Wyn's *Gwelidigæthu Y Bardd Cwsg*. At any rate, beginning with Huw Morus (1622–1709) and Lewis Morus (1700–65), a sustained revival set in, producing the greatest master of the closed metres, Goronwy Owen (1722–69), William Williams of Pant y Celyn, a hymnologist of transcendent power; Twm o'r Nant (Thomas Edwards), of lesser calibre, but the most popular author of interludes and ballads; Dr. Lewis Edwards, essayist and theologian (1809–87); and Daniel Owen, novelist (1836–95). This movement never lost force, because it had emancipated itself from the bardic narrowness and appealed to the people at large. A new line of popular poets, mostly of humble origin and avocation, writing in the free metres or in looser adaptations of the old, brought the Welsh lyric to perfection. Their number is great and their work possessed of lasting merit, but it will suffice to mention Ieuan Glan Geirionydd (1795–1855), Ceiriog (1832–57), and Islwyn (1832–78), who was perhaps the greatest of all Welsh poets of the XIX. cent.

Maclean, *Literature of the Celts* (1902); Macneill, *Literature of the Highlanders* (1892); Morrice, *Manual of Welsh Literature* (1909); Hull, *Text-Book of Irish Literature* (1908); Rhys, *Celtic Britain* (1908).

CEMENT is a material used for sticking things together, and therefore might include gum, glue, paste, plaster of Paris, mortar, etc. The term, however, generally implies *hydraulic* c., which sets under water. This consists of silicates of lime and alumina, with smaller quantities of magnesia, oxide of iron, etc., and may be made from volcanic tufas, blast furnace slag, or wholly artificial mixtures. The chief c. is *Portland* c. (yielding a product resembling Portland stone); its composition is as follows (Blount): silica, 21·76 %, insoluble matter, 0·78, alumina, 6·77, ferric oxide, 3·43, lime, 62·06, magnesia, 1·14, sulphuric anhydride, 1·55, carbon dioxide and water, 1·72, alkalis and loss, 0·79.

The available materials for c.-making, which may be chalk, limestone, marl, clay, shale, etc., are employed in proportions determined by their composition; an Eng. mixture is 3 parts of chalk to 1 of Medway mud. The ingredients are mixed into a thick paste called *slurry*, ground wet, and dried into a tough cake which cracks into blocks ready for roasting in kilns heated with coke to 1500° C. The mass nearly fuses, forming *clinker*, a solid solution believed to contain tricalcium silicate (Ca_3SiO_5) and aluminate ($Ca_3Al_2O_6$), which is ground till floury. Fineness and specific gravity (3·15) are criteria of c.

The power to harden while wet distinguishes c. from mortar, whose hardening follows drying, and is due to carbonation of lime. When mixed into a paste with water, c. stiffens in a time varying from a few minutes to some hours, but gradually hardens over a longer period.

The following changes are believed to take place during hardening:—

$$2Ca_3SiO_5 + 9H_2O = (CaSiO_3)_2.5H_2O + 4Ca(OH)_2$$

$$Ca_3Al_2O_6 + Ca(OH)_2 + 11H_2O = Ca_4Al_2O_7.12H_2O.$$

The former reaction, including both hydrolysis and hydration, probably accounts for the hardening, which, like the setting of plaster of Paris, is due to transition

to a less soluble, crystalline form, through the medium of water. Uses: For pavements and tanks, for making concrete for docks, harbours, bridges, lighthouses, foundations of buildings, and reinforced or steel concrete (*q.v.*).

Cement Manufacture in Great Britain, W. H. Stanger and B. Blount.

CÉNACLE, Fr. name for gathering at the 'Last Supper'; afterwards applied to literary clubs, especially *Romantiques* gathered round Victor Hugo.

CENCI, BEATRICE (1577–99), Ital. parricide; b. Rome. Her f., Francesco C., a man of great wealth and an adjudged criminal from his eleventh year, was murdered while asleep by two assassins hired by his wife, Lucrezia, Beatrice, and several sons. The two women were found guilty, and beheaded. Beatrice's defence was that her f. had forcibly committed incest with her, but the charge rests entirely on the unsupported statement of her advocate, Farinaccio, who is known to have made false statements. Beatrice's own life was not free from error, and she made provision in her will for the care of 'a certain poor boy,' said to have been an illegitimate son.

Article in *Edinburgh Review* (1879); P. B. Shelley, *The Cenci*.

CENIS, MT. (45° 17′ N., 7° E.), peak of Alps, between France and Italy; the pass, 6700 ft. high, is much used; over it a road was constructed by Napoleon. Near M. C. is tunnel of same name; 8 miles long; cost *c.* £3,000,000.

CENOBITES, monks who, like the Benedictines, live a common life in conventual foundation, as opposed to anchorites (hermits or eremites) who live in solitude.

CENOTAPH ('empty tomb'), commemorative monument or tablet to person buried elsewhere; originally employed in cases where the bodies of persons could not be recovered, such as death in foreign wars, or by drowning.

CENSOR.—(1) Title of two Rom. officials whose business was to register the citizens and assess their property, and to regulate morals and conduct. (2) An official in the univ's of Oxford and Cambridge who is responsible for the conduct of the non-collegiate students.

CENSORSHIP.—(1) **Press.**—In Tudor times the Company of Stationers regulated printing under control of Star Chamber. Milton in *Areopagitica* protested against Parliament's c. It was abolished, 1695, The John Wilkes case, 1764, and 'Junius' prosecution, 1770, confirmed right of press to criticise king and Parliament; and in 1835 pressmen were admitted to parliamentary debates.

(2) **Drama.**—In Elizabethan times the Government regulated plays through the Master of the Revels; in James II.'s reign the Lord Chamberlain became censor. C. was mainly political. In 1642 the theatres were closed by the Puritans. In Charles II.'s reign grossness in plays was general. The modern c. dates from 1737, when Walpole muzzled Fielding, who in plays criticised politics; the Act of 1737 limited the number of theatres. By the Theatres Act, 1843, a play must be licensed by the Lord Chamberlain before public performance; penalty for breach of Act, £50 and forfeiture of theatre licence. Parliamentary committees, 1866 and 1909, vindicated system. Supporters of c. claim that it is necessary to protect public morality; opponents declare that it trammels original thought. Modern plays banned include Ibsen's *Ghosts*, Maeterlinck's *Monna Vanna*, Shaw's *Mrs. Warren's Profession*, Barker's *Waste*.

CENSUS, a numbering of the people; formerly used also for the purpose of assessment of property. Some such method has been in use from the earliest times, though in the beginning it was chiefly employed to ascertain the fighting strength of a tribe or people. It was under the Rom. Empire, however, that the system was first established upon a thorough basis. The c. was then taken every five years. During mediæval times, and even down to the XVIII. cent., there were religious objections raised to the taking of a c., in support of which the disaster which overtook David was quoted (1 *Chronicles* 21), beginning, 'And Satan stood up against Israel, and provoked David to number Israel.' Some such dread, and the fear of making Britain's enemies acquainted with the limit of her fighting strength, was the cause of a c. bill being thrown out, which was introduced into Parliament in 1753; but a second bill successfully passed through both Houses in 1800. The first decennial c. for Gt. Britain was taken in the following year. Sweden, in 1749, was the first country to undertake a complete c. in modern times; an American c. was taken in 1790; and a French in 1801. C's are now taken every ten years in U.S.A., Russia, Italy, Austria, Belgium, Norway, India, and the Brit. colonies; in France and Germany every five years; and in some other countries at irregular periods. By an Act of 1906 a *Census of Production* of trade is to be taken periodically.

CENT, Amer. coin, value $\frac{1}{100}$th part of dollar (*i.e.* ½d.); it is contraction of Fr. **centime** (Lat. *centesimus*), $\frac{1}{100}$th part of franc.

CENT JOURS, LES, HUNDRED DAYS, see FRANCE (HISTORY).

CENTAUR (classical myth.), hybrid creature, half horse, half man. Also name of a S. constellation (*Centaurus*); has ten stars brighter than the third magnitude; *Alpha Centauri*, inferior only to Sirius and Canopus in brilliance, is the nearest star (25 billions of miles distant), and is a revolving double star.

CENTERING, wooden structure over which a stone arch is built.

CENTERVILLE (40° 43′ N., 92° 23′ W.), city, Iowa, U.S.A.; coal mines. Pop. (1910) 6936.

CENTIGRADE, see THERMOMETER.

CENTIMETER, see WEIGHTS AND MEASURES.

CENTIPEDE, see MYRIAPODA.

CENTLIVRE, SUSANNA (d. 1723), Eng. playwright and actress; wife of Joseph C., Queen Anne's cook; author of *The Perjured Husband* (1700), *Love at a Venture* (1706), *The Busybody*, *A Bold Stroke for a Wife*, *The Wonder*, and other plays.

CENTNER, see WEIGHTS AND MEASURES.

CENTO (44° 44′ N., 11° 16′ E.), town, Ferrara, Italy. Pop. 4500.

CENTRAL AFRICA PROTECTORATE, see BRITISH CENTRAL AFRICA.

CENTRAL AMERICA, see AMERICA.

CENTRAL CITY (39° 53′ N., 105° 39′ W.), town, Colorado; gold and silver mines.

CENTRAL FALLS (41° 52′ N., 71° 23′ W.), city, Rhode Island, U.S.A.; cotton, wool. Pop (1910) 22,754.

CENTRAL INDIA (24° N., 78° E.), political agency, Brit. India; area, 78,774 sq. miles; bounded N. by Rajputana, United Provinces, E. by Chota-Nagpur, S. by Central Provinces, W. by Bombay; comprises about seventy native states, of which Gwalior, Indor, Rewah, Bhopal, and Bundelkhand are most important; large part of surface rugged; drained by Ken, Nerbudda, Son, and other streams; chief mountains, Vindhyas, Kaimur Hills; produces opium, tobacco, rice. Pop. (1911) 9,356,980.

CENTRAL PROVINCES AND BERAR (18° to 24° N., 76° to 85° E.), province, India; bounded N. by Central India and Chota-Nagpur, E. by Bihar and Orissa, Madras, S. by Hyderabad, W. by Bombay; area, 100,345 sq. miles. Surface generally is mountainous; chief ranges, Satpura, Maikal, drained by Nerbudda, Tapti, Mahanadi, Indravati, Wardha, and other streams; climate hot; considerable rainfall, rainy season, June to Sept.; irrigation supplied by tanks in C. P.; B. has ample rainfall. They produce rice, cotton, millet, wheat, oil-seeds, oranges; minerals include coal, iron; manufactures cottons, iron goods; chief towns, Nagpur, Jabalpur, Amraoti; administered by chief commissioner, app. by gov.-gen. Great majority of inhabitants are Hindus; other religions, Islamism, Christianity. Sagar and Nerbudda were annexed by British, 1818, and other territories were

added later; present province formed in 1903 by union of Central Provinces and Berar. Pop. (1911) 13,916,308.

CENTRALIA (38° 32′ N., 89° 10′ W.), city, Illinois, U.S.A.; fruit-canning, coal mines. Pop. (1910) 9680.

CENTRALISATION, concentration of power in hands of central government. In the early Middle Ages the king had two objectives, the extension of his rule to the natural boundaries of his kingdom, and the imposition of his authority within those boundaries. The early success of the rulers of Spain, England, and France against the centrifugal tendencies of feudalism secured prosperity which contrasts markedly with the misfortunes which befell disunited Germany and Italy until the XIX. cent. Socialism as set forth in *The Great State* would mean complete c. within national boundaries.

From the point of view of world politics, however, modern history has been a process of decentralisation. The Rom. Empire gave birth to the mediæval idea of a universal State and Church. This idea was temporarily destroyed by the movement towards sectional c. (the growth of modern nationalities), and by the Reformation, which broke up Christendom into sects, accentuating local differences. The *philosophes* of the XVIII. cent. (deists or agnostics) abhorred nationality, but Edmund Burke made a brilliant attack on the whole school, and in his *French Revolution* resuscitated localism, a favourite theme of Belloc and Chesterton.

CENTRIFUGAL PUMP, see PUMP.

CENTUMVIRI, Rom. judicial body originally numbering 100 members; retained under the Empire.

CENTURION, officer in the Rom. legion; commanded division called *centuria*, originally composed of 100 foot-soldiers; early lost numerical connection.

CENTURIPE, formerly CENTORBI (37° 35′ N., 14° 53′ E.), town, Catania, Sicily; Rom. antiquities. Pop. 10,800.

CEORL, member of class in A.S. society between serfs and eorls; the richer c's were named thegns; the landless c. tended to sink into serf class.

CEOS (37° 37′ N., 24° 21′ E.), island, one of Cyclades, Ægean Sea; modern Zea; belongs to Greece.

CEPHALODISCUS, see under PTEROBRANCHIA.

CEPHALONIA (38° 15′ N., 20° 35′ E.), one of Ionian Islands, Greece; area, 290 sq. miles; surface mountainous; highest peak, Megas Soros; capital, Argostoli; produces currants, olive oil, wine, grain, pulse; belonged to Rom. and Byzantine Empires; to Venice (1350–1797), subsequently to France, Britain, and finally to Greece (since 1864). Pop. 71,235.

CEPHALOPODA, CUTTLEFISH, the fifth and highest class of the Mollusca, containing well-developed creatures, which in habit, appearance, and structure differ greatly from their brother molluscs.

They are free-swimming creatures, bilaterally symmetrical, but in all, except the Pearly Nautilus (see below), the shell, characteristic of most molluscs, is invisible—buried within the body. The most striking feature of C., and that which has received most attention in legendary lore, is the presence of a ring of 'arms' which surround the head and bear on their surface many strong suckers, or, in Nautilus, tentacles. Strange stories have been told of the size and strength of the arms of cuttlefish, and, indeed, they scarcely exceed the truth; for it has been calculated from captured fragments that, in the neighbourhood of Newfoundland, specimens of *Architeuthis* may exceed 50 feet in total length, and may possess 'arms' 30 to 40 feet long. Indeed, an Irish specimen has been found with 30-foot arms and eyes nearly a foot and a half across.

In the midst of the arms lies the mouth, with strong, horny, beak-like jaws and a rasping radula; and on the sides of the very distinct head are two large, complicated, and highly efficient eyes. Other senses—hearing, or, at least, balancing, and smell—are present; and so delicate is the general nervous mechanism that the slightest irritation, or even the change from one colour of environment to another, causes fleeting changes in the colour of the skin—a faculty which has protective value. Beneath the head, as it were, is another structure of great interest—the 'siphon' or 'funnel,' a complete or partial tube formed from part of the 'foot.' Through the funnel water can be expelled with considerable force, so that the animal moves backwards through the sea in a series of jerks. Behind the head is the solid-looking globular or elongated body, sometimes bearing fleshy fins. This shelters highly developed gills and vascular system, with simple hearts which drive the bluish blood to gills and body. Worthy of mention also is a peculiar rectal gland—the 'ink-sac'—containing dense inky colouring matter, which the creature ejects in order to conceal its retreat in a cloud of darkness.

C. are marine animals found in all seas; a few are found near the coast, especially in spring-time at the spawning season, but the majority prefer deeper water, some inhabiting the bottom in almost 2000 fathoms, while others sail the open sea. They creep with humped back upon the sea-floor by means of their arms, or swim horizontally backwards through the water by use of their funnel, their long arms streaming in 'rear.' C. are exceedingly fierce and voracious. They are altogether carnivorous, and feed upon molluscs, crabs, and fishes, which they occasionally follow in schools, sometimes completely ruining local fisheries by reason of their numbers and destructiveness. The sexes are separate, and in spring the females of some species approach the shore and attach their eggs in bunches to seaweeds. Others lay huge globular floating masses of eggs in the open sea.

C. are of some, though not of great, value to man. On many of the European coasts they are used as food, the arms of cuttlefish when cooked being alleged to resemble lobster in flavour. From the ink-sac a writing-ink—'sepia'—was obtained, and it is said that this formed the base of China or India ink and other paints. It is interesting to recollect that Cuvier drew his illustration of the structures of various cuttles with the 'ink' obtained from the animals themselves. The internal 'bones' of cuttles, again, are powdered, the powder or 'pounce' being used for polishing articles of bone and ivory and as an ingredient of tooth-powder. And lastly, the shells of the Pearly Nautilus are stripped of their outer layers and become iridescent ornaments of great beauty.

The class CEPHALOPODA is divided into two main groups or orders—

Order I., **Tetrabranchia** (Gk. *tetra*, prefix=four; *brangchia*, gills), C. with four gills. Although the class was abundantly represented in prehistoric seas, judging from the numerous shells which occur as fossils in rocks from the Silurian to the Tertiary age, it is now represented by only one living genus, NAUTILUS, found in the Indian and Pacific Oceans. This—the Pearly Nautilus—has many curious features. It is protected by a large spiral shell composed of many chambers, in the last formed of which the body of the animal rests, although a tube of skin—the siphuncle—runs through all the chambers. The arms bear tentacles in tiny sheaths, instead of suckers, and the eye is simple, without lens, having only a pin-hole aperture through which light-rays pass to the retina behind, bathed by the sea water, which also enters. The shell of Nautilus stripped of its outer layers is beautifully pearly, and is often cast on the shores of the Indian and Pacific Oceans after storms.

The extinct AMMONITES, the remains of which are popularly called 'snake-stones,' were distinguished by the wavy sutures on their shells, the Nautiloids by their simply curved sutures.

Order II., **Dibranchiata** (Gk. *di*, prefix=two; *brangchia*, gills), C. with only two gills. These fall into two easily distinguished groups—

Sub-Order 1, **DECAPODA**, with 10 arms, 8 shorter and 2 longer; body long, with fins, and an internal 'shell'; suckers on stalks. Examples—the common CUTTLEFISH or SQUID (*Sepia*), and the extinct Belemnites,

the fossil shells of which, known popularly as 'thunder-bolts,' are common in some clays of Liassic age.

Sub-Order 2, OCTOPODA, with only 8 similar arms; body dumpy and rounded, no 'shell' except in the Paper Nautilus (*Argonauta*), where a shelly brood chamber is formed; suckers without stalks. The most familiar example is the common OCTOPUS (*Octopus* or *Polypus*), frequent in British seas.

CEPHALUS (classical myth.), s. of Thessalian king Hermes; accidentally shot his wife, Procris, and thereupon took his own life by leaping into the sea.

CEPHEUS (classical myth.), king of Ethiopia, f. of Andromeda, who was saved from the sea-monster by Perseus. C. is name of less conspicuous N. constellation adjoining Cassiopeia; *Mu Cephei*, a fourth-magnitude star ('the garnet star'), probably the reddest star visible in N. hemisphere with unaided eye.

CEPHISSUS (38° 2′ N., 23° 44′ E.), river, ancient Greece.

CERAM, SERANG (3° S., 130° E.), largest island, Moluccas group, Dutch East Indies, W. of New Guinea; traversed E. to W. by mt. chain; numerous streams and forests; exports sago, rice, tobacco, sugar-cane; area, 7000 sq. miles. Pop. 100,000.

CERAMICS, the study of the art of pottery (*q.v.*).

CERBERUS (classical myth.), the triple-headed dog who guarded the door of Hades, permitting all to enter, but none to escape.

CERCHNEIS, see HAWK FAMILY.

CERCOCEBUS, see under CERCOPITHECIDÆ.

CERCOPITHECIDÆ, OLD WORLD MONKEYS AND BABOONS, a family of monkeys confined to the Old World, whose general structural characters are mentioned in article PRIMATES. Many have cheek-pouches, in which they can store fruits previous to consumption; those without cheek-pouches feed mainly on vegetation; probably the most familiar of monkeys, owing to their abundance and wide distribution, and to the readiness with which some can be tamed. Of the 174 known species we can mention only a few examples: the LANGURS (*Semnopithecus*), slender monkeys, with very long tails and no cheek-pouches, found in South-Eastern Asia, common in India and Burma. The PROBOSCIS MONKEY (*Nasalis*), with very long tail, and absurdly long nose, no cheek-pouches, ochre-yellow in colour, an inhabitant of Borneo. Thick-pouched monkeys, with arms and legs nearly equal in length, are the GUENONS (*Cercopithecus*), including several oval-headed, stiff-whiskered species such as the red PATAS MONKEY of Senegambia, the greenish VERVET MONKEY of Cape Colony, and the GRIVET; or the round-headed, soft-whiskered forms with black fur intermingled with yellow, such as the familiar and pretty MONA MONKEY, with white-spotted hips, and the DIANA MONKEY, with long pointed white beard, both West African; or beardless individuals, such as the PLUTO or BLACK-BELLIED MONKEY of Angola. Very similar are the MANGABEYS or WHITE-EYELID MONKEYS (*Cercocebus*) from West Africa, whose name indicates their recognition mark.

The Macaques (*Macacus*) which, with the exception of the Barbary Ape of Gibraltar and North Africa, are confined to Asia, have longer muzzles and larger bare patches on the buttocks and are less slender than the Mangabeys, which otherwise they resemble. Very similar to the true Baboons (*q.v.*), on the other hand, is the long-faced, black-furred BLACK APE (*Cynopithecus*) from the island of Celebes, and the dark, shaggy-maned GELADA BABOON (*Theropithecus*) of Abyssinia.

Lastly, among the true Baboons (*Cynocephalus*)—fierce-tempered, long-faced creatures with nostrils projecting to the tip of the muzzle, and large bare buttock-patches, often brightly coloured—are to be reckoned the South African CHACMA, or PIG-TAILED BABOON, grey-black in colour, and without mane on neck, and the familiar and hideous Mandrill, with large head, short tail, and blue, purple, and scarlet-coloured muzzle and buttocks.

CERDIC (d. 534), Saxon chief, who landed in Hampshire about 495, and, after winning many victories over Britons, became king of W. Saxons (519).

CEREALS, see GRASS.

CEREBELLUM, see BRAIN.

CEREBRO-SPINAL FLUID, see BRAIN, SPINAL COLUMN.

CEREBRO-SPINAL MENINGITIS, see MENINGITIS.

CEREBRUM, see BRAIN.

CEREMONIES, MASTER OF, see CHAMBERLAIN.

CERES, Latin name of the goddess of agriculture (Greek, DEMETER); usually represented with ears of corn round her head, poppies in her left hand, and a sceptre in her right. Her dau., Proserpine (Persephone), when gathering flowers in the vale of Enna, was carried off to Hades by Pluto, the god of the under-world. The **Cerialia**, feast-day of C., was held on April 19 in celebration of fertility of earth.

CERIGNOLA (41° 15′ N., 15° 53′ E.), town, Foggia, Italy; here the Spaniards defeated French, 1503, establishing Spain's supremacy in Naples. Pop. 36,000.

CERIGO, see CYTHERA.

CERIGOTTO (35° 50′ N., 23° 18′ E.), small Gk. island, Ionian group; ancient *Ægila*; Gk. *Antikythera*.

CERINTHUS, philosopher who became prominent in the latter years of the Apostle John. He held that Jesus was the natural offspring of Joseph and Mary, and that the world was created by angelic powers, and not by God.

CERIUM (Ce=141·2), metallic element; occurs in Norway with metals *Lanthanum* and *Didymium* in rare pink-coloured mineral *Cerite*, a silicate of the three metals; C. is of iron-grey colour, malleable; S.G. 5·5.

CERNUSCHI, HENRI (1821–96), Ital. economist; b. Milan; spent most of life in France; specialist on bimetallism; pub. *Mécanique de l'échange* (1861), *Le Bimétallisme en Angleterre* (1879), etc.

CERRETO (41° 16′ N., 14° 35′ E.), cathedral town, Benevento, Italy; wines. Pop. 5000.

CERRO DE PASCO, PASSO (10° 48′ S., 76° 12′ W.), town, Peru; silver mines. Pop. 6500.

CERRO GORDO, mountain pass on road between Vera Cruz and Mexico City, where Mexicans defeated by Americans (1847) under General Scott.

CERTALDO (44° 33′ N., 11° 2′ E.), town, Florence, Italy; Boccaccio's birth- and death-place. Pop. 9000.

CERTIORARI, WRIT OF, issued by Chancery for holding of a new inquisition when finding of first jury is questioned.

CERUMEN, wax of the ear (*q.v.*).

CERUSSITE, mineral consisting of lead carbonate; found in Devon, Cornwall, and Cumberland, as right prismatic twin-crystals; transparent or translucent, colourless, yellow, brown, or black.

CERVANTES SAAVEDRA, MIGUEL DE (1547–1616), Span. novelist, dramatist, and poet; b. Alcalá de Henares; s. of Rodrigo de C., an apothecary-surgeon; studied under Juan Lopez de Hoyos, a Madrid prof. of *belles-lettres*. In 1568 C. entered the service of Cardinal Acquaviva, who had been sent on a mission to Philip II. at Madrid, returning with him to Rome. In 1570 he enlisted as a private soldier, serving under Don John of Austria and other great military leaders. He was severely wounded at the battle of *Lepanto* (1571), took part in the naval battle off *Navarino* (1572), and was at the capture of Tunis (1573). In 1575 C. was granted leave to return to Spain, but the fleet in which he sailed was captured, off Marseilles, by Algerine pirates. The captives, including C. and his younger bro., Rodrigo, were all disposed of as slaves, C. becoming the property of a Gk. renegade, Dali Mami. C. made many attempts to escape, but it was not until five years had elapsed that his family were able to secure his freedom by ransom.

After his return he devoted several years to further military service, but finally abandoned arms for lit. His first publication was a pastoral romance, *Galatea*

(1585), which apparently did not attract much notice. At this time he married. He now turned his attention to the stage, and produced between twenty and thirty plays, but without achieving any substantial success. He was made deputy-purveyor to the fleet at Seville (1587), a post which he exchanged for that of collector of revenues in Granada (1594). One may assume that he gave more attention to poetry than to accounts, for in 1597 he was cast into prison at Seville because of a monetary deficiency. He was eventually released upon finding security for the restoration of the money, but was not reinstated. Little is known of the events of his life from this period until 1603, when he is known to have been living at Valladolid, but it is believed that during his imprisonment his world-famous romance, *Don Quixote*, was begun. The first part of this great work was pub. at Madrid (1605). It was intended as a satire upon the ultra-chivalric romances of the period, and met with an instant success. The second part of the book appeared in 1615, and contains the author's most mature work. Had C. never written this masterpiece he would have secured a high place in Span. lit. by virtue of his *Novelas Exemplares*, to name only one phase of his work. Of the immortal *Don* it may safely be said that it is much more widely read at the present time than it was three hundred years ago.

Lives by J. Fitzmaurice-Kelly (1892), H. E. Watt (1894), and by A. F. Calvert (1905).

CERVERA, PASCUAL CERVERA Y TOPETE (1839–1909), Span. admiral; commanded a squadron of four ships in the Span.-Amer. War (1898), which, being opposed to a greatly superior force, was destroyed at *Santiago de Cuba*. He was afterwards tried, but acquitted of blame.

CERVETRI (41° 59′ N., 12° 6′ E.), ancient city, Italy; has Etruscan rock tombs.

CERVIDÆ, see DEER.

CESAREVICH (more correctly, *Tsesarevich*), heir-apparent to Russ. throne. The Cesarewich Handicap, founded at Newmarket in 1839, was named after the C. (later Alexander II.), who visited England in that year.

CESARI, GIUSEPPE (1568–1640), Ital. artist of the 'Idealist' school, who spent many years in the execution of frescoes in the Capitol of Rome.

CESAROTTI, MELCHIORE (1730–1808), Ital. poet, b. Padua; known chiefly as a translator of Homer and Ossian; author of a poem, *Pronea*, addressed to Napoleon; also numerous prose works on Gk. lit., taste, and the poetic art.

CESENA (44° 8′ N., 12° 18′ E.), town, Forlì, Italy; cathedral; exports wine, silk. Pop. 7700.

CESNOLA, COUNT LUIGI PALMA DI (1832–1904), Ital. archæologist and diplomatist; carried out fruitful excavations in Cyprus and wrote its history.

CESPEDES, PABLO DE (1538–1608), Span. artist and poet; a fine specimen of his work is a *Last Supper* at Cordova, his native place, and other examples are to be found at Seville and Madrid. He also wrote a didactic poem on *The Art of Painting*, which was greatly esteemed.

CÉSPEDES Y MENESES, GONZALO DE (d. 1638), Span. novelist; wrote a *Historia de Felipe IV.* (1631) and several novels.

CESSIO BONORUM (Lat.), term in law for voluntary 'ceding of goods' by debtor as alternative to distraint.

CESTIUS, LUCIUS, Gk. rhetorician, who flourished at Rome during the age of Augustus, but who invariably used Latin as the medium of his declamations; examples of his work are to be found in Seneca.

CESTODA, see TAPEWORMS.

CETACEA, mammalian order, including whales and dolphins. They are characterised chiefly by their fishlike form, essential because of their aquatic habits; the possession of paddle-like fore-limbs (flippers); the absence of external hind-limbs; by a layer of fat (blubber) beneath the skin, and their habit of living together in herds or 'schools.' They chiefly feed on the minute organisms composing the plankton (*q.v.*), and some species on small fish, cephalopoda (*q.v.*); the grampus even attacks seals. The order is generally divided into two suborders, one, the **Mystacoceti**, comprising the whales with baleen (whalebone), such as the hump-back (*Megaptera*), the common whale (*q.v.*) (*Balæna*); the other, **Odontoceti**, being represented by toothed genera such as the cachalot or sperm whale (*Physeter*), the grampus, the dolphin (*q.v.*) (*Delphinus*), the porpoise (*Phocæna*), and the narwhal (*Monodon*). The Zeuglodonta, discovered in Eocene strata, have been supposed to show affinities to recent cetacea.

CETEWAYO (d. 1884), Zulu king; s. of King Panda, whom he deposed (1873); was required by the Brit. Government to disband his strong army and to give promises to live at peace with his neighbours. The promises were not kept, and the Government was openly defied, and as a consequence Lord Chelmsford invaded Zululand with 13,000 men (Jan. 11, 1879); the disasters of *Isandhlwana* and *Rorke's Drift* followed, but the Zulus were signally defeated at *Ulundi* (July 4). C., who had become a fugitive, was afterwards captured, his kingdom being divided amongst a number of his chiefs. He was eventually restored to part of his kingdom, but, being defeated by his enemies, took refuge in the Native Reserve, where he died.

His son, **DINIZULU**, attempting to become king, was exiled to St. Helena (1889), but allowed to return (1898). In 1907 he was imprisoned on suspicion of being implicated in a Zulu revolt, being sentenced (1909) to four years' imprisonment. The incident created considerable ill-feeling between the home government and Natal.

CETINA, GUTIERRE DE (1518–72), Span. soldier and poet; saw military service under Charles V. in Italy and Germany, but spent many years of his life in Mexico, where he d.; wrote sonnets and other poems in the Ital. manner (under pen-name, VANDALIO).

CETONIA, see CHAFERS.

CETORHINUS, see under SHARKS and DOG-FISHES.

CETTE (43° 23′ N., 3° 42′ E.), fortified seaport, Hérault, France; has spacious harbour and extensive shipping trade; chief trade is in fish, wine, brandy. Pop. (1911) 33,049.

CETTINJE, CETTIGNE (42° 45′ N., 19° E.), capital of Montenegro (*q.v.*), in fertile valley, surrounded by mountains; residence of the prince and metropolitan; has several times been burnt by Turks. Pop. 5300.

CEUTA (35° 54′ N., 5° 17′ W.), fortified seaport, on small peninsula, N. of Morocco, opposite Gibraltar; military and convict station; castle occupies highest point of a mountain, 636 ft. (the ancient *Abyla*); cathedral; Span. possession since 1508. Pop. (1910) 13,000.

CEVA (44° 22′ N., 8° 4′ E.), town, on Tanaro, Piedmont, Italy.

CÉVENNES (44° 15′ N., 3° 44′ E.), mountain range, S. France, extending from Canal du Midi, north-eastward to Canal du Centre; divided into N. and S. Cévennes; separate basins of Loire and Garonne from those of Rhône and Saône; highest point, 5753 ft.

CEYLON (5° 56′ to 9° 46′ N., 79° 36′ to 81° 58′ E.), island and Brit. crown colony at S. extremity of India; consists largely of undulating plains, but S. part is mountainous in interior; extreme length, 226 miles; width, *c.* 145 miles; area, 25,333 sq. miles; separated from India by Gulf of Manaar and Palk Strait, with width of 32–120 miles. These openings have between them chain of islands so close together and with such shallow water between that it has been proposed to carry railway across. Highest mountains are Pedrotallagalla (8300 ft.) and Adam's Peak. C. is drained by Mahavillaganga, which flows N.E., entering sea near Trincomali. Chief towns are Colombo (capital), Galle, Trincomali, Kandy. Climate is cooler than in India, and healthy except on coast; N.E. and S.E. get little rain and need irrigation, but S.W. is damp, as it has rainfall of both monsoons. In geological structure gneiss is predominating formation, and there are marine deposits in W.

History.—In V. cent. B.C. the Singhalese dynasty was established in C. by invasion of Hindus under Vijaya. Under his successors, country prospered and attained remarkable degree of civilisation. Buddhism was introduced in III. cent. B.C. In early XVI. cent. settlements were made by Portug. traders, but in 1656 Portuguese were expelled by Dutch. In 1795 Brit. force sent to C., captured Dutch forts; in 1802 C. was ceded to Britain by Dutch in exchange for Java, and in 1815 whole island came under Brit. control.

C. is administered by gov., who is assisted by Executive Council of six members and Legislative Council of seventeen members. For administrative purposes island is divided into nine provinces, each under government agent; provinces are Northern, North-Western, Western, North-Central, Central, Eastern, Southern, Uva, Sabaragamuwa.

A considerable amount of iron and plumbago is obtainable; anthracite, gold, monazite, mica, thorium, rubies, sapphires, topazes, and other gems produced; pearl fishery important government monopoly, as is salt-making. Vegetable products include tea, coffee, cinchona, cinnamon, cacao, tobacco, cardamoms, cocoa-nuts, areca-nuts, rubber, camphor, rice. All these are exported, also cocoa-nut oil, coir, copra; horses, cattle, sheep, goats, and pigs raised; elephants exported to India; imports cottons, iron, machinery, coal, salt fish, provisions, liquor.

Inhabitants include, besides Europeans, Singhalese, Tamils, Moormen, Eurasians, Malays, and Veddahs. By far greater number are Singhalese, who belong to S., Tamils to N. Veddahs are aborigines. Principal religions are Buddhism, Hinduism, Islamism, Christianity. Education is controlled by government. Pop. 1911) 3,592,397.

Emerson Tennent, *Ceylon* (1860); Willis, *Ceylon* (1907); Cave, *Book of Ceylon*; Farrer, *In Old Ceylon*; Ferguson, *Ceylon Handbook*.

CEZIMBRA (38° 26′ N., 9° 6′ W.), town, Estremadura, Portugal. Pop. 6000.

CHABAROWSK, see KHABAROVSK.

CHABAS, FRANÇOIS-JOSEPH (1817–82), Fr. Egyptologist.

CHABAZITE, mineral; hydrated silicate of aluminium and calcium ($AlSi_2O_6 + CaSiO_3 + CH_2O$), occurring in rhombohedral crystals, colourless or brownish-yellow, lining cavities in ancient lava rocks (Giant's Causeway, Faroes).

CHABLAIS (46° 17′ N., 6° 35′ E.), district, Haute-Savoie, France; produces wine, fruit, cheese.

CHABLIS (47° 50′ N., 3° 47′ E.), town, Yonne, France; produces famous wine of same name (white Burgundy).

CHABOT, PHILIP DE, COUNT OF CHARNY (d. 1543), admiral of France; was held in great favour by Francis I., who made him gov. of Burgundy, and bestowed on him many high offices. His only serious rival for power was Anne de Montmorency, and there was a lifelong conflict between the two. His magnificent tomb is in the Louvre.

CHABRIAS (IV. cent. B.C.), famous Athenian general.

CHABRIER, ALEXIS EMMANUEL (1841–94), Fr. composer. *Gwendoline* was produced at Brussels (1886), and later at the Grand Opéra, Paris; and *Le Roi malgré lui* at the Opéra Comique (1887). C. was also the composer of a number of pianoforte pieces.

CHACMA BABOON, see under CERCOPITHECIDÆ.

CHACO (27° S., 61° W.), government, N. Argentina, bordering river Bermejo and forming part of district, El Gran Chaco; area, 52,741 sq. miles. Pop. 28,000.

CHACONNE, a Span. dance of XVII. cent., in slow three-four measure.

CHAD (d. 672), Eng. saint; pupil of St. Aidan; became abbot of Lastingham; later made bp. of Mercia, and fixed his see at Lichfield; famed for his humility and saintly life.

Bede, *Ecclesiastical History*.

CHAD, LAKE, TSAD (13° 30′ N., 14° E.), lake in West Central Africa; area, c. 10,400 sq. miles, varying according as season is wet or dry; 830 ft. above sea-level; N.E. and part of S. shore are in Fr. sphere, part of S. shore in Ger. Kamerun, S.W. shore in Brit. Northern Nigeria; water fresh; fish, turtles, waterfowls, and crocodiles abound.

CHADDERTON (53° 33′ N., 2° 9′ W.), town, Lancashire, England; cotton manufactures, coal mines. Pop. (1911) 28,305.

CHADERTON, LAURENCE (d. 1640), Puritan preacher and educationist; had a distinguished career at Cambridge, and became first Master of Emmanuel Coll.

CHADWICK, SIR EDWIN (1800–90), Eng. social reformer; assisted in drafting Poor Law report (1834); report on 'Sanitary Condition of the Labouring Population' (1842); commissioner of Board of Health (1848–54).

CHÆREMON.—(1) Stoic philosopher and grammarian; in 49 A.D. he became one of the tutors to Nero; author of a *History of Egypt*, and treatises on astron., astrology, and grammar. (2) (IV. cent. B.C.) Athenian dramatist, whose *Centaurus* is commented upon by Aristotle.

CHÆRONEIA, ancient city, Bœotia, Greece; remains of theatre and small temple exist; birthplace of Plutarch; famous as site of battle in which Greeks were defeated by Philip of Macedon, 338 B.C.

CHÆTOGNATHA, ARROW-WORMS, class of translucent marine animals attaining a length of up to 2½ in. The body is divided by septa into three divisions, and shows certain affinities to the Annelida. *Sagitta* and *Spadella* are two species common in the plankton of the sea.

CHÆTOPODA (Gk. *chaitē*, hair; *pous, podos*, a foot), BRISTLE-WORMS.—This great class includes the majority as well as the most familiar of 'worms.' All are ringed or segmented, often with the external rings continued in partitions across the body-cavity and cutting off similar segments; and all bear large or small, many or few, bristles—chitinous setæ embedded in skin-pits.

The Bristle-Worms fall into three orders, one of which, MYZOSTOMIDA, a small group, may be dismissed with the remarks that its members are degenerate forms which live upon the discs and arms of Feather Stars (crinoids), causing the formation of galls. The larva, however, shows Bristle-Worm characters, and the adult bears five pairs of parapodia—structure typically Polychæt (see below). The most important groups, however, are the Sea-Worms, or POLYCHÆTS, and the Earth-Worms, or OLIGOCHÆTS, containing individuals so diverse in appearance and in habit that they had best be considered separately.

Order I. POLYCHÆTA (Gk. *polus*, much; *chaitē*, hair), SEA-WORMS, are for the most part marine Bristle-Worms, only a few freshwater inhabitants (such as *Lumbriconereis* from Trinidad) being known. They are distinguished by possessing many bristles (hence the general name) set on processes of the body known as parapodia. They have a distinct head with sensory tentacles, minute eyes, and a horny 'jaw' apparatus within the mouth. The sexes are generally separate, and the young form develops into the adult through a metamorphosis. Of the marine Polychæts a few are parasitic, a few live in friendly association with starfishes and other worms, and a few transparent gelatinous forms (such as *Tomopteris*) float in the open sea. But the vast majority live in shallow water near the shore, after the most diverse fashions. Some hide beneath stones or crawl over the bottom by means of their parapodia; in others the parapodia are modified into leaf-like paddles, as in *Phyllodoce*, the 'Paddle-Worm' of British coasts, by which they swim with undulating motion; a few bore homes for themselves in chalk or limestone (*Polydora*); the common Lug-Worm (*Arenicola*), a favourite bait, forms 'castings' by burrowing in sand; and many build for themselves

limy tubes (*Serpula*), or transparent quill-like tubes (*Hyalinœcia*), or patchwork tubes of sand and mud grains, or shell fragments (*Sabellaria, Terebella*).

Their food also differs much. A few are vegetarians, feeding on seaweed, some extract the organic matter from sand they swallow, but the majority are carnivorous, devouring Sponges, Crustacea, other worms, and such-like. Besides the normal mode of reproduction, budding often occurs, even a long chain of young individuals at various stages remaining attached to the parent stock as in *Autolytus*. Polychæta are often brilliantly and beautifully coloured, and some are phosphorescent. Apart from their value in the sea as forming a great part of the food-supply of certain fishes, Polychæta are made use of by man as bait for fishes, and even as food—the strange Palolo worm being captured for this purpose at definite lunar times by the Samoans and Fijians.

Order II. OLIGOCHÆTA (Gk. *oligos*, few; *chaitē*, hair), EARTH-WORMS, are distinguished from Polychæta by their terrestrial habit, by their rare setæ, their lack of parapodia and 'jaw' apparatus, by their indefinite head, without tentacles, by their hermaphrodite character, and by the fact that the young form develops directly into the adult.

Although 'Earth-Worm' as a general name describes the group, a few simple forms inhabit fresh water (*Microdrili*), or are amphibious. The majority burrow in earth, feeding upon the organic matter contained in the soil they swallow, and by their feeding and burrowing opening the ground to the beneficent action of the weather, to the great advantage of gardener and agriculturist.

CHAFERS (*Scarabæidæ*), a huge family of Lamellicorn beetles, comprising *c.* 13,000 species, found all over the globe. Many of the males are armed with horns. They include the Sacred Beetle of the Egyptians (*Scarabæus sacer*), which feeds ingloriously upon dung; and in Britain, the Cockchafer (*Melolontha vulgaris*), the larva of which is exceedingly destructive to crops, and the Rose Chafers (*Cetonia*).

CHAFFARINAS, ZAFFARINES (35° 10′ N., 3° W.), group of small islands, off N. coast Morocco, belonging to Spain.

CHAGNY (46° 56′ N., 4° 47′ E.), town, France; wines. Pop. 4700.

CHAGOS (5° S., 72° E.), Brit. group of islets, Ind. Ocean; dependency of Mauritius.

CHAGRES, river, flows across Isthmus of Panama; at mouth on N. coast of Isthmus is port of C.

CHAILLU, PAUL BELLONI DU (1835–1903), Fr. traveller and author; made numerous discoveries in zoology, anthropology, and geography in his extensive African travels.

CHAIR, article of domestic furniture. Though of great antiquity, c's, now so common, did not come into general use until about the XVI. cent. Before that period, chests, stools, and benches formed the usual seat of ordinary persons, the c. being more in the nature of a state seat used only by persons of rank. Ancient Egyptian c's were generally of carved and gilded woods, inlaid or decorated with ivory; Rom. c's were frequently of marble; and the c. of Dagobert, preserved in the Louvre, is of bronze. Mediæval c's were usually low, with arm-rests terminating in the heads of beasts or birds, and were without backs. The oldest known Eng. c. is that of Edward I. (1239–1307), at Westminster. It is of oak, and is used in the coronations of Brit. monarchs. Up to the middle of the XVII. cent. the c's of all countries were usually without upholstery, which, when introduced, developed into the gorgeous productions of the XVIII. cent.

CHAITYAS, see ARCHITECTURE (INDIAN).

CHALCEDON, CALCHEDON (*c.* 40° 55′ N., 29° 5′ E.), ancient town, Bithynia, Asia Minor, on Bosporus, opposite Byzantium. THE COUNCIL OF C., held here in 451 A.D., declared its belief in the duality of the natures united in the one Person of Christ, the doctrine now held by the vast bulk of Christians; and fixed ecclesiastical jurisdiction of Rome and Byzantium.

CHALCEDONY, CALCEDONY (S_1O_2), variety of *native silica*, found in translucent masses, with waxy lustre, coloured veins, rings, or spots; common examples, pebbles and agates.

CHALCIS (38° 28′ N., 23° 27′ E.), chief town, island of Eubœa, Greece, on Euripus; flourishing town and colonising centre in ancient times; belonged successively to Athenians, Macedonians, Romans, and Turks. Pop. 10,958.

CHALDÆA (*c.* 35° N., 45° E.), ancient country, between Tigris and Euphrates Rivers, Asiatic Turkey; an immense plain of extremely fertile soil; produces wheat, barley; has palm forests; abode of civilised races for many cent's; empire dated from remote antiquity; destroyed *c.* 2300 B.C. See BABYLON.

CHALDEE, language in which some portions of the Books of *Daniel* and *Ezra* were written, said to have been the vernacular language of Babylon.

CHALDRON, coal or coke measure, generally about 36 bushels in England.

CHALFONT ST. GILES (51° 38′ N., 0° 34′ W.), village, Buckinghamshire, England; here Milton wrote part of *Paradise Lost*.

CHALGROVE (51° 41′ N., 1° 6′ W.), village, Oxford, England; here Royalists defeated Roundheads, 1643; Hampden killed.

CHALICE, primarily the eucharistic wine-cup; but also name for an ordinary goblet.

CHALIER, JOSEPH (1747–93), Fr. Jacobin leader.

CHALK, a soft, pure white limestone composed of shells of microscopic marine animals, mostly *Foraminifera*, and rich in fossils (corals, sponges, molluscs); geologically forms distinguishing feature of the Upper Cretaceous formation, being represented in England by the N. and S. Downs, York and Lincoln Wolds, Salisbury plain, Chiltern Hills; used for writing, preparation of lime, Rom. cement, putty.

CHALKHILL, JOHN, Eng. poet, of whose life nothing is known. Two songs, stated to be by him, are quoted in Walton's *Compleat Angler*; and a long poem, *Thealma and Clearchus*, bearing his name as author, appeared in 1683.

Saintsbury's *Minor Poets of the Caroline Period* (1906).

CHALLEMEL-LACOUR, PAUL AMAND (1827–96), Fr. philosophical writer and statesman.

'CHALLENGER' EXPEDITION, scientific expedition (1872) fitted out by Brit. government for investigation of fauna and flora of deep sea. Its results fill 50 vol's.

CHALLONER, RICHARD (1691–1781), Eng. R.C. bp.; ed. Douai; bp. of Hammersmith (1741), later Vicar-Apostolic of London district; pub. *Catholic Christian Instructed* (1737), *Memoirs of Missionary Priests* (1741), *Britannia Sancta, Garden of the Soul*, etc.

CHALMERS, ALEXANDER (1759–1834), Scot. writer and edit.; *Biographical Dictionary* still used.

CHALMERS, GEORGE (1742–1825), Scot. antiquarian; b. Fochabers (Elgin); visited America (1763), and settled in Maryland as lawyer, but returned to Scotland on the outbreak of the War of Independence. He wrote numerous antiquarian and political works, also several biographies, but is chiefly remembered for his contribution to Scot. history, *Caledonia*, of which, however, only three vol's appeared ere his death.

CHALMERS, GEORGE PAUL (1833–78), Scot. landscape painter of heavy Romantic school.

CHALMERS, JAMES (1841–1901), Scot. missionary; b. Ardrishaig; spent ten years at Raratonga, S. Pacific (1866–76), as representative of London Missionary Society. He exercised great influence over the natives. Later he transferred to New Guinea. He was killed by cannibals at Goaribari Island.

CHALMERS, THOMAS (1780–1847), Scot. preacher and philanthropist; ed. St. Andrews, and entered the ministry, officiating at Kilmeny (Fife) and later at Glasgow, where his preaching made him

famous. In 1823 he became prof. of Moral Phil. at St. Andrews, and in 1828 prof. of Divinity at Edinburgh. He was one of the chief promoters of the Free Church of Scotland, and became its first Moderator. He possessed a character of great simplicity and nobility, and much of his time during his later years was given to philanthropic work.

CHALONER, SIR THOMAS (1521–65), Eng. state official; held various court appointments under the Protector Somerset and Queen Mary, and acted as ambassador for Queen Elizabeth on several occasions. He was the intimate friend of Burghley, and employed his leisure in the composition of pastorals and Latin verses, which were held in some repute.

CHALONNES-SUR-LOIRE (47° 21′ N., 0° 46′ W.), town, France. Pop. 4500.

CHÂLONS-SUR-MARNE (48° 59′ N., 4° 20′ E.), city, on Marne, France; ancient *Catalaunum*; seat of bp.; principal buildings, XIII.-cent. cathedral of St. Etienne, church of Notre Dame, Hotel de Ville (1772); formerly famous for manufacture of woollen cloth; has large trade in champagne. Napoleon III. formed celebrated camp of C. for training of troops, about 17 miles N.E. Here Attila was defeated by Romans and Franks, 451 A.D., which saved W. Europe from falling into hands of Huns. Pop. (1911) 31,367.

CHALON-SUR-SAÔNE (46° 47′ N., 4° 52′ E.), Saône-et-Loire, France; manufacturing and commercial town; ancient *Cabillonum*; cathedral is of XIV. cent.; has copper and iron foundries. Pop. (1911) 31,550.

CHALUKYA, Ind. dynasty, founded by Pulakesin I., which fl. in the Deccan (550–750 A.D.), and again (973–1190). **Chalukyan style**, see ARCHITECTURE (INDIAN).

CHALUMEAU, Old Fr. musical wind-instrument or shawm; pipe of a bagpipe; Fr. chemical instrument for blowing on a flame to raise its temperature.

CHALYBAUS, HEINRICH MORITZ (1796–1862), Ger. philosopher; prof. of Philosophy in Kiel Univ.; pub. *Historische Entwickelung der spekulativen Philosophie von Kant bis Hegel* (1837); Eng. trans. by Tulk (1854) and Edersheim (1854).

CHALYBEATE WATERS, see MINERAL WATERS.

CHALYBITE ($FeCO_3$), mineral consisting of iron carbonate; a common iron ore, yellowish-brown rhombohedral crystals found in Devonshire, Cornwall, Cumberland.

CHAM, second s. of Noah (*q.v.*).

CHAM (49° 14′ N., 12° 38′ E.), town, Bavaria. Pop. 4200.

CHAMÆLEON, genus of lizards characterised by the peculiar structure of its skeleton and skull, the soft small-scaled skin with power of changing colour, circular eyelids, long, slender tongue which it protrudes exceedingly quickly to catch insects, prehensile tail, digits adapted for grasping the branches of trees in which the c. lives. Several species occur in Africa and one in Andalusia.

CHAMBA (32° 29′ N., 76° 10′ E.), native hill state, Punjab, India; traversed by Ravi and Chenab Rivers; chief industries, agriculture and grazing; copper, iron, and slate plentiful; capital, Chamba; area, 3216. Pop. 1911) 134,351.

CHAMBAL (*c.* 24° N., 75° 26′ E.), tributary of Jumna River, Central India; rises in Vindhya Mts.

CHAMBERLAIN, official appointed by a sovereign or corporation to undertake performance of ceremonial duties. The **Lord Chamberlain** is a court official whose institution dates back to the XIV. cent., or earlier. He has control, assisted by the *Vice-C.*, over a great number of the court servants, the royal wardrobe, selects tradesmen, etc., issues invitations to state functions, and is the licenser of theatres and plays. **The Lord Great C.** is an hereditary household magnate, the old *camerarius regis*, whose office is now held jointly by the Marquess of Cholmondeley and the Earls of Ancaster and Carrington; he has a station in the palace, control of ceremonies, care of sword of state, etc.

CHAMBERLAIN, JOSEPH (1836–), Brit. statesman; b. London; e. s. of Joseph C., master of the Cordwainers Company; ed. at Canonbury, and Univ. Coll. School, London; joined his cousin, Joseph Nettlefold, in a screw-making business; retired (1874) and devoted his energies to political work. He married thrice; unsuccessful as Liberal candidate for Sheffield, 1874; Mayor of Birmingham, 1873–76; responsible for many local reforms, *e.g.* municipalisation of gas and water supply, erection of improved municipal buildings, abolition of much slum property, laying out of open spaces for recreation; returned unopposed for Birmingham as John Bright's colleague, 1876.

C. entered Gladstone's Cabinet as Pres., Board of Trade (1880), and was largely responsible for Bankruptcy Act (1883), Patents Act, and Franchise Act (1884); returned for W. Birmingham again (1885), but objecting to Gladstone's Home Rule policy resigned his seat in the Cabinet (March 15, 1886). Thereafter he became leader of the 'Liberal Unionists.' In 1895, C. became Colonial Sec. in Lord Salisbury's Cabinet, and advocated old age pensions; as Colonial Sec., 1895–1900, was strongly imperialistic and was in great measure responsible for the negotiations which ended in the Boer War (1899–1902). When Mr. A. J. Balfour (*q.v.*) succ. Lord Salisbury as Premier (July 1902) C. again became Colonial Sec., but withdrew, 1903, having adopted a policy of 'Tariff Reform' not entirely compatible with his chief's programme. In 1906 he ceased to take an active part in politics, owing to illness, but was returned unopposed for W. Birmingham, 1910. He was instrumental in founding Birmingham Univ. (1900) and became its first chancellor. A. Mackintosh, *Life* (1906).

CHAMBERLAIN, JOSEPH AUSTEN (1863–), e. s. of Joseph C. (*q.v.*); Unionist M.P., E. Worcestershire, since 1892; Civil Lord of Admiralty, 1895–1900; Financial Sec. to Treasury, 1900–2; Post master-Gen., 1902–3; Chancellor of Exchequer, 1903–6.

CHAMBERLAIN, JOSHUA LAWRENCE (1828–), Amer. soldier and educationist; held various professorships before entering Federal army (1862); fought in important battles, and was six times wounded; governor of Maine, 1867–70; pres. of Bowdoin Coll. (1871–83); pub. *Maine: Her Place in History* (1877); edit. *Universities and Their Sons* (1898).

CHAMBERLAIN, SIR NEVILLE BOWLES (1820–1902), Eng. field-marshal; s. of Sir Henry Chamberlain, Bart.; served in first Afghan War (1839–42), Gwalior campaign (1843), Punjab cam (1848–49), distinguished himself at siege of where he was wounded.

G. W. Forrest's *Life* (1909).

CHAMBERLAYNE, WILLIAM (1619–79), Eng. poet; physician by profession; fought on Royalist side during Civil War; pub. *Pharonnida*, narrative poem in 5 books (1659), an important work in history of prosody, containing many poetical gems, but bad in construction, *Love's Victory*, tragi-comedy (1658), *England's Jubilee* (1660).

CHAMBERS, EPHRAIM (*c.* 1680–1740), Eng. encyclopædist; b. Kendal; apprenticed to a London globe-maker; later devoted his whole time to the production of his *Dictionary of Arts and Sciences*, pub. 2 vol's, 1728. A Fr. trans. inspired Diderot and D'Alembert to produce their *Encyclopédie*, and C.'s work was not without influence on Dr. Samuel Johnson.

CHAMBERS, GEORGE (1803–40), Eng. marine artist; b. Whitby; s. of a sailor, was himself apprenticed to the sea; later he became a house-painter, took drawing lessons, and produced small marine pictures. Afterwards he moved to London, and became a scene-painter; elected associate of Water Colour Soc. (1834), and member (1836).

CHAMBERS, ROBERT (1802–71), Scot. author and publisher; b. Peebles; opened a book-stall in Leith Walk, Edinburgh (1818); later joined his bro.

William as partner in the firm which bears their names; was a frequent contributor to *Chambers's Journal*, and author of *Traditions of Edinburgh* (1824), *History of the Rebellions in Scotland* (1828), *Vestiges of the Natural History of Creation* (1846), *Book of Days* (1862–64), and many other works.

CHAMBERS, ROBERT WILLIAM, (1865–), Amer. novelist; works include *Cardigan*, *The Fighting Chance*, *The Cambric Mask*; painter also.

CHAMBERS, WILLIAM (1800–83), Scot. author and publisher; b. Peebles; elder bro. of Robert C., and, like him, began life as a small bookseller in Edinburgh; founder of firm, Messrs. W. & R. Chambers; began publication of *Chambers's Journal* (1832); famed for public munificence; restored St. Giles' Cathedral; twice Lord Provost of Edinburgh; author of minor antiquarian works.

CHAMBERS, SIR WILLIAM (1726–96), Brit. architect; spent some of his early years in China, acquiring a knowledge of the art and arch. of that country. Later studied arch. in Italy, and upon his return to London found constant employment as architect and furniture-designer. He designed many houses for the nobility, the buildings at Kew (of which the pagoda remains), and the state coach for George III. (Victoria and Albert Museum).

CHAMBERSBURG (39° 53′ N., 77° 41′ W.), town, Pennsylvania, U.S.A.; has several machine-shops, foundries, and breweries. Pop. (1910) 11,800.

CHAMBERTIN, red wines obtained from Gevrey-C., France.

CHAMBÉRY (45° 34′ N., 5° 54′ E.), town, France, capital of former Duchy of Savoy (*q.v.*); cathedral, seat of abp.; manufactures silk-gauze, etc. Pop. 16,000.

CHAMBON-FEUGEROLLES (45° 23′ N., 4° 20′ E.), town, Loire, France. Pop. 11,600.

CHAMBORD (47° 38′ N., 1° 33′ E.), famous château Loir-et-Cher, France; begun by Francis I.; served as royal residence.

CHAMBORD, HENRI CHARLES FERDINAND, COMTE DE (1820–83), Fr. Royalist; s. of Duc de Berry; grandson of Charles X.; b. seven months after his f.'s assassination; claimed Fr. crown and title of Henry V.; m. Archduchess Maria Theresa, but had no issue, and thus the Comte de Paris, representing the Orleans branch of the Bourbons, became heir to his claims.

CHAMBRE ARDENTE (Fr.: 'the fiery chamber'), inquisitorial court established in France by Francis I. (1535) for trial of heretics, and abolished in 1682. Its work was similar to that of the Holy Office in Spain, and the chamber was particularly active during the reign of Henry II.

CHAMBRE INTROUVABLE, *i.e.* 'non-such'; name applied by its critics to reactionary Fr. Chamber of Deputies, 1815–16.

CHAMELEON, see CHAMÆLEON.

CHAMFER, architectural term for the planing of an angle, much seen in Gothic mouldings.

CHAMFORT, SEBASTIEN ROCH NICOLAS (1741–94), Fr. author; natural s. of a grocer named Nicolas; b. Clermont (Auvergne); took active part in the Revolution, and was involved in numerous troubles by his bitter speeches; is chiefly remembered by his *Maximes et Pensées*, which have been favourably compared with those of La Rochefoucauld.

CHAMIER, FRÉDÉRIC (1796–1870), novelist; served in navy until 1833; captain, R.N. His nautical stories were very popular; pub. *Life of a Sailor* (1832), *Ben Brace* (1836), *The Arethusa* (1837), *Jack Adams* (1838), *Tom Bowling* (1841), *Jack Malcolm's Log* (1846); edit. James' *Naval History* (1837).

CHAMISSO, ADELBERT VON (1781–1838), Ger. poet and botanist; pub. *Frauen Liebe und Leben* (1830), lyrical poems, set to music by Schumann; *Peter Schlemihl* (1813), a weird tale (trans. into Eng. by W. Howitt), and numerous botanical treatises.

CHAMOIS, *Rupicapra tragus* (Ger. *Gemse*), a goat-like type of antelope (*q.v.*), with small horns, inhabiting the Pyrenees, Alps, Carpathians, Caucasus, and the mountains of W. Asia. They occur in herds of up to twenty, and display remarkable agility and keenness of scent and sight. The leather made from their skin was the original *shammy* leather.

CHAMOMILE, CAMOMILE, medicinal herb (*Anthemis nobilis*), common in Britain; dried flowers made into 'c. tea' possess excellent tonic and stomachic properties.

CHAMONIX, CHAMOUNI (45° 56′ N., 6° 51′ E.), mountain valley and village, Haute-Savoie, France, at foot of Mont Blanc; glaciers; tourist resort.

CHAMP DE MAI, Frankish national meeting-place for political purposes under Carolingian kings. Under the Merovingians this was the **Champ de Mars.**

CHAMPAGNE (48° 30′ N., 4° E.), old province, France, now included chiefly in Marne, Ardennes, Haute-Marne, Aube. Surface largely consists of chalk downs; in N. and E. are vineyards producing champagne wines. C. was feudal state in mediæval times; united to Fr. crown by marriage of Philip IV. with Jeanne of Navarre in 1284. See WINES.

CHAMPAGNE, PHILIPPE DE, CHAMPAIGNE (1602–74), Fr. painter of valued portraits.

CHAMPAGNEY (47° 44′ N., 6° 41′ E.), town, Haute-Saône, France. Pop. 4100.

CHAMPAGNY, JEAN BAPTISTE NOMPÈRE DE (1756–1834), Fr. diplomatist, statesman, and historian; Minister of Foreign Affairs (1807); favoured restoration of Bourbons.

CHAMPAIGN (40° 7′ N., 88° 16′ W.), city, Illinois, U.S.A.; has an Industrial Univ.; railway workshops and foundries. Pop. (1910) 12,421.

CHAMPARAN, CHUMPARUN (26° 50′ N., 84° 30′ E.), district, Tirhut division, Bihar and Orissa, India; area, 3531 sq. miles. Pop. 1,800,000.

CHAMPAUBERT (48° 53′ N., 3° 47′ E.), district, France, where Napoleon defeated Prussians and Russians, 1814.

CHAMPERICO (14° 25′ N., 91° 40′ W.), port, Guatemala; railway terminus.

CHAMPERTY, legal term for illegal collusion by which one person agrees to pay costs of lawsuit in which he is not a litigant on condition of dividing the profits.

CHAMPFLEURY, pseudonym of **Jules Fleury-Husson** (1821–89), Fr. novelist and art critic; wrote valuable *Bibliographie céramique*.

CHAMPIGNY, commune of the Seine; scene of battles between French and Prussians, 1870.

CHAMPION, one who represents or contends in the cause of another. Thus in the Middle Ages a priest, a woman, or an old or otherwise enfeebled person could nominate a 'champion' as their representative in any quarrel or passage of arms. The 'King's Champion' was an officer who, after a coronation in England, summoned to single combat any person who dared dispute the sovereign's title to the throne. The office was of very early origin, and continued until after the coronation of George IV.

CHAMPIONNET, JEAN ÉTIENNE (1762–1800), distinguished Fr. general of the Revolution.

CHAMPLAIN (44° 30′ N., 73° 25′ W.), lake between states of New York and Vermont, U.S.A.; area, 500 sq. miles; numerous affluents; contains about fifty islands; drains N. by Richelieu River into St. Lawrence; communicates with Hudson River by C. Canal; scene of two naval battles between British and Americans, 1776 and 1814.

CHAMPLAIN, SAMUEL DE (1567–1635), Fr. colonial agent and writer of travels; sent on exploring expedition up St. Lawrence (1603); made settlement at Port Royal (1604), but was forced to retire; established first European colony at Quebec (1608); discovered Lake 'Champlain,' and started Fr. conflict with 'Five Nations' of Indians; made trading settlement (1611) at Mont Royal (Montreal); *Life*, by Dix (1905), Dionne (1905).

CHAMPLEVÉ, surface in which hollows are made to receive enamels; hence applied to enamel work.

CHAMPOLLION, JEAN FRANÇOIS (1790–1832), and his bro., **Jacques Joseph C.-Figeac** (1778–1867), Fr. archæologists; the former a pioneer in study of Egyptian hieroglyphics.

CHAMPS ELYSÉES, Parisian thoroughfare, from the Arc de Triomphe to the Place de la Concorde; formed from the open country in XVIII. and XIX. cent's; now promenade of rank and fashion.

CHANCEL, eastern portion of church building, occupied by the altar, accommodating the choir and clergy. It is often separated from the nave by a carved wood or wrought-iron chancel-screen. See CHANCELLOR.

CHANCELLOR, title in England of head of legal profession. The name *cancellarius* was given by Romans to official who in law courts sat at 'chancel' or screen separating public from judge and counsel; in Byzantine Empire notaries were called *cancellarii*; title retained by barbarian states who imbibed Rom. law, and given to subordinate legal officials, over whom was *archi-cancellarius*; the keeper of the Royal Seal, who developed in England into the *Lord High C.* The name has been since applied to keepers of seals of many organisations; title lost in most European countries, and applied in Germany to chief political (not legal) official. In England the office existed from Saxon times, and became next in importance to justiciarship in time of Henry II.; equitable jurisdiction dates from 1280, when petitions to king were referred to chancellor; in reign of Edward III. he ceased to follow the court, and petitions were directed to him straight; later, keepership of Great Seal sometimes separated from chancellorship. *Ireland* has still a Lord C. For office of *Lord C. of Scotland*, that of Keeper of Great Seal was substituted at the Union (1707).

Chancellorship of Exchequer originated with separation of Exchequer from Chancery in the time of Henry III.; **Chancellorship of Duchy of Lancaster** with Act of Parliament, when Duke of Lancaster succ. to the throne, decreeing that lands of the Duchy should be separately administered.

Chancellor of a diocese, univ., etc., is primarily keeper of seals of diocese, etc.

CHANCELLOR, RICHARD (d. 1556), Eng. explorer in Russia, Archangel, etc.

CHANCELLORSVILLE (38° 14′ N., 77° 36′ W.), village, Virginia, U.S.A.; here Confederates defeated Federals, 1863.

CHANCE-MEDLEY, legal term for offence which is partly matter of chance; does not include crimes of passion.

CHANCERY DIVISION, successor to the old Chancery Court, is presided over by the Lord Chancellor; in it there are six judges. The Chancery Court was formerly notorious for its slow administration, but there is now no division of the High Court where cases are so promptly heard; in it alone there are practically no arrears. The business with which the C. D. deals is regulated by section 34 of the Judicature Act, 1873: (1) The administration of the estates of dead persons; (2) dissolution of partnerships and the taking of partnership and other accounts; (3) mortgages, with their redemption and preclosure; (4) the raising of portions or other charges on land; (5) the sale and distribution of the proceeds of property, subject to any lien or charge; (6) trusts, both charitable and private, and their execution; (7) the rectification or setting aside or cancellation of deeds or other written documents; (8) the specific performance of contracts between vendors and purchasers of real estate, including contracts for leases; (9) the partition or sale of real estates; and (10) the wardship of infants and the care of infants' estates.

CHANCRE, see SYPHILIS.

CHANDA (19° 50′ N., 79° 20′ E.), town, Nagpur division, Central Provinces, India; cotton, silk. Pop. 16,000.

CHANDAUSI (28° 27′ N., 78° 49′ E.), town, Moradabad district, United Provinces, India; cotton. Pop. 28,000.

CHANDERI (*c.* 24° 43′ N., 78° 8′ E.), town, Central India; formerly fortified. Pop. 4100.

CHANDERNAGORE, CHANDARNAGAR (22° 52′ N., 88° 25′ E.), town, on Hugli, Bengal, India; Fr. possession and settlement; manufactures cotton cloth; taken by Brit., 1757 and 1816; finally restored to France, 1816. Pop. 24,500.

CHANDLER, HENRY WILLIAM (1828–89), Eng. classical scholar; ed. Pembroke Coll., Oxford, of which he became fellow; prof. of Moral Philosophy (1867); curator of Bodleian (1884); pub. *Practical Introduction to Greek Accentuation* (1862), and was a leading authority on works of Aristotle.

CHANDLER, RICHARD (1738–1810), Eng. antiquary; pub. large work on *Ionian Antiquities* (1769), *Life of Bishop Waynflet* (period of Henry VI.), *Travels in Greece, History of Ilium*, etc.

CHANDLER, SAMUEL (1693–1766), Eng. Nonconformist preacher; was a Presbyterian, and famed for his learning; for about forty years conducted a meeting-house in Old Jewry; pub. *Vindication of the Christian Religion* (1725), *Reflections on the Conduct of Modern Deists* (1727), *Vindication of the Old Testament* (1740), and other controversial works.

CHANDOR (20° 19′ N., 74° 17′ E.), town, Bombay, India; captured by British, 1804, 1818. Pop. 5500.

CHANDOS, title of an Eng. barony held by the Brydges family, 1554–1719; in the latter year it was raised to a dukedom, and so continued until 1789, when it became extinct. It was revived and added to the dukedom of Buckingham in 1822, with which it became extinct, March 26, 1889.

CHANDOS, SIR JOHN (d. 1369), Eng. military commander; fought at *Cambrai* (1337), *Crécy* (1346), *Poitiers* (1356), where he saved life of the Black Prince. He won the victories of *Auray* (1364), and *Navaret* (1367). He was held in great estimation by Edward III., who made him a Knight of the Garter, and Seneschal of Poitou. He was killed at *Lussac*.

CHANDPUR (29° 10′ N., 78° 19′ E.), town, United Provinces, India. Also name of several places in Bengal. Pop. 13,000.

CHANDRAGUPTA MAURYA, SANDROCOTTUS (*c.* 321–296 B.C.), Ind. king; conquered the Punjab and other districts, and made himself paramount throughout India.

CHANGARNIER, NICOLAS ANNE THÉODULE (1793–1877), Fr. general and politician; distinguished in Algeria and in the Franco-Prussian War.

CHANG-CHOW (24° 28′ N., 117° 42′ E.), walled city, province of Fu-Kien, China; silk. Pop. 500,000.

CHANG-CHOW (31° 52′ N., 119° 47′ E.), town, Kiang-Su, China. Pop. 360,000.

CHANGRA, KANGHARI (40° 35′ N., 33° 40′ E.), town, Kastamuni vilayet, Asia Minor; ancient *Gangra*; fruit. Pop. 7000.

CHANG-SHA (28° 22′ N., 112° 50′ E.), town, Hunan, China; site of Yolo Coll. Pop. 300,000.

CHANNEL ISLANDS, ÎLES NORMANDES (49° 20′ N., 2° 30′ W.), Brit. islands in Eng. Channel, off coast of Normandy; largest are Jersey, Guernsey, Alderney, Sark, Herm; area, 75 sq. miles; produce large quantities of fruit, flowers, and vegetables, which are exported to England; important cod, lobster, and oyster fisheries; famous for special kind of cattle, each island having its particular strain; climate mild. Jersey and Guernsey (the latter including Alderney and Sark) are each administered according to their own laws by a military lieutenant-governor and a bailiff (who presides over the parliament or 'states'), app. by the Crown. Alderney has a parliament, and both Alderney and Sark have courts of justice subordinate to Guernsey. Jersey and Guernsey have local copper coinage. Taxes and customs duties are very low.

History.—C. Islands are said to have been inhabited successively by Celts, Romans, Saxons, Goths, and

Franks in early times; granted to Dukes of Normandy in X. cent.; united with Eng. crown since Norman Conquest; frequently invaded by French, who, however, failed to subjugate them. In Civil War Jersey supported Charles I., Guernsey the Parliament. Last Fr. attack occurred in 1781. Victor Hugo came here as refugee in 1852.

Inhabitants are of Norman stock; official language is French, though English is taught in schools; the country people speak a Norman-French dialect, resembling that spoken in England in the time of William the Conqueror. Religion, Protestantism. Militia service is compulsory. Pop. (1911) 96,900.

Ansted and Latham, *Channel Islands* (new ed., 1893); Carey, *Channel Islands* (1904).

CHANNING, WILLIAM ELLERY (1780–1842), Amer. preacher and author; b. Newport, Rhode I.; graduated at Harvard, and became a tutor in Virginia; was app. (1803) pastor of the Federal St. Congregational Church, Boston, a position he held till death. He was especially noted for his powerful advocacy of social reforms. During 1821–23 he visited Europe, and while in England made the acquaintance of Wordsworth and Coleridge. His works include *Remarks on the Life and Character of John Milton* (1826), *Life and Character of Napoleon Bonaparte* (1827–28), *Character and Writings of Fénelon* (1829), *Essay on Self-Culture*.

CHANSONS DE GESTE (songs of deeds), long narrative verse-cycles written in France during XI.–XIII. cent's, describing adventures of knightly heroes. The earliest, and perhaps greatest, is the *Chanson de Roland* (XI. cent.). There are several cycles dealing with the exploits of Charlemagne and his knights, Ogier the Dane, and others. In one of these, *The Pilgrimage to Jerusalem*, the Alexandrine verse was first used in French.

CHANT ROYAL, Fr. mediæval verse-form, somewhat like the *ballade*, consisting of sixty lines, in five strophes and an envoi, and having only five rhymes; much used for songs in praise of the Virgin.

CHANTABUN (12° 28′ N., 102° 20′ E.), town, C. province, Siam; rubies, sapphires.

CHANTADA (42° 37′ N., 7° 47′ W.), town, Lugo province, Spain; tiles, tanneries. Pop. 5000.

CHANTAL, STE. JEANNE FRANÇOISE DE (1572–1641), Fr. lady who founded the Order of the Visitation; grandmother of Mme de Sévigné (*q.v.*); feast-day, Aug. 21.

CHANTILLY (49° 9′ N., 2° 27′ E.), town, on Nonette, Oise, France; formerly celebrated for manufacture of lace; has magnificent Renaissance château, destroyed by Revolutionaries, 1793, rebuilt by Duc d'Aumale, and presented to Fr. Institute, 1886; horse-racing centre. Pop. 4900.

CHANTONNAY (46° 41′ N., 1° 4′ W.), town, Vendée, France. Pop. 4100.

CHANTREY, SIR FRANCIS LEGATT (1782–1841), Eng. sculptor; b. Norton, Derbyshire; s. of a carpenter; as a wood-carver in his early years acquired a knowledge of painting and sculpture; m. his cousin, Miss Wale (1807); exhibited a head of Satan at the R.A., 1808; and quickly rose to fame; elected A.R.A. (1815) and R.A. (1818); knighted (1835). A fine example of C.'s work is the *Sleeping Children*, in Lichfield Cathedral; and his best-known statues are those of George Washington, at Boston; George III., in London Guildhall; George IV., at Brighton; Pitt, in Hanover Square, London; John Dalton, at Manchester, etc.

C., having no children, left the bulk of his fortune, after the death of his widow, in trust to the R.A. for 'the purchase of works of fine art' by Brit. artists, or by foreign artists who have completed their work within the U.K. Lady C. died in 1875. The administration of the **Chantrey Bequest**—which usually produces a yearly income of upwards of £2000—has been the subject of much criticism in recent years, with the result that a committee of the House of Lords (1904) sat to inquire into the subject, and made certain recommendations which, it was hoped, would prevent further dissatisfaction.

Arthur Fish, *Chantrey and his Bequest* (1904).

CHANTRY.—(1) oratory founded for chanting masses for the departed or prayers for the living according to terms of bequest. (2) in XVI. cent. chapel below rank of parish church.

CHANUTE (37° 40′ N., 97° 27′ W.), city, Kansas, U.S.A.; natural oil and gas; extensive industries. Pop. (1910) 9272.

CHANZY, ANTOINE EUGÈNE ALFRED (1823–83), Fr. general; served at *Magenta* and *Solferino* (1859); in Syrian campaign (1860–61); commanded second army of the Loire in the Franco-German War (1870); gov. gen. of Algeria (1873–79); ambassador to Russia (1879–81); nominated for Pres. of the Republic (1879), receiving one-third of the votes.

CHAPEL HILL (35° 57′ N., 79° 3′ W.), town, N. Carolina, U.S.A.; seat of N. Carolina University; cotton mills. Pop. (1910) 1149.

CHAPELAIN, JEAN (1595–1647), Fr. poet; author of epic, *La Pucelle*, which occupied him for twenty years.

CHAPEL-EN-LE-FRITH (53° 21′ N., 1° 58′ W.), market town, Derbyshire, England; paper-making and cotton industries. Pop. (1911—rural district) 16,557.

CHAPELLE, appellation of **Charles Emmanuel Luillier** (1626–86), Fr. poet and wit of classical school.

CHAPLAIN, clergyman who officiates at court, or in private chapels; in workhouses and hospitals, etc.; there are also bp.'s c's, army c's, and navy c's.

CHAPLIN, CHARLES JOSUAH (1825–91), Fr, society portrait-painter.

CHAPLIN, HENRY (1841–), Eng. politician; b. Blankney, Lincolnshire; ed. Harrow and Ch. Ch., Oxford; won the Derby (1867) with 'Hermit'; M.P. (Conservative) for Mid-Lincolnshire (1868–1906) and for Wimbledon (since 1907); chancellor of duchy of Lancaster (1885–86); pres. of Board of Agriculture (1886–92); pres. of Local Government Board (1895–1900); leader of the Tory Protectionist wing of the Conservative party, and took a prominent part in Mr. Chamberlain's Tariff Reform campaign.

CHAPMAN, GEORGE (1559–1634), Eng. dramatist and translator; b. near Hitchin; ed. Oxford; wrote numerous plays, of which the earliest was *The Blind Beggar of Alexandria* (1596), followed by *Bussy d'Amboise*, *All Fools*, *Gentleman Usher*, *Monsieur d'Olive*, *Eastward Hoe* (with B. Jonson), etc. As a dramatist he possesses some humour, but his work for the most part is somewhat heavy. His name will live by virtue of his great translation of Homer; *Iliad* (1611), *Odyssey* (1616).

CHAPONE, HESTER (1727–1801), Eng. letter-writer and essayist; dau. of Thomas Mulso, a Northamptonshire gentleman; admirer and correspondent of Samuel Richardson; m. a solicitor, John C.; wrote *Letters on the Improvement of the Mind* (1772).

CHAPPE, CLAUDE (1763–1805), Fr. engineer who with his brother, **Ignace Urbain Jean C.** (1760–1829), invented the telegraph.

CHAPPED HANDS, see CHILBLAINS.

CHAPPELL, WILLIAM (1809–88), Eng. music editor and publisher; partner in Messrs. Chappell & Co.; noted for his collection and publication of *Popular Music of the Olden Time* (1855–59).

CHAPRA, CHUPRA (25° 46′ N., 84° 46′ E.), chief town, Saran district, near junction of Gogra and Ganges, Bihar and Orissa, India; indigo. Pop. 47,000.

CHAPTAL, JEAN ANTOINE CLAUDE (1756–1832), Fr. chemist and statesman; prof. Chem., Montpellier (1781); minister of Interior (1800–4), minister of Commerce (1811); founded Fr. Chamber of Commerce.

CHAPTER.—(1) assembly of members of a religious house (conventual c.) or order (in a provincial or general c.); (2) body which with the dean is governing body of a collegiate or cathedral church. Name is

probably derived from the portions of the Rule or the Scriptures read out when this body came together. The members of c's were termed canons, or prebendaries, the latter being of inferior status; under Ecclesiastical Commissioners Act, 1840, all members of c. of cathedral and collegiate churches in England and of St. David's and Llandaff churches, Wales, received status of canons.

Chapter-house, building where a cathedral or monastic chapter meets; used sometimes as place of sepulture, as at Wells and Westminster.

CHAPU (30° 35′ N., 121° 10′ E.), seaport, province of Chekiang, China; formerly had important trade with Japan.

CHAR, name for several palatable fishes of the genus *Salmo* occurring in clear mountainous lakes, *e.g.* in Scandinavia, Switzerland, Westmoreland, Scotland, Ireland, and Wales.

CHARCHARODON, see under SHARKS and DOG-FISHES.

CHARCOAL, form of amorphous carbon; (1) *wood* c., prepared by limited or smothered combustion of wood; black, porous solid used for fuel, gunpowder, filters, crayons, and as a deodorant; (2) *animal or bone* c., obtained by charring bones, used as a decoloriser in sugar-refining. See CARBON.

CHARCOT, JEAN MARTIN (1825–93), Fr. physician, prof. of Pathology in medical faculty of Paris, and physician at the Salpêtrière (1860); made investigations on neurology, hypnotism, etc.

CHARD (50° 53′ N., 2° 59′ W.), market town, Somersetshire, England; lace. Pop. (1911) 4568.

CHARD, JOHN ROUSE MERRIOTT (1847–97), Eng. soldier; hero of *Rorke's Drift*. Ordered to S. Africa during the Zulu War of 1879, he was in command of this small post on the Buffalo River, when news reached him of the disaster at Isandhlwana (Jan. 22). His garrison consisted of Lt. Bromhead and about 100 men, besides the sick in hospital, and, expecting an immediate attack, he hastily improvised defences, and succeeded in keeping 3000 Zulus at bay until help arrived. This spirited defence secured the retreat of Chelmsford's column, and both C. and Bromhead were afterwards awarded the V.C.

CHARDIN, SIR JOHN (1643–1713), Fr. traveller; b. Paris; s. of a jeweller; spent many years in Eastern travel; settled in London (1681), and was knighted by Charles II.; went to Holland (1683) as representative of East India Company; pub. *The Travels of Sir John Chardin into Persia and the East Indies* (London, 1686); buried in Westminster Abbey.

CHARENTE (45° 40′ N., 0° 10′ E.), inland department, France, formed principally from old province Angoumois; traversed by Charente; surface undulating, wooded hills, sandy plains; exports wheat, brandy (cognac); capital, Angoulême (*q.v.*); area, 2305 sq. miles. Pop. (1911) 346,424.

CHARENTE (45° 55′ N., 1° 10′ W.), river, France; enters Atlantic.

CHARENTE-INFÉRIEURE (45° 45′ N., 0° 40′ W.), maritime department, W. coast, France, nearly corresponding to old provinces of Saintonge and Aunis; includes islands of Ré and Oléron; well cultivated; good pastures; exports brandy and salt; oyster and pilchard fisheries important; capital, La Rochelle; area, 2791. Pop. (1911) 450,871.

CHARENTON-LE-PONT (48° 47′ N., 2° 25′ E.), town, on Marne, France; manufactures artificial flowers, porcelain. C. in French is equivalent of Eng. 'Bedlam.' Pop. 17,980.

CHARETTE (1763–96), name of leader of rebels of La Vendée; fell at Nantes.

CHARGÉ D'AFFAIRES, fourth grade of diplomatic agent, usually sent in place of an ambassador. His credentials are endorsed by the foreign minister, and not by the sovereign.

CHARGING ORDER, in Eng. law, order of court making a debt chargeable upon stocks or other funds of the debtor.

CHARIBERT (d. 567), Frankish king; s. of Clotaire I.; notorious for dissolute habits; on death of his f., received as his share of the kingdom Paris, Rouen, Tours, Bordeaux, and several other towns.

CHARIDEMUS (d. 333 B.C.), Gk. mercenary who, in 351, led the Athenians against Philip II. of Macedon, in the Chersonese.

CHARING CROSS, district, W. end of Strand, London; site of old village of Charing and one of the crosses erected by Edward I. in memory of Queen Eleanor.

CHARIOT, ancient horse vehicle used by Greeks, Romans, Egyptians, Assyrians, Persians, etc., first in war, but later only in games and processions. These conveyances were without springs of any kind, the body resting on the axle.

CHARIOTEER, see AURIGA.

CHARITÉ-SUR-LOIRE (47° 11′ N., 3° 2′ E.), town, France. Pop. 5200.

CHARITY, act of benevolence, inspired by love for one's fellow-men, particularly the poor and suffer- gifts to benevolent institutions; leniency in judging persons and their actions, and an inclination to put the best construction upon the words or works of others. 'Charity,' says Addison, 'is a habit of goodwill, or benevolence, in the soul, which disposes us to the love, assistance, and relief of mankind.' Among all civilised peoples, from the earliest times, the demands which the poor and outcast have upon their richer brethren have always been recognised to a greater or less degree. Consequently, in the Middle Ages, when the Church dominated all public life throughout Europe, it naturally followed that the monastery and the friary, whose inmates endeavoured to emulate the Christ-life, should devote much of their revenue and time to relieving the wants of the poor or destitute. Thus it came about that the different kinds of monastic institutions in England continued to be the chief distributors of c. until the time of their dissolution under Henry VIII. Of institutions devoted to charitable purposes in London alone the oldest is St. Bartholomew's Hospital, founded 1123; while St. Katherine's Hospital is a close second, having been instituted in 1145. Many of the educational charities belong to the XVI. cen amongst which may be named St. Paul's School (1509), Christ's Hospital (1553), and Merchant Taylors' School (1561). Since the establishment of these early charitable institutions, great numbers of others have come into being in various parts of the country.

To proceed to the consideration of the modern distribution of charity, it is indisputable that indiscriminate almsgiving is productive of much waste of mone[illegible] and, further, that it encourages imposture and idleness, which it should be the primary aim of charitable workers to eradicate. Apart from work undertaken at large by the State, it should be the business of private benevolent workers to remove, if possible, the cause of distress, and not so much attempt to provide the necessaries of life, which is the work of the Government, but to remove the causes of destitution, and, by placing means of employment within reach of the fallen, attempt to restore their independence and self-respect, and so revive an interest in life.

The **Charity Commissioners** are a body constituted n 1853, under the Charitable Trusts Act of that year, to undertake the better administration of charitable trusts in England and Wales. The business of this permanent board is to supervise the expenditure of charity trustees; to exercise control over capital; to prepare schemes for the modification of trusts, if need arises; and to appoint trustees, etc.

The **Charity Organisation Society** was founded in London in 1869, and affiliated with various societies in the provinces, the Colonies, and America for improving the conditions of the poor. The Society endeavours to do this by encouraging co-operation between charitable trusts, or persons, and the Poor

Law officials; by the dissemination of sound and practicable views on the administration of charitable work; by securing proper investigation into all claims and such-like matters. Above all, the Society endeavours to make the assistance given of permanent value by avoiding such means of assistance as may lessen the self-respect of the recipient. The office of the Society is Denison House, 296 Vauxhall Bridge Road, S.W. The first Charity Organisation Society in U.S.A. was founded in 1877, at Buffalo, N.Y., and there now exist Bureaux of Charities, Associated Charities, and similar organisations in some 150 cities. See POOR LAW.

Tudor's *Charitable Trusts* (1906); Loch's *Charity Organization* (1890); Devine's *Principles of Relief*, and Henderson's *Modern Methods of Charity* (1904).

CHARIVARI (Fr.), hideous din caused by beating on tin kettles, etc., and employed as a mock-serenade in the case of unpopular weddings in mediæval France. Later, as the medium of ridicule, became the name of a Parisian journal established 1832; from which is derived the sub-title of the Eng. *Punch*.

CHARKHARI (25° 30′ N., 79° 50′ E.), native state, Bundelkhand, Central India; area, 703 sq. miles. Pop. 130,000.

CHARLEMAGNE, CHARLES THE GREAT, CHARLES I. (742–814), King of the Franks, Emperor of the West, and perhaps greatest figure of the Middle Ages; s. of Peppin the Short, King of the Franks, and Bertha, dau. of Count Charibert of Laon; place of his birth unknown, and it is uncertain whether his parents were then married. In 768 King Peppin divided his kingdom between his sons, Charles and Carloman, and on the latter's death in 771 the elder son became sole King of the Franks. In 772 he conducted a war against the Saxons, who threatened the Frankish frontiers, and advanced as far as the Weser, when he was recalled to the aid of Pope Adrian I., who was in conflict with Desiderius, the Lombard king. C. had married a dau. of this monarch, but repudiated her because she bore him no offspring, afterwards uniting himself with Hildegarde, an Alemannian princess. Desiderius was endeavouring to compel the Pope by force of arms to establish the sons of Carloman in their f.'s territory.

C. crossed the Alps with two large armies, and succeeded in conquering the Lombard kingdom (774), which he added to his possessions. During the years immediately following he was constantly engaged in warfare. He won a victory over the Saxons, who acknowledged him as their king; was called to Spain (778) as intermediary between the Moors and Arabs, where he secured considerable territory, but lost Roland, Oliver, and other knights in the famous fight at the Pass of Roncesvalles. On Christmas Day, 800, C. was crowned emperor by Pope Leo III., and saluted as Carolus Augustus; the remaining years of his life were chiefly devoted to the consolidation of his great empire, and an attempt to revive Rom. civilisation, encouraging Alcuin (*q.v.*) in establishment of schools and commencing codification of the laws in the famous Capitularies (*q.v.*); buried at his capital, Aachen; his empire was soon after his death dismembered.

In personal appearance C. is said to have been tall and of a robust frame, with handsome features. He was sparing in his diet, loved hunting and other manly exercises, and was devoted to his children. Though he was unable to write, he read Latin and Greek, and was greatly interested in history and astronomy. As a soldier his successes were due rather to his ability as an organiser than personal brilliance in the field. His descendants, the 'Carolingians,' reigned over France until the death of Louis V. (985). His exploits, real and imaginary, were the subject of a cycle of romance.

Mombert, *History of Charles the Great* (1888); and *Life*, by Hodgkin (1897).

CHARLEMONT, JAMES CAULFEILD, 1ST EARL OF (1728–99), Irish statesman; man of fearless and resolute character, with literary and artistic tastes; prominently associated with Grattan in the assertion of Irish independence.

CHARLEROI (50° 25′ N., 4° 27′ E.), town, on Sambre, Hainault, Belgium; collieries, iron foundries; taken by French, 1794. Pop. (1910) 28,177.

CHARLEROI (*c.* 40° 10′ N., 79° 52′ W.), borough, on Monongahela, Pennsylvania, U.S.A.; glass factories. Pop. (1910) 9615.

CHARLES I. and II., Kings of Great Britain and Ireland.

CHARLES I. (1600–49), King of Gt. Britain and Ireland; 2nd s. of James I.; b. Dunfermline; succ. March 27, 1625; m. Henrietta Maria of France (May 1625). C. dissolved his first two Parliaments because of their opposition to his favourite Buckingham (*q.v.*). Funds for war with France and Spain were raised by a forced loan, and enforced by penalty of imprisonment. In 1628 a third Parliament compelled the king to redress the grievances stated in the *Petition of Right*, viz. forced loans, arbitrary imprisonment, illegal billeting of soldiers, and commissions of martial law. Early in 1629 Parliament attacked C. for levying tonnage and poundage, and for furthering Abp. Laud's innovations in religion. For eleven years C. ruled without Parliaments, raising money unconstitutionally. In 1634 he began to levy 'ship money.' The king's unpopularity was increased when the Scots rose in arms (1639) against a determined attempt to impose upon them the Eng. Church service.

Advised by his chief supporter Wentworth, now Earl of Strafford, C. summoned a Parliament (*Short Parliament*, April 13–May 5, 1640), which refused supplies, and was dissolved. In Aug. C. was defeated in the Second *Bishop's War* against the Scots, and in Nov. again summoned Parliament (*Long Parliament*). C. consented to various reforms, and was forced to sign a bill of attainder against Strafford, who was beheaded May 12, 1641. The violence of the extremists in pressing for the abolition of Episcopacy (*Root and Branch Bill*, May 1641) threw moderates on the side of the king. In Oct. C. sought help in Scotland, but failed, and his enemies took the opportunity of passing the *Grand Remonstrance* (Nov. 22), by which they proposed to monopolise the government themselves.

Following an attempt to arrest five members with an armed force in the House of Commons (Jan. 4, 1642), C. abandoned the capital (Jan. 10). The N. and N.W. were strongly Royalist, and on Aug. 22 C. set up his standard at Nottingham. After an indecisive battle at *Edgehill*, Oct. 23, C. was victorious (in 1643) at *Adwalton Moor*, *Roundway Down*, and *Cropredy Bridge*. At the end of the year the Scots gave their help to Parliament, while the Royalists were reinforced by the army from Ireland. On July 2, 1644, Prince Rupert was defeated at *Marston Moor*, and the North fell to Parliament. The Parliamentary army, remodelled by Cromwell, gave the Royalist cause its deathblow at *Naseby* (June 14, 1645).

In April 1646 C. sought the protection of the Scots, who surrendered him to the Eng. Parliament. The army, now divided against the Parliament, seized C. and imprisoned him at Carisbrooke. The Royalists rose in Wales and Kent, and Parliament, largely Presbyterian, negotiated with the king, but its action was nullified by the army. A High Court of Justice was, however, appointed by the Rump of Independents to try the king, and he was beheaded as a traitor at Whitehall, Jan. 30, 1649. C. had many noble traits, but had little appreciation of men and forces. In private life he was strongly affectionate, he was sincerely religious, and he faced death with heroic courage.

S. R. Gardiner, *History of the Great Civil War*; Adams, *The White King*.

CHARLES II. (1630–85), King of Gt. Britain and Ireland; s. of Charles I.; b. London; took part in Civil War and retired to France. Ormonde in Ireland and Montrose in Scotland took up arms for C., but he repudiated both in order to gain support of Covenanters; landed in Scotland, 1650, and was crowned at Scone. After defeat of Presbyterians at Dunbar, C. discarded their aid and marched south with Huntly;

defeated at Worcester, fled to France, and wandered over W. Europe till he was recalled to England in 1660. After passing a decree of indemnity he endeavoured to gain toleration for his fellow-Roman Catholics, and incidentally for Nonconformists, but Parliament passed various intolerant measures, 1661–65. Venner's rebellion gave an excuse for maintaining a standing army. Episcopacy was re-established in Scotland and the Covenanters persecuted—a good instance of C.'s perfidy; another is his dismissal of Clarendon, his adviser since long before his accession, to satisfy popular discontent at the Dutch War, 1665–67. Clarendon was succeeded by the Cabal ministry (*q.v.*), but the history of the rest of C.'s reign is one of deception and intrigue. He secretly received money from Louis XIV. for support against Holland, and at the same time countenanced a treaty with Holland and Sweden.

The 'Popish Plot' was successful in arousing opposition to Roman Catholicism, and an Exclusion Act was introduced debarring them from reigning—directed against James, Duke of York. Charles's astuteness secured its defeat. He died a Roman Catholic. Compared with his father, C. is a poor person indeed. He was profligate, untrustworthy, thoroughly insincere, but he knew when to bend to public opinion, and this pliability, coupled with geniality and air of frankness, secured his popularity.

CHARLES I.–VII., Holy Rom. Emperors; for Charles I., see Charlemagne.

CHARLES II., THE BALD (823–77), Holy Rom. Emperor and King of the West Franks (modern France); s. of Emperor Louis the Pious; succ., 843; **Charles I.** of France.

CHARLES III., THE FAT (832–88), Holy Rom. Emperor and King of the West Franks; s. of Emperor Louis; succ. his bro's in the inheritance of his f.'s territories; was crowned Rom. emperor by Pope John VIII. in 881; but was deposed by his nobles, 887; reckoned as **Charles II.** of France.

CHARLES IV. (1316–78), Holy Rom. Emperor and King of Bohemia; b. Prague; s. of King John of Bohemia; fought at *Crécy* (1346), where his f. was killed; largely extended Bohemian territory, and was noted for the exemplary wisdom of his government; he founded the first Ger. univ. at Prague (1348), and promoted agriculture and various industries.

CHARLES V., CHARLES QUINT (1500–58), Holy Rom. Emperor and King of Spain (Charles I.); b. Ghent; s. of Philip of Burgundy and Joanna, dau. of Ferdinand and Isabella of Spain. From his f. he inherited the Low Country dominions and Burgundy, and through his mother he became heir to the kingdoms of Spain and Naples, and the rich possessions in Span. America. On the death of King Ferdinand (1516) C. left the Netherlands for Spain, where he was recognised as joint ruler with his mother, who had now become hopelessly insane; and on the death of his paternal grandfather, the Emperor Maximilian, in 1519, he was elected Emperor of Germany, the rival candidate being Francis I. of France. By virtue of his great possessions C. became the most influential political figure of his time, and thus began the intense rivalry between himself and Francis I., which dominated the history of W. Europe during the next quarter of a century. The conflict was waged in many quarters, but most decisively in Italy, where the French were dispossessed of the duchy of Milan, and finally driven out of Italy altogether. In 1525, however, Francis again entered Italy, occupied Milan, but was taken prisoner at *Pavia*, and, being carried to Madrid, was only released upon signing a treaty in which he resigned all his claims and pretensions, being further required to aid C. in the suppression of heresy. In this year (1526) C. married Isabella, sister of John III. of Portugal, to whom he is said to have been greatly devoted, and who became the mother of Philip II. of Spain.

Like his notorious s. (Philip II.), C. was a religious zealot, and a relentless opponent of Lutheranism. It was, therefore, his earnest desire to witness the restoration of Ger. allegiance to the See of Rome. In this dream, however, he was doomed to disappointment, for the Peace of Augsburg (1555), brought about by the formidable Prot. opposition under Maurice of Saxony, compelled him to acquiesce in the establishment of Protestantism over the greater part of Germany. This blow to his hopes, and his declining health, led to his abdication in favour of his s. Philip (1556), and he retired to the monastery of San Yuste, in Estremadura, where he lived in great seclusion, but continued to direct the policy of his successor.

C.'s features were ugly, but he possessed a graceful and handsome figure; he was simple in his dress, was fond of children and animals, and had a fine appreciation of music and painting. He left two illegitimate children: a dau. named Margaret, and a son, who became famous as Don John of Austria.

Robertson, *Life of Charles V.*; and Sir W. Stirling-Maxwell's *Cloister Life of Charles V.*

CHARLES VI. (1685–1740), Holy Rom. Emperor s. of Emperor Leopold I.; his claim to the throne of Spain, on the death of Charles II., brought about the War of the Span. Succession. He was proclaimed emperor (1711) on the death of his bro., Joseph I.; though he acquired much Span. territory by the Treaty of Utrecht, it was only to relinquish it in later years; an unsuccessful Turkish campaign increased his misfortunes. An only s. died in infancy, and the succession was secured to his dau., Maria Theresa, by the Pragmatic Sanction.

CHARLES VII. (1697–1745), Holy Rom. Emperor and Elector of Bavaria; s. of Elector Maximilian Emmanuel, whom he succ., 1726, having m. Maria Amelia, dau. of Emperor Joseph I. He became one of the claimants in the War of the Austrian Succession, refusing to recognise the 'Pragmatic Sanction' (1713), by which Charles VI. had secured to his own dau., Maria Theresa, the succession of the Hapsburg dominions. He proclaimed himself King of Bohemia (1741), and was elected emperor (1742), but was eventually driven even from Bavaria.

CHARLES I.–X., Kings of France. In some chronologies Charlemagne and Charles the Bald are reckoned as Charles I. and II. of France, in others, Charles the Bald and Charles the Fat.

CHARLES III., THE SIMPLE (879–929), King of France; s. of Louis 'the Stammerer'; his reign was chiefly notable for the treaty of peace (911) by which he conferred upon Rollo, a Norman chief, and his heirs, the hereditary dukedom of Normandy. At a later date his nobles revolted, and C. being captured, was kept a prisoner in the castle of Péronne for several years, until his death.

CHARLES IV., THE FAIR (1294–1328), King of France; youngest s. of Philip IV.; succ. his bro., Philip V., as King of France and Navarre (1322); being by lack of revenue, he put public offices to auction. He rendered aid to his sister Isabella in the overthrow of her worthless husband, Edward II. of England. C. was the last of the direct line of Capetian kings.

CHARLES V., THE WISE (1337–80), King of France; s. of John II.; his f. was captured at *Poitiers* (1356), but C. escaped, and ruled in his f.'s stead during John's long captivity in England. He came to the throne in 1364, and, with the aid of Bertrand du Guesclin, succeeded in clearing France of the mercenary bands which ravaged the country, sending them against the English in Spain, and finally driving the English out of the greater part of France. The country groaned under his heavy taxation, but, on the other hand, C. gave France a navy, encouraged the development of the mercantile marine, restricted the power of the nobles, built the Bastille, erected palaces, and made a valuable collection of books and articles of vertu.

CHARLES VI., LE BIEN-AIMÉ (1368–1422), King of France; s. of Charles V.; succ. his f. when twelve, the government of the country being in the hands of his uncles, the Dukes of Anjou, Berry, Burgundy, and

Bourbon; he m. Isabeau of Bavaria, dau. of Stephen II. (1385); was crowned in 1389. Henry V. of England (1414) having formed an alliance with the Duke of Burgundy, revived the Eng. claim to Fr. throne, and won the victory of *Agincourt* (1415); compelled C. to sign Treaty of Troyes, m. Katherine, dau. of the Fr. king, and was acknowledged heir to the throne. C. was, throughout his life, subject to fits of insanity.

CHARLES VII., THE INDOLENT, later THE VICTORIOUS (1403–61), King of France; s. of Charles VI.; his title to the throne of France was disputed by Henry VI. of Eng., N. France being ruled by the Duke of Bedford, until the advent and successes of Joan of Arc eventually gave C. rule over the entire kingdom. It is to the lasting shame of this king that he made no effort to save Joan from her fate. See FRANCE (*History*).

CHARLES VIII. (1470–98), King of France; s. of Louis XI.; succ. at age of thirteen; m. Duchess Anne of Brittany (1491); was an utterly vain and worthless king, his head being filled with vague dreams of military glory, which never came to fruition.

CHARLES IX. (1550–74), King of France; 3rd s. of Henry II. and Catherine de' Medici; succ. his bro., Francis II. (1560). He appears in his earlier years to have had the makings of a man, but was spoilt by his upbringing. He submitted, easily for the most part, to the empire of his mother, who lured him from his attachment to the gallant Admiral de Coligny, and was, throughout his short life, his evil genius, compelling him, amongst other things, to sanction the Massacre of St. Bartholomew.

CHARLES X. (1757–1836), King of France; reigned 1824–30; 3rd s. of the Dauphin, Louis, grandson of Louis XV., and younger bro. of Louis XVI. and Louis XVIII.; before his accession known as Count of Artois. His youth was marked chiefly by dissipation and boundless extravagance; succ. Louis XVIII., but his short reign involved him in frequent troubles with his people, chiefly by reason of his incompetency. He abdicated (1830), and was succ. by Louis Philippe, Duke of Orleans. On two occasions of exile C. took up his residence at Holyrood Palace, Edinburgh.

CHARLES I.–IV., Kings of Spain. For Charles I., see Emperor Charles V.

CHARLES II. (1661–1700), King of Spain; s. of Philip IV.; was feeble from birth, and grew u ignorant and incapable, and d. of senile decay. He was twice m., but left no issue, and was the last Hapsburg to occupy the Span. throne. He bequeathed the throne to Philip, Duke of Anjou, grandson of Louis XIV., which action gave rise to the War of the Span. Succession.

CHARLES III. (1716–88), King of Spain; s. of Philip V. and Elizabeth Farnese; succ. his bro., Ferdinand VI. (1759). He cherished a lifelong detestation of England, but showed a progressive policy, introduced many reforms, and displayed a real zeal for improving the conditions of his people. He expelled the Jesuits, reduced the Inquisition to a state of inactivity, encouraged trade, and built many of the finest buildings of modern Spain.

CHARLES IV. (1748–1819), King of Spain; 2nd s. of Charles III. and Maria Amelia of Saxony. His elder bro. was an imbecile, and therefore incapable of ruling, while C. was probably the most foolish king who ever occupied the Span. throne. He became practically a puppet in the hands of his unscrupulous wife, Maria Luisa of Parma, and her favourite, Emmanuel Godoy, who ruled the country. His fleet was destroyed by Nelson at Trafalgar. He abdicated at Napoleon's suggestion, accepted a pension from the emperor, and died at Rome.

CHARLES I.–XV., Kings of Sweden; regarding Charles I.–VIII. little historical is known.

CHARLES IX. (1550–1611), King of Sweden; s. of Gustavus Vasa; was recognised as king, 1600; crowned, 1607; during his short reign he was engaged in wars with Russia and Denmark, which were continued, after his death, by his s., Gustavus Adolphus. He aimed at the foundation of a great Prot. kingdom. Personally C. is said to have been hard, cruel, and violent; notwithstanding his faults he was the people's hero.

CHARLES X. (1622–60), King of Sweden; s. of John Casimir, Count Palatine of Zweibrücken, and Catherine, dau. of Charles IX.; succ. his cousin, Queen Christina, who resigned in his favour (1654); m. Hedwig Leonora, dau. of Frederick III., Duke of Holstein-Gottorp (1654). Of a warlike spirit, C. in 1655 overran Poland. Later he compelled the Elector of Brandenburg to surrender Pomerania; subsequently obtaining a second conquest over the Polish army in the three days' battle of *Warsaw* (July 28–30, 1656). Next he invaded Denmark, crossed both the Great and Little Belt over the ice with a large army, and forced the cession of great territories as price of peace. Later, when attacking Copenhagen, he was beaten off, as the Danes were assisted by the Dutch and the Prussians; and when preparing for a further war he died suddenly at Gothenburg.

CHARLES XI. (1655–97), King of Sweden; only s. of Charles X.; was only four years of age at his f.'s death, and up to the time of his majority at the age of seventeen his education was sadly neglected. But, upon his accession, he threw himself diligently into the business of administration; won two great victories over his hereditary enemies the Danes, and thereby restored the prestige of his country; and proved his right to be considered one of the greatest of Swed. kings.

CHARLES XII. (1682–1718), King of Sweden; s. of Charles XI.; succ., 1697. A hostile league was formed in 1699 by Russia, Denmark, and Poland for the overthrow of Sweden, but C., in spite of his youth, landed near Copenhagen, and compelled the Dan. king to sue for peace. Next he turned his arms against the Tsar Peter I., and with about 9000 men routed 50,000 Russians at *Narva* (Nov. 30, 1700). Then he proceeded to the reduction of Poland, dethroned Augustus II., and compelled the election of Stanislaus Leszezynski as King of Poland. His subsequent operations against Russia were unsuccessful, and he became a prisoner to the Turks, whose aid he had unsuccessfully sought. He contrived, however, to escape, and in a brief space of time was busy preparing an expedition against Norway, during the progress of which he was killed by a stray shot before the fortress of Fredrikshald. C. had many personal characteristics which were calculated to render him popular with the Swed. people. He was brave to recklessness, despised rank, dressed simply, lived on the coarsest food, and shared with his soldiers all the hardships of war.

Voltaire, *Histoire de Charles XII.*; R. N. Bain, *Charles XII.* (1895).

CHARLES XIII. (1748–1818), King of Sweden and Norway; s. of Adolphus Frederick, King of Sweden. By the union (1814) C. became King of Sweden and Norway. He served with distinction, as Admiral of the Fleet, in the Russo-Swedish War (1788).

CHARLES XIV. (1763–1844), King of Sweden and Norway; his name was Jean Baptiste Bernadotte; s. of Henri Bernadotte; b. Pau; entered Fr. army (1780); won speedy promotion during progress of Fr. Revolution; commander of army in La Vendée (1800–1); made Marshal of France under the Empire; gov. of Hanover (1804–5). He was adopted as heir by Charles XIII., whom he succ. 1818.

CHARLES XV. (1826–72), King of Sweden and Norway; s. of Oscar I.; became regent (1857); succ. his f. as king (1859); m. Louisa, dau. of Prince Frederick of the Netherlands. He promoted many useful reforms in the administration, and personally attained some eminence both as poet and artist.

CHARLES I.–III., Kings of Navarre. For Charles I., see Charles IV. of France.

CHARLES II., THE BAD (1332–87), King of Navarre; s. of Jeanne II., Queen of N., and Philip, Count of Evreux; m. Jeanne, dau. of King John II. of France. Through both his parents he was descended from Fr. kings, and thus was a rival claimant with Edward III. of England for Fr. throne. He possessed insinuating manners, but was cruel, dissolute, and unscrupulous.

CHARLES III., THE NOBLE (1361–1425), King of Navarre; s. of above. His reign was memorable for its peace and the improved economic conditions which his care brought about; he m. Leonora, dau. of Henry II. of Castile.

CHARLES I. and II., Kings of Naples and Sicily.

CHARLES I. (1226–85), King of Naples and Sicily, and Count of Anjou; s. of Louis VIII. of France, and bro. of St. Louis; accompanied the latter on a crusade in Egypt (1248); received crown of Naples and Sicily from Clement IV. (1266); made himself by conquest one of most powerful European sovereigns. But his greed, ambition, and cruelty raised up enemies everywhere, and his vast empire dwindled gradually away. He died of fever at Foggia, when preparing an expedition against Sicily.

CHARLES II. (1250–1309), King of Naples and Sicily; s. of preceding; was a prisoner in the hands of King Peter of Aragon at time of his f.'s death, but was released later on condition that he resigned crown of Sicily to Aragon. C. afterwards made unsuccessful attempts to recover the island. He spared no expense in his efforts towards the improvement of the city of Naples.

[illegible]RLES (1771–1847), Archduke of Austria; b. Florence; s. of Emperor Leopold II.; gov. of the Netherlands (1790); was engaged in battles with the French from his twenty-first year; defeated Masséna at *Caldiero* (Italy) in Oct. 1805; was several times opposed to Napoleon, whom he defeated at *Aspern* and *Esslingen* (1809).

CHARLES ALBERT (1798–1849), King of Sardinia; succ. his cousin, Charles Felix, 1831; during early part of reign much exercised in combating secret societies, particularly Mazzini's 'Young Italy'; founded liberal constitution, devoted to administrative reforms, and encouraged art, science, and letters; abdicated (1849) in favour of e. s., Victor Emmanuel, who afterwards became first King of Italy.

CHARLES ALEXANDER (1712–80), Prince of Lorraine; s. of Leopold, Duke of Lorraine; m. Marianne, sister of Maria Theresa of Austria; became commander-in-chief of Austrian army, and performed many brilliant services; was also gov. of Austrian Netherlands.

CHARLES AUGUSTUS (1757–1828), Grand-Duke of Saxe-Weimar; m. Princess Louise of Hesse-Darmstadt; patron of art, science, and letters; intimate friend of Goethe.

CHARLES, CAROL (1839–), King of Rumania; Prince of Hohenzollern-Sigmaringen; elected prince of Rumania, 1866; was proclaimed king, 1881; m. Princess Elizabeth of Wied (1869), better known as 'Carmen Sylva'; their only child d. (1874), and the heir to the throne is the king's nephew, Prince Ferdinand, who m. Marie, dau. of the Duke of Saxe-Coburg.

CHARLES, CHARLES IV. (1421–61), Navarrese prince; s. of Queen Blanche of Navarre and her husband, John (II.), who, after her death, seized the crown to exclusion of Charles; trans. Aristotle's *Ethics* into Spanish.

CHARLES EDWARD STEWART, PRINCE (1720–88), 'THE YOUNG PRETENDER,' s. of James, 'Old Pretender'; b. Rome; took part in Don Carlos' expedition against Naples, 1734; attempted, with French help, invasion of England, but was driven back by storm, 1744; landed in Scotland, 1745, and obtained support first of Lochiel then of many Highland chiefs; defeated Cope at Prestonpans, Sep. 20; took Carlisle; reached Derby, Dec. 4; compelled to retreat by desertion of troops; marched north, defeating Hawley at Falkirk; utterly defeated at Culloden by Duke of Cumberland, April 16, 1746. After five months' wandering C. took ship to France, whence he was driven, 1748; wandered over Europe intriguing, but meeting with coldness; m. Louise of Stolberg, 1772; separated, 1784; d. Rome. C. was brilliant, versatile, and courageous, but profligate; romantic interest attached to his name has formed subject of many Highland poems, and there are still Jacobite societies.

CHARLES EMMANUEL I. (1562–1630), Duke of Savoy; succ. his f., Emmanuel Philibert (1580); m. Catherine, sister of Henry of Navarre; upon the murder of Henry III. of Valois, C. aspired to Fr. throne, but the recognition of the King of Navarre as Henry IV. of France put an end to his hopes.

CHARLES LE BON (1084–1127), Count of Flanders; s. of King Knut IV. of Denmark; was named as heir to the countship of Flanders by his cousin, Baldwin VII., whom he succ. in 1119; was an earnest supporter of the cause of Christianity, and laboured tirelessly for the welfare of his people; murdered in church of St. Donat, Bruges.

CHARLES LEOPOLD (1643–90), Duke of Lorraine; nephew of Charles IV.; his duchy was occupied by the French, and he failed, after strenuous efforts, to recover its possession; he was also twice an unsuccessful candidate for the crown of Poland, which eventually was bestowed upon John Sobieski, in 1674, with whom he was later intimately associated in resisting the Turkish invasion of Europe.

CHARLES MARTEL, *i.e.* 'THE HAMMER' (688–741), Frankish king; natural s. of Pippin II., mayo of the palace under the last Merovingian kings; was grandfather of Charlemagne; memorable for having stemmed tide of Moslem conquest; but for his efforts, Gibbon tells us, 'perhaps the interpretation of the Koran would now be taught in the schools of Oxford.' He was succ. by his sons, Carloman and Pippin the Short.

CHARLES OF BLOIS (1319–64), Duke of Brittany; s. of Guy of Châtillon, Count of Blois; m. Jeanne, dau. of Guy of Brittany, in whose right he claimed the duchy of Brittany. He was killed at *Auray* (1364). C. was noted for his piety, and received canonisation.

CHARLES OF GUISE (1525–74), Cardinal of Lorraine; the cunning, ambitious, and unscrupulous bro. of Francis, Duke of Guise; exercised considerable influence at the courts of Henry II. and Francis II., but fell into disfavour with Catherine de' Medici, and was dismissed the court.

CHARLES THE BOLD (1433–77), Duke of Burgundy; s. of Philip the Good; m. Margaret of York, his third wife, and was thus bro.-in-law of Edward IV. of England; succ. to the duchy in 1467. During the greater part of his life, he was engaged in conflict with the Fr. king (Louis XI.), whose vassal he was, and his ambition was to raise Burgundy into a powerful kingdom. Possessing great strength and a handsome person, brave and reckless to a fault, he was undoubtedly the most conspicuous military figure of his age. He was killed at the siege of Nancy, Jan. 5, 1477.

Ruth Putnam, *Charles the Bold* (1908).

CHARLES, COUNT OF VALOIS (1270–1325), Fr. military leader, who distinguished himself in many battles in Guienne and Flanders. His s., Philip, became King of France (1328), founding the Valois dynasty.

CHARLES, ELIZABETH (1828–96), Eng. novelist; dau. of John Rundle, M.P.; m. Andrew P. Charles (1851); wrote about fifty books, including a story written around Martin Luther, *The Chronicles of the Schönberg-Cotta Family* (1862), which enjoyed an immense vogue in England and abroad.

CHARLES, THOMAS (1755–1814), Welsh

Methodist preacher and writer; pioneer of Sunday Schools in the principality; issued *Biblical Dictionary* (in Welsh), 4 vols., 1805–11.

CHARLES'S WAIN, see URSA MAJOR.

CHARLESTON (32° 55′ N., 80° W.), town, S. Carolina, situated on point of land between Cooper and Ashley Rivers, which, uniting, form fine harbour. Regularly laid out, many fine houses and gardens. Public buildings include city hall, custom-house, arsenal; there are military and musical academies, and a Medical College. Seat of Catholic bp.; many fine churches and charitable institutions. Several parks and pleasure resorts. Important commercial centre; manufactures fertilisers, clothing, etc.; exports cotton, rice, lumber, phosphates. Founded 1670 by English colonists. Successfully besieged by English, 1780. Civil War broke out here by seizure of Fort Sumter by S. Carolinians, 1861. Suffered from earthquake, 1886. Pop. (1910) 58,833.

CHARLESTON (39° 30′ N., 88° 14′ W.), city, Illinois, U.S.A. Pop. (1910) 5884.

CHARLESTON (38° 21′ N., 81° 32′ W.), capital of West Virginia, U.S.A.; vicinity produces bituminous coal, salt. Pop. (1910) 22,996.

CHARLESTOWN (42° 22′ N., 71° 4′ W.), former city, Middlesex County, Massachusetts; since 1874 a district of Boston; sugar refineries. Here the battle of *Bunker's Hill* was fought, 1775, British ruining the town, which was afterwards rebuilt.

CHARLESTOWN (17° 8′ N., 62° 35′ W.), town, Nevis, W. Indies.

CHARLET, NICOLAS TOUSSAINT (1792–1845), Fr. artist and designer; served in the National Guard; later adopted the artist's profession, and excelled in military subjects.

CHARLEVILLE (49° 47′ N., 4° 42′ E.), town, on Meuse, Ardennes, France; manufactures hardware, leather, and beer. Pop. 18,772.

CHARLEVOIX (45° 19′ N., 85° 17′ W.), summer resort, Michigan, U.S.A.; trade in lumber.

CHARLEVOIX, PIERRE FRANÇOIS XAVIER DE (1682–1761), Fr. Jesuit historian; travelled frequently for his order in America and elsewhere; wrote *History of the Church of Japan*, Eng. trans. 1715), *History of San Domingo* (1730), *History of Paraguay* (1756), *History of Canada*, Eng. trans. (1769).

CHARLOTTE (35° 17′ N., 80° 39′ W.), city, N. Carolina, U.S.A.; seat of Biddle Univ. for negroes; manufactures cotton and machinery. Pop. (1910) 34,104.

CHARLOTTE AMALIE, ST. THOMAS (18° 24′ N., 64° 56′ W.), port, St. Thomas, Danish W. Indies. Pop. 8600.

CHARLOTTE, PRINCESS, AUGUSTA (1796–1817), only child of Prince George of England (Geo. IV.) and Caroline of Brunswick; contracted to William of Orange and m. Leopold of Saxe-Coburg, but left no issue.

CHARLOTTENBURG (52° 32′ N., 13° 17′ E.), town, Prussia; virtually a suburb of Berlin; has royal palace; famous Technical College; manufactures china, beer, iron goods. Pop. (1910) 305,978.

CHARLOTTESVILLE (38° 3′ N., 78° 28′ W.), city, Virginia, U.S.A.; seat of Univ. of Virginia, founded by Thomas Jefferson; manufactures agricultural implements. Pop. (1910) 6756.

CHARLOTTETOWN (46° 14′ N., 63° 10′ W.), capital of Prince Edward Island; fine harbour; has woollen factory and iron foundry. Pop. 12,100.

CHARMETTES (c. 45° 30′ N., 5° 50′ E.), village, Savoie, France; near Chambéry.

CHARNER, VICTOR-JOSEPH (1797–1869), Fr. admiral distinguished in Chin. expeditions.

CHARNOCK, ROBERT (d. 1696), Eng. R.C. priest; was concerned in the plot to assassinate King William III. at Turnham Green, Feb. 1696; arrested, found guilty, and hanged in the following month.

CHARNOCKITE, important group of igneous rocks, found India, Ceylon, Madagascar, parts of Africa, France, Norway, Germany, S. America, and Scotland. The tombstone of JOB CHARNOCK (d. 1693), the founder of Calcutta, was made from this stone, and Dr. T. H. Hallam named it after him. The rocks are regarded as belonging to the Archæan age.

CHARNWOOD FOREST (52° 15′ N., 1° 18′ W.), barren hill tract, N.W. Leicestershire, rising to elevation of 912 ft.

CHAROLAIS (46° 26′ N., 4° 16′ E.), district, Saône-et-Loire, France; wines, cereals, live stock.

CHAROLLES (46° 26′ N., 4° 16′ E.), town, Saône-et-Loire, France; noted cattle and pottery. Pop. 3176.

CHARON (classical myth.), s. of Erebus and Nox; a minor deity whose business it was, for payment of an obolus, to ferry souls of the departed across the Styx to the infernal regions.

CHARPENTIER, FRANÇOIS (1620–1702), Fr. man of letters; pub. *Vie de Socrate* (1650); trans. Xenophon's *Cyropædia* (1658) and other works.

CHARPENTIER, GUSTAVE (1860–), Fr. composer; b. Alsace-Lorraine; studied violin; best-known work, romantic opera *Louise*; also wrote *Julien*.

CHARPENTIER, JACQUES (1524–74), Fr. scholar thought to have murdered Ramus.

CHARRON, PIERRE (1541–1603), Fr. theologian; after studying for law entered the Church, became canon, and was app. preacher in ordinary to Marguerite of Valois. He attacked the League in his *Discours Chrétiens* (1589); championed Catholicism in *Les Trois Vérités* (1594), while his *De la Sagesse* (1601) brought down upon him the charge of atheism. He lived on intimate terms with Montaigne.

CHARRUA, tribe of S. Amer. Indians, now almost extinct.

CHART, marine map, showing the nature of the sea floor, with soundings for use of the seafaring population. The Brit. Admiralty c's are issued by the hydrographic office; prepared with extreme care, with constant reference to surveys of other nations, and, as far as possible, are kept up to date.

CHARTE CONSTITUTIONELLE, the Magna Carta of France, obtained from Louis XVIII. (1814) and expanded after Revolution, 1830.

CHARTER, a written instrument, conferring certain privileges, granted by the Crown, the most famous example in Eng. history being Magna Carta given by King John. C's are now chiefly granted to Univ's, corporations, public companies, and similar bodies. The term is also used in the sense of 'to hire,' as to charter a vessel; and was used by Shakespeare in the sense of license ('chartered libertine').

CHARTER OAK, tree (supposed to be 1000 years old) at Hratford, Conn., till blown down (1856), in hollow of which colonists hid colonial charter to evade surrendering it to New England governor-general.

CHARTERED COMPANIES are trading corporations existing under a charter from a sovereign power, usually for a fixed period, and limited by clearly defined regulations. Such companies existed amongst foreign nations long before they were instituted by Eng. merchants. The Hanseatic League, which maintained its Eng. branch at a place known as the Steel Yard, on the Thames embankment, until the yard was closed by Queen Elizabeth, dates from the XIII. cent. Eng. trading companies came into existence under Elizabeth. The most famous was the EAST INDIA COMPANY, instituted for the purpose of opening up an Eng. trade with India and the Far East. It received its first charter in 1600, and became the ruling power in India, and it was not until 1858 that its powers were finally absorbed by the Crown.

Second only in importance is the HUDSON'S BAY COMPANY, which was established in 1670, when Charles II. granted a charter to Prince Rupert and seventeen other speculators, who were described as 'the Governor and Company of Adventurers of England trading into Hudson's Bay.' Other early companies were the Turkey and Russian Companies;

while later institutions have been the NATIONAL AFRICAN Co. (1881), which secured the lower Niger for Brit. trade, the BRIT. NORTH BORNEO Co. (1881), Royal Niger Co. (1886), which enjoyed all rights of government in its territories until they were incorporated with N. and S. Nigeria (1900), the IMPERIAL BRIT. EAST AFRICA Co. (1888; see BRITISH EAST AFRICA) and the BRIT. S. AFRICA Co. (1889), formed under auspices of Cecil Rhodes, which secured Rhodesia (*q.v.*) for England.

CHARTERHOUSE (Eng. form of *Chartreuse*), famous London school occupying the site of a Carthusian monastery founded by Sir Walter de Manny (1371). The school itself was founded and endowed under the will of Thomas Sutton (1532–1611), a London merchant. The number of foundation scholars was at first limited to 40, but has since been increased to 60. In 1872 new school buildings were erected at Godalming, and a portion of the old Charterhouse now accommodates the boys of Merchant Taylors' School.

CHARTERS TOWERS (20° 6′ S., 146° 6′ E.), town, Devonport County, Queensland, Australia; gold mines. Pop. (1911) 17,298.

CHARTIER, ALAIN (d. 1430), Fr. poet; was sec. to Charles VII.; famous for his poems, *Le Lay des Quatre Dames*, *Débat du réveille-matin*, *La Belle Dame Sans Merci*, etc. A prose work, *Le Curial*, was trans. and pub. by Caxton.

CHARTISM, popular movement demanding (1838) universal suffrage, vote by ballot, annual parliaments, payment of members, and abolition of property qualification—'The People's Charter'; Parliament refused to receive their petition; came to a head in 1848, when a huge procession was massed, but the strategic disposition of troops about London overawed the demonstrators, and the menace passed away.

CHARTRES (48° 26′ N., 1° 29′ E.), city, Eure-et-Loir, France; formerly capital of Beauce; seat of bp.; cathedral of Notre Dame is one of most magnificent in France; scene of coronation of Henry IV., 1594; obelisk to memory of General Marceau; taken by Germans, 1870; hosiery, leather manufactured. Pop. 19,232.

CHARTREUSE, see CARTHUSIANS, CHARTERHOUSE.

CHARTREUSE, LA GRANDE, formerly mother house of Carthusians, founded by St. Bruno (1084). The present building, dating only from XVII. cent., is situated in the mountainous country *c.* 13 miles N. of Grenoble. The monks were expelled, 1793; returned, 1816; again expelled in 1904, and are now settled at Lucca and Tarragona. The profits from their world-famous liqueur have been almost entirely devoted to church-building and benevolent purposes.

CHASE, SALMON PORTLAND (1808–73), Amer. statesman; sec. of Treasury under Lincoln (1861–64); promoted establishment of national banking system.

CHASE, SAMUEL (1741–1811), Amer. jurist; opponent of Stamp Act; chief judge of Maryland Court (1791); later justice of Supreme Court of U.S.A.

CHASING, the art of ornamenting metals by means of a snarling-iron and other tools.

CHASLES, VICTOR PHILARÈTE (1798–1873), Fr. man of letters; librarian of the Bibliothèque Mazarine; prof. of Lit. in Collège de France; wrote for Eng. reviews and *Revue des deux mondes*, and was the author of many books on literary subjects.

CHASSELOUP-LAUBAT, FRANÇOIS, MARQUIS DE (1754–1833), Fr. military engineer; performed brilliant service in Napoleonic campaigns, and was made general of division; cr. peer and knight of St. Louis by Louis XVIII.

CHASSEPOT, Fr. breech-loading rifle (used 1866–74), invented by A. A. CHASSEPOT (1833–1905); superseded by the Gras rifle in 1874.

CHASSERIAU, THÉODORE (1819–56), Fr. painter; combined Romantic colouring with Classical subjects.

CHASTELARD, PIERRE DE BOSCOCEL DE (1540–63), Fr. poet; page to Marshal Damville, in whose train he accompanied Mary Stewart to Scotland; afterward entered Mary's service at Holyrood; nourished a passion for the queen, which she is said (with little probability) to have encouraged, but, having twice been discovered hiding in her room, was arrested and hanged.

CHASTELLAIN, GEORGES (d. 1475), Burgundian historian; served in the Anglo-Fr. wars, and later was frequently employed in diplomatic missions between the courts of France and Burgundy. His *Chronique*, which he left in an unfinished MS. state at his death, is invaluable as an authority upon the persons and events of his time.

CHASTELLUX, FRANÇOIS JEAN, MARQUIS DE (1734–88), type of old Fr. noblesse, distinguished soldier, and wit.

CHASUBLE, a liturgical vestment, sleeveless, with a hole for the head, of silk or velvet; worn for celebration of Mass. The colours vary according to season, and the shapes are various. The 'Gothic' c. falls in folds over the shoulders and comes to a point both at back and front, while the 'Roman' rests on the shoulders and is rounded back and front. See VESTMENTS.

CHÂTEAU, Fr. mediæval name for castle; the town houses of the nobility and other distinguished persons being known as *hôtels*, thus, 'Hôtel de Guise,' 'Hôtel de Richelieu,' etc.

CHATEAUBRIAND, FRANÇOIS RENÉ, VICOMTE DE (1768–1848), Fr. author; b. St. Malo; ed. Dol and Rennes; served short time as ensign; spent eight months in N. America (1791), and recorded his impressions in *Voyage en Amérique*. Upon arrest of Louis XVI. he returned to France, and joined army of *émigrés*; left for dead at *Namur*, but succeeded in making his way to London, where for several years he maintained himself by teaching and translating. During this period he wrote his famous romance, *Atala* (1801), dealing with the Indians and prairie life of N. America; and another story, *René* (1802), which established the author's fame as a prose-poet. His other works include *Génie du Christianisme* (1802), a vindication of the R.C. Church; *Les Martyrs* (1809), prose epic of the days of Diocletian; *Itinéraire à Jérusalem* (1811); *Adventures du Dernier des Abencérages* (1826); and his posthumous autobiography, *Mémoires d'outre Tombe*. He held diplomatic posts under Napoleon, and was later ambassador to Berlin, London, and Rome, but his career as a statesman was a failure. As a writer of poetic prose C. is incomparable, and no writer of the Romantic school has ever approached the grandeur and fascination of his finest descriptive passages.

Sainte-Beuve, *C. et son groupe littéraire* (1860); Faguet, *Les Écrivains du XIXe Siècle* (1887).

CHÂTEAUBRIANT (47° 43′ N., 1° 22′ W.), town, on Chère, Loire-Inférieure, France; leather. Pop. 5945.

CHÂTEAUDUN (48° 5′ N., 1° 19′ E.), town, Eure-et-Loir, France; manufactures blankets; has mediæval castle, which was originally built in X. cent., and was stronghold of Counts of Dunois. Pop. 5600.

CHÂTEAU-GONTIER (47° 50′ N., 0° 42′ W.), town, Mayenne, France; has linen and woollen manufactures. Pop. 7100.

CHÂTEAULIN (48° 12′ N., 4° 4′ W.), town, Finistère, France. Pop. 4000.

CHÂTEAUMEILLANT (46° 34′ N., 2° 11′ E.), town, France. Pop. 4000.

CHÂTEAUNEUF, name of eleven towns and villages in France.

CHÂTEAUNEUF, LA BELLE, court name for RENÉE DE RIEUX, dau. of a Breton noble, Jean de Rieux, Seigneur de Châteauneuf. She was maid of honour to Catherine de' Medici, and the Duc d'Anjou

became infatuated with her. The queen-mother wished to marry him to Queen Elizabeth of England, and La Belle C. was therefore banished from court.

CHÂTEAUPONSAC (46° 8′ N., 1° 16′ E.), town, France. Pop. 4000.

CHÂTEAURENARD PROVENCE (43° 53′ N., 4° 52′ E.), town, France. Pop. 7500.

CHÂTEAU-RENAULT (47° 36′ N., 0° 55′ E.,) town, France. Pop. 4300.

CHÂTEAU-RENAULT, FRANÇOIS LOUIS DE ROUSSELET, MARQUIS DE (1637–1716), Fr. admiral; after service in army he transferred to the navy, and was sent in command of expeditions against the Barbary corsairs; commanded the Fr. ships at *Bantry Bay*; in charge of a squadron at *Beachy Head* (1690); during the War of the Span. Succession had to convoy the Amer. treasure-ships. His ships were destroyed or captured at *Vigo Bay* (1702), by an Eng. fleet under Sir George Rooke.

CHÂTEAUROUX (46° 49′ N., 1° 42′ E.), town, on Indre, France; manufactures of woollen goods, iron, leather, and tobacco. Pop. 24,957.

CHÂTEAUROUX, MARIE ANNE, DUCHESSE DE (1717–44), Fr. courtesan; dau. of the Marquis de Nesle; after the death of her husband, the Marquis de la Tournelle, in 1740, she became mistress to Louis XV.

CHÂTEAU-THIERRY (49° 2′ N., 3° 21′ E.), town, on Marne, Aisne, France; has cathedral and ruined castle; birthplace of La Fontaine. Pop. 7100.

CHÂTELAIN (Fr.), in Carolingian times, a high court officer; later, the custodian of a feudal castle.

CHÂTELAINE, female keeper of a castle; hence, from the custom of carrying a bunch of keys at her girdle, is derived the modern name of the 'lady's companion.'

CHÂTELET, name used in mediæval France for a fort which was not inhabited; also applied to a criminal court abolished in 1790.

CHÂTELET (50° 25′ N., 4° 32′ W.), town, on Sambre, Hainault, Belgium; coal and potteries. Pop. 13,000.

CHÂTELLERAULT (46° 49′ N., 0° 33′ E.), town, Vienne, France; cutlery. Pop. 17,962.

CHATHAM (51° 23′ N., 0° 32′ E.), town, naval port, on Medway, Kent, England, adjoining Rochester, Brompton, and Gillingham; has important fortifications, and immense dockyards covering over 500 acres, and extending over 3 miles; also great wet docks and graving docks. Other important buildings are the arsenal; infantry, Royal Marine, engineer, and artillery barracks; military hospitals, schools, and convict prison; shipbuilding, sawmills, brickworks. Pop. (1911) 42,256.

CHATHAM (47° 2′ N., 65° 31′ W.), town, port of entry, on Miramichi, New Brunswick, Canada; chief industries, lumber trade and fisheries. Pop. 5000.

CHATHAM (42° 27′ N., 82° 20′ W.), city, port of entry, on Thames, Ontario, Canada; mills, foundries, and large export trade. Pop. 10,770.

CHATHAM ISLANDS (44° 20′ S., 176° E.), Brit. group in S. Pacific Ocean, consisting of three islands (*Chatham*, the largest, 38 miles long) and several rocky islets; dependency of New Zealand; total area, 375 sq. miles; coasts rocky; surface hilly, undulating, fertile; discovered by Lieut. Broughton, 1791; inhabitants chiefly Maoris; chief industry is stock-rearing, and wool is exported.

CHATHAM, WILLIAM PITT, 1ST EARL OF (1708–78), Brit. statesman; b. Westminster (Nov. 15), and ed. Eton and Trinity Coll., Oxford. Suffering from ill-health, he travelled abroad, and then entered the army. But in 1735 he became M.P. for Old Sarum, and in the Commons vigorously attacked Walpole. In 1746 Pitt became Vice-Treasurer of Ireland, and then Paymaster-General. In 1751 he was dismissed from office for speaking against a government proposal. In 1756, however, he became Sec. of State and Leader of the House. In 1757 he was dismissed, but was reinstated as practical though not nominal head of the Government. The administration of 1757–61 is famous in Brit. history for the successes of Wolfe in Canada and Clive in India, and for the Seven Years War, in which Pitt supported Frederick the Great. He opposed the peace of 1763, but from this time on he was frequently very ill, and unable to take part in public affairs. He retired from office, but came back to form a ministry, he himself being Lord Privy Seal, in 1766. He was then cr. Earl of Chatham. During most of his term of office he was ill, and his conduct was somewhat strange. He resigned in 1768. He appeared in the House of Lords again in 1770, and before his death vigorously opposed the government policy towards America. He was a great orator, and a brilliant if in some ways mysterious personality.

Harrison, *Chatham* in 'Twelve English Statesmen'; Lord Rosebery, *The Early Life of Chatham*; Green, *Life* (1901).

CHÂTILLON-SUR-SEINE (47° 53′ N., 4° 33′ E.), town, on Seine, Côte d'Or, France; C. congress between Napoleon and allies, 1814; iron foundries. Pop. 4900.

CHATSWORTH (55° 24′ N., 1° 37′ W.), village, Derbyshire, England. C. Hall, seat of Duke of Devonshire, has fine grounds, gardens, library, and art collection; for several years Mary, Queen of Scots, was imprisoned here.

CHATTANOOGA (35° N., 85° 21′ W.), town, Tennessee, U.S.A., on Tennessee R.; important railway centre and manufacturing town; has cotton-mills, foundries, steel works, blasting furnaces; manufactures carriages, furniture, bricks, tiles, wire, nails, chemicals, etc.; extensive trade in lumber, grain, coal, etc. Public buildings include two opera-houses, library, custom-house, various colleges and univ's. There is fine park and National Cemetery. Town was well-nigh destroyed in Civil War; Grant gained victory here in 1863. Pop. (1910) 44,604.

CHATTEL, any kind of property other than freehold.

CHATTERIS (52° 27′ N., 0° 2′ E.), market town, Cambridgeshire, England; breweries, engineering and rope-making works. Pop. (1911) 5259.

CHATTERJI, BANKIM CHANDRA (1838–94), Ind. novelist; modelled his hist. stories on Scott.

CHATTERTON, THOMAS (1752–70), Eng. poet; b. Bristol; posthumous s. of a schoolmaster; ed. Colston's School; apprenticed to a solicitor; was reckoned a dull boy at school, but afterwards developed an intense love for archaic lit. When the new bridge was opened at Bristol (1768), C. contributed to *Felix Farley's Journal* an alleged description of the opening of the earlier bridge by a XV.-cent. monk, Thomas Rowley. Shortly afterwards he entered into correspondence with Horace Walpole, drawing his attention, amongst other matters, to a number of poems by Rowley, which he claimed to have discovered in a muniment chest of the Church of St. Mary Redcliffe. Specimens of these he submitted to Walpole, who at first wrote to him in a most courteous manner, but some of his learned friends, to whom they were submitted, pronounced them to be forgeries. Whereupon ensued a number of bitter letters on the part of C., while Walpole treated the boy with silent contempt and neglect.

The poet, with a few pounds in his pocket, quitted Bristol for London (April 1770), where he found a precarious employment as a writer of political squibs and songs for Ranelagh Gardens. On August 25, after starving for a week, he committed suicide by taking arsenic in his garret at 4 Brook Street, Holborn, and received a pauper's burial. C.'s work is very unequal, and though he courted fame by imposition, a few of his ballads and lyrics are amongst the most precious things of their kind in Eng. lit. Amongst these may be named *The Bristowe Tragedy*, *The Balade of Charitie*, and the Minstrel's Song in *Ælla*. He was one of the

founders of modern romantic poetry, and his influence upon Coleridge was very considerable. He was inordinately ambitious, of a proud and independent spirit, and of an affectionate disposition. Despite his faults, to posterity he is the 'heaven-born genius' of Coleridge's tribute—'the marvellous boy . . . that perished in his pride.'

Poetical Works (Aldine edn.), edited by Prof. W. W. Skeat; also in 'Canterbury Poets' Series; biographies by Masson (1874), Russell (1909), Ingram (1910).

CHATTI, Ger. tribe, which, during the period of the Roman Empire, dwelt in the neighbourhood of the river Weser.

CHAUCER, GEOFFREY (c. 1340–1400), the first great Eng. poet; s. of a London vintner. Nothing is known of his early years until, in 1357, he appears as page to the Duchess of Clarence. In 1359 he was following the war in France, and was captured, but ransomed in the following year. Six years later he married Phillipa Roet, a lady attending the Duchess of Lancaster. In 1367 he was a valet to the king, and later esquire. Subsequently he again served in the Fr. wars, and was frequently employed in diplomatic missions abroad. He was app. Comptroller of the Customs of Wool, Skins, and Leather in 1374; Comptroller of Petty Customs of the Port of London (1382); and other offices and varying fortunes followed. Thus he occupied a position of honour and substance during the greater portion of his life, and that his work was held in some estimation in his lifetime is evidenced by his burial in Westminster Abbey.

In person the poet was inclined to stoutness, with a fair beard, and a somewhat sly or 'elvish' expression of countenance. His works include *The Book of the Duchess, The House of Fame, Troilus and Criseyde, The Legend of Good Women*, and probably the *Romaunt of the Rose*, and numerous minor works, several of doubtful authorship. The work upon which his fame chiefly rests is *The Canterbury Tales*, begun about 1373, and left incomplete at his death. The various tales are equally remarkable for their lyrical and decorative qualities, the knowledge of life which they display, keen insight into character, playful satire, and joyous humour. Besides an absolute poetic position irrespective of date, C. is important for his influence on language and metre. That English was substituting French in common use is shown by the statute of 1362 that English should be employed in the law courts, but there were many dialects of English, and this first great vernacular literature helped to create a central speech. In prosody C. gave an example of the first regular verse, the octosyllabic couplet.

Works, edit. by Skeat (1894); also in the 'Aldine Classics,' edit. by R. Morris; biography by A. W. Ward (1879), Legouis (1913).

CHAUDESAIGUES (44° 51′ N., 2° 59′ E.), village, Cantal, France, with celebrated mineral springs.

CHAULIEU, GUILLAUME AMFRYE DE (1639–1720), Fr. poet.

CHAUMETTE, PIERRE GASPARD (1763–94), Fr. revolutionist; member and pres. of Commune (1792), he attacked the Girondists (1793); accused by Robespierre and executed (1794).

CHAUMONT (48° 6′ N., 5° 8′ E.), town, Haute-Marne, France; gloves. By Treaty of C. (1814), U.K., Austria, Prussia, and Russia agreed to continue war against France. Pop. 12,200.

CHAUNCEY, ISAAC (1772–1840), Amer. naval commander, entered U.S.A. navy, 1798; took a prominent part in war of 1812, taking command on Lake Ontario.

CHAUNCY, CHARLES (1592–1672), Anglican divine; went to America, 1637; pres. of Harvard, 1654; his great-grandson, CHARLES (1705–87), Amer. divine, wrote several works.

CHAUNY (49° 38′ N., 3° 14′ E.), town, Aisne, France; glass-polishing works; scene of heavy fighting in Hundred Years War. Pop. 10,547.

CHAUTAUQUA (42° 12′ N., 79° 30′ W.), village, summer resort, on Lake C., W. New York, U.S.A.; centre of religious, educational, and social movement founded in 1874 by Mr. Lewis Miller and Bp. Vincent. Pop. 4000.

CHAUVELIN, BERNARD FRANÇOIS, MARQUIS DE (1766–1832), Fr. politician; though an aristocrat, and Master of Wardrobe to Louis XVI., took part in the Revolution, and became member of the Council of State under Napoleon.

CHAUVIGNY (46° 35′ N., 0° 38′ E.), town, Vienne, France; interesting antiquities.

CHAUVIN, ÉTIENNE (1640–1725), Huguenot theologian at Rotterdam and Berlin.

CHAUVINISM, term used in Napoleon's days for hero-worship of the emperor; derived from Nicholas Chauvin; exaggerated patriotism, jingoism.

CHAUX-DE-FONDS, LA (47° 6′ N., 6° 50′ E.), town, Neuchâtel, Switzerland; centre of watch-making industry. Pop. (1912) 38,600.

CHAVES (41° 44′ N., 7° 33′ W.), town, Portugal; famous for hot saline springs; ancient *Aquæ Flaviæ*. Pop. 6463.

CHAWADIS, see ARCHITECTURE (*Indian*).

CHAZELLES, JEAN MATHIEU DE (1657–1710), Fr. hydrographer; carried out surveys of the Mediterranean.

CHEADLE (53° 26′ N., 2° 13′ W.), town, Cheshire, England; printing and bleaching works. Pop. (1911) 9914.

CHEADLE (52° 59′ N., 1° 59′ W.), market town, Staffordshire, England; extensive collieries in vicinity.

CHEBISHEV, PAFNUTIY LVOVICH (1821–94), renowned Russ. mathematician; pub. researches on prime numbers, rectilinear motion, theory of integrals, and many other subjects. He was a foreign member of the Royal Soc.

CHEBOYGAN (45° 40′ N., 84° 28′ W.), city (and county), Michigan, U.S.A.; sawmills. Pop. (1910) 6859.

CHECKERS (Amer.), game of draughts (*q.v.*).

CHEDDAR (51° 17′ N., 2° 47′ W.), village, Somersetshire, England; famed for its cliffs and caves; cheese (*q.v.*).

CHEDUBA, MAN-AUNG (18° 40′ N., 93° 30′ E.), island, E. coast, Bay of Bengal, forming part of Arakan; famous for petroleum wells; chief export, rice; area, 240 sq. miles. Pop. 24,000.

CHEESE, article of food manufactured by separating solid from liquid parts of milk, which is heated to *c.* 80° Fahr., and rennet (an extract from calf's stomach which possesses power of curdling milk) is poured in; milk curdles and yellowish fluid (whey) appears on surface, and after more heating and stirring whey is drained off. The curd is then cut and allowed to stand to become acid, then salted and pressed. The richness of c. depends on quality of milk and amount of fat collected in curd (sometimes as much as 45 %); inferior c., made of skim-milk, is much poorer in fat and therefore of less value.

C. is used as food in Britain, but in countries such as Switzerland and France it forms a staple article of diet; best known varieties, Stilton, Cheddar, Cheshire, Dorset (Eng.), Camembert, Limburg, Gruyère, Gouda, and Gorgonzola.

CHEETAH, HUNTING LEOPARD (*Cynælurus jubatus*), animal of the cat family; claws not retractile; body covered with small black spots; occurs in Africa, Persia, India, where it has been trained for hunting antelopes and other game.

CHEFOO, see CHI-FU.

CHEH-KIANG (29° N., 120° E.), E. province, China, bordering Pacific Ocean; hilly, fertile; tea and silk chief exports; principal cities, Hang-chow and Ning-po; area, 36,670 sq. miles. Pop. *c.* 12,000,000.

CHEKE, SIR JOHN (1514–57), Eng. scholar; tutor to Edward VI.

CHELLIAN, in palæo-ethnology, term for an epoch characterised by remains of 'Neandertal' man, rhinoceros, elephant, cave bear, etc., and crude

flint implements discovered at Chelles (France), held to be the earliest evidence of human life in the Quaternary period.

CHELMSFORD (50° 44′ N., 0° 28′ E.), market town, capital of Essex, England; has grammar school, founded by Edward VI. (1551); industries, electrical engineering, agricultural produce; C. corn and cattle markets are among largest in county. Pop. (1911) 18,008.

CHELMSFORD, FREDERIC THESIGER, 1ST BARON (1794–1878); Eng. politician; Q.C., 1834; Solicitor-General and knighted, 1844; Attorney-General, 1845; sat in Parliament; cr. baron, 1858; Lord Chancellor, 1858–59, 1866–68.

CHELSEA, W. district, London, England; on N. bank of Thames, communicating with Battersea by three bridges; residence of numerous celebrities, including Sir Thomas More, Katherine Parr, Walpole, Swift, Leigh Hunt, Carlyle, Turner, Rossetti, Whistler; formerly famous for porcelain; most notable building is C. Royal Hospital, for invalid soldiers, designed by Wren (built 1682–90). Pop. (1911) 66,404.

CHELSEA (42° 23′ N., 71° 2′ W.), city, Massachusetts, U.S.A.; rubber goods. Pop. (1910) 32,452.

CHELTENHAM (51° 55′ N., 2° 5′ W.), watering-place and market town, on Chelt, Gloucestershire, England; mineral springs discovered, 1716; has medicinal baths, winter gardens, public parks; among notable educational institutions are grammar school, founded 1576; Cheltenham Coll. for boys, founded 1842; Ladies' Coll., associated with Miss Beale (*q.v.*); two training colleges for teachers, and many private schools. Pop. (1911) 48,944.

CHELYABINSK, Tchelyabinsk (55° 20′ N., 61° 15′ E.), town, Orenburg, Russia; tanneries and distilleries. Pop. 62,000.

CHELYS, ancient Gk. lyre.

CHEMISTRY is the science of the composition and transformations of material substances. It is closely related to physics, which deals with the general properties of substances, and the phenomena they display. It underlies geol. and mineralogy, bot., zool., and physiology, since these sciences deal with phenomena which ultimately depend on the specific properties and reactions of the different substances with which c. deals.

History.—The ancient Greeks recognised four 'Elements': Earth, Water, Air, Fire; and believed that matter was atomic. The Egyptians worked in metals, and made glass and pigments. 'Chemia,' the old name for Egypt, gave the name to the science. The Arabians developed the Egyptian learning, and called it *Alchemy* (VII. cent.). The Alchemists searched for the Philosopher's Stone, which might turn base metals into gold; and, notwithstanding error and fraud, they enriched c. during nearly 1000 years. The *Iatrochemists*, (1525–1650), led by Paracelsus, taught that 'the object of c. is not to make gold, but to prepare medicines.' Thus the quest of the *elixir vitæ* replaced that of the Philosopher's Stone. During the phlogistic period (1650–1770), the experimental foundations of the science were laid, in spite of the error which regarded *phlogiston* as the elemental principle of combustibility present in all combustible substances. The discovery of oxygen by Scheele (1773) and Priestley (1774), of the compound nature of water by Cavendish (1781), together with the interpretation of these facts by Lavoisier, overthrew the phlogiston theory, and established the foundations of scientific c.

The elucidation of the laws of chemical combination, and their embodiment in Dalton's atomic theory (1807), and the establishment of the molecular theory by Gay Lussac and Avogadro (1811), made possible our knowledge of the structure of chemical compounds, which was developed chiefly in the domain of organic c. by the discovery of isomerism (Liebig, Wöhler, and Berzelius, 1823), the recognition of compound radicles (Gay Lussac on cyanogen, Liebig and Wöhler on benzoyl, Bunsen on cacodyl), the discovery of substitution (Dumas), the theory of types (Gerhardt, Würtz, Hofmann, Williamson), the doctrine of valency (Frankland, 1852), and the introduction of structural formulæ (Couper, Kekulé). Of the greatest importance has been the growth of our knowledge of the elements and their atomic weights. The labours of Berzelius sufficed to show the untenability of Prout's hypothesis, that the elements are condensations of hydrogen; and the laws of specific heat (Dulong and Petit, 1819) and isomorphism (Mitscherlich, 1819), together with method of vapour density according to Avogadro's hypothesis, furnished the three recognised methods for deriving atomic weights from analytical data. The most accurate work in this field was that of Stas (1840 to 1880); and the establishment of reliable atomic weights justified comparison between them. This resulted in the great generalisation known as the periodic law (Newlands, 1864; Mendeléeff, Lothar Meyer, 1869).

The isolation of the metals of the alkalis and alkaline earths by Humphry Davy (1807–8) led to the electrochemical theory and dualistic hypothesis of Berzelius. The latter was an error, rectified by the establishment of unitary views by Dumas; but the study of electrolysis by Faraday has been followed by the modern theory of electrolytic dissociation, which forms so important a part of physical c. The synthesis of urea from an inorganic source by Wöhler, in 1828, destroyed the old idea of 'vital force,' which assumed that carbon compounds produced within a living organism were elaborated by a force not available outside the organism. A distinction is still drawn between *inorganic* and *organic* c., but the latter is now regarded simply as the c. of the compounds of carbon, which, being so numerous and complex, are conveniently classified and studied apart from those of the other elements. So extraordinary has been the development of organic c., that the synthetic carbon compounds number at least 150,000.

Chemical Action.—When two elements or compounds are brought together they may simply form a mechanical mixture, in which the molecules of each remain intact, or they may react and form a third substance (or substances) with quite different properties from the substances giving rise to it. In the latter case the molecules have broken up, and the atoms have reunited in a different manner. This constitutes chemical action, or the redistribution of atoms when different kinds of matter are brought together. Atoms may redistribute themselves in several ways. The two molecules may simply unite to form one complex molecule. An atom of one molecule may exchange places with an atom of another molecule. If the atoms of each of the original substances are identical, *i.e.* if the substances are elements, then a compound is produced from the elements which compose it. This is *synthesis*. If the compound is brought into contact with something which breaks it down into its elements, such a resolution is called *analysis*. Synthesis and analysis are the most common forms of chemical action.

Mere contact may bring about chemical action, but usually the process is hastened by some form of external energy—heat, light, etc. Chlorine and hydrogen may be kept in the dark for years without uniting, but on exposure to sunlight, instantaneous chemical action occurs, with a loud explosion. Oxygen can be obtained from potassium chlorate at a much lower temperature if it is previously mixed with manganese dioxide. Manganese dioxide undergoes no change itself, but it hastens the chemical action. Such substances are called *catalytics*. Some chemical actions are reversible. Alcohols and acids heated together form esters and water. When the water reaches a certain percentage chemical reaction takes place, and alcohol and acid are regenerated.

Certain actions, however, will not take place without moisture. Ammonia and hydrochloric acid in the gaseous state unite very readily under ordinary conditions, but if the gases are dry no action takes place.

Chemical action is accompanied either by the absorption or evolution of heat. When heat is absorbed, the action is called *endothermic*, and it takes place more readily at high temperatures. The compounds formed are unstable. *Exothermic* reactions are accompanied by the evolution of heat, the compounds formed are stable at ordinary temperatures, and unstable at high temperatures. The Law of Mass Action is: 'Chemical action is proportional to the active mass of each substance taking part in the change.' No destruction of matter accompanies chemical action.

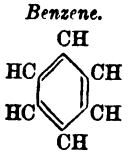
Inorganic Chemistry, E. C. C. Baly (Jack, 1912).

Chemical Compounds.—CLASSIFICATION.—With one or two exceptions, all the elements form compounds with oxygen, called oxides. Broadly speaking, non-metals form acidic oxides, or anhydrides, which combine with water, forming acidic hydroxides or oxyacids; whilst metals similarly form basic oxides and hydroxides, or bases. Compounds of sulphur and sodium are typical.

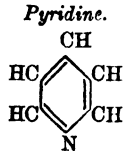
Thus $\begin{cases} S+O_2=SO_2, \text{ acidic oxide = sulphurous anhydride.} \\ SO_2+H_2O=H_2SO_3, \text{ acidic hydroxide or oxyacid = sulphurous acid.} \end{cases}$

$\begin{cases} 4Na+O_2=2Na_2O, \text{ basic oxide.} \\ Na_2O+H_2O=2NaOH, \text{ basic hydroxide or base.} \end{cases}$

Soluble basic hydroxides are alkalis, but many are insoluble in water.



Hydracids, such as hydrochloric acid, HCl, contain no oxygen, and therefore possess no anhydride. But hydrogen, not oxygen, is the essential element in an acid. Acids of each kind react with bases forming salts with elimination of water, thus:—



$$2NaOH+H_2SO_3=Na_2SO_3+2H_2O.$$
$$NaOH+HCl=NACl+H_2O.$$

Within the scope of this brief outline the chief inorganic compounds can be included; for they are oxides, acids, bases or salts, or compounds closely related thereto.

Carbon compounds are more diversified; but the fundamental class is that of the hydrocarbons, from which many of the others are directly derived. Carbon atoms combine together to form chains and rings, but the rings may include other elements within them. So three great groups of compounds are recognised, of which the following are typical:—

Hexane. $H_3C.CH_2.CH_2.CH_2.CH_3$ — Chain compound.

Benzene.  — Carbocylic compound.

Pyridine.  — Heterocyclic compound.

The simplest derivatives of the hydrocarbons (RH), where R = *e.g.* C_2H_5 or C_6H_5, are halides (R.Cl, R.Br, R.I), alcohols and phenols (R.OH), aldehydes (R.COH), ketones (R.CO.R), monocarboxylic acids (R.COOH), esters (R.COOR[1]), acid chlorides (R.COCl), amides (R.CONH$_2$), primary amines (R.NH$_2$), sulphonic acids (R.SO$_3$H), nitro-compounds (R.NO$_2$). Among other important derivatives are di- and poly-hydric alcohols and phenols, di- and poly-carboxylic acids, carbohydrates, substituted amides, secondary and tertiary amines.

General Principles.—The first problem of general c. is to determine the atomic weights of the elements; the next to investigate the conditions under which compounds are formed. The periodic law indicates what kinds of compounds certain elements may be expected to form, as well as what their properties are likely to be. The properties of organic compounds, however, are determined, not so much by the elements present in them, for these are few in kind, as by the number and mode of arrangement of their atoms within the molecule.

The relationship between physical properties and chemical constitution thus becomes an extensive problem of general c. The following physical properties of compounds have been examined: capillarity, viscosity, molecular volume, specific heat, melting-point, boiling-point, optical properties including refractive and dispersive power, absorption of light with or without visible colour, fluorescence, specific and magnetic rotatory power. An example will show the method and value of these investigations. The molecular refractive power of a substance is the sum of the atomic refractive powers of its constituent elements. The observed molecular refractive power for lactic acid ($CH_3.CHOH.COOH$), in which one of the three oxygen atoms is assumed to be linked differently from the other two, is 31·87; whilst the calculated value is 31·80. This agreement shows the use of molecular refractive power in deciding chemical constitution. For if these three oxygen atoms had been arranged differently from what was assumed, molecular refraction would have revealed the fact.

Thermochemistry.—Matter is always associated with energy, and the manifestation of energy frequently accompanies chemical change. To every mass equation there belongs a corresponding energy equation, expressing in heat units or *calories* the heat energy evolved or absorbed during the reaction.

Consider the reaction: $Pb+I_2=PbI_2$, to which there corresponds the energy equation: $Pb+I_2=PbI_2+398K$. (K=heat necessary to raise 1 gram of water 1° C.) The latter equation signifies that when 1 gram-atom of lead (207·1 g.) combines with 2 gram-atoms of iodine (253·8 g.), 398 calories are evolved; or that 1 gram-molecule of lead iodide contains an amount of energy represented by 398K less than its component elements separately contain. The *heat of formation* of lead iodide is thus said to be 398K. A thermochemical equation does not state the total energy content of any substance, for, except in the case of radium (*q.v.*), the energy content of the atoms themselves is quite unknown.

If during the formation of a compound from its elements heat is developed, the compound is *exothermic*; if absorbed, *endothermic*. Acetylene is an endothermic hydrocarbon. Important applications of thermochemical principles are: the measurements of heats of neutralisation of acids and alkalis, and the heats of combustion of solid, liquid, and gaseous fuels. The measurements are carried out in some form of calorimeter.

PHASE RULE.—The Phase Rule is a method of studying the conditions of equilibrium between substances in different physical states. For example: water and water-vapour are in equilibrium at any temperature within a certain range when the vapour is under a specific pressure corresponding to the temperature. But ice, water, and water-vapour can remain together in equilibrium only at one temperature to which a specific vapour pressure corresponds. The equilibria between a solid and its solid and gaseous decomposition products (*e.g.* $CaCO_3 \rightleftarrows CaO+CO_2$), or the different allotropic forms of an element, and also the phenomena presented by hydrated salts, have been elucidated by means of the phase rule.

PROPERTIES OF SOLUTIONS.—An analogy exists between the processes of evaporation and solution, and also between the properties of gases and of solutions. Thus *osmotic pressure*, by which a substance in solution tends to diffuse into the pure solvent, and which is made apparent by the use of a membrane permeable by the solvent but not by the dissolved substance, is closely analogous to gas pressure by which a gas tends to diffuse into space. For the gas equation: $pv=RT$ is applicable to solutions; R has the same value [illegible] ...ve equal osmotic pressures, and osmotic, like gas pressure varies inversely as specific volume, and directly as absolute temperature.

The *vapour pressure* of a solvent is lowered and the

boiling-point consequently raised, whilst the freezing-point is lowered in proportion to the amount of non-volatile substance in solution. Further, equimolecular solutions have the same boiling- and freezing-points. These facts enable the molecular weights of substances in solution to be determined by *ebulliscopic* and *cryoscopic* methods respectively.

The properties of aqueous solutions of *electrolytes*, that is, of acids, bases, and salts, are anomalous from the above point of view, and suggest the existence in solution of more molecules or parts of molecules than would have been anticipated. It is believed on this account that *electrolytic dissociation* or *ionisation* has taken place; then, when dissolved in water, the electrolyte spontaneously separates more or less into parts called *ions*, which exist independently in solution, possessing equal and opposite charges of electricity. It is these ions which are conveyed by the energy of the current and separated at the electrodes during *electrolysis*.

The idea of electrolytic dissociation underlies the modern interpretation of those properties of solutions on which chemical analysis depends.

Thomsen, *Thermochemistry*.

Chemical Dynamics, or the theory of chemical change, forms an important branch of general chemistry. Consider the reversible reaction :—

$$AB + C \rightleftarrows AC + B.$$

The effectiveness with which C displaces B from combination with A depends upon the relative affinities or powers of attraction of B and C for A, and also upon the relative proportions in which the components of the reaction are present. A relatively small affinity may be compensated for by a relatively large molecular concentration, and *vice versa*. So chemical action depends on both affinity and active means. Active mass depends on physical conditions; insolubility and volatility profoundly influence it by rendering material unavailable, and so determine the direction and extent of chemical change. When, however, differences of physical condition are absent, a state of dynamic equilibrium is established by the operation of the above two factors.

The speed at which chemical equilibrium is attained, or, more generally, the velocity at which chemical transformation takes place, increases rapidly with rise of temperature, is influenced by the medium in which the reaction is carried out, and by the presence of catalytic agents (*q.v.*).

Chemical Analysis embraces all processes by which the chemical composition of substances is investigated. There are two fundamental divisions: qualitative and quantitative. By qualitative analysis the constituent elements or radicles of a chemical compound or mixture are identified; by quantitative analysis their proportions are estimated.

QUALITATIVE ANALYSIS.—The methods for the qualitative analysis of inorganic substances consist of: I. Preliminary examination by dry reactions; II. systematic examination for basic and acidic radicles.

Method II., which is analysis proper, consists of identification: *A.*, by volatile products obtained by treatment of the substance with acids and alkali; *B.*, by reactions in solution. In *A.*, volatile acids, or their decomposition products, and ammonia are detected. In *B.*, suitable solutions are prepared and tested for metallic and acidic radicles by the production of precipitates or characteristic colour changes. Groups of metals are successively precipitated by group-reagents, and the metals in these groups separated by means of the differences in solubility of certain compounds. Acidic radicles are identified in solution by similar, but less systematic, methods.

On account of their greater variety, the qualitative analysis of organic compounds is less stereotyped. The behaviour of substances towards heat, acids, alkalis, oxidising, reducing, and substituting agents, the elements they contain, and their physical properties furnish the chief evidence on which their identity is established.

QUANTITATIVE ANALYSIS *may be*: I. *Gravimetric*; II. *Volumetric*. I. In *gravimetric* analysis a constituent part of a substance is estimated by separating and weighing it in a pure state; or, more often, by preparing and weighing a chemically pure derivative of the substance. II. *Volumetric* analysis may deal with (*A.*) liquid solutions or (*B.*) gases. *A.* The volumetric analysis of liquid solutions involves definite chemical reactions between measured volumes of them and of solutions of standard strength, the completion of such reactions being shown by suitable indicators. The operations, which are called titrations, include acidimetry, alkalimetry, and colorimetry, and reactions of oxidation, reduction, and precipitation. *B. Gasometric* analysis includes estimations of the diminution in volume of mixtures of gases caused by absorption or combustion, and measurements of the volumes of gases evolved in definite chemical reactions.

The analysis of natural and technical products may be highly specialised, but includes one or more of the above processes.

Methods and Results of Modern Research.—Rubidium, cæsium, thallium, indium, gallium, and helium have been discovered by spectrum analysis, other rare elements have been investigated, and the composition of the sun and stars made known. Argon has been isolated from the air, and by low temperature research has been separated from neon, krypton, and xenon; whilst terrestrial helium has been liquefied at about 4° C. above absolute zero. Radium has been obtained from pitchblende; and thence has arisen the new science of radioactivity, which investigates atomic disintegration and the constitution of the atoms. By high temperature research the diamond has been prepared, and a large class of new compounds obtained. Electrochemistry has provided the means of obtaining aluminium and other metals and commercial products, as well as effecting the fixation of atmospheric nitrogen for plant food. Rare earths have been employed for incandescent gas mantles, and the metals tantalum and tungsten for metallic filament lamps.

The study of the constitution of organic compounds has led to the synthesis of sugars, terpenes, glucosides, alkaloids, and other vegetable products, including indigo and alizarin, and the preparation of innumerable dyes, as well as drugs, perfumes, antiseptics, explosives, and substitutes for ivory, india-rubber, etc. Our knowledge of ferments, enzymes, and catalysts has increased and borne fruit in pure and applied chemistry.

CHEMNITZ (50° 50′ N., 12° 55′ E.), town, on Chemnitz, Saxony, Germany; one of leading industrial commercial centres; has important locomotive and engineering works; manufactures cottons and woollens. Pop. (1910) 287,807.

CHEMNITZ, MARTIN (1522–86), Lutheran divine; lecturer at Wittenberg, then pastor at Brunswick; wrote against Calvinism and helped to maintain dogmatic standards in Lutheranism.

CHEMOTAXIS (biol.), the reaction of bacteria, protozoa, and zoospores of Algæ with chemical substances (carbon dioxide, acids, alkalis) in solution, being either attractive (positive c.) or repellent (negative c.). The term chemotropism is applied to the sensitive movement of certain plant organs either towards or from a chemical stimulus.

CHEMULPO (37° 24′ N., 126° 37′ W.), town, W. coast of Korea; scene of first naval battle of Russo-Jap. War (1904); treaty port opened, 1883. Pop. 25,000.

CHENAB (30° 50′ N., 71° 54′ E.), one of the 'five rivers,' of Punjab, India; rises in Kashmir range, N.W. Himalayas, and joins Jhalum at Timmu; ancient *Acesines*.

CHÊNEDOLLÉ, CHARLES JULIEN PIOULT DE (1769–1833), Fr. poet.

CHENERY, THOMAS (1826–84), Eng. scholar; prof. of Arabic, Oxford; later, editor of *The Times*.

CHEN-HAI, CHINHAI (29° 58′ N., 121° 45′ E.), town, Cheh-kiang, China, on Hangchow Bay; taken by British, 1841.

CHÉNIER, ANDRÉ DE (1762–94), Fr. poet; served for short time in army, afterwards travelled in Italy, and imbibed strong sympathy for Gk. idyllic poetry; wrote *La Jeune Tarentine* and other poems in manner of Theocritus. In 1790 C. took part in Revolution, first on side of Constitutionalists, but, disgusted with their excesses, wrote *Ode* in praise of Charlotte Corday; aided Malesherbes in defence of Louis XVI.; later, arrested and guillotined. In prison wrote famous *Jeune Captive* and satirical poem, *Iambes*. All his work is marked by exquisite workmanship, imagination, and feelings for nature, in which latter quality he anticipated the Romantic school.

CHÉNIER, MARIE-JOSEPH BLAISE DE (1764–1811), Fr. poet, dramatist, and politician; bro. of above.

CHENONCEAUX (47° 20′ N., 1° 4′ E.), village, on Cher, Indre-et-Loire, France; famous château is delightfully picturesque, transitional structure, showing survival of late Gothic mingled with early Renaissance forms; residence of Diane de Poitiers.

CHENOPODIUM, GOOSE-FOOT, genus of herbs (order Chenopodiaceæ) so called from the shape of the leaves of some species; *C. bonus-Henricus*, good King Henry, being a well-known Brit. representative.

CHEOPS (Gk. form of *khufu*), an Egyptian king; founder of the fourth dynasty; famous as builder of the Great Pyramid, which still survives; date, according to some, 3969–3908 B.C., others, *c.* 2900 B.C. (Herodotus, quite incorrectly, later).

CHEPSTOW (51° 38′ N., 2° 41′ W.), market town and port, on Wye, Monmouthshire, England; has ruins of XI.-cent. castle; salmon fisheries.

CHEQUE, written order on a banker, signed by a person having an account with the bank; formerly sometimes spelt 'check.'

CHER (47° N., 2° 30′ E.), department, Central France; formed part of old province, Berry; chief rivers, Cher and Loire; surface generally flat; fertile; extensive pastures, fine timber; coal and iron mines; grain, porcelain; area, 2819 sq. miles. Pop. (1911) 337,810.

CHERAT (33° 50′ N., 72° 1′ E.), hill cantonment and sanatorium, Peshawar district, N.W. Frontier Province, India.

CHERBOURG (49° 38′ N., 1° 37′ W.), fortified town and seaport, Manche, France, at mouth of Divette on north coast of peninsula Cotentin; roadstead protected from north by magnificent breakwater over two miles in length; has extensive docks and arsenal; but C.'s chief importance is derived from its naval and commercial harbours; chief industries, shipbuilding, rope-making, tanning, etc.; dairy and poultry produce. Pop. (1911) 43,731.

CHERBULIEZ, CHARLES VICTOR (1829–99), Fr. novelist and essayist; belonged to Swiss family distinguished as scholars.

CHERCHEL (36° 33′ N., 2° 10′ E.), seaport, N. coast Algeria; agricultural wine-growing centre; has extensive ruins of former cities; ancient *Cæsarea*. Pop. 9000.

CHERCHEN, oasis and town, Eastern Turkestan.

CHERIBON, TJERIBON (6° 55′ S., 118° 26′ E.), town, N. coast, island of Java, Dutch East Indies; sugar, coffee, and rice chief products. Pop. 52,000.

CHERKASY (49° 26′ N., 32° 8′ E.), town, on Dnieper, Kiev, Russia. Pop. 30,000.

CHERNIGOV, TCHERINGOV (51° 40′ N., 32° E.), government, Little Russia, traversed by Dnieper and Desna; cereals and tobacco chief products; area, 20,232 sq. miles. Pop. (1910) 2,975,500.

CHERNIGOV (51° 29′ N., 31° 19′ E.), town, on Desna, Russia; capital of C. government; abp.'s seat; XI.-cent. cathedral. Pop. (1910) 31,920.

CHEROKEES, tribe of N. Amer. Indians of the Iroquois family, now occupying reservations in the U.S.A. Many have adopted Christianity, and have made such progress in education and civilisation as to be able to support a native newspaper.

CHERRAPUNJI (25° 15′ N., 91° 45′ E.), village, Kashi Hills district, Assam; has heaviest known rainfall in world; average, *c.* 500 in. per annum.

CHERRY, trees and shrubs with serrate leaves and white blossoms belonging to the plum genus (*Prunus*), and derived from two species, the wild or dwarf c. (*Prunus cerasus*) and the gean (*Prunus avium*). Many varieties are cultivated for the red fleshy fruit containing a kernel. The c. is used for eating and in the preparation of the liqueurs, kirschwasser, ratafia, and maraschino, and the kernel of the perfumed c. (*P. mahaleb*) is used in perfumery and confectionery. Cherry wood is employed by cabinetmakers and in the manufacture of tobacco pipes, walking-sticks, etc.

CHERRY VALLEY, summer resort, New York State, U.S.A.; scene of massacre by Indians, 1778; has sulphur springs.

CHERRYVALE (37° 15′ N., 95° 32′ W.), city, Kansas, U.S.A.; has ironworks, and produces natural oil and gas. Pop. (1910) 4304.

CHERSO (44° 59′ N., 14° 25′ E.), Austrian island, Gulf of Quarnero, Adriatic Sea; forms part of Istria; wine. Pop. 9000.

CHERSONESE (Gk. *Chersonesos*, peninsula), name used specially of 'Tauric Chersonese,' now called the Crimea; it was colonised by the Gks. in V. cent. B.C.; the city of *Cherson* (conquered by the Romans) was of commercial importance in the later empire, and lasted till the XIV. cent.

CHERTSEY (51° 24′ N., 0° 30′ W.), market town, Surrey, England; remains of Benedictine abbey (founded VII. cent.); agricultural produce. Pop. (1911) 13,819.

CHERUBIM (Hebr. plural of *Cherub*), celestial spirits mentioned in Old Testament; usually represented as winged children. Bacon states that in celestial hierarchy the c., angels of light, come next in order to the seraphim, angels of love.

CHERUBINI, MARIA LUIGI CARLO ZENOBIO SALVATORE (1760–1842), Ital. composer; b. Florence; his earliest work was performed in Italy, but, after visiting London, he finally settled in Paris as director of the Conservatoire; operas were popular during his lifetime, but fame now chiefly rests upon his sacred compositions; *Requiem in C minor* regarded as his masterpiece.

CHÉRUEL, PIERRE ADOLPHE (1809–91), Fr. historian; made special study of the XVII. cent., and particularly the Mazarin period.

CHERVIL, small umbelliferous plant; one species, *Anthriscus*, used as salad by ancients; another, *Chærophyllum bulbosum*, has large edible root; only Brit. variety is *C. temulentum*, with hairy stem and white umbels.

CHESAPEAKE, bay on E. coast, U.S.A.; celebrated for its oysters; scene of naval engagement between French and Brit. fleets, 1781; name of vessel defeated by *Shannon* under Broke, 1813.

CHESELDEN, WILLIAM (1688–1752), Eng. anatomist and surgeon; introduced several new methods of operation; friend of Sir Isaac Newton and of Pope.

CHESHAM (51° 42′ N., 0° 37′ W.), market town, on Chess, Bucks, England; wooden ware manufactured from beech of surrounding district. Pop. (1911) 8204.

CHESHIRE (53° 15′ N., 2° 30′ W.), maritime county, N.W. England; bounded N. by Lancashire, N.E. by Yorkshire, E. by Derbyshire, S.E. by Staffordshire, S. by Shropshire, S.W. by N. Wales, N.W. by Irish Sea; area, 1007 sq. miles. Greater part of surface is undulating plain, with fine woods and number of small lakes; watered by Mersey, Dee, and other rivers; soil generally fertile; market-gardening and dairying carried on, cheese largely produced; manufactures textiles, leather, thread, gloves, etc.; shipbuilding. Minerals include salt, coal, ironstone.

Chief towns are Chester (capital), Birkenhead, Macclesfield, Stockport, Crewe. C. belonged to Romans; formed part of kingdom of Mercia in IX. cent.; became earldom under Canute, palatinate under William the Conqueror; united to Eng. crown by Henry III., 1265; again became palatinate under Henry IV.; governed by king's eldest sons as Earls of Chester; has monastic remains; is crossed by Roman roads. Pop. (1911) 676,356.

CHESHUNT (51° 48′ N., 0° 3′ W.), town, on Lea, Hertfordshire, England; nursery and market-gardening, brick-making. Pop. (1911) 12,956.

CHESIL BANK (50° 37′ N., 2° 32′ W.), remarkable ridge of sand and pebbles, on coast of Dorsetshire.

CHESNELONG, PIERRE CHARLES (1820–94), Fr. politician; favoured the establishment of Catholic univ's, and opposed the government measures for secularising education.

CHESNEY, CHARLES CORNWALLIS (1826–76), Brit. colonel and author; prof. of Military History at Sandhurst, 1858; pub. *Campaigns in Virginia and Maryland* (1863), *Waterloo Lectures*, first critical account of that campaign (1868), *Essays in Military Biography* (1874).

CHESNEY, FRANCIS RAWDON (1789–1872), Brit. major-general; chief advocate of construction of Suez Canal; explored Euphrates and Tigris, 1831–37, proving practicability of new trade-route from Syria to India; wrote travels.

CHESNEY, SIR GEORGE TOMKYNS (1830–95), Brit. general, administrator, politician, and author; distinguished in Indian Mutiny; pres. of Engineering Coll., Calcutta; helped to establish Royal Indian Civil Engineering Coll., Cooper's Hill, Staines; first pres., 1871–80.

CHESS.—The origin of this game, which is popular throughout the civilised world, is lost in antiquity, but there seems reason for believing that it came from India, and was introduced into Persia about the VI. cent. Then it was acquired by the Arabs, and through them it probably came to be introduced into Europe during the earlier crusading period. Perhaps the earliest writer on the game was a XII.-cent. Dominican friar, Jacobus de Cessolis, whose treatise was first trans. into French and thence into English, and printed by Caxton (1474) under the style of *The Game and Playe of the Chesse*. William I. is said to have been a chess-player, and it was undoubtedly a popular form of amusement amongst the Eng. nobility in very early times. In course of time various changes in the game were evolved, and its present laws date back to about the XVI. cent. The game is played between two persons on a board of 64 squares, alternately black and white. Each player has 16 pieces—king, queen, two bishops, two knights, two castles (or rooks), and eight pawns. The pieces of one player are black, of the other white. The opponents, facing one another across the board, must each have a white square on his extreme right. They draw for colour. The pieces of each player are arranged in two rows: eight pawns in the front row; at either end of the back row a castle, next to each castle a knight, next to each knight a bishop; and on the two centre squares the king and queen. The queen always stands upon a square of her own colour.

The game is always opened by white moving a piece, and the game is played afterwards in alternate moves. The object of each player is to capture his opponent's king. All the pieces are capable of capturing pieces of the opposite colour in various manners to be described below. In attacking the king with any piece the player must give warning by saying *Check!* and the next move of his opponent must be to place his king out of check: (1) by moving him to another square out of check; (2) by interposing another piece of his own colour between the king and the checking piece; or (3) by capturing the checking piece. If a player is unable to place his king out of check in any of the three manners, his king is *checkmated*, and the game is lost. If a player, whose king is not in check, has no alternative left but to move it into check, he is *stalemated*, and the game is drawn. Thus it will be seen that a king may never be really captured, for the game stops short of the move by which he would be captured. An opponent's piece is captured in the following manner. As no two pieces may stand on the same square, a player cannot move one of his own pieces on to a square already occupied by one of the same colour. If, however, the square is occupied by one of his opponent's pieces he may move his own piece on to that square (subject to the rules below) and capture his opponent's piece, *i.e.* remove it from the board for the rest of the game.

The pieces are moved, and make captures in the following manner: Pawns may only move forwards in a straight line—never backwards or sideways. In making their first move they may, however, advance two squares in a straight line. After their first move they may only move forward one square at a time. They can capture other pieces only by moving diagonally forward into a square occupied by the opposing colour. A pawn which succeeds in crossing the board must be exchanged, before the game is continued, into any other piece. The other pieces, unlike the pawns, may move backwards or forwards, and capture in the same way as they move. The *King* may only move one square at a time, but in any direction. It may not move into a checked position, and when once checked, must be extricated in the very next move, or the game is lost. No two kings may stand in adjacent squares. If the king and either one or other of the castles have not yet been moved, and the space between them is clear, the king may, once only, be *castled*, i.e., he is moved two squares towards the castle, which is then placed in the adjacent square on the opposite side of him. The *Queen* may move in a straight line in any direction, vertically, horizontally, or diagonally. The *Bishop* moves in a straight line diagonally in any direction. The *Castle* moves in a straight line vertically or horizontally in any direction. The *Knight* moves in any direction, first a square horizontally, or vertically, and then a square diagonally. It is the only piece that may jump other pieces in its pathway. It may also capture or check the king over the heads of other pieces.

Howard Staunton's *Chess Player's Handbook, Companion, and Chess Praxis*; Mason's *The Art of Chess*, etc.

CHEST, see THORAX, RESPIRATORY SYSTEM.

CHEST, oblong wood or metal box. Formerly a more important article of furniture than now, it was emblazoned and otherwise decorated; it was used for the storage of household requisites and valuables, and carried from place to place; 'marriage-chests' contained the bride's household linen; the 'chest of drawers' is a later development.

CHESTER (53° 12′ N., 2° 52′ W)., capital, Cheshire, on Dee; port, great railway centre; surrounded by ancient walls; has old Gothic cathedral dedicated to St. Werburgh (dating from XI. cent.). Other important buildings are bp.'s palace, and church of St. John (VII. cent.), both outside walls; Blue-Coat School (founded 1700), grammar school founded by Henry VIII.; modern castle (built 1786) on site of old building, which dated from William the Conqueror's reign; many old timbered houses of XVI. cent.; Gothic town hall, free library, museum, market hall; several public parks; manufactures cheese, leather, gloves, boots, shoes. C. was an important station (Deva) under Romans, of whom traces remain; site of mint in Middle Ages; taken by Roundheads after three months' siege, 1645. Pop. (1911) 39,038.

CHESTER (39° 52′ N., 75° 20′ W.), city, on Delaware, Pennsylvania, U.S.A.; is seat of Pa. military coll.; shipbuilding is chief industry. Pop. (1910) 38,537.

CHESTER, EARLDOM OF.—Chester was formed

into county palatine (of which there was only one other in England) for Gherbod, a Fleming (1070); held by Hugh d'Avranches, nephew of William I., and his heirs until 1237, since when, except for Simon de Montfort's brief tenure (1264–65), it has been granted to kings' eldest sons.

CHESTERFIELD (53° 14′ N., 1° 26′ W.), market town, Derbyshire, England; Gothic church of All Saints and St. Mary contains ancient monuments, and has remarkable twisted spire, 230 ft. high; Trinity Church is burial-place of George Stephenson; industries include iron- and brass-founding, and manufactures of cotton and silk. Pop. (1911) 37,429.

CHESTERFIELD, PHILIP DORMER STANHOPE, 4TH EARL OF (1694–1773), Eng. statesman and author; s. of Philip, 3rd earl; M.P. for St. Germains, 1715; became earl, 1726; went as ambassador to The Hague, 1728; Lord-Lieutenant of Ireland, 1744, and ruled with firmness and moderation; Sec. of State, 1746–48; he then retired. His *Letters to his Son*, i.e. his natural s., Philip, he having no children by his wife, Melusina, natural dau. of George I., are the best literary production of the age of Walpole. They are frank to impropriety, and cynical, but a compendium of wisdom and craft. *Life*, by Craig (1907).

CHESTER-LE-STREET (54° 52′ N., 1° 35′ W.), town, Durham, England; collieries, ironworks. Pop. (1911) 14,713.

CHESTERTON (52° 18′ N., 0°), village, on Cam, forming N.E. suburb of Cambridge, England; boat-building and tile manufacture.

CHESTERTON, GILBERT KEITH (1874–), Eng. author and journalist; has written on Dickens, Browning, Bernard Shaw, etc.; several novels and miscellaneous works; a journalist of distinction, art critic, brilliant satirist, and paradoxical writer.

CHESTNUT (*Castanea sativa*), large tree of the order *Fagaceæ*, with large serrated lanceolate leaves and yellowish catkin. The timber is somewhat like oak, and used for gate-posts, etc., while the fruit (chestnuts), ground to a meal and made into a porridge, are roasted or boiled as a vegetable, or candied or preserved (*marrons glacés, crême de marrons*). The tree is a native of Mediterranean countries, and an allied species, *C. americana*, occurs in N. America.

The HORSE-CHESTNUT (*Æsculus hippocastanum*), a beautiful tree, is frequently planted in avenues, on account of its large foliage and 'candelabra' of white or red flowers. The wood is soft, and used as fuel, for making charcoal, and common carpentry. Three seeds or nuts are enclosed in one capsule, and are used for feeding stock, and for the manufacture of a burning-oil.

CHETHAM, HUMPHREY (1580–1653), Eng. merchant; sheriff of Lancashire and collector of ship-money under Charles I.; founder of Chetham's Hospital, Manchester, for forty poor boys, and the famous library connected with it, containing many rare books and MSS.

CHETTLE, HENRY (1565–1607), Eng. dramatist and satirist; wrote *Jane Shore*, *Hoffmann*, *The Blind Beggar of Bethnal Green*; also satires.

CHEVALIER, MICHEL (1806–79), Fr. economist; prof. in the Coll. de France; helped to bring Britain and France into better commercial relations; wrote economic works.

CHEVALIER, ULYSSE (1841–), Fr. priest and bibliographer; authority on mediæval history.

CHEVAUX-DE-FRISE, military device, first used in the Dutch War of Independence, consisting of planks in which swords and spikes were fixed, to impede cavalry.

CHEVERUS, JEAN LOUIS ANNE MAGDELEINE LEFEBVRE (1768–1836), Fr. divine; went to America, 1796; bp. of Boston, 1808; back in France, 1823; abp. of Bordeaux, 1826.

CHEVIOT HILLS (55° 18′ N., 2° 30′ W.), range of hills forming border between England and Scotland, extending 35 miles N.E. to S.W.; highest point, 2676 ft.; numerous ruins and border 'peels'; famed for valuable breed of sheep.

CHEVREUL, MICHEL EUGÈNE (1786–1889), Fr. chemist; pupil of Vauquelin, whom he succ. as prof. of Organic Chem. and director of the Paris natural history museum; celebrated for his researches on colours, fats, and saponification; foreign member and Copley medallist of the Royal Society.

CHEVRON, a figure shaped thus ∧ forming the highest part of the framework of a house; a similar figure upon a heraldic shield; a badge of rank, or good conduct, in the military, naval, and other services.

CHEVROTAIN, MOUSE-DEER, tiny, hornless, slightly deer-like, artiodactylous mammals, family Tragulidæ, comprising several species in tropical Asia, W. and E. Central Africa.

CHEYENNE (41° 9′ N., 104° 40′ W.), city, capital of Wyoming, U.S.A.; coal and iron mines in district. Pop. (1910) 11,320.

CHEYENNE, tribe of N. Amer. Indians of the Algonquian family, now living in reservations in Oklahoma and Montana.

CHEYNE, THOMAS KELLY (1841–), Anglican theologian; authority on Old Testament exegesis; prof. at Oxford.

CHÉZY, ANTOINE LÉONARD DE (1773–1832), noted Fr. Orientalist.

CHHATARPUR (24° 55′ N., 79° 45′ E.), chief town, native state, Chhatarpur, Bundelkhand, Central India, coarse cutlery and paper. Pop. (state) 156,139; (town) 13,000.

CHHATTISGARH (*c.* 21° 20′ N., 82° E.), S.E. division, Central Provinces, India, comprising districts of Raipur, Bilaspur, and Drug. Area, 21,240 sq. miles. Pop. 2,642,983.

CHHINDWARA (22° 3′ N., 79° E.), town and district, Nerbudda division, Central Provinces, India; cotton cloth. Area, 4631 sq. miles. Pop. 407,927. Pop. (town) 9736.

CHIANA (42° 50′ N., 12° 7′ E.), river, Tuscany, Italy; conducted by canals into Arno and Tiber; ancient *Clanis*; originally tributary of Tiber.

CHIAPAS (16° 25′ N., 93° W.), Pacific state, Mexico, W. of Guatemala; mountainous; immense forests; maize, sugar; capital, Tuxtla Gutierrez. Area, 27,230 sq. miles. Pop. (1910) 438,843.

CHIAVARI (44° 19′ N., 9° 19′ E.), town, Genoa, Italy; lace and silk. Pop. 10,500.

CHIAVENNA (46° 19′ N., 9° 23′ E.), town, Lombardy, Italy; cotton and pottery. Pop. 3200.

CHIBOUQUE, long Turk. tobacco pipe.

CHICACOLE (18° 17′ N., 83° 56′ E.), town, Ganjam, Madras, India. Pop. 18,500.

CHICAGO (41° 58′ N., 87° 36′ W.), city, Illinois, at S. end of Lake Michigan, on small river C., the two branches of which unite in middle of city, thus dividing it into N., W., and S. sides; regularly laid out, with wide streets crossing each other at right angles; many fine parks, which almost surround city, and are controlled by three special boards, one for each division of town; include Lincoln Park on N. side, Jackson Park on S. side (where Columbian Exposition was held, 1893); some fine public buildings, including town hall, art institute, museum, library, auditorium, R.C. and Prot. cathedrals. Among educational institutions are North-Western and Lake Forest univ's, R.C. coll., medical coll., various theological seminaries, many schools. *University of Chicago* (opened 1892) is unsectarian, except the theological school, which is Baptist; extensive buildings, with accommodation for students; faculties — arts, literature, science, divinity, medicine, law, education, commerce, administration; fine library. Charitable institutions include numerous hospitals, dispensaries, asylums, mission settlements; many hotels and theatres. Municipal administration is carried out by mayor and council of 70 members, elected for two years. There are boards of health and education; other principal

departments are those of public works, finance, law, police, and fire.

History.—Earliest settlement was made at Fort Dearborn in 1804; this was annihilated by Indians in 1812 and rebuilt four years later; still quite small village in 1830, with log houses; but henceforward it developed rapidly, owing chiefly to construction of Illinois and Michigan canal and development of lake trade; became city, 1837, when had about 4000 inhabitants. By 1850 population had increased to over 29,000, and by 1870 to over 300,000. In 1871 occurred a terrible fire which destroyed great part of city, sweeping over area of over 2000 acres; subsequently rebuilt in stone and brick instead of wood. Columbian Exposition held here in 1892–93; Iroquois theatre burnt, 1903.

C. is one of busiest commercial centres in world, acting as distributing centre to, and collecting centre from, large district increasing in wealth and population. Natural advantages of situation, railway, and waterway facilities, and enterprise and keen commercial spirit of its merchants have made it what it is. Trade in grain, flour, and pork is enormous, surpassing anything else of kind in world; there are factories and workshops connected with hog- and beef-packing, soap, rolling-mills, foundries, machinery, wagons, agricultural implements, cars, bridges, tanneries, boot-making, electric supplies, jewellery, furniture, pianos, breweries, tobacco, clothing, furs, printing, bakeries, coffee and spice mills, all turning out products to large value. Cold storage in connection with perishable goods is amply provided and carefully regulated. Pop. (1910) 2,185,283.

Kirkland, *The Story of Chicago* (1904); Andreas, *History of Chicago* (1886).

CHICHELEY, HENRY (1364–1443), Eng. prelate; an ecclesiastical lawyer in the Court of Arches, he became archdeacon of Dorset and chancellor of Salisbury Cathedral, 1402; bp. of St. David's, 1407; abp. of Canterbury, 1413—about the time of the persecution of the Lollards (*q.v.*). He was involved in a dispute with Pope Martin V., which was personal rather than ecclesiastical. He founded St. Bernard's Coll. at Oxford, superseded by St. John's, and in 1438 the famous All Souls' Coll., a college which is now a grammar school at Higham Ferrars, and he may have inspired the foundation of Eton and King's.

CHICHEN-ITZA (*c.* 20° 13′ N., 88° 12′ W.), ancient ruined city, Northern Yucatan, Mexico; ruins.

CHICHESTER (50° 51′ N., 0° 47′ W.), episcopal city, Sussex, England, between South Downs and an inlet of Eng. Channel; has old octagonal market cross and remains of ancient walls. Holy Trinity Cathedral (founded XI. cent.) has detached belfry and contains interesting relics. Modern buildings include Council House, Guildhall, Corn Exchange. C. was destroyed by Ælla, V. cent., and rebuilt by Cissa, his s., king of Sussex; wooden ware; agricultural produce, breweries, and tanneries. Pop. (1911) 12,594.

CHICHESTER OF BELFAST, ARTHUR CHICHESTER, BARON (1563–1625), lord-lieutenant of Ireland, 1604–14; was fairer to the Irish Catholics than the Eng. government approved; cr. Baron C. in 1613.

CHICKAMAUGA (34° 45′ N., 85° 20′ W.), small river, rises Walker County, Georgia, U.S.A., flows N.W., enters Tennessee above Chattanooga; here Confederates defeated Federals, Sept. 19–20, 1863.

CHICKASAWS, tribe of N. Amer. Indians of the Muskhogean family, who assisted the Confederates in the Amer. Civil War; now dwelling in reservations at Oklahoma.

CHICKASHA (35° 3′ N., 97° 57′ W.), city, Oklahoma, U.S.A.; trade centre for corn, cotton, live stock, etc., of district. Pop. (1910) 10,320.

CHICKEN-POX (*Varicella*), specific contagious disease, manifested by slight fever, and by successive crops of little vesicles mainly on the chest and neck. Children of 2–6 years are chiefly attacked. Treatment is to give soothing applications for the itching, and tonics and nourishing food in convalescence.

CHICLANA (36° 25′ N., 6° 10′ W.), town, Cadiz, Spain; mineral springs. Pop. 10,768.

CHICOPEE (42° 9′ N., 72° 35′ W.), town, on Connecticut, Massachusetts, U.S.A.; cotton, firearms, rubber goods. Pop. (1910) 25,401.

CHICORY (*Cichorium intybus*), perennial plant (order Compositæ) with bright blue flowers occurring in the north temperate zone chiefly on chalky soils, and cultivated in Yorkshire, Holland, Belgium, France, and Germany. Its leaves are used as a salad, and the roots are dried, roasted, ground, and decocted as a substitute for, or addition to, coffee.

CHIDAMBARAM (*c.* 11° 24′ N., 79° 44′ E.), town, South Arcot district, Madras, India; sacred temples. Pop. 20,000.

CHIEMSEE (47° 50′ N., 12° 25′ E.), largest lake, Bavaria; length, 8½ miles.

CHIENG-MAI (18° 50′ N., 99° 2′ E.), town, on Me-ping, Chieng-Mai, N. Siam; centre of teak trade. Pop. *c.* 100,000.

CHIERI (45° 1′ N., 7° 49′ E.), town, Turin, Italy; ancient *Carea*; Gothic cathedral; silks. Pop. 12,500.

CHIETI (42° 21′ N., 14° 10′ E.), city (and province), Italy; abp.'s seat; cathedral; woollens and cottons manufactured. Pop. (1911) 25,628.

CHIFF-CHAFF, small warbler (*Sylvia hippolais*), of S. Europe; visits England in summer. So called from its constant repetition of two notes.

CHI-FU, CHEFOO (37° 31′ N., 121° 25′ E.), seaport, N. coast, province, Shantung, China; coaling station. The *Chefoo Convention* (1876), between Britain and China, gave to Britain certain commercial rights, threw open four treaty ports, and promised protection to foreigners in China. Pop. 50,000–100,000.

CHIGOE, see JIGGER.

CHIGWELL (50° 38′ N., 0° 5′ E.), village, Essex, England.

CHIH-LI, PE-CHI-LI (*c.* 38° 30′ N., 115° E.), N.E. province, China, bordering Gulf of Chih-li on east; forms immense plain watered by Pei-ho, Hun-ho, and Lan-ho; mountainous N. and W.; contains Peking, capital of China; coal, iron, and silver found; cereals and cotton produced. Area, 120,500 sq. miles. Pop. *c.* 25,000,000.

CHIHUAHUA (29° N., 106° W.), state, Mexico; hot, dry climate; in east large tracts are devoid of vegetation; traversed in west by Sierra Madre, which form fruitful valleys of good pasture. C. is rich in minerals, gold and silver mining being principal industry. Area, 87,828 sq. miles. Pop. (1910) 405,265.

CHIHUAHUA (28° 32′ N., 106° 15′ W.), city, capital of C. state, Mexico; chief occupation, mining; manufacture of cottons and woollens. Pop. (1910) 39,061.

CHILAS (35° 25′ N., 74° 16′ E.), fort, on Indus, N.W. Frontier Provinces, India.

CHILBLAINS, irritating inflammation of the skin, usually at the fingers ('chapped hands') or toes; caused by cold in those whose circulation or general nutrition is deficient; treatment is to apply iodine or ichthyol to affected part, and take tonics, *e.g.* strychnine or iron, internally.

CHILD, FRANCIS JAMES (1825–96), Amer. scholar; prof. of English at Harvard.

CHILD, SIR FRANCIS (1642–1713), Eng. banker; founder of Child's Bank; formerly a goldsmith; Lord Mayor of London (1699); afterwards entered Parliament.

CHILD, SIR JOHN (d. 1690), Anglo-Indian official; was in the East India Co. service, and became gov. of Bombay; subsequently involved in a quarrel with the Moguls.

CHILD, SIR JOSIAH (1630–99), an Eng. merchant who became a director of the East India Company in 1677, then gov.; cr. baronet in 1678; wrote works on economics.

CHILD, LYDIA MARIA (1802–80), Amer. author and slavery abolitionist.

CHILDEBERT I., CHILBERT, s. of Clovis; reigned 524–58 over part of Franco. **Childebert II.**, king of Austrasia, 570–95. **Childebert III.**, king, 695–711; all three were of the Merovingian race.

CHILDERS, HUGH CULLING EARDLEY (1827–96), Brit. statesman; Sec. for War (1880–82), during which period occurred the Egyptian and Boer Wars; Home Sec., 1886; retired from active parliamentary work, 1892.

CHILDERS, ROBERT CÆSAR (1838–76), Eng. Orientalist.

CHILDREN.—*Employment of Children Act*, 1903, forbids: (1) employment of children in certain occupations; (2) trading in streets by children under eleven; (3) employment of children after 9 p.m. *Prevention of Cruelty to Children Act*, 1904, renders punishable assault or ill-treatment of children under sixteen by persons over that age, in whose charge they are; and imposes restrictions concerning their employment in dangerous performances, or in singing, selling, etc., in public places. *Children Act* of 1908 defines cruelty to children as wilful neglect, abandonment, or ill-treatment, the offence being possible only by persons over sixteen in charge of child under that age; it also imposes restrictions on employment of children.

Children's Courts.—Courts of summary jurisdiction for hearing charges against children or young persons, or hearing applications for orders or licences relating to such persons where their attendance is necessary. Only newspaper representatives and those directly concerned can be present. See also BABY.

Children's Games are naturally of great antiquity; of use in study of folk-lore. Singing games play important part; players (generally girls) either form circle or two lines facing each other, representative of occasions of rejoicing; boy's games usually mimic contests, survival of fighting.

CHILDRENITE ($Al(FeMn)(OH)_2PO_4+H_2O$), mineral occurring as translucent pale yellow to dark brown orthorhombic crystals in Cornwall, Devon, and Connecticut.

CHILDS, GEORGE WILLIAM (1829–94), Amer. publisher and philanthropist.

CHILE, CHILI (17° to 55° 58′ S., 75° 30′ to 67° W.), republic, S. America, lying along W. coast between main chain of Andes and Pacific; greatest length, 2650 miles; breadth varies from 60 to 200 miles; area, 279,901 sq. miles; bounded N. by Peru, E. by Bolivia and Argentina. Surface generally slopes from E. to W., and also from N. to S., Andes being higher in N. than in S.; average height of Andes about 9000 ft., highest peak, Aconcagua (22,867 ft.). Many of these mountains are dormant or sub-dormant volcanoes. From E. to W. there is slope of Andes, central valley tableland, Coast Cordillera, coastal strip; first slopes down as it passes southward and finally dips under sea so that Coast Cordillera takes form of chain of islands parallel to southern third of coast and curving S. round Tierra del Fuego; Juan Fernandez Island, W. of Valparaiso, also belongs to C. Chief rivers are Maipu in valley tableland at Santiago, Biobio at Concepcion, and Valdivia. Flora includes cacti, palms, peumo trees, cypress, eucalyptus. Fauna includes guanacos, pumas, chinchilla, polecat, lizards, frogs, buzzards, parrots, etc. Largest towns are Santiago (capital) and Valparaiso.

History.—Prehistoric inhabitants of C. were Yaghans, savages of degraded type, and other tribes of whom most important were Araucanians. Northern districts conquered by Incas of Peru in first half of XV. cent., their control lasting until a cent. later. After Spaniards had conquered Peru, they turned their attention to C., first expedition being undertaken by Almagro in 1535 without much success. He was followed by Valdivia, to whom the foundation of Santiago in 1541 is due. He also established the towns of Concepcion, Imperial, Villa Rica, and Valdivia, but was ultimately taken, tortured, and killed by the Indians in revenge for the cruelty with which he had treated them. Warfare between Spaniards and Araucanians continued intermittently for two and a half cent's, and was characteristic of whole colonial period, during which the gov's of C. were generally nominated by viceroys of Peru. A treaty of peace was concluded in 1640, but wars again broke out at various dates. Under O'Higgins, gov. from 1788 to 1795, considerable progress was made; agriculture, irrigation, commerce, and labour conditions were all improved, and many public buildings erected.

The movement for independence began about 1810, after the abdication of Span. king, Ferdinand VII., which followed the Fr. invasion of Spain. The gov., Carrasco, was compelled by an assembly of patriots to hand in his resignation, and a new system of government was established; abolition of slavery was one of first laws passed. For some time fighting was carried on with Spaniards; and internal disputes also occurred between rival patriotic parties. For short time, from 1814 to 1817, Span. authority was restored; but in Feb. 1817 the Chilians, under Bernardo O'Higgins and San Martin, completely defeated Span. forces at *Chacabuco*; an assembly was summoned and O'Higgins became director. Spaniards were again defeated at *Maipo* in 1818, in which year Chilian independence was formally proclaimed. New republic was recognised by U.S.A. shortly afterwards; independence not recognised by Spain until 1844. O'Higgins abdicated in 1823, when Ramon Freire became pres., and a constitution was framed, which has since been twice modified. After Freire's administration came to an end in 1826 there was a succession of presidents, each of whom ruled only a short time. Under Pinto, pres. 1827–29, some progress was made; army was reorganised, educational system improved, and financia reforms carried out. During his administration disputes occurred between rival political parties. Don Joaquin Prieto was pres. from 1831 to 1841; his famous minister of state, Portales, enforced the new constitution framed in 1833, and put down revolts and disorders with great severity, all revolutionists being banished from the country. Many of these sought refuge in Peru.

On the announcement that Peru and Bolivia intended to unite as one republic, C. declared war against them; and the Confederates were defeated by Chilians under Bulnes at *Yungay* in 1839. Bulnes became pres. in 1841; under his administration no revolutions occurred, and country enjoyed period of peace, during which great progress was made. He was succeeded as pres. by Manuel Montt, whose administration was marked by civil war and riots, both of which he succeeded in suppressing; in his time educational and commercial matters were improved, banks founded, and many charitable institutions established. In 1861 Perez became pres.; in his time occurred dispute with Spain, against whom war was declared by Peru, Chile, Ecuador, and Bolivia; Valparaiso suffered bombardment in 1866, but the Spaniards withdrew soon afterwards, and active hostilities ended in 1869.

In 1870 expeditions were sent against the Indians, who had again been troublesome; they were defeated, and peace was concluded. Boundary dispute with Bolivia in 1879 led to long war with Peru, called the *War of the Pacific*. The first battles were at sea, and Chilian navy was victorious. Peruvians and Bolivians were completely defeated at *Dolores* in 1879, and again at *Miraflores* in 1881; other victories, both by land and sea, were won by Chilian arms, and war ended with peace treaties in 1883, whereby C. acquired Antofagasta from Bolivia, Tacna and Tarapaca from Peru. In 1891 civil war again broke out, during Balmaceda's presidency; his party being defeated at *Coñcoñ* and *La Placilla*, he committed suicide, and Jorge Montt became pres. During Riesco's administration boundary dispute with Argentina was settled in 1902, award being made by King Edward VII.

Government is republic on model of U.S.A., pres. holding office five years; legislative vested in Congress, consisting of Senate and Chamber of Deputies; the former has 37 members elected by popular vote for six years; latter, 108 members, elected by popular vote for three years. Pres. is assisted in executive by council of state of eleven members and cabinet of six ministers.

Inhabitants include Spaniards, French, English, and other European nationalities. Natives are Araucans, Fuegians, Changos. State religion is Roman Catholicism. Education is free, but not obligatory. Military service is compulsory.

Soil of valleys in central provinces is very fertile; over half population engaged in agriculture, producing wheat and other cereals, rearing sheep, cattle, growing vines, oranges, figs, olives, and other fruits, beetroot, producing silk. In S. and islands are dense forests; in N. are enormous deposits of nitrates, which are great source of wealth. Other minerals include salt, borax, copper, silver, manganese, gold, cobalt, iron, sulphur, coal. Industries include copper-smelting, sugar-refining, tanning, manufacture of soap, candles, chemicals, boots, shoes, textiles. Among exports are copper, nitrates, guano, wool, silver ore, grains, flour, skins, furs, borax, caoutchouc, coffee, cotton, Peruvian bark, manganese ore, sugar, vegetables; among imports—textiles, metals, coal, machinery, oilcloth, cordage, tools, earthenware, leather, paper, spirits, scientific instruments, cod-liver oil, pianos, etc. Railway mileage in 1910 was *c.* 3570; C. is well provided with telegraphic communications. Pop. (1910) *c.* 3,415,000.

Scott Elliot, *Chile* (1907); Wright, *Republic of Chili* (1905); Hancock, *History of Chile* (1893); Holdich, *Countries of the King's Award* (1904).

CHILIASM, belief in the coming of a millennium or golden age.

CHILLAN (36° 4′ S., 71° 57′ W.), city, Chile; has ot sulphur springs. Pop. 35,000.

CHILLIANWALLA (32° 39′ N., 73° 38′ E.), village, on Jhelum, Punjab, Brit. India; scene of battle between Brit. and Sikhs, Jan. 13, 1849.

CHILLICOTHE (39° 47′ N., 92° 34′ W.), city, Mo., U.S.A.; flour-mills, iron foundries. Pop. (1910) 6265.

CHILLICOTHE (39° 17′ N., 82° 58′ W.), city, Ohio, U.S.A.; has railway workshops and carriage factories. Pop. (1910) 14,508.

CHILLINGWORTH, WILLIAM (1602–44), Anglican divine; ed. Oxford; became R.C., then Prot. again, but had scruples about signing Thirty-nine Articles; pub. *The Religion of Protestants a Safe Way to Salvation* (1637); chancellor of Sarum, 1638.

CHILOÉ (*c.* 44° S., 74° W.), southern province, Chile, including large island of same name, off coast, and several smaller islands; capital, San Carlos; area, 8580 sq. miles. Pop. 95,000.

CHILPERIC I. (d. 584), Frankish king; was a dissolute tyrant who repudiated his first wife and murdered his second; was assassinated whilst hunting.

CHILTERN HILLS (51° 36′ N., 1° W.), range of chalk hills, in S.E. Oxfordshire, Buckinghamshire, and borders of Bedfordshire and Herts, England; highest point, 905 ft., near Wendover.

CHILTERN HUNDREDS, by Eng. law a Member of Parliament cannot resign his seat, but if he accepts an office of profit under the Crown he *ipso facto* vacates it. Any one who wishes to resign, therefore, petitions for a nominal office, *e.g.* to be made Steward of the Chiltern Hundreds (viz. Stoke, Burnham, and Desborough, in Buckinghamshire), or the Manor of Northstead.

CHILWA (15° 5′ S., 35° 50′ E.), shallow lake, S.E. Africa; length once 40 miles, gradually drying up.

CHIMÆRA (classical myth.), fire-breathing monster, having head of lion, body of goat, and tail of dragon; wrought great havoc in Lycia; slain by Bellerophon on his winged horse, Pegasus.

CHIMAY (50° 2′ N., 4° 17′ E.), town, Hainaut, Belgium; marble quarries. Pop. 3400.

CHIMBORAZO (1° 29′ S., 79° 5′ W.), extinct craterless volcano, Ecuador; 20,498 ft. above sea-level, 11,000 ft. above plateau; capped with snow. C. name also of province to S.; area, 5544 sq. miles. Pop. *c.* 123,000.

CHIMERE, CHYMERE, an ecclesiastical vestment worn by Anglican bp's over the rochet; shaped like a gown without sleeves; generally of black satin, for convocation it is of scarlet cloth; thought to be a survival of the mantelletta worn by cardinals, bishops, and certain other R.C. prelates.

CHIMESYAN, small tribe of N. Amer. Indians now living in Skeena district of Brit. Columbia.

CHIMKENT (42° 15′ N., 69° 50′ E.), town, health resort, Syr-Darya, Asiatic Russia; taken by Russians, Sep. 1864. Pop. 11,000.

CHIMPANZEE (*Anthropopithecus troglodytes*), anthropoid ape of the forests of tropical Africa; is less fierce and more docile than the gorilla.

CHINA (18° to 52° N., 74° to 135° E.), republic, E. Asia; bounded N.W. and N. by Russia; E. by Russia, Korea, Yellow Sea, Eastern Sea; S. and S.W. by South China Sea, Fr. Indo-China, Burma, India; W. by Turkestan, Afghanistan, Kashmir; includes China Proper and the dependencies of Manchuria (*q.v.*), Mongolia (*q.v.*), Tibet (*q.v.*), and E. Turkestan (*q.v.*); area, *c.* 4,300,000 sq. miles.

China Proper (18° to 47° N., 98° to 135° E.) is bounded N. by Mongolia and Manchuria, E. by North Pacific, S. by Burma, Fr. Indo-China, and China Sea, W. by Tibet; area, *c.* 1,530,000 sq. miles. Along the E. is great plain, broken only by hilly peninsula of Shantung; elsewhere surface is mountainous, or hilly plateau. Principal mountains are Yun-ling in Sze-chuen, Nan-ling in Kwang-si, Tai-shan in Shantung, Pe-ling in Kansu, Wa-shan in Shen-si, Mo-hi in Fu-kien, Sung-shan in Honan, Hang-shan in Shansi, Hang-shan in Hunan. N. is drained by Hoang-ho and its tributaries, centre by Yang-tse-kiang and tributaries, S. by Si-kiang and tributaries. Hoang-ho rises in Kuen-lun mountains, flows N.E. through Tibet, Kansu, S. Mongolia, between Shansi and Shensi, and through Honan and Shantung into Gulf of Pechihli. Yang-tse-kiang also rises in Kuen-lun range, and flows S.E. through Tibet, Sze-chuen, Yunnan, Hupeh, Kiangsi, Anhwei, Kiangsu, into Pacific. Si-kiang rises in Yunnan, flows through Kwangsi and Kwangtung, unites with Pe-kiang and Tung-kiang, and enters South Sea near Lappa. An interesting topographical feature is the *Great Wall*, which stretches along Chihli, Shansi, Shensi, a Kansu, and was built as a means of defence in t III. cent. B.C., since when it has been lengthened at various dates. The climate varies greatly; temperature in N. ranges from 23° to 80° Fahr. at ordinary heights, in S. from 60° to 85° Fahr.; everywhere is sufficient rain for agriculture, with wet winds off sea in summer and dry winds from interior in winter.

History.—In earliest times C. was inhabited by various aboriginal tribes who were conquered by the Chinese sometime in the III. millennium B.C. Of early history of nation before VIII. cent. B.C. little is known, except from traditions collected and transmitted by Confucius and Mencius. Legendary records begin with Fu Hsi, who is generally considered founder of Chin. history, and is said to have reigned in XXIX. cent. B.C. Of his successors, Yao became king in 2356 B.C.; he is generally regarded as model ruler, as is his successor Shun. Shun was succeeded by Yü, who is said to have founded first Chin. dynasty and to have extended his kingdom. Yü's successors were superseded in 1766 by T'ang, prince of Shang, who defeated the then king and established a new dynasty which lasted till XII. cent. B.C. Of this dynasty there were 28 kings, during whose reigns little of importance occurred. The last was Chon Hsin, who was defeated by Wu Wang of Chon in 1122, when the Chon dynasty was established, which continued until 255 B.C.

Under the *Chon* rulers the feudal system was established and whole country was divided up into vassal states, many of which afterwards became powerful kingdoms; in this period art and lit. attained considerable

development, and the three great Chin. philosophers, Laotze, Confucius, and Mencius, lived and produced their works. Interstate war was almost continuous, and in III. cent. B.C. the vassal kingdom of Tsin or Ch'in attained great power, ultimately deposing the Chon emperor, Nan Wang, and establishing on imperial throne the *Tsin* dynasty, which endured until 206 B.C., providing five rulers, of whom most important was Tsin Shih Huang-ti. He consolidated his empire by abolishing feudalism and establishing a new system of government; his other principal exploits were the building of the Great Wall in the northern provinces, and the attempt to burn all Chin. classical lit. The Tsin line did not endure long after his death; rebellion broke out, and resulted in establishment of *Han* dynasty, about 206 B.C. First Han emperor was Liu Pang, who repealed the proclamation as to burning the classics; he assumed name of Kao Ti; during his reign several invasions and rebellions occurred, which he succeeded in suppressing. His son and successor, Hui, died young, by that of T'ang in 618. First *T'ang* emperor was Kao Tsu, who carried out religious and educational reforms. His son and successor, T'ai Tsung, strengthened and reformed the army and encouraged learning; he also extended his dominions. He was followed by his son, Kao Tsung, whose wife, the Empress Wu Hon, was notorious for her cruelty, and after her husband's death ruled for over twenty years. The T'ang dynasty lasted until 907; under it Chin. dominions were greatly enlarged, but in VIII. and IX. cent's serious rebellions occurred; after its fall there were five short-lived dynasties, the last of which came to an end in 960, in which year the *Sung* line was established by Chao K'uang-yin, who took name of T'ai Tsu and ruled till 976. The Sung period was the great age of Chin. lit., and endured until 1279. In XI. cent. various reforms in financial matters were carried out. In XII. cent. the Kins, a Tartar race, became powerful; they attacked and defeated the Chinese in 1125, and the northern provinces were ultimately yielded to them.

and in 179 B.C. Wen Ti became emperor. He instituted a less barbarous system of punishments than had previously been customary, and in his reign various invasions occurred. One of his successors, Wu Ti (140–86 B.C.), was a mighty warrior who enlarged his empire by conquests.

I.–XII. Century A.D.—The Han line came to an end about 220 A.D., after which the country was for a time divided into three kingdoms. In 265 A.D. Ssuma Yen established the Western Tsin dynasty in the north, taking name of Wu Ti; he afterwards subdued the south, consolidating the empire for short time; his successors were defeated by some of the northern tribes, and later the whole of the north was conquered by the Tartars. In 317 Yüan Ti (a descendant of Ssuma I., grandfather of Ssuma Yen) founded the Western Tsin dynasty in the south; this lasted till 420 when it was overthrown by Liu Yü, founder of Sung dynasty. From this time till 618 there were many dynasties, none of which lasted long; the last of these, the Sui dynasty, was superseded

XIII.–XVIII. Century.—Later in XII. cent. the Mongols appeared, and struggle between them and the Chinese began, which ended in the establishment of *Mongol* dynasty by Kublai Khan in 1279, when Ping Ti, the last Sung emperor, committed suicide. Kublai Khan assumed title of Shih Tsu, the dynasty he founded being called *Yüan*. Under him great splendour was attained by China, boundaries of which were greatly extended by conquests. He died in 1294; and the dynasty ended in 1368, when a revolution occurred, which resulted in the flight of the Mongol emperor Shun Ti, and the establishment of the *Ming*, a Chinese dynasty. The first Ming emperor, T'ai Tsu (Hung Wi), carried out various reforms and added to his dominions. At his death a struggle took place between his son and grandson, former ultimately becoming emperor, as Ch'eng Tsu. In XV. cent. occurred a Mongol invasion, when emperor Ying Tsung was taken and kept prisoner for a time. Under Ming emperors learning was encouraged; in XVI. cent. appeared the

first Portug. traders; and latter occurred another Mongol invasion.

The dynasty endured until 1644, when the Manchus, having been appealed to for aid in putting down a rebellion, placed a *Manchi* prince upon the throne, and thus established the Ch'ing or Tsing line of emperors. This prince reigned as Shih Tsu Chang until 1662, when K'ang Hsi became emperor. K'ang Hsi succeeded in consolidating his empire; conquered Tibet and Formosa; encouraged learning; d. in 1723, succ. by Yung Cheng, who persecuted Roman Catholic missionaries in C. Yung Cheng's s., Ch'ien Lung, acceded in 1736; in his reign several insurrections took place, including a rebellion in Mongolia; Eastern Turkestan was annexed to the empire, and war occurred with Burma and other states and tribes; he abdicated in 1796, when his s., Chia Ch'ing, became emperor. In his reign many secret societies were formed, one of which, the *White Lily*, raised a rebellion and twice tried to assassinate the emperor. The latter d. in 1820, succ. by his s., Tao Kuang, in whose reign occurred first war with Great Britain.

XIX.–XX. Century.—Brit. trade in China had hitherto been entirely in hands of East India Company, whose monopoly expired in 1834, when the Brit. Government determined to take it into their own hands, and sent Lord Napier as representative. He was not able to accomplish anything, nor was his successor, Captain Elliot. Relations were already somewhat strained when the question of opium traffic brought matters to a head. This had been declared illegal in 1796; in 1839, Liu Tse-hsü became commissioner to put an end to it, and demanded the surrender of all opium in foreign merchants' hands. Captain Elliot handed over all supplies held by Brit. merchants, but refused to accede to other demands, and eventually war broke out in 1840, lasting until 1842. In that year peace was concluded by Treaty of Nanking, whereby Britain received Hong-kong and a large money indemnity, and Canton, Amoy, Shanghai, Fu-chow, and Ning-po were declared open to foreign trade. Treaties of same nature were subsequently concluded with U.S.A. and France.

Tao Kuang died in 1851, succ. by his s., Hsien Fêng, in whose reign the *T'aiping rebellion* was first important event. This had first broken out in 1850, under leadership of Hung Hsiu-ch'üan, whose object was to supersede Confucianism by Christianity and to overthrow the Manchus. Several towns were seized by rebels in 1850, and in 1853 they captured Wu-chang and Nanking and advanced on Peking. Force was then raised by Li Hung-chang, and eventually the rebels lost some of the cities they had taken, their territories being reduced to small district near Nanking.

Before the final suppression of the T'aipings, however, there occurred another war with Great Britain, This broke out in 1856, when the *Arrow*, a ship under Brit. flag, was boarded and some of her crew seized by Chinese. The British were supported by the French; and the allies in 1857 advanced on Canton, which was taken in that year. Peace was concluded in 1858 by Treaty of Tientsin, whereby other ports were opened to foreign trade, an indemnity was paid by Chinese, and tariff was modified, while Great Britain also obtained right to send resident minister to Peking. The treaty, however, was not held to in all particulars, and hostilities again broke out. Allied British and French were defeated at *Taku* in 1859; but in 1860 they captured Pehtang, Tangku, and the forts at Taku, and fought and won battle at *Palikiao*. Peace was concluded by Treaty of Peking in 1860, in which further concessions were made by Chinese.

Hsien Fêng d. soon afterwards, whereupon, his heir being a child of four, T'ung Chih, the reins of government were assumed by the Empress Dowager and Prince Kung. Meantime the T'aiping rebellion remained unsuppressed; the rebels had increased their territories during the war with Britain, and as there was some danger of their seizing Shanghai a force was raised by that city to resist them. This was organised and led by two Americans and two Britons in succession, the last of whom was Charles George Gordon, who accepted the command in 1863. He reorganised his forces and brought them to a high pitch of discipline. After the capture of Soochow, Gordon resigned in consequence of Li Hung-chang's treacherous behaviour towards those rebels who surrendered; but subsequently he again took command. Soon afterwards, the rebellion was ended by the capture of Nanking, and the imperialist forces were disbanded. Other rebellions occurred in various provinces, but were suppressed.

In 1870 occurred an outbreak at Tientsin, in which a massacre of nuns took place and numbers of foreigners were killed by mob. In 1873 the emperor, T'ung Chih, granted personal interview to foreign ministers for first time. He was succeeded in 1875 by Kwang Hsü, his cousin; but the Empress Dowager, T'ung Chih's mother, continued to rule. In 1884 war broke out with France, which ended in 1885 by treaty whereby French acquired control of Annam and Tongking. War with Japan broke out in 1894 owing to C.'s refusal to urge reforms in Korea. Success followed Jap. arms; Port Arthur and Weihaiwei were taken, and the Chin. fleet annihilated at the *Battle of The Yalu*; and war ended in 1895 with Treaty of Shimonoseki, whereby China paid a large indemnity to Japan, ceded Formosa to her, and declared independence of Korea. After this war, which showed weakness of C., various European powers exacted from her commercial concessions, and encroached upon her dominions: Kiaochau was seized by Germany; Great Britain and Russia respectively obtained leases of Weihaiwei and Port Arthur. The empress in 1898 compelled her nephew to transfer the imperial authority to herself; and soon afterwards she put down the reform party which had then arisen.

The *Boxer* risings began in 1899; their aim being to expel foreigners. Various massacres occurred, in which missionaries and native converts to Christianity were specially singled out. Foreign Legations of Peking were besieged, and a relief force composed of Brit., Ger., Fr., Amer., Russ., and Jap. soldiers, after heavy fighting at Tientsin and other places, entered the city in Aug. 1900. Peace was concluded in same year, and C. had to make many concessions, but lost none of her territory. During war between Japan and Russia, which broke out in 1904, C. maintained neutrality; this war ended in 1905, when both Japan and Russia agreed to evacuate Manchuria and restore it to China.

Since then many important reforms have been carried out in C. Many government offices were abolished as useless, and a new system of education introduced; army has been reorganised, railways increased, etc. Emperor Kwang-Hsü died on Nov. 14, 1908, and the Dowager Empress a day later—an ominous event; in Dec., Pu Yi became emperor at age of two. In 1911 the emperor's three advisory councils were abolished, and a Cabinet and Privy Council established instead. In Dec. 1911 the regent abdicated, and in Feb. 1912 an edict was published announcing the abdication of the emperor; and thus on Feb. 12, 1912, China became a republic.

Literature. Most important of old Chin. works are those known as the Five Classics; these are, according to the great authority on Chin. lit., Professor Giles: (1) The *Shu Ching*, an hist. work composed of many old documents and fragments collected by Confucius in VI. cent. B.C., some of them dating back to III. millennium B.C. (2) The *Shih Ching*, or Book of Odes, also collected from early writings by Confucius, and giving information concerning pre-Confucian manners and customs. (3) The *I Ching*, a book of essays on philosophical and other subjects, attributed to Wen Wang, who lived in XII. or XIII. cent. B.C., and was ancestor of long line of kings.

(4) The *Li Chi*, a work on social matters, edit. by two men called Tai. (5) The *Ch'un Ch'iu*, an account of Lu from VIII. to V. cent. attributed to Confucius. This work is augmented by a commentary by an otherwise obscure writer named Tso, called the *Tso Chuan*. Next to the Five Classics in importance are the Four Books; these are (1) the *Lun Yü*, containing many precepts of Confucius and giving information concerning him; (2) the *Book of Mencius*, or the words and actions of Mencius, a IV.-cent. B.C. disciple of Confucius; (3) the *Ta Hsüeh*, a work on political and social matters, written probably by Confucius and one of his followers; (4) the *Chung Yung*, on conduct, ascribed to K'ung Chi. Confucius, who was born in 551 B.C., is generally considered father of Chin. lit., but there were many other important writers who flourished between the VI. and III. cent's B.C. Of these Lao Tzu, a philosophical writer of VI. cent., was important as the founder of Taoism, which is described in a work called *Tao-te-ching*, sometimes ascribed to him. In IV. cent., Chuang Tzu was important philosophical writer who followed Lao Tzu; and the poet Chü Yüan also flourished at this time. Among III.-cent. writers the essayist Han Fei Tzu and the philosopher Hsün Tzu may be mentioned; and to II. or I. cent. belongs a forged work under name of Lieh Tzu, which is still widely read. Between 200 B.C. and 200 A.D. flourished many writers, among them the poets Mei Sheng and Liu Heng, the historian Ssu-ma Ch'ien, the philosophers Yung Hsuing, Wang Ch'ung and Ma Jung; and during this period there were many Buddhist writers who came to C. from India. Towards the end of this era there lived a group of poets, of whom Wang Tsan may be mentioned.

After the close of the Han dynasty in 220 A.D. there ensued a period of several cent's during which there were few outstanding names in Chin. lit.; a group of poets flourished in the III. cent.; of IV.–V.-cent. poets, T'ao Ch'ien is best known, and of VI.–VII. cent., Hsieh Tao Heng. In early VII. cent. the T'ang dynasty was established, during which there was great development of literary activity. Li Po, who lived in the VIII. cent., is generally considered the greatest Chin. poet; he was a court favourite, and wrote many poems at the emperor's command, was of dissipated habits, and met his death by drowning. His contemporary, Tu Fu, was also a great poet. Han Yü, who lived 768–824, was a philosopher, essayist, and poet; he was also a great statesman, as was his contemporary, the poet Po Chüi. After the close of the T'ang dynasty there ensued a short period of decline in lit., during which, however, block-printing was invented by Feng Tao.

Under the Sung emperors, whose dynasty was established in 960, there was another great period of literary production, which has been termed the Augustan age of Chin. lit. Sze-ma Kwang (1019–86) was a famous historian whose chief work was the *T'ung Chien*. Another great name of this era is that of Chu Hsi (1130–1200), who wrote a commentary on Confucius and some hist. and philosophical works. Encyclopædias were first produced under the Sungs, and some dictionaries also appeared. Plays and novels were first written under the Mongol emperors in the XIII. and XIV. cent's, but during their rule there was a decline in poetry. Under the Ming emperors, 1366–1644, the writing of novels became more important, and many appeared, majority of which are anonymous. This period saw few great poets; but there was considerable development of encyclopædic writing, and works on med., philosophy, lit., and agriculture appeared.

Under the Manchus, whose dynasty was established in 1644, the short story attained great perfection at the hands of Pu Sung-Ling, who, a master of style, wrote a collection of these in the XVII. cent. which was pub. in the XVIII. cent. In the XVII. cent. the *Hung Lou Meng*, the greatest Chin. novel, was written. Other important productions of this era are various encyclopædias, a concordance, and a dictionary. There is a great number of proverbs, and many of the *facetiæ* have a great family resemblance to those found in Eng. comic papers.

Art.—Chin. art is perhaps best known to Europeans in its forms of hand embroidery on silk and other fabrics, and enamelling on metal. Some of the jars made of *cloisonné* enamel are very beautiful; among others, those of blue enamel on silver may be mentioned. Painting is a very old art in C.; it is largely conventional, no shadows being put in. Sculpture includes carvings on ivory, jade, wood, and other substances. Porcelain was discovered many cent's B.C., and is still made in great perfection. The most outstanding feature of Chin. arch. is the tent-like roof.

Education.—Before 1905 education led to an elaborate system of examinations for state employment. Since then Western methods have obtained. Peking has a univ. and medical school; in Tientsin are a univ., industrial school, medical colleges, mission schools. In 1911 the chief univ's of England and America promoted a scheme to establish a modern univ. in Central China. Elementary and secondary schools are rising all over C., and technical instruction in engineering, agriculture, etc. is advancing, while special attention is given to military education.

Government.—China became a republic in Feb. 1912; before that it was a monarchy, executive being in hands of emperor, whose rule was somewhat autocratic. There is now a Cabinet, composed of Ministers of State, and a Privy Council. Ministries are ten in number, including those of Foreign Affairs, Finance, Education, War, Navy, Laws, Interior, Agriculture and Commerce, Communications, Dependencies. There are also several departments, such as the revenue council, the board of astronomy, and the ceremonies department, which are part of the central administrative system. C. is for local administration divided into twenty-two provinces; these are Chihli, Shantung, Kiangsu, Cheh-kiang, Fukien, Kwangtung, Shensi, Kansu, Sin-kiang, Sze-chuen, Kweichau, Yunnan, Kwangsi, Shansi, Honan, Anhwei, Kiangsu, Hupeh, Hunan, in China Proper; Fengtien, Kirin, Heilung-kiang, in Manchuria. These are ruled by governors and deputy-governors.

Inhabitants generally are of Mongolo-Tartar stock, of which there are many different tribes; there are English Portuguese and other Europeans, and considerable number of Japanese and Americans. Chinese are yellow in colour, have black, straight hair, obliquely set eyes, and high cheek-bones. Among the upper classes the feet of the women are bound up during their early years; but attempts at preventing this are being made. The men have greater part of their head shaved, but wear a long pigtail growing from the crown; pigtails are being abolished under new régime. There is little distinction in dress, both sexes wearing loose coats and wide trousers. Rice is the principal article of diet; edible birds' nests are among greatest luxuries. A great deal of tea is drunk, and opium-smoking is largely indulged in, although now in course of suppression. Infanticide was at one time extremely common, especially in case of girls, most families killing all their offspring except two boys and one girl. This state of things has recently improved, and, as a rule, young children are not murdered except in times of famine. The state religion is Confucianism, but other faiths are tolerated; Buddhism, Taoism, Muhammadanism, and Christianity are all well represented. Ancestor-worship is extremely important, and enters greatly into daily life of people. Educational system is being reformed; primary schools are kept up by state; but education is not yet obligatory.

C. is meanwhile an agricultural country; soil everywhere fertile, producing large crops of wheat, barley, maize, millet, beans, and peas, chiefly in N., rice mainly in S. Other important vegetable products are mul-

berries, for silkworm rearing; these are found almost everywhere, but chief silk-producing districts are middle E., middle W. and S. Tea is found in middle W., centre, S., and S.E.; sugar, indigo, cotton, in S.; opium used to be grown almost everywhere (for international arrangements see under OPIUM); oil-seed plants, rhubarb, tobacco, ginseng, cinnamon, gum-producing shrubs. C. is extremely rich in minerals, especially coal, greatest quantities of which are found in Shansi and Hunan; rich deposits of iron, copper, quicksilver, china clay, lead, tin, silver, etc. Working of these is limited, owing to difficulties of access and transit. Industries are many; most important are winding, weaving, and embroidery of silk, production of porcelain and lacquered wares, grass-cloth, carving in wood, ivory, bone, iron, steel, and other metal goods, paper, ink, bells, gongs, etc. Wheat and rice are milled, and lately cotton-milling has become important. Imports include cotton goods, opium, kerosene, sugar, metals, woollens, flour, cigarettes, dyes, soap, paint, etc.; exports silk (raw and woven), tea, raw cotton, hides, skins, tobacco, wool, sugar, beans, bean-cake, oil, rhubarb, sesame. Most of wool exported goes to U.S.A. Chief imports received by Britain are silk, tea, furs; chief goods received from Britain are cottons, woollens, iron, soap, machinery, coal, chemicals, etc. The Imperial Customs Service, organised by Sir Robert Hart (*q.v.*) in 1863, collects the revenue of the coast trade. Railway mileage in 1911 was 5820; while over 2000 miles were in process of construction. Pop. c. 350,000,000; including dependencies, c. 380,000,000.

China Year-Book (1912); Boulger, *History of China* (1898); Parker, *China Past and Present* (1903); Giles, *Chinese Literature* (1901); Bushell, *Oriental Ceramic Art* (1889); Hardy, *John Chinaman at Home* (1905).

CHINA, see POTTERY.

CHINA INK, see INK.

CHINA SEA, part of Pacific Ocean, stretching from Corea to Siam; three sections—Yellow Sea between China and Corea, E. China Sea occupying middle portion, S. China Sea from Formosa to Philippines.

CHINANDEGA, CHINENDEGA (12° 38′ N., 87° 36′ W.), town (and department), W. Nicaragua; bananas, sugar-cane, and cotton cultivated. Pop. 11,000.

CHI-NAN-FU (36° 40′ N., 117° E.), town, capital of Shan-tung, China; commercial centre. Pop. 300,000.

CHINCHA ISLANDS (13° 45′ S., 76° 28′ W.), group of three rocky islands off coast of Peru; formerly noted for large deposits of guano.

CHINCHEW, TSUAN-CHOW (24° 58′ N., 118° 32′ E.), seaport, Fo-kien, China; tea and sugar exported.

CHINCHILLA (*C. lanigera*), rodent about the size of a squirrel living in high altitudes in Peru and Chile, burrowing among loose rocks; prized for its soft pearly grey fur.

CHINDE (18° 33′ S., 36° 30′ E.), port, at mouth of Chindo R., Portug. E. Africa; only navigable mouth of Zambesi; chief port for Zambesi valley and Nyasaland; exports coffee and rubber. Pop. c. 3000.

CHINDWIN (c. 25° N., 95° E.), river, Burma; principal tributary of Irrawadi; rises Patkoi Hills; flows S.; joins Irrawadi between Mandalay and Pagan; navigation difficult owing to whirlpools and sandbanks.

CHINDWIN (c. 22° 30′ N., 95° E.), two districts (Upper and Lower), Sagaing division, Upper Burma; hilly; valuable teak wood forests; extensive coalfields; indigo and rice cultivated; areas, 19,062 and 3480 sq. miles. Pops. 154,551 and 276,383.

CHINESE LABOUR, see ASIATIC QUESTION.

CHINGFORD (51° 38′ N., 0°), village, Essex, England; tourist resort; ancient ruined church.

CHINGLEPUT, CHENGALPAT (12° 42′ N., 80° 1′ E.), town (and district), Madras, India; soil poor, badly watered; town noted for pottery manufacture; C. taken from French by British, 1752. Pop. 10,700.

CHINKIANG (32° 10′ N., 119° 30′ E.), treaty port, on Yangtsze-kiang, Kiang-su, China; taken by British, 1842. Pop. 200,000.

CHINON (47° 10′ N., 0° 14′ E.), town, Indre-et-Loire, France; ruins of ancient royal castle; birthplace of Rabelais; trades in brandy and red wine. Pop. 4183.

CHINOOK, tribe of N. Amer. Indians of Oregon; name of warm wind experienced on lower E. slopes of the Rocky Mts.

CHINSURA (22° 53′ N., 88° 23′ E.), town, on Hugli, Bengal, India; military station; ceded to British by Dutch, 1825. Pop. 29,383.

CHINTZ, gaily-printed, glazed calico, used for hangings, curtains, etc.

CHIOGGIA, CHIOZZA (45° 12′ N., 12° 17′ E.), seaport, Italy; built on piles in Venetian lagoon, connected by bridge with mainland; has cathedral (built XVII. cent.) and old corn-hall; seat of bishopric; has fortified harbour; fisheries important; has shipbuilding yards; manufactures of bricks, sails, etc.; flax-spinning carried on. Pop. 30,563.

CHIOS, CHIO (38° 25′ N., 26 E.), island, in Ægean Sea, off W. coast, Asia Minor; mountainous; salubrious climate; subject to earthquakes; fertile and well cultivated; antimony mines and marble quarries. C. was colonised by Ionians; became province of Rome II. cent. B.C.; held by Genoese, 1346; by Turks, 1566; scene of massacres by Turks, 1822. Chief town, CHIOS, is by tradition the birthplace of Homer. Wine, figs, and gum mastic are chief exports; area, 250 sq. miles. Pop. c. 70,000.

CHIPMUNK (*Tamias striatus*), N. Amer. ground squirrel having cheek pouches; has dark bands on its back. See SQUIRREL.

CHIPPENDALE, THOMAS (d. 1779), Eng. furniture maker; the most famous cabinetmaker of his period; work characterised by solidity; though long held in great estimation, eventually gave place to designs of Sheraton and others.

CHIPPENHAM (51° 28′ N., 2° 6′ W.), town, on Avon, Wiltshire, England; noted for grain and cheese-markets; cloth manufactures. Pop. (1911) 5332.

CHIPPEWA FALLS (44° 56′ N., 91° 28′ W.), city, Wisconsin, U.S.A.; railway centre. Pop. (1910) 8893.

CHIPPING CAMPDEN (52° 3′ N., 1° 47′ W.), small market town, Gloucestershire, England; formerly famous wool mart.

CHIPPING NORTON (51° 56′ N., 1° 33′ W.), market town, Oxfordshire, England; woollens and gloves. Pop. (1911) 3972.

CHIQUITOS, native S. Amer. tribes inhabiting Bolivia.

CHIROMANCY, another name for palmistry (*q.v.*).

CHIRON (classical myth.), one of the Centaurs; lived on Mount Pelion; famed for wisdom.

CHIRONOMIDÆ, see BLOOD-WORMS.

CHIROPODIST, in modern usage, one who attends to the feet and their ailments; the older and, from the derivation, correct meaning includes the care of both hands and feet.

CHIROPTERA, or **Bats**, order of mammals of nocturnal habits, having the fore-limbs modified as wings for flight. The wing is formed of a fold of skin stretched over the elongated fingers and extending between the hind limbs and the tail. The thumb is short and clawed, and does not take part in the formation of the wing. The thumb and toes (which are also clawed) are used for suspending the animal when not flying, the latter being practically their only method of locomotion. The sense organs are well developed, especially the ears, the remarkable 'nose leaves' round the nostrils occurring in some species, and the whisker hairs of the snout. The order is divided into two sub-orders. The *Megachiroptera* or fruit-eating bats occur in tropical and sub-tropical countries of the eastern hemisphere, and include the *flying foxes*, in which the tail is not contained in the membrane between the legs. The larger sub-order, *Microchiroptera* or insect-eating bats, include all the smaller types in which the tail is either included

in or lying along the interfemoral membrane. They occur in tropical and temperate countries of both hemispheres, the pipistrelle (*Vesperugo*), *Vespertilio*, the horse-shoe bats (*Rhinolophus*), the blood-sucking vampires (*Desmodus*), the so-called vampires (*Vampyrus*), which, however, live on insects and fruit, are typical representatives.

CHIRU (*Pantholops Hodgsoni*), Tibetan antelope with woolly fawn-coloured hair and a swollen muzzle; the bucks have long slender horns with ridges.

CHISLEHURST (51° 25′ N., 0° 4′ E.), urban district, Kent, England. The mansion of Camden Place was the residence of Napoleon III., who d. there 1873. Pop. (1911) 8668.

CHISWICK (51° 28′ N., 0° 9′ W.), town, Middlesex, England; market gardens. Pop. (1911) 38,705.

CHITA (52° 2′ N., 113° 37′ E.), town, on Chita, capital of Transbaikalia, E. Siberia. Pop. 11,500.

CHITALDRUG (14° 14′ N., 76° 26′ E.), fortified town, Mysore, India; woollen manufactures. Pop. 5000.

CHITON, genus of marine mollusca occurring from Silurian times onwards and belonging to the sub-class *Polyplacophora* or *Isopleura*, which, together with the sub-class *Anisopleura* (which includes snails, whelks, and limpets), form the class Gasteropoda. Several species occur on Brit. coasts. The elongated body is bilaterally symmetrical both externally and as regards the inner organs, and the back is covered by a shell consisting of eight plates which are usually jointed on one another so that the animal can roll itself up. Like the snail, it has a muscular foot with which it can sluggishly creep about. The species are usually vegetarian and have a ribbon-shaped tooth or radula in the mouth.

CHITRAL (*c.* 36° N., 72° E.), small native state, S. of Hindu Kush Mts., N.W. Frontier Province, Brit. India; occupies fertile valley of Chitral River; capital, CHITRAL; came under Brit. control, 1895; is of great strategical importance as it commands principal passes over the Hindu Kush. Pop. *c.* 50,000.

CHITTAGONG (22° 21′ N., 91° 53′ E.), port, on Karnaphuli, Bengal, India; commercial centre. Pop. 22,140.

CHITTUR (13° 13′ N., 79° 8′ E.), town, N. Arcot, Madras, India. Pop. 11,000.

CHITTY, SIR JOSEPH WILLIAM (1828–99), Eng. judge.

CHIUSI (43° 2′ N., 11° 57′ E.), town, Siena, Italy; ancient *Clusium*; Etruscan antiquities. Pop. 6000.

CHIVALRY, the spirit and practice of knight-errantry; also, in Eng. law, feudal tenure by knight's service; in modern use it means courtesy and consideration, particularly towards women.

CHIVASSO (45° 12′ N., 7° 52′ E.), town, Turin, Italy; XV.-cent. cathedral; important fortress formerly. Pop. 4400.

CHIVE (*Allium schœnoprasum*), perennial plant allied to the onion, cultivated for its leaves, which are used in cookery.

CHLAMYDOPHORUS, genus of armadillo (*q.v.*); Pichiciago (*C. truncatus*) is found in W. Argentine.

CHLOPICKI, GREGORY JOZEF (1772–1854), Polish general; distinguished himself at battles of *Busaco*, *Casabianca*, *Eylau*, and *Saragossa*; wounded at *Smolensk*, 1812.

CHLORAL (CCl_3CHO), oily liquid with bitter taste and pungent smell; B.P. 94·4° C., Sp. G. 1·512; prepared by the action of chlorine on alcohol; water converts it into a hydrate.—**Chloral Hydrate** is a white crystalline substance, used in med., usually in the form of a syrup, as a hypnotic, producing a safe and natural sleep.

CHLORATES, the salts of chloric acid ($HClO_3$). They are all decomposed by heating liberating oxygen, and dissolve in water. *Potassium chlorate* ($KClO_3$), crystallising in colourless tablets, is the most important, and is used for manufacturing oxygen, matches, and fireworks, and in med. Large doses are poisonous, but a solution is valuable in treating ulcerative stomatitis, tonsillitis, and pharyngitis, probably owing to the action of nascent oxygen.

CHLORINE (Cl=35·5), greenish yellow gaseous element of very unpleasant odour, M.P. −102°, B.P. −34°, soluble in water, and noted for its bleaching properties. Its chemical properties resemble those of the other halogens (*q.v.*), and it occurs in nature chiefly in the form of sodium chloride (salt), carnallite, and sylvine. It is prepared by the action of hydrochloric acid on manganese dioxide, and on a large scale in the manufacture of alkali (*q.v.*) by the Leblanc process.

CHLORITE, group of greenish minerals closely resembling micas and consisting of hydrous silicates of magnesium, aluminium, and ferrous iron. They occur as alteration products of amphibole, biotite, and pyroxene in igneous and schistose rocks. A few of the more important representatives are clinochlore, corundophilite, penninite, and prochlorite.

CHLOROFORM ($CHCl_3$), colourless liquid with a distinctive and pleasant smell and taste; B.P. 61·2° C., Sp. G. 1·525°; prepared by the action of bleaching powder on alcohol. Chief use is as an anæsthetic, being the most generally useful one known. See ANÆSTHESIA.

CHLOROPHYLL, the green colouring matter of plant cells. It is only developed in chloroplasts exposed to the light and when iron and magnesium are present, and is essential in the formation of carbohydrates. It is soluble in alcohol, ether, etc., and the solution is fluorescent. Chemically, c. is related to the proteids, and contains both green and yellow (xanthophyll) pigments, and is frequently masked, as in many algæ, by red, brown, yellow, or blue pigments.

CHLOROSIS, in med. a type of *Anæmia* (*q.v.*); in bot. the loss of colour in a part or whole of a plant.

CHLORPICRIN, NITROCHLOROFORM ($C.NO_2.Cl_3$), heavy, colourless, pungent liquid, B.P. 112°, obtained by the action of chlorine on picric acid or of nitric acid on chloroform.

CHMIELNICKI, BOGDAN (*c.* 1593–1657), Cossack leader; after several crushing defeats of the Polish army became master of Poland, and champion of the orthodox party, cruelly persecuting Jews and Roman Catholics; defeated in 1651, and finally in 1654.

CHOATE, JOSEPH HODGES (1832–), Amer. diplomatist; b. Salem, Mass.; became successful lawyer; ambassador to Great Britain (1899–1905); fostered friendly relations between the two powers.

CHOATE, RUFUS (1799–1859), Amer. lawyer and politician; noted as an orator, speaking specially on the Tariff.

CHOBE (18° S., 22° 42′ E.), W. tributary, Zambesi, Central Africa; discovered by Livingstone, 1851.

CHOCTAWS, large tribe of N. Amer. Indians of the Muskogean family, now living in Oklahoma; they sided with the Confederates in the Civil War.

CHODKIEWICZ, JAN KAROL (1560–1621), Polish general; won the victory of *Kirkolm* over the Swedes in 1605; fought also against Muscovy, 1617, and against the Turks, dying during the campaign.

CHODOWIECKI, DANIEL NICOLAS (1726–1801), Ger. artist and engraver.

CHOERILUS.—(1) Gk. tragic poet, contemporary with Æschylus; (2) an epic poet who fl. V. cent. B.C.

CHOIR AND CHORAL SINGING, terms used with reference to ecclesiastical or secular bodies of singers; many c's and choral unions in Britain, notably in Lancashire and Yorkshire.

CHOISEUL, CÉSAR, DUC DE (1602–75), Fr. marshal.

CHOISEUL, ÉTIENNE FRANÇOIS, DUC DE (1719–85), Fr. statesman; served in army, 1741–48; became ambassador at Rome, 1753, and at Vienna, 1757, then duke and peer of France; directed the foreign affairs of France with great ability, till 1770, when he fell from power and retired.

CHOISEUL-STAINVILLE, CLAUDE ANTOINE

GABRIEL, DUC DE (1760–1838), Fr. Royalist soldier.

CHOISY, FRANÇOIS TIMOLÉON, ABBE DE (1644–1724), Fr. author; famous for his *Mémoires*.

CHOKING is caused by obstruction of larynx, *i.e.* top of windpipe, frequently due to piece of food; if acute, the mouth should be opened and the forefinger inserted to remove obstruction; if this fails, windpipe must be pierced in order to secure respiration; suffocation often occurs in this way.

CHOLERA, a very fatal disease, the symptoms of which occur in three stages: first, violent vomiting and diarrhœa, with liquid colourless stools and severe cramps; second, the individual becomes collapsed, the pulse hardly perceptible, the skin dry and cold, the body of a livid colour, while the vomiting and cramps still continue; third, if death does not take place before this, there is a reaction, the pulse is stronger, the temperature rises, the bowels are usually constipated, and the urine scanty. This stage is followed by great weakness, which retards recovery and may even cause a fatal ending. There are two main schools of treatment, the one aiming at getting the toxins out of the system by every possible means, and the other making its chief object the cessation of the diarrhœa, and so keeping up the strength. The patient must at any rate be kept warm in bed, hot baths may be found of benefit in the second or cold stage, while saline intra-venous injections will assist in overcoming the stage of collapse; cramps and other secondary symptoms may be treated as they arise. Inoculation against cholera, introduced in 1893–94, is now practised to a considerable extent and with much success in India, an antitoxin being prepared from the attenuated virus according to the method of Haffkine.

The cause of c. is a specific organism, the common bacillus or vibrio, discovered by Koch. The disease is endemic in the delta of the Ganges, and from time to time, for reasons which have not yet been fully ascertained, it becomes epidemic and is carried in waves, north, west, and east, going as far as Europe on the one hand and America on the other. It appeared in England in 1831–32, causing over 2500 deaths, and also in the latter year on the Continent, the mortality reaching many thousands. In 1837 it raged throughout Italy (causing 24,000 deaths in Palermo alone), and reached Berlin, while in 1849 it invaded England, London alone having 13,000 deaths from the disease. There was a severe outbreak in the north of England in 1853, and it again reached London in the autumn of 1854. In 1865 about 50,000 deaths were caused by it in Constantinople, and it only declined after the outbreak of the great fire which destroyed the worst parts of the city; cases also appeared in Italy, France, and Spain, and in 1866, in the south of England, a relief fund being raised in London. In 1883 the disease appeared in Egypt, causing deaths among the Brit. troops, spreading in 1884–85 to France (5000 deaths), Italy, and Spain (over 91,000 deaths), and in 1886 to Austria and Hungary, while in the same year there were 37,000 deaths in Japan. In 1892 there was a severe outbreak in Persia (60,000 deaths), Russia (260,000 deaths), Rumania, Austria and Hungary, France (3000 deaths), Spain, Belgium, Hamburg (7600 deaths), and eastern seaports of England. In 1894 there was another epidemic in Russia, reaching also Austria and Germany. In 1897 there was an outbreak on a P. & O. liner which arrived at Plymouth, causing 4 deaths, infection being conveyed by fruit from Port Said. In 1908–9 there was a severe epidemic at St. Petersburg and elsewhere in Russia.

The season in which it has always occurred in Britain has been the late summer and autumn.

It is communicated by contamination with evacuations from the bowel, which may have got into drinking water through cesspools, etc., or the infection may be from soiled clothes, rags, etc.

The means of prevention, as may be gauged from a knowledge of the sources of infection, are simply cleanliness, general hygiene, and attention to sewage disposal and water supplies.

Wall, *Asiatic Cholera*; *Local Government Board Reports*, 1892–95.

CHOLET (47° 3′ N., 0° 51′ W.), town, department Maine-et-Loire, France; manufacture of linen, woollen fabrics, chief industry. Pop. 15,335.

CHOLON (10° 40′ N., 106° 30′ E.), town, Fr. Indo-China; commercial centre; extensive rice trade. Pop. 40,000.

CHOLONES, S. Amer. Indian tribe inhabiting the Amazon valley.

CHOLULA (19° 2′ N., 98° 14′ W.), ancient town, Puebla, Mexico; has remarkable pyramidal temple, covering area of about 45 acres, dedicated to god Quetzalcoatl. Pop. 6899.

CHONDROSTEI, see under FISHES.

CHOPIN, FRÉDÉRIC FRANÇOIS (1810–49), Polish composer and pianist; b. near Warsaw; settled in Paris, 1831; of delicate health and highly nervous nature; formed intimate relations with George Sand, and friendships with Heine, Berlioz, Liszt, and other famous contemporaries; most works for pianoforte: original poetic style of great lyric beauty, with marked Polish characteristics; sonatas, ballads, études, nocturnes, preludes, polonaises, valses, etc.

Niecks, *C. as Man and Musician*.

CHORALE, Ger. hymn-tune.

CHORD, in music. See HARMONY.

CHORDATA, see VERTEBRATA.

CHOREA, ST. VITUS'S DANCE, nervous disorder occurring most commonly in children, characterised by irregular jerking movements of the muscles of the limbs and trunk, usually most marked in the fingers and toes; the child seems very restless and makes grimaces. There is inco-ordination of movements,—for instance, the hand carrying something to the mouth does not reach its goal,—the speech is often impaired, mental symptoms may be present, and the affected muscles are weak; the heart may be affected, the action rapid and irregular, or valvular lesions may be present. The cause of chorea is now believed to be a micro-organism, the diplococcus of rheumatism, and other manifestations of rheumatism may be present in the condition, *e.g.* pericarditis, arthritis, tonsillitis. A few weeks to a few months is the usual duration of an attack, but recurrences are common. The treatment is rest, both physical and mental, a light, nutritious diet, plenty of fresh air. The salicylates are administered, as in rheumatism with success; bromide of potassium and chloral are useful sedative drugs in this condition, arsenic is a most valuable tonic, while massage and electricity are employed with benefit.

CHORIAMB, a metrical foot of four syllables, two short between two long, viz. — ∪∪ —.

CHORICIUS (fl. 490–518 A.D.), Gk. rhetorician.

CHORLEY (53° 38′ N., 2° 38′ W.), market town, Lancashire, England; cotton manufactures, coal mines. Pop. (1911) 30,317.

CHORLEY, HENRY FOTHERGILL (1808–72), Eng. musical critic, author, and librettist.

CHORLU, TCHORLAU (41° 12′ N., 27° 48′ E.), town, on Chorlu, European Turkey; carpets. Pop. 8000.

CHOROGRAPHY, chart, or description of a region or district; 'topography' is now the usual term.

CHORUM (40° 25′ N., 35° E.), town, vilayet of Angora, Asia Minor. Pop. 13,000.

CHORUS, a band of people singing together, or a composition that is sung by a number of people together. In ancient Gk. drama the chorus consisted of a number of people on the stage who either explained the action of the play, or commented on the events portrayed. Sometimes the chorus addressed, and was addressed by, the actors.

CHOSE IN ACTION, Eng. legal term, designating the right to sue for damages, legacies, copyrights, etc.

CHOSEN, KOREA (*q.v.*).

CHOSROES I., king of Persia (531–579); went to war with the Rom. Empire, then under Justinian; a wise ruler, tolerant of Christianity though himself Zoroastrian.

CHOSROES II., king of Persia (590–628); at first successful, but afterwards defeated by the Romans under Heraclius; great neither as a king nor a man.

CHOTA NAGPUR, Chutia Nagpur (*c.* 24° N., 48° E.), division, Bihar and Orissa, India, comprising five Brit. districts and several tributary states; mountainous; forest-covered; rich in minerals; rice, lace, coarse silk; area, 27,101 sq. miles. Pop. 4,900,000.

CHOUANS, Fr. Royalists, who, after the Revolution, strove to maintain the Royal cause in Brittany Cadoudal, the leader, was executed (1804).

CHOUGH (*Pyrrhocorax graculus*), member of Crow family (*q.v.*); very red feet; rare in Britain.

CHRÉSTIEN, FLORENT (1541–96), Fr. poet and satirist.

CHRÉTIEN DE TROYES (*c.* 1150), Fr. poet.

CHRISM, oil (generally mixed with balm), used in R.C. Church, after being blessed by a bp. (on Maundy Thursday), for anointing in Baptism, Confirmation, Ordination, etc.

CHRIST, 'anointed'; title applied specially to **Jesus Christ** (*q.v.*).

CHRIST, WILHELM VON (1831–1906), Ger. classical scholar.

CHRISTADELPHIANS, sect founded in U.S.A., 1848; believe in immortality for the faithful only; now *c.* 3000 members.

CHRISTCHURCH (50° 44′ N., 1° 47′ W.), town, Hampshire, England, at junction of Avon and Stour; famous for mediæval priory church, and ruins of Norman castle; watch and clock chains. Pop. (1911) 5104.

CHRISTCHURCH (43° 30′ S., 172° 30′ E.), city, Canterbury, New Zealand; bp.'s see; cathedral, government buildings, hospital, museum; active trade in agricultural produce and wool; frozen and tinned meat exported. Pop. (1911) with suburbs, 80,193.

CHRISTENING, see Baptism.

CHRISTIAN II. (1481–1559), king of Denmark, Norway, and Sweden; succ. his f. as king of Denmark and Norway, 1513; showed his determination to rule, and deeply offended the nobles by his patronage of the middle classes. War broke out with Sweden, and at length C. managed to defeat the Swedes at the battle of *Upsala* in 1520; he then was crowned king of Sweden, and carried out a treacherous massacre of his opponents. He was a strong and able monarch, but his autocracy deeply offended his people, and he was deposed in 1531, spending his later years in prison.

CHRISTIAN III. (1503–59), king of Denmark and Norway; succ. in 1533. C. was a strong Lutheran, plundered the Catholic Church and enriched the nobles. He was a strong and careful ruler, and Denmark prospered under him.

CHRISTIAN IV. (1577–1648), king of Denmark and Norway; succ. to the throne, 1588. C. set to work to reorganise the army and navy; went to war with Sweden in 1613, and later with the Empire; was utterly defeated in 1626, and was obliged to form an alliance with Gustavus Adolphus; made peace in 1629. In his later years he was never really successful, and was defeated in war with Sweden.

CHRISTIAN V. (1646–99), king of Denmark and Norway; though popular with the lower classes, was weak and despotic; engaged in a fruitless war with Sweden; killed in hunting accident.

CHRISTIAN VII. (1749–1808), king of Denmark and Norway; m. Caroline Matilda, dau. of Frederick, Prince of Wales; was weak, abandoned, and became partially insane.

CHRISTIAN VIII. (1786–1848), king of Denmark; succ. **Frederick VI.**, 1839. His short reign was marked by improvements in administration and finance.

CHRISTIAN IX. (1818–1906), king of Denmark; s. of Frederick William, duke of Schleswig-Holstein-Sonderburg-Glücksburg; succ. his distant cousin, Frederick VII., as king, 1863; his oldest dau., Alexandra, became wife of Edward VII.

CHRISTIAN X. (1870–), king of Denmark; s. of Frederick VIII., whom he succeeded.

CHRISTIAN CATHOLIC CHURCH, religious community; founded by J. A. Dowie (*q.v.*); *c.* 12,000 members.

CHRISTIAN CONNECTION, Amer. sect, split off from Methodist Church, 1793; now *c.* 100,000 adherents.

CHRISTIAN ENDEAVOUR, societies first formed, 1881; especially for young people of various denominations; founded by Rev. F. E. Clark (Maine, U.S.A.); over 4,000,000 members.

CHRISTIAN OF BRUNSWICK (1599–1626), Prot. bp. of Halberstadt; fought in Thirty Years War.

CHRISTIAN SCIENCE, a religious system, originated in America in 1866 by Mrs. Mary Baker Glover Eddy, which teaches that since man's essential nature is spiritual, the body of man being an exact manifestation of his mind, therefore a perfect knowledge of the nature and essence of God not only prevents but cures bodily disease, which is a subjective state of error. *Science and Health, with Key to the Scriptures*, by Mrs. Eddy, the text-book of the system, was first pub. in 1875; several hundred editions have subsequently appeared, and many hundreds of C. S. churches have been established in America and in Europe. The doctrine of the cure of disease by faith which Christian Scientists propound has provoked attacks, and has even led to indictments for man-slaughter, but, while the ill-advised efforts of bigoted adherents may have led at times to disastrous results, there is no doubt that in many conditions, particularly those affecting the nervous system, faith-healing may work cures where medical science may fail.

CHRISTIANIA, Kristiania (59° 54′ N., 10° 43′ E.), capital, Norway; situated on C. Fjord; seat of Parliament and supreme law courts. Other important buildings are royal palace, univ., citadel, arsenal, town hall, observatory; seat of bishopric; has old cathedral; manufactures woollens, cotton yarns, tobacco, liquors, paper, oil; has fine harbour; exports timber, fish, textiles, matches. Pop. (1910) 241,834.

CHRISTIANITY, the religion professed by the followers of Jesus Christ. It has more adherents than any other single faith, though less than half the world is Christian. Christianity is an *historical* religion (for this and other points, see below, Church History), and, like some other great religions, looks back to an historic founder. Externally it belongs to the same group as Judaism, from which it sprang, and Muhammadanism, an offshoot, partly Jewish, partly Christian in origin, with other elements besides. It is therefore a monotheistic faith, but differs from other forms of monotheism in the supreme place in which it places its Founder. Though Christological controversies have rent the Church and are not yet settled, the Church has felt her Lord to be more than human, though His claim to Deity has been denied by Monarchians and Unitarians. Then the question of the relation of the Son to the Father arises, and the doctrine of the Trinity tries to solve the problem.

That Christ is in some sense our Saviour is generally held, though the Atonement seems to be capable of endless restatement. Belief in future reward and punishment is likewise found in all forms of Christian theology. Baptism and the Eucharist are almost universal, but about other matters there is endless divergence. But there are certain clearly marked types of Christianity. I. **Catholicism**, reaching its most developed form in the R.C. Church. The Gk. and Eastern Churches, though in some ways different, largely resemble the Roman and the Anglican Churches. The claim of the latter to Catholicity is denied by Rome; it approaches in government and practice the Rom. and Gk. Churches, but its theology is more

Protestant. Catholicism is sacerdotal and sacramental, making essential the preservation of the threefold order (bishops, priest, and deacons), and making Baptism and the Eucharist generally essential to salvation, though the Rom. Church recognises seven sacraments. For Catholics the ultimate authority is the Church, the mind of which is expressed in the decrees of its Councils. Greeks and Anglicans recognise only the undivided Church, while the Rom. Church accepts later Councils, *e.g.* Council of Trent, 1565, and the Vatican Council of 1870, which are binding and accept the infallibility of the Pope.

II. **Protestantism** was based originally on the doctrine of the sufficiency of Scriptures, but the doctrinal position of Prot's now varies greatly, and there is considerable latitude in Biblical criticism, etc. A recent phenomenon in theology is what is called 'Liberalism,' *i.e.* the laying of great emphasis on freedom and development of thought, and on the ethical side of religion rather than on doctrine, government, or sacrament. Though this is largely Protestant in origin, it has in 'Modernism' sprung up in the R.C. Church. Prot. Church government is either Presbyterian, *i.e.* government by elders, or independent, each congregation is autonomous, *i.e.* is governed from below, not, as in Catholicism, from above.

Christianity claims to be universal, *i.e.* it can and should be adopted by all men at all times and under all conditions. It also claims to be an absolute religion, that is, a final and supreme revelation of eternal truth, and to be supernatural in that it reveals things beyond our world of sense, though its truths may be only realised by degrees. See CHURCH HISTORY, (*infra*), RELIGION.

Bethune Baker, *Outlines of the History of Christian Doctrine*; Harnack, *What is Christianity?*; Tyrrell, *Christianity at the Cross-Roads.*

Church History.—To trace completely the history of the Christian Church would be to tell the story of Judaism, to which it owes its birth, of Greek thought, which has exerted such an influence on Christian theology, and of the various political institutions, particularly the Roman Empire, with which it has come in contact. This can hardly be done, but certain principles of study can be laid down, and its main divisions indicated. The beginning of Christianity lives in the life and work of Jesus Christ and the belief in His Resurrection. Jesus had claimed to be Messiah and to come again to judge the world, hence Christianity was at first eschatological (see ESCHATOLOGY), *i.e.* expectant of the end of the world. At first, too, it was entirely Jewish, but the work of St. Paul won the Gentiles equal rights in the Church. Meanwhile Christianity was but one of a welter of rites, cults, and philosophies competing for influence in the Rom. Empire—an Empire compounded of Rom. government and Gk. culture. Christians moved in the same spheres of thought as they lived in the same cities as other men, hence there are parallels between the Christian and other religions, and some direct borrowing on each side. Herein lies the importance of Comparative Religion for Christian origins.

Several tendencies were now at work: (1) Greater systematising of dogma, culminating in the Great Councils of the Church, especially Nicæa (325 A.D.), and Chalcedon (461 A.D.), definition generally resulting from the crystallising of inherited belief. Most of the early controversies turned on the person and work of Christ. (2) The centralising of Church authority, first in the monarchical episcopate reached in early II. cent., then in the power of the great patriarchates, culminating in the supreme authority gained in the West by the See of Rome. (3) With the development of dogma and Church government came that of ritual, worship, and (generally) of ecclesiastical life. Besides internal development the first three cent's of Christianity saw bitter and frequent conflict with the State. By the conversion of Constantine and the recognition of Christianity as the State religion of the Rom. Empire, the Church had won, and now had the still mightier task of winning to real allegiance to Christ those who acknowledged her sway. While the Church was perse-

[illegible]

with her triumph came nominal conversions. After t onslaught of the barbarians and the collapse of the W. Empire the Church set herself to the task of civilising and converting them. Though her work was noble it must never be forgotten that whole tribes were baptized *en masse* and thus their Christianity was superficial.

The Middle Ages saw Catholicism dominant not only in religion but in politics, and from XI. to XIII. cent's the Papacy wielded enormous power. The growth of the monastic and mendicant orders is likewise most important.

In the XV. and XVI. cent's came the Renaissance (*q.v.*), when there arose a split (seemingly final) in Western Christendom. Theological questions were mingled with political till the XVII. cent., but the XVIII. was anti-religious. Thus the French Revolution endeavoured to sweep away Christianity, which was identified with the *ancien régime.*

The XIX. cent. saw most important movements in Christian history; science and the growth of hist. criticism questioned old positions, yet there were frequent outbursts of religious life, *e.g.* the Oxford Movement, the Salvation Army, Christian Science. The XX. cent., with the deeper understanding both of past history and of religious psychology, will probably have no less important results.

Christianity existed outside the Rom. Empire. Recent research has shown how widespread was the Nestorian Church in Asia till crushed by Islam, and Oriental Churches still survive. The Gk. Churches have remained little changed since the VI. cent., and the Russian Church has been formed on their model. But Asia and Africa have never been thoroughly Christianised.

Horton, *The Early Church*; Harnack, *Mission and Expansion of Christianity* (1908), *History of Dogma* (1893); Hunt and Stephens, *History of the Eng. Church* (9 vols., 1901–10); Adeney, *Gk. and Eastern Churches* (1908); Burkitt, *Early Eastern Christianity.*

CHRISTIANSAND (58° 8′ N., 7° 55′ E.), seaport, on fjord of Skagerrack, S. Norway; timber, fish. Pop. (1910) 15,291.

CHRISTIANSUND (63° 10′ N., 7° 45′ E.), seaport, Romsdal County, N.W. coast of Norway; exports wood, fish products, and butter. Pop. (1910) 13,201.

CHRISTIE, RICHARD COPLEY (1830–1901), Eng. scholar; wrote *Étienne Dolet, the Martyr of the Renaissance* (1880).

CHRISTINA (1626–89), queen of Sweden, dau. of Gustavus Adolphus; succ., 1632, and took the reins of government herself in 1644; was able and brilliant, but self-willed; quarrelled with her chancellor, Oxenstjerna. In 1654 she abdicated, joining later the R.C. Church; d. in obscurity in Rome.

CHRISTINA, MARIA CHRISTINA HENRIETTA DESIRÉE FÉLICITÉ RÉNIÈRE (1858–), queen-mother of Spain; *née* Archduchess of Austria; m. late King Alphonso XII., 1879; regent for her s., Alphonso XIII., until 1902.

CHRISTISON, SIR ROBERT, Bart. (1797–1882), Scot. physician, toxicologist, and medical jurist; prof. of Forensic Med. (1822), of Med. and Clinical Med. (1832) in Edinburgh Univ.; made important researches in toxicology and pathology.

CHRISTMAS ('Christ-Mass').—The festival of the birthday of Jesus Christ was at first closely connected with the Epiphany, celebrated on Jan. 6. The observance of Dec. 25 only dates from IV. cent. and is due to assimilation with the Mithraic festival of the birthday of the sun. Dec. 25 was, too, according to Bede, a pagan festival in ancient Britain. The real day of Christ's birth is unknown. Owing to this, its ob-

servance was condemned by the Puritans, New Year's Day being celebrated instead in Scotland to-day.

CHRISTMAS ISLAND (10° 31′ S., 105° 33′ E.), island, Ind. Ocean, S.W. of Java; dependency of Straits Settlements.

CHRISTMAS ROSE, see HELLEBORE.

CHRISTOPHER, ST., commemorated in the West on July 25, was martyred in the Decian persecution, c. 250 A.D.; many legends about him.

CHRISTOPOULOS, ATHANASIOS (1772–1847), Gk. lyric poet.

CHRIST'S HOSPITAL, the *Blue-Coat School*, founded by Edward VI.; transferred to Horsham, 1902; has now about 800 boys.

CHRISTY, HENRY (1810–65), Eng. archæologist and ethnologist; travelled extensively in Europe and N. America, where he made many discoveries and got together a very fine archæological collection (now in Brit. Museum).

CHROMATIC SCALE, musical term for a scale in semitones.

CHROMIC ACID (H_2CrO_4), an acid formed like sulphuric acid from a trioxide (CrO_3); forms CHROMATES with the formula K_2CrO_4. Other salts are known as BICHROMATES and TRICHROMATES according as the combining metal has one or two additional molecules of the trioxide; thus a bichromate would be XCr_2O_7.

CHROMITE, CHROMIC-IRON ORE ($FeCr_2O_4$), iron-black mineral, occurring in compact or granular masses or as octahedral crystals in the Urals, New Zealand, U.S.A., and Unst. It is the chief source of chromium and its compounds.

CHROMIUM (Cr = 52), metallic element, occurring only in combination, chiefly as chromite ($Cr_2O_3.FeO$), chromeochre (Cr_2O_3), crocoisite ($PbCrO_4$), and a few other minerals. Many of its compounds have striking colours, and are used in dyeing, etc. Its principal use is as a constituent of chromium steel. According to the valence of its molecules it forms salts termed chromous, chromic, chromates, and dichromates.

CHROMOSPHERE, reddish gaseous layer outside the photosphere of the sun, shown by the spectroscope to consist of incandescent hydrogen and helium. It is particularly visible during a total eclipse. A corresponding layer round stars is also termed c.

CHRONICLE, hist. record, often compiled by several hands. The early Christian c's were written in Gk. and Latin. The Anglo-Saxon C. was commenced in King Alfred's reign and ended in Stephen's.

CHRONICLES, BOOK OF, in Eng. Bible follows *1* and *2 Kings*, but in the Hebrew Canon comes with *Ezra* and *Nehemiah* 'last of all.' These three form one work covering the whole of history from Adam to 432 B.C. *Chronicles* thus covers the same ground as *Genesis* to *Kings*, from which there are considerable extracts, but much is missed out, *e.g.* the patriarchal history is given very shortly, and the later history of the kingdom of Israel (as distinct from Judah) is omitted.

The date of C. is probably *c.* 330 B.C., and the author very likely a Levite. Additions—genealogies, etc.—are described as being from the 'Book of the Kings of Judah and Israel,' etc. The historicity is not so sure as that of *Kings*, for the writer of C. looks at the early monarchy from the standpoint of a later age. The literary style is late and peculiar.

Harvey-Jellie, *1 and 2 Chronicles* (Century Bible).

CHRONOGRAPH, instrument for recording a period of time. The *stop-watch* is used for time-keeping in races, by doctors, and for scientific purposes; it can be stopped at any moment by pressing a button. The *Ballistic Pendulum* was used by early experimenters for finding the velocity of a bullet, which was fired into a wooden shield attached to the bob of the pendulum. The bob was moved by the impact, the motion being recorded by a movable rod. From this record, and a knowledge of the time of a small oscillation of the pendulum and the weights of the bob and bullet, the velocity was calculated. Modern c's consist of electrically controlled mechanism. It is required, for example, to find the time a sound takes to travel from A to B. The same mechanism driven by the same current is fitted up at each place. When the sound reaches A it moves a delicate drum and breaks the connection, resulting in a mark being made on a moving surface; the same happens at B. Since both surfaces are started together and move at the same *known* speed, the time interval is easily ascertained by placing them alongside each other and measuring the length of surface between the two marks. To measure a small fraction of a second, a tuning-fork of known frequency is employed—an attached stylus making a trace of the vibrations on a moving blackened glass surface. If, for instance, the fork's frequency is 256, and eight vibrations are traced, the time taken must be $\frac{1}{32}$ second.

CHRONOLOGY, science that treats of time, and is concerned with arrangement of historical events in order of time and determining the intervals between them. It is necessarily based on method of measuring or computing time by regular divisions or periods, according to the revolution of the earth or moon. (See TIME.) As there can be no exact computation of time or placing of events without a fixed starting-point, dates are in every case referred to some arbitrary point or *epoch*, which forms the beginning of an *era*. Most epochs are selected on account of some notable event which occurred, or was supposed to have occurred, at the time in question. Thus the Jews reckoned time from the Creation, which they dated at 3760 B.C. The Creation has been the starting-point of many chronologies, but among Christians the birth of Christ is now generally adopted, dates before that event being denoted by the letters B.C. (Before Christ), and dates after that event by the letters A.D. (Anno Domini, or In the year of the Lord), which are often omitted.

The method of computing from the time of the birth of Christ was first introduced in the VI. cent. A.D., and was adopted generally in Christian countries by the year 1000 A.D. It is not certain that the birth of Christ took place at the usually accepted date; it is believed by some to have occurred perhaps four years earlier. The only epoch with an astronomical basis is the Julian epoch, 4713 B.C., based on the coincidence of the solar, lunar, and indictional periods. The *indictional period* is a period or cycle of fifteen years, relating to some judicial acts, probably the publication of tariffs of the taxes which took place at stated intervals. The Cæsarian indiction fell on the 8th day before the kalends of October, or Sep. 24.

The paucity of ancient records of contemporary events renders the construction of accurate chronologies of ancient times extremely difficult, if not altogether impossible; but modern archæological research has already considerably modified the opinions of a decade ago, and is gradually leading to definite outlines of the history of the nations of whom any records have been preserved. Thus it is now fairly certain that the historical period of such nations as the Egyptians and Babylonians was at least 5000 years B.C., and there is evidence of a high state of civilisation in Mesopotamia at least 7000 years B.C. Increased knowledge of Assyrian and Babylonian records has led to the rejection of some accounts hitherto regarded as authentic. Thus it is now certain that the Hebrew record of the *Book of Daniel* is far from accurate in the portions dealing with Babylonian history. Belshazzar, for instance, was never king, and was, moreover, not the son of Nebuchadrezzar (fl. 604–564 B.C.) (misspelt Nebuchadnezzar), but a son of a certain Nabonidos, who usurped the throne, and was the fourth king after Nebuchadrezzar, the three intermediate kings not being mentioned in Daniel.

Classical history is also being modified as the result of archæological research. Thus, instead of the mythical so-called 'Heroic Age' of Greece, we now have historical

records of a definite 'Mycenæan Age,' and also, from researches in Crete, of a pre-Mycenæan Age. See GREECE (*History*).

Several epochs have been already mentioned; others are met with among various nations. Ussher, Bossuet, and others dated the Creation at 4004 B.C. The *Era of Constantinople*, adopted in Russia, dates from the Creation, fixed at 5508 B.C. Among the Greeks, the Olympic games, which occurred every fourth year, served as a basis, each group of four years being an *Olympiad*; the starting-point was the year in which Coræbus was victor in the Olympic games—776 B.C.

The Romans started their chronology from the date of the supposed founding of their city (*Ab Urbe Condita*, A.U.C.), April 21, in 3rd year of 6th Olympiad, *i.e.* 753 B.C.

The *Muhammadan Era*, or *Era of the Hegira*, in common use among the Muhammadan nations, dates from the *Hegira*, or flight, of Muhammad from Mecca to Medina, July 16, 622 A.D.

The most important eras of *Hindu Chronology* in use at present time are the *Kaliyuga*, an astronomical era reckoning from 3102 B.C., but only founded, by astronomers, early in V. cent. A.D.; the *Saka* era, a hist. era which dates from 78 A.D., and is in use in S. India; and the *Vikramaditya* (founded 58 B.C.), the hist. reckoning used in N. India. There are also two religious eras, which reckon from the supposed deaths of the respective founders of religions—the Jain era, reckoning from 528 B.C., and the Buddhist from 544 B.C.

The *Persian Era* or *Era of Yazdegerd* starts at the accession of Yazdegerd III., June 16, 632 A.D. The *Chinese* reckon time in cycles of 60 years, but do not number the years in any one cycle. Each cycle is divided into two subordinate cycles of 10 and 12 years respectively, each year of each subordinate cycle having a definite name. By combining the names for any particular year in each cycle different names are obtained for each year of the major cycle. The starting-point of the first cycle is usually taken as 2277 B.C. See CALENDAR.

Chronologies and Calendars, J. C. Macdonald.

CHROTTA, probably the oldest of European stringed musical instruments; supposed to be identical with the 'crwth' or 'crowd.' It is mentioned by Fortunatas in 609.

CHRUDIM (49° 58′ N., 15° 47′ E.), town, Bohemia, Austria; sugar, beer, cloth; horse markets. Pop. 13,200.

CHRYSANTHEMUM (*C. sinense*), popular garden plant of the order Compositæ, with beautiful flowers, cultivated in many varieties, such as the Jap., Chin., and pompom kinds, with many shades of colour and different habit. It was introduced into Europe from China in the XVIII. cent.

Stevenson, *Chrysanthemums* (Jack, 1912).

CHRYSENE ($C_{18}H_{12}$), coal-tar product, crystallising in colourless plates or octahedra, which show a violet fluorescence. M.P. 250°.

CHRYSIPPUS (280–*c.* 206 B.C.), Stoic philosopher; b. Cilicia. See STOICS.

CHRYSOBERYL ($BeAl_2O_4$), hard yellow or green gem-stone, found chiefly in Brazil, U.S.A., and Ceylon. A cloudy opalescent variety is known as cymophane, and when cut is a valuable 'cat's-eye' (*q.v.*).

CHRYSOCOLLA ($CuSiO_3.2H_2O$), bluish green mineral of opal-, emerald-like, or earthy texture, occurring as encrustations or masses in the upper parts of copper-ore veins, from which it is derived.

CHRYSOLITE, a yellowish gem-stone, being a transparent variety of olivine (*q.v.*). Darker green stones are called Peridote (*q.v.*).

CHRYSOPRASE, apple-green variety of chalcedony, used in jewellery; found in Silesia, the Urals, India, and U.S.A.

CHRYSOSTOM (345–407), generally called St. John C.—one of the greatest Gk. Fathers, baptized *c.* 369, lived some time the life of a recluse; was deacon and priest at Antioch; bp. of Constantinople, 398, but exiled, 404; wrote *De Sacerdotio*, a treatise on the priesthood, and many *Homilies* on books of the Bible; belonged to the Antiochene school; called C. or Golden Mouthed because of oratorical gifts.

CHUB (*Leuciscus cephalus*), fresh-water fish of the family *Cyprinidæ*, found in England and northern Europe generally; other fish of the same family are given this name in America.

CHUBB, CHARLES (d. 1845), Eng. locksmith, made improvements on 'detector' locks patented by his bro., Jeremiah Chubb, and invented burglar- and fire-proof safes. Further improvements were made on his locks, etc., by his s., JOHN CHUBB (1816–72).

CHUBUT (*c.* 44° S., 67° W.), territory, S. Argentine Republic, between Atlantic and Andes; area, 93,427. Pop. 29,500.

CHUDE, Russ. name for Esthonian tribes in Siberia.

CHUGUYEV, CHUGUIEV, town of strategic importance in Kharkov, Russia. Pop. 12,000.

CHUKCHI, small Christianised tribe inhabiting a district of N.E. Siberia; habits polygamous.

CHULALONGKORN (1853–1910), king of Siam; succ., 1868; abolished slavery; developed education and the study of med.; introduced social improvements; visited England, 1897.

CHUMBI VALLEY (27° N., 88° 30′ E.), valley, Chola range, Himalayas, leading from Sikkim eastwards into Tibet.

CHUNAR, CHUNARGHUR (25° 5′ N., 82° 55′ E.), town, on Ganges, Mirzapur, United Provinces, India; ceded to Britain, 1768. Pop. 9926.

CHUNCHO, tribe of warlike S. Amer. Indians occupying a forest tract in central Peru.

CHUNGA, see SERIEMA.

CHUNGKING (29° 38′ N., 107° 2′ E.), river port, at junction of Kialing and Yangtse-kiang, China; commercial centre. Pop. 598,000.

CHUPATTY, Hindu unleavened bread. These cakes were passed from hand to hand among natives before outbreak of Indian Mutiny, and are said to indicate disaffection.

CHUQUISACA (*c.* 20° S., 62° W.), department, S.E. Bolivia; S. America; agriculture, stock-raising, silver mines; area, 26,400 sq. miles. Pop. (1911) *c.* 250,000. The capital, Sucre, was called C. till Declaration of Independence. Pop. 23,500.

CHURCH, see RELIGION, CHRISTIANITY.

CHURCH, FREDERICK EDWIN (1826–1900), Amer. landscape artist.

CHURCH, GEORGE EARL (1835–1910), Amer. geographer; explored the Amazon (1868–79), and became prominent authority on geography of S. and Central America.

CHURCH, RICHARD WILLIAM (1815–90), Anglican ecclesiastic; ed. Oxford; fellow of Oriel, 1836; dean of St. Paul's, 1869, where he reorganised the cathedral and became one of the most prominent men in the Church; wrote several works on religious and literary subjects.

CHURCH, SIR RICHARD (1784–1873), soldier; entered the army in 1800, served in Egypt, in 1817 app. lieut.-general in the Neapolitan army, and from 1827 commander-in-chief of Gk. army; resigned in 1829, but spent his life in Greece, dying in Athens.

CHURCH ARMY, Anglican organisation, founded 1882 by Rev. Wilson Carlisle for work in slums and among criminals; workers are working men and women licensed by the bp.; it has labour bureaus.

CHURCH CONGRESS, annual assembly, first held, 1861, for discussion of Anglican problems; has no formal authority.

CHURCH HISTORY, see CHRISTIANITY.

CHURCH OF ENGLAND, see ENGLAND, CHURCH OF.

CHURCH RATE, tax for maintenance of parish churches, formerly compulsory in England, but not since 1868.

CHURCHILL (57° 30′ N., 95° W.), river, Saskatchewan, Canada; 925 m. long; flows N.E. through series of lakes; enters Hudson Bay.

CHURCHILL, CHARLES (1731–64), Eng. satirist and clergyman; author of the *Rosciad* (1761), an amusing satire on contemporary stage; friend of John Wilkes; a man of dissipated habits.

CHURCHILL, LORD RANDOLPH HENRY SPENCER (1849–95), Brit. statesman; s. of 7th Duke of Marlborough; elected M.P. for Woodstock (Conservative), 1874; became prominent as an independent Conservative; with Gorst, Drummond Wolff, and (occasionally) A. J. Balfour formed 'Fourth Party,' c. 1880; became the pioneer of 'Tory democracy'; Sec. of State for India (1885) in Salisbury administration; Chancellor of the Exchequer (1886) and leader of the House of Commons; resigned owing to differences with his colleagues; became independent again, then travelled till his health gave way. *Life*, by Winston S. C.; monograph, by Rosebery.

CHURCHILL, WINSTON (1871–), Amer. novelist; author of *Richard Carvel*, 1899, *Coniston*, 1906, *Mr. Crewe's Career*, 1908; Member of N.H. legislature, 1903 and 1905.

CHURCHILL, WINSTON LEONARD SPENCER (1874–), Brit. Liberal statesman; c. s. of Lord Randolph C.; soldier, war correspondent, in Boer War; left Conservative Party, 1906. Under-Sec. for Colonies, 1906–8; Pres. of Board of Trade, 1908–10; Home Sec., 1910–11; First Lord of Admiralty (1911–).

CHURCHING OF WOMEN, ceremony for women after child-birth, necessary in Rom. but optional in Anglican Church; service in Prayer Book.

CHURCHWARDEN, lay representative of the parish appointed for certain functions, including collection and charge of offertory, care and upkeep of church buildings, maintenance of order during divine service. In many parishes one is appointed by incumbent and one elected by parishioners.

CHURCHYARD, ground adjoining a church, used for burials; legal difficulties have arisen on rights of burial, as parishioners and incumbents have certain privileges.

CHURCHYARD BEETLES, see HETEROMERA.

CHURCHYARD, THOMAS (d. 1604), Eng. poet; pub. *Churchyard's Chips* (1575), etc.

CHURL (A.S., *ceorl*), man; a freeman of low rank; after the Conquest became a serf; in modern use, an ill-mannered fellow, a boor.

CHUSAN (30° 15′ N., 122° 30′ E.), island, largest of a group off E. coast, China; rice.

CHUTNEY, Ind. condiment containing sweet fruits, acids, etc.

CHUVASHES, tribe, somewhat resembling the Finns, dwelling in Eastern Russia.

CHYLE, term applied to the partly digested food in the small intestine. See DIGESTION.

CHYME, see DIGESTION.

CIALDINI, ENRICO (1811–92), Ital. soldier and diplomatist; in command of the troops opposed to Garibaldi (1862), whom he defeated at *Aspromonte*.

CIBBER, CAIUS GABRIEL (1630–1700), Dan. sculptor; settled in England; f. of Colley C.

CIBBER, COLLEY (1671–1757), Eng. actor and dramatist; joined Betterton's company at Drury Lane (1690); made great reputation as Lord Foppington in Vanbrugh's *Relapse*; eventually became associated with management of Drury Lane; prepared numerous adaptations of Shakespeare's plays; his own plays had also considerable vogue, and include *Love's Last Shift*, *The Careless Husband*, *She Would and She Would Not*. His famous *Apology* (1740) is of considerable value for its criticism of the contemporary stage, and for sidelights upon persons of eminence; he succ. Eusden as poet laureate in 1730, although his gift as an *esprit moqueur* gave him little claim to the bays; attacked by Pope in the *Dunciad*.

CIBBER, THEOPHILUS (1703–58), Eng. actor and dramatist; s. of the above; famous as actor and manager at Drury Lane and Covent Garden; d. by shipwreck. His wife, SUSANNAH MARIA C. (1714–66), was a tragic actress and vocalist.

CIBORIUM, originally the altar-canopy; later the casket hanging therefrom, containing the Eucharistic wafer; subsequently Latin name for drinking-vessel.

CIBRARIO, LUIGI, COUNT (1802–70), Ital. historian and statesman; served King Charles Albert of Savoy; in 1855 became Minister for Foreign Affairs.

CICADA, homopterous insects of the family Cicadidæ, with a wide head, stout body, and large clear wings. The males are noted for their shrill call, which is produced by two membranes in the thorax, which are vibrated by powerful muscles. The larvæ live underground, and the life cycle may extend over many years. The c. are abundant in tropical and warm countries, and one species occurs in England.

CICERO, MARCUS TULLIUS (106–43 B.C.), Rom. orator and statesman; b. at Arpinum and studied under Molo at Rhodes. C. served under Sulla in the Civil War, 89 B.C. His legal work began in 81 B.C.; in 80 he had the courage to defend S. Roscius, who was accused of parricide at the instance of Sulla's freedman. In 70 he prosecuted Gaius Verres for his oppression of Sicily. From 68 we have the help of his letters for much of the secret history of his times. In 66 he was prætor; in 63 he became consul, and his term of office is famous for his suppression of the Catilinarian conspiracy. By his execution of the Catilinarian conspirators he had incurred the enmity of the democrats, and owing to the scheming of P. Clodius was obliged to go into exile in 58. He returned to Italy next year; opposed Cæsar and was compelled to recant in the *De Provinciis Consularibus*. In 52 he defended Milo for the murder of Clodius. In 50 he became gov. of Cilicia, and was annoyed at having to leave Rome, where he suppressed a revolt. He returned to Rome in Jan. 49 at the outbreak of the Civil War; after some hesitation he threw in his lot with Pompeius. Seeing further resistance useless, after the battle of *Pharsalus* he went to Brundisium, and thence to Rome in 47, as Cæsar was anxious to be on friendly terms with him. He was much distressed at the death of his dau., Tullia, in 46. After Cæsar's murder he joined the Republican party, delivering the two *Philippics*. He was among those proscribed, and was killed near Formiæ on Dec. 7, 43.

C.'s works are more extensive than those of any other ancient writer. His *Letters* to his friend, Atticus, and others are most valuable both for revealing his personality and for the history of his times. His speeches are numerous, many of them of great political and constitutional importance. His chief oratorical works are the *Brutus* and *De Oratore*. He wrote also many philosophical and political works, *e.g.* the *De Finibus*, *De Natura Deorum*, *De Officiis*, *De Republica*, and *De Legibus*.

His letters show a many-sided, able, and versatile personality, with distinct traits of vanity and weakness, but one that wins the sympathy of most historians (Mommsen is the great exception).

Strachan-Davidson, *Life of Cicero*; the most convenient complete edition of Cicero's works is that in Oxford Classical Texts.

CICERO, QUINTUS TULLIUS (120–43 B.C.), was bro. and correspondent of Marcus Tullius C.

CICERONE, person who acts as guide to museums and similar places; derived from the name of Cicero, the famous Rom. orator.

CICHLIDÆ, large family of Acanthopterygian fishes inhabiting fresh and brackish water of tropical countries, where they are used for food. They are remarkable for their complex nursing habits and high development of parental care.

CICOGNARA, LEOPOLDO, COUNT (1767–1834), Ital. antiquary and art critic.

CID, THE (Arabic *El Seid*, the lord), name of a famous character in Span. history and romance. So much has his story been overgrown with legend that some have doubted whether he ever really existed;

but it seems clear the original was RODRIGO DIAZ, b. c. 1030, called *the Cid*. He played a prominent part in the struggles of his day, fighting now for Christians, now for the Moslems, but as a freebooter rather than a religious or political leader; d. 1099. He has become the theme for a large body of Span. romances from the XI. to the XIX. cent's; subject of Corneille's play.

CIDER, beverage consisting of the fermented juice of apples, made chiefly in south-western England, northern France and Germany, and the U.S.A. The fruit is crushed and the juice run into vats, where it is fermented, and afterwards put into casks and stored in a cool place. The best c. is made from a mixture of varieties of apples, and from late apples rather than early.

CIENFUEGOS (22° 11′ N., 80° 33′ W.), seaport, Santa Clara, Cuba; spacious harbour, cathedral, military and government hospitals; commercial centre of sugar and tobacco trade. Pop. 35,000.

CIEZA (38° 18′ N., 1° 25′ W.), town, Murcia, Spain; paper mills. Pop. 13,700.

CIGNANI, CARLO (1628–1719), Ital. artist.

CIGOLI, LUDOVICO CARDIA DA (1559–1613), Ital. artist, architect, and poet.

CILIA (biol.), hair-like processes on cells which keep up a lashing or vibratory motion, either for the purpose of moving the cell itself, as in the case of many unicellular organisms, or for creating a current in the surrounding fluid, as in the mucous membranes of the respiratory passages.

CILIATA, unicellular organisms with permanent cilia, which vary in size and distribution and are used in locomotion and for wafting food particles to the 'mouth.' *Paramæcium*, *Stylonychia*, *Stentor*, and *Vorticella* are types with different arrangements of the cilia occurring in stagnant water and in fusions. The *Opalinidæ* have no 'mouth' or contractile vacuole and are parasitic in the rectum of Amphibians. See PROTOZOA.

CILICIA (c. 36° 30′ N., 34° E.), old division, S.E. Asia Minor, bordering on Mediterranean; now forms part of vilayet of Adana; chief rivers, Pyramus, Calycadnus, Sarus; produces grain, wine, timber; chief town, Tarsus; was ruled by native princes; subsequently belonged to Persia; inhabited later by pirates, who were subdued by Pompey, 66 B.C.

CILLI (46° 14′ N., 15° 16′ E.), town, on Save, Styria, Austria; ancient Rom. colony; ruined castle; warm mineral springs. Pop. 6713.

CILLI, ULRICH, COUNT OF (1406–56), ruled Hungary during youth of Ladislaus V.; rich, ambitious, and unscrupulous; assassinated by Laszlo Hunyadi.

CIMABUE, GIOVANNI (1240–1302), Ital. artist; generally credited with having revived the art of painting in Italy after the neglect of the Dark Ages; undoubtedly the founder of the Florentine school, which produced Raphael, Michelangelo, and Da Vinci. His mosaics at Pisa and his frescoes at Florence are world-famous. See PAINTING.

CIMAROSA, DOMENICO (1749–1801), Ital. composer.

CIMBRI, Germanic tribe inhabiting peninsula of modern Jutland; among earliest of northern barbarians to come into conflict with Rome; first recorded appearance in history, 113 B.C., when they defeated the Rom. consul at Noreia; they then poured boldly over Rhine, Danube, Ebro, and Alps into Rom. territory until finally crushed by Marius in the battle of the Raudine Plains, 101 B.C.

CIMICIFUGA, genus of herbaceous plants (order Ranunculaceæ) of N. temperate countries. The roots of *C. racemosa* or black cohosh (snake-root) is sometimes used medicinally in the treatment of dyspepsia, amenorrhœa. See GYNÆCOLOGY.

CIMMERII, a nomadic people, referred to in Homer's *Odyssey*; supposed to live in perpetual dark.

CIMON (c. 507–449 B.C.), Athenian statesman; fought against the Persians at *Salamis*; in 464 the Athenians sent an unsuccessful expedition to Messenia, and C. was 'ostracised' for his share in the matter; d. in Cyprus.

CINCHONA, name for trees of the order *Rubiaceæ*; natives of Western S. America cultivated in India, Ceylon, and East Indies for their bark, which contains alkaloids of great medicinal value, the most important being quinine (*q.v.*). Decoctions of the bark have been used for many centuries against malarial fever.

CINCINNATI (39° 8′ N., 84° 29′ W.), second largest town of Ohio, on N. bank of Ohio R.; built partly on plain bordering river, partly on two terraces above plain, with semicircle of hills behind, on which are some picturesque suburbs. C. has important public buildings, including city hall, chamber of commerce, government buildings, court-house, Masonic Temple, library, museum, music-hall. There are R.C. and Prot. cathedrals, C. being archiepiscopal see of R.C. church and episcopal see of Prot. church; many churches and synagogues; has univ., various R.C. seminaries and colleges, art school, and other educational institutions; numerous charitable institutions, including many hospitals and homes; fine system of parks; largest is Eden Park, near river; Burnet Woods in centre, with zoological gardens to N.E.; important trading and industrial centre. Chief industries are transporting of grain and trade in pork; there are great stock-yards and slaughter-houses; also foundries, machine shops, factories for manufacture of clothes, furniture, leather, shoes, tobacco, cutlery, saddlery, carriages, etc.; famous for decorative pottery and woodcarving; large river and canal traffic; great railway centre. C. is administered by mayor and council; first laid out in 1789; has frequently suffered from floods. Pop. (1910) 363,591.

CINCINNATUS, LUCIUS QUINCTIUS (fl. 458 B.C.), Rom. hero; twice dictator; won a signal victory over the Æquians; famed for simplicity of life.

CINDERELLA, heroine of a fairy-tale, which, with variations, is common to a number of languages. That known in England is a trans. of Perrault's Fr. version.

CINEAS, Thessalian mentor of Pyrrhus, king of Epirus.

CINEMATOGRAPH or KINEMATOGRAPH (Gk. *kinēma*, movement, and *-graphos*, written), apparatus which exhibits series of photographs which to the observer gives the effect of a picture in continuous motion.

The c. is really a complicated piece of apparatus originating in the *Zoetype*, or wheel of life, with which our grandfathers amused themselves. Successive photographs of a running horse were first obtained in 1877. These were taken by a row of cameras, the shutters of which were automatically opened at succeeding fractions of a second. It was not until the invention, in 1890, by Marey, of the celluloid roll film, however, that modern cinematography became possible. Nowadays 16 to 50 pictures are taken per second, and for an hour's exhibition anything up to 165,000 are needed. Cinematography has been put to scientific use by photographing minute forms of life as seen through microscope.

CINERARIA, garden plant, allied to *Senecio*, with heart-shaped leaves and white, red, or purple, frequently variegated, flowers in clusters; native of S. Africa.

CINGALESE, SINHALESE, natives of Ceylon (*q.v.*).

CINGOLI (43° 23′ N., 13° 13′ E.), town, Macerata, Italy; ancient *Cingulum*. Pop. 14,000.

CINNA, LUCIUS CORNELIUS, Rom. patrician; follower of Marius; elected consul (87 B.C.); killed by mutineers (84 B.C.) when undertaking expedition against Sulla. His dau. Cornelia m. Julius Cæsar.

CINNABAR (HgS), the only important ore of mercury, occurring in reddish masses or in brilliant red rhombohedral crystals of the hexagonal system, chiefly in Spain, Istria (Austria), Servia, California, Nevada, Peru, Kwei-chow (China). It is used as a pigment (vermilion) for the extraction of mercury.

CINNAMIC ACID, PHENYLACRYLIC ACID, ($C_6H_5CHCHCoOH$), compound crystallising in colourless needles or prisms, M.P. 133°, occurring in Peru and Tolu balsams and storax. It has the physiological effect of increasing the leucocytes in the blood.

CINNAMON, the dried inner bark of the small evergreen tree, *Cinnamomum Zeylanicum*, of a light yellowish brown colour, of peculiar aromatic taste and odour; used in cookery as a spice and in med. as a stomachic. The oil distilled from the bark is used medicinally and in the preparation of liqueurs and perfumes.

CINNAMON STONES, HESSONITE, red-orange variety of garnet found as pebbles in Ceylon.

CINNOLIN ($C_8H_6N_2$), poisonous oily base, crystallising from ether-white silky needles; M.P. *c.* 24°. The compound is isomeric with phthalazine.

CINO DA PISTOIA (1270–1336), Ital. poet; friend of Dante.

CINQ-MARS, HENRI COIFFIER RUZÉ D'EFFIAT, MARQUIS DE (1620–42), Master of the Horse to Louis XIII.; engaged in an abortive attempt to overthrow Richelieu; was condemned and executed; subject of a novel by A. de Vigny.

CINQUE PORTS, name given to the five ports of Hastings, Romney, Hythe, Dover, and Sandwich; to these Winchelsea and Rye were added, and other small places incorporated, the whole forming a jurisdiction for the defence of the coast of Kent and Sussex. Their first charter was granted by Edward I., and they received various rights; the jurisdiction still survives with modified privileges.

CINTRA (38° 56′ N., 8° 23′ W.), town, Portugal, on N. slope of Serra da C.; pleasant climate; resort of wealthy bourgeoisie of Lisbon; interesting Moorish relics; by 'Convention of Cintra' (1808), France undertook to evacuate Portugal. Pop. 6000.

CIPHER, see CRYPTOGRAPHY.

CIPRIANI, GIOVANNI BATTISTA (1727–85), Ital. artist and engraver; did much decorative work in England.

CIRCA, BERNARD, see CANON LAW.

CIRCAR, an Indian name for one of the subdivisions of a province, specially applied to those of the Madras presidency, 'the Northern Circars'; they became British, 1823.

CIRCASSIA (*c.* 44° N., 40° E.), district, W. Caucasus; bounded N. by Kuban R., S.W. by Black Sea; now included in Black Sea Territory and Kuban province of Russia. Circassians are noted for beauty, and belong to Muhammadan religion. They were finally subdued by Russia in 1864, when numbers of them emigrated to Turkey.

CIRCE (classical myth.), sorceress who lived on the island of Æsea. Ulysses, in his wanderings, landed there, and she changed some of his companions into pigs. Ulysses, however, persuaded her to remove the spell, after which he stayed with her for a year.

CIRCEO (41° 11′ N., 13° 3′ E.), promontory (1775 ft.), on Tyrrhenian Sea, W. coast, Italy; said to have been abode of Circe; favourite seaside resort in ancient times; Rom. antiquities are to be seen.

CIRCLE, a plane figure enclosed by a curve called the circumference, all the points on which are the same distance from a fixed point within, called the centre. The c. is the curve which encloses the largest area within a given perimeter (length of line enclosing the area). The following are some properties of the c.:—

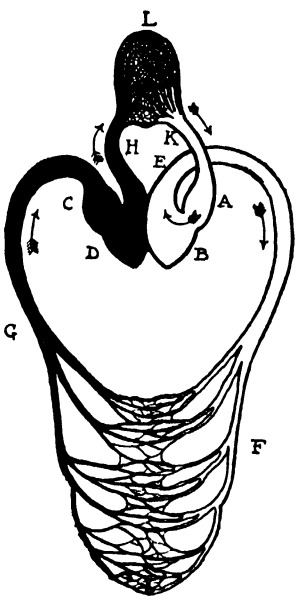
No matter what the size of the c., the ratio of the circumference to the diameter is always the same. This ratio, called π, has been calculated to hundreds of decimal places (for methods of calculating π, see any book on Advanced Trigonometry); correct to eight decimal places π is 3·14159265 . . ., but for all practical purposes the value $\frac{22}{7}$ is sufficiently accurate.

The area of the c. is π times the square of the radius (πr^2), and is found by dividing the c. into a large number of very small triangles, the apex of each being at the centre and the base forming a small portion of the circumference.

The c. is divided into 360 degrees (written 360°); two diameters drawn so as to divide the c. into four equal parts will thus make an angle of 90° with each other, and similarly with other angles.

The c. is a Conic Section (see CONIC SECTION), and may be considered as an ellipse in which the foci are at the centre and the eccentricity is zero. The general equation of a c. is of the second degree with no term in xy, and in which the coefficients of x^2 and y^2 are equal, as $x^2+y^2+ax+by+c=0$. In polar co-ordinates the equation is $r^2-2r\rho\cos(\theta-a)+\rho^2-a^2=0$, where (r, θ) are the co-ordinates of any point, (ρ, a) those of the centre, and a the radius.

Euclid, book iii.; Casey's *Sequel to Euclid*; Briggs and Bryan, *Co-ordinate Geometry of Right Line and Circle.*



CIRCLES, STONE, see STANDING STONES.

CIRCLEVILLE (39° 37′ N., 82° 57′ W.), city, on Scioto, Ohio, U.S.A.; agricultural implements. Pop. (1910) 6744.

CIRCUITS, in Eng. law, territorial divisions in which assize courts must be held at stated towns and times. Eng. c's are South-Eastern, Midland, North-Eastern, Northern, Oxford, North Wales, South Wales, Western, Chester. There are five c's in Ireland, three in Scotland. Assizes are held four times yearly in England, and twice or three times in Scotland. The same judge attends all assizes in one circuit, those held in summer and winter being more important than the Easter and autumn courts. In U.S.A. there are both State and Federal c's.

CIRCULAR NOTE, document addressed by a bank to its foreign agents for payment of money to a person named.

CIRCULATORY SYSTEM.—The function of the circulatory system is to convey nourishment by means of the *blood* to all parts of the tissues of the body. The nourishment consists of oxygen and of the nutritive substances derived from the food; the oxygen is obtained from the air through the lungs, and the nutritive substances from the alimentary canal either directly through the blood stream or by the intermediary of the lacteals and the lymphatic system. After having nourished the tissues, the blood becomes impure, and part of the impurities is got rid of by the kidneys (urea and other salts), part by the skin (urea and other salts in smaller amount), and part, before which it must first return to the heart, by the lungs (carbon dioxide), while superfluous water is got rid of by all three modes.

CIRCULATORY SYSTEM (DIAGRAMMATIC). The arrows indicate the direction of the blood flow, from the lungs (*L*) by the pulmonary veins (*K*) to the left auricle (*A*) and left ventricle (*B*) of the heart, through the aorta (*E*) to the arteries and capillaries of the body (*F*); from the capillaries and veins of the body by the great veins (*G*) to the right auricle (*C*), thence to the right ventricle (*D*), and by the pulmonary artery (*H*) back to the lungs.

The circulatory system consists of two distinct sets of tubular vessels; one set conveys the blood from the left side of the heart to the tissues of the body, and, after it has given up its

nourishment to the tissues, back to the right side of the heart, while the other set conveys the blood from the right side of the heart to the lungs, where it gives up carbon dioxide and obtains oxygen, and then back to the left side of the heart, from which it is conveyed in the first set of blood-vessels again, and so on.

The organs of the circulatory system include the *heart*, the *arteries*, the *veins*, and the *capillaries*.

The *heart* is a cone-shaped, hollow, four-chambered, muscular organ, about the size of the closed fist, which is situated in the central part of the chest, between the two lungs and resting upon the diaphragm, and it acts as the central pump which propels the blood through the blood-vessels. It is completely ensheathed by a double membranous bag, the *pericardium*, which binds it down to the upper surface of the diaphragm.

The upper and posterior chambers of the heart, or the *auricles*, are the receiving chambers for the blood—the *right auricle* receiving the impure blood from the great veins of the body, and the *left auricle* receiving the purified blood from the lungs. Each auricle communicates with the corresponding lower and anterior chamber, or *ventricle*, the propelling chamber for the blood, but there is no communication between the right and left sides of the heart, which is practically a double organ. The *right ventricle* pumps the impure blood to the lungs, where it is purified; and the *left ventricle* pumps the impure blood through the *aorta*, the main arterial blood vessel, to the different parts of the body.

The *arteries*, or tubular blood-vessels which convey the blood from the heart to the tissues, have walls composed of three coats—an outer coat of fibrous tissue with some elastic fibres, a middle coat of muscular fibres, arranged circularly, and an inner coat of elastic fibres, delicate connective tissue, and a smooth internal layer of endothelial cells. The arteries of the body consist of two sets—those which convey the blood to the tissues of the body, termed the arteries of the *systemic circulation*, and those which convey the blood to the lungs, termed the arteries of the *pulmonary circulation*. The main arterial trunk of the systemic circulation is the *aorta*, which commences at the left ventricle of the heart, passes for a short distance upwards, and then curves downwards through the thorax and down the middle of the posterior wall of the abdomen as far as the level of the fourth lumbar vertebra, giving off important branches in all directions. The main trunk of the pulmonary circulation is the *pulmonary artery*, which conveys 'venous' or impure blood from the heart to the lungs, and commences at the right ventricle of the heart and branches to enter the substance of the two lungs.

The *veins* are the vessels which convey the blood from the tissues back to the heart, and their walls are similar in structure to the walls of arteries, the outer coat being composed of fibrous tissue and elastic fibres, the middle coat, which is much slighter than the corresponding coat of arteries, containing muscular fibres, and the inner coat of elastic fibres, slight connective tissue and an internal layer of endothelial cells. In the interior of veins are found pouch-shaped valves, usually in pairs, composed of a fold of the endothelial layer, the purpose of which is to prevent the backward flow of blood in the sluggish blood-stream of the veins. The most important veins of the systemic circulation are the *superior vena cava*, which collects the impure blood from the upper parts of the body, and the *inferior vena cava*, which collects it from the lower parts of the body, both opening into the right auricle of the heart. The chief veins of the pulmonary circulation are the pulmonary veins, four in number, conveying 'arterial' or purified blood from the lungs to the heart, and opening into the left auricle of the heart.

The *capillaries* are vessels of much smaller size which connect the terminations of arteries with the beginnings of veins, and, ramifying amid the tissues and organs of the body, bring the nourishing blood-stream into close relation with the tissues. The walls of the smaller capillaries are formed of a single layer of endothelial cells, while the larger capillaries have an additional investing sheath of connective tissue.

CIRCUMCISION, cutting off the foreskin; practised by Jews and Muhammadans and by the Christian Abyssinians as a religious rite, as well as more generally to-day as a hygienic measure. It was practised in Egypt in very ancient times, and has also been found to be a custom as a preliminary to marriage in aboriginal tribes in different parts of the world.

Feast of the C. held on Jan. 1 in Anglican, R.C., and Eastern Churches to celebrate the c. of Jesus Christ.

CIRCUMFERENCE, see CIRCLE.

CIRCUMVALLATION, LINES OF, obsolete term for entrenchments surrounding a fortress.

CIRCUS (Latin and Gk. 'ring' or 'circle'), in ancient Rome was a building adapted for chariot-racing; the *Circus Maximus* was the most famous; seats were arranged in tiers, special seats being reserved for persons of dignity. Chariots decked with different colours were raced round the c., valuable horses being used. There were also the *Circus Flaminius* and the *Circus Neronis*; races were held on public festival days.

The *Circus* popular for the last hundred years is too well known to need description.

CIRCUS, harriers. See HAWK FAMILY.

CIRENCESTER (51° 43′ N., 1° 57′ W.), market town, on Churn, Gloucestershire, England; site of Rom. *Corinium*; church of St. John the Baptist contains numerous ancient brasses, interesting monuments, old glass; has museum of antiquities and Agricultural College; bacon-curing, cutlery. Pop. (1911) 7632.

CIRILLO, DOMENICO (1739–99), Ital. physician; chosen as pres. in Neapolitan revolution of 1799, and, after surrender to Royalist forces, was hanged; wrote several books.

CIRQUE, a corrie, or steep semicircular recess in a mountain, due to glacial erosion.

CIRRIPEDIA, see under ENTOMOSTRACA.

CIRTA (36° 20′ N., 6° 33′ E.), ancient city and fortress, Numidia, Africa; fell into decay IV. cent. A.D.; rebuilt by Constantine the Great; modern Constantine.

CISALPINE REPUBLIC, see ITALY (*History*).

CISSEY, ERNEST LOUIS OCTAVE COURTOT DE (1810–82), Fr. general; took part in the Crimean and Franco-Ger. Wars; noted for rigour in suppression of Commune; sometime Minister of War.

CIS-SUTLEJ STATES (*c.* 30° 55′ N., 75° 54′ E.), name formerly given to division, S. of Sutlej, Punjab, India.

CISTERCIANS, religious order of monks and nuns, following the rule of St. Benedict, and founded by St. Robert, abbot of Molesme, Langres, 1098, in the forest of Cîteaux (Lat. *Cistercium*), France. Within a cent. the C. possessed 800 important abbeys on the Continent, and before the Reformation numerous convents in Britain. Silence, abstinence from flesh meat, manual labour, chanting of the office, and common life (extending even to common dormitories) are included in the rule. The Trappists, C. of the Reformed Order, number *c.* 4000, and C. of the Common Observance, *c.* 1000 members.

CISTUS, ROCK-ROSE, family of dicotyledons, found mostly in Mediterranean countries; thalamiflora; some are resinous.

CÎTEAUX (47° 9′ N., 5° 5′ E.), village, Côte d'Or, France; celebrated for abbey, headquarters of Cistercian order, founded 1098.

CITHÆRON (38° 13′ N., 23° 30′ E.), mountain range separating Bœotia from Megaris and Attica; figures in numerous Gk. myths.

CITHARA, ancient stringed musical instrument, of the lyre kind; invented before Christian era.

CITIUM, KITION (35° 2′ N., 33° 35′ E.), ancient Phœnician city, Cyprus; name generally taken to include island of Cyprus.

CITRIC ACID, Oxytricarballylic Acid ($C_3H_4(OH)(COOH)_3$), tribasic acid, crystallising in colourless rhombic prisms, of an agreeable sour taste; M.P. 150°; occurs in lemons, citrons, oranges, gooseberries, and other fruits. Its salts are called citrates. C. a. is used in calico printing, in the preparation of beverages, and in medicine as a refrigerant and antiscorbutic, and to reduce obesity. The citrates increase the alkalinity of the blood, and iron and quinine citrate is a valuable tonic.

CITRUS, genus of evergreen shrubs and trees (order Rutaceæ) with fragrant white blossoms and sometimes with axillary thorns, bearing luscious edible fruit with a tough skin or peel. Natives of tropical Asia, they are now widely cultivated in Mediterranean countries, Madeira, W. Indies, Florida, and California, the principal species being the lemon (*C. limonum*), the citron (*C. medica*), the lime (*C. limetta*), the Seville orange (*C. vulgaris*), the sweet orange (*C. aurantium*), the mandarin (*C. nobilis*), the kumquat (*C. japonica*), the shaddock (*C. decumana*).

CITTÀ DELLA PIEVE (42° 57′ N., 12° E.), town, Perugia, Italy; birthplace of Perugino. Pop. 6736.

CITTÀ DI CASTELLO (43° 27′ N., 12° 14′ E.), town, on Tiber, Perugia, Italy; cathedral; picture-gallery. Pop. 6061.

CITTÀ VECCHIA, Città Notabile (35° 52′ N., 14° 23′ E.), fortified city, Malta; bp.'s see; cathedral. Pop. 6152.

CITTADELLA (45° 38′ N., 11° 47′ E.), town, Padua, Italy; has cathedral, and is trade centre for agricultural produce of district. Pop. 3627.

CITTERN, stringed musical instrument, very popular during XVI. and XVII. cent's. It had an oval-shaped body, with flat back, a longish neck, and was played with the fingers.

CITY, in U.K. the term is applied to towns which either are or have been episcopal sees, and by royal authority to other large towns; it is sometimes applied to central part of a large town, *e.g.* city of London. In U.S.A. term denotes towns enjoying certain form of municipal government; in some states a c. may have under 2000 inhabitants.

CIUDAD BOLIVAR (8° 8′ N., 63° 57′ W.), city, river port, on Orinoco; capital of Bolivar, Venezuela; commercial centre; cattle, tobacco. Pop. 13,000.

CIUDAD DE CURA, see Cura.

CIUDAD JUAREZ (31° 47′ N., 106° 25′ W.), town, on Rio Grande, Chihuahua, Mexico; has large transit trade with U.S.A., having a customs station. Pop. 7000.

CIUDAD PORFIRIO DIAZ (28° 44′ N., 100° 30′ W.), town, on Rio Grande, Coahuila, Mexico; on border of Texas. Pop. 6000.

CIUDAD REAL (39° 5′ N., 3° 50′ W.), province, Spain; traversed E. to W. by Guadiana; wide undulating plains; dry climate; rich in minerals, iron, silver, copper, lead; sheep and cattle rearing; brandy, wine; area, 7620 sq. miles. Pop. (1910) 380,565.

CIUDAD REAL (38° 59′ N., 3° 58′ W.), town, Spain; woollen cloth, gloves. Pop. 15,255.

CIUDAD RODRIGO (40° 36′ N., 6° 32′ W.), fortified town, Salamanca, Spain; is episcopal see and has XII.-cent. cathedral; surrendered to Marshal Ney, 1810; recaptured by British under Wellington (1812), who for this received title of Duke of C. R. and other honours. Pop. 8930.

CIVET FAMILY (*Viverridæ*), a family of carnivores (*q.v.*), containing about 150 species, confined to the Old World; with long flexible bodies, long faces, and rather short legs. They include the Fossa (*Fossa*), a peculiar creature, 5 feet long, confined to Madagascar; the Genets (*Genetta*), ranging over southern Europe, and Asia, and Africa, with brownish-yellow or greyish fur, marked by darker spots and stripes; the weasel-like Linsangs (*Linsang* and *Poiana*) of Asia and Africa; the arboreal palm civets (*Paradoxurus*), and mungooses, mongooses, or ichneumons (*Herpestes*, etc.) from the same areas, the latter group, however, having a single representative in Spain; and the true civets, bintourongs and meerkat (*Suricata*).

CIVIDALE DEL FRIULI (46° 4′ N., 13° 25′ E.), town, on Natisone, Venetia, Italy; ancient *Forum Julii*; has notable cathedral and museum of antiquities; silk. Pop. 4174.

CIVIL LAW, local law of a state, more particularly that derived from the Rom. *jus civile*, and distinct from international law.

CIVIL LIST, the name given in U.K. to that portion of the national expenditure which goes to the upkeep of the king and royal family, with the various expenses of the crown. Until the reign of William and Mary all the national expenses, other than those of war, were grouped together, but then the sum of £700,000 a year was set aside, not only for the personal expenses of the sovereigns and the royal household, but for pensions and the civil service. When George III. came to the throne a certain fixed sum was settled for the C. L., not as heretofore the sources of revenue, and the surplus, should there be any, was no longer to go to the king. In the reign of William IV. the crown was relieved of all that really belonged to the expenses of Government, and the C. L. became solely for the upkeep of the royal family.

CIVIL SERVICE, name for public officials who administer civil affairs. Principal departments are Treasury, Privy Council Office, Home Office, Foreign Office, Board of Agriculture, Education Department, Scottish Office, Post Office; Indian and Colonial C. S. also included. Originally C. S. posts were given by minister of department in question; there was no qualifyi[illegible] by influence. In 1855 examinations were established, and since 1870 appointments have been made according to results of open competitive examinations. The system is administered by commissioners, who arrange the subjects for examination, and must ascertain that the candidate is within the age limits prescribed and a fit and proper person to be entrusted with public employment. Service is in two divisions. Examinations for first-class clerkships, Indian and Colonial Services are held simultaneously, candidates being allowed to compete for all three. Examinations resemble those of univ's, include classics, math's, science, economics, philosophy, modern languages; age limit, 22 to 24; salaries, £200 to £1000. Successful candidates in Ind. C. S. must spend another year in England and pass final examination in Ind. law, language, etc., and in riding. Medical test must also be passed. In second division, examinations resemble ordinary school examinations; include usual school subjects, history, geography, French, Latin, etc.; salaries, £70 to £500. Women are employed chiefly in post office, but also in Customs, Boards of Education and Agriculture, etc. In U.S.A. appointment of Civil Servants is constitutionally vested in pres., but competitive system is now largely employed.

CIVILIS, CLAUDIUS, famous Batavian leader in revolts against Romans during rule of Nero and Vespasian.

CIVILISATION is the condition of advanced nations, as compared with that of savage and barbarous peoples; it is result of long evolutionary processes and its history is that of material and moral development of mankind. There are, however, two movements always going on in all communities—one progressive, the other retrogressive: if former is predominant, community advances; if latter, it stands still or degenerates. Generally speaking, community which is continually in contact with other c's progresses; while one that is isolated either retrogrades or remains stationary; good example of stationary c. is China, where it dates back to several millennia B.C., but has made little advance throughout many cent's.

Chief physical influences which have affected c. are

climate, food, soil, and general aspect of nature. One of first factors in social development is accumulation of property. So long as each man must work to live, and consumes as much as he produces, neither science nor organisation can be created; but as soon as production surpasses consumption there grows up beside working class an intellectual class which creates science on which progress of c. depends. Accumulation of property depends on energy of worker and also on return obtained for work; of these causes first depends on climate, second on fertility of soil. An examination of history shows that no people has of itself attained c. unless one of these conditions was favourable; thus in Asia c. was limited to district of fertile alluvial soil, stretching from E. China to Asia Minor. In N., where soil was unproductive, Mongols and Tartars remained in barbarous state until comparatively recent date. Arabs made little progress owing to the poverty of their soil until they were enabled, by their conquests of Persia, Spain, and Lahore, to accumulate wealth. Eastern c. generally was thus due to fertility of soil; in W., favourable climatic conditions were more important factor; in Europe, climate developed energy and was favourable to work.

Progress of c. has from time to time received great impetus from discoveries and practical inventions. Earliest and perhaps most important was discovery of uses of fire in prehistoric times; before this discovery man lived chiefly on fruits and nuts, but after it animal foods were added to his diet. Another and much later invention was that of system of writing, which must have occurred in VII. millennium B.C., and was important step in human progress. In modern times, exploration, intercommunication of advanced races, progress of science and invention (especially in steam and electricity) have promoted c. amazingly.

Avebury, *Origin of Civilisation* (1902); Seignobos, *History of Civilisation* (1908); Buckle, *History of Civilisation in England.*

CIVITA CASTELLANA (42° 17′ N., 12° 26′ E.), town and episcopal see, Rome, Italy; with cathedral and citadel; near site of ancient city, Falerii. Pop. 5265.

CIVITA VECCHIA (42° 6′ N., 11° 48′ E.), seaport town, on Mediterranean, Rome, Italy; episcopal see; Rom. relics; ancient *Portus Trajani.* Pop. 12,000.

CLACKMANNAN (56° 7′ N., 3° 45′ W.), county town, on Devon, Clackmannanshire, Scotland; ancient market cross; ruins of Clackmannan Tower, once seat of Bruces; has spinning mill; coal mines.

CLACKMANNANSHIRE (56° 7′ N., 3° 46′ W.), smallest county, Scotland; lies between Ochil Hills and Forth; area, 55 sq. m.; surface partly flat (carse), partly undulating and hilly; fertile soil; well cultivated; uplands afford excellent pasturage; rich in minerals; towns—Alloa, Clackmannan, Alva, Dollar, Tillicoultry; principal stream, Devon; coal extensively mined; woollen manufactures; distilleries. Pop. (1911) 31,121.

CLACTON-ON-SEA (51° 48′ N., 1° 9′ E.), watering-place, Essex, England. Pop. (1911) 9777.

CLAIRAUT, ALEXIS CLAUDE (1713–65), Fr. mathematician and astronomer; author of *Théorie de la figure de la terre* and *Théorie de la lune*; accompanied an expedition to Lapland for measuring the meridian.

CLAIRON, LA (1723–1803), eminent Fr. actress.

CLAIRVAUX (46° 35′ N., 5° 42′ E.), village, Aube, France; site of famous Cistercian abbey, founded by St. Bernard, 1115; C. has important ironworks.

CLAIRVOYANCE is power claimed by spiritualistic 'mediums,' of seeing things invisible to ordinary persons, when in hypnotic condition; astuteness of professional mediums has rendered scientific investigation on the subject extremely difficult. See SPIRITUALISM.

CLAM, family of bivalves found in mud and gravel bottoms; giant c. (*Tridacna gigas*) is often 3 or 4 feet in length; soft c. (*Ohama arenaria*) is considered a delicacy in parts of U.S.A.

CLAMECY (47° 27′ N., 3° 31′ E.), town, at confluence of Yonne and Beuvron, France; manufactures, textiles, leather. Pop. 4722.

CLAN (Gaelic *Clann*), the name given in Scotland and Ireland to a group of families often living together as a community. In ancient Ireland several 'septs' or communities formed a c., and each sept was divided into several households. Alike in Scotland and Ireland the Celtic tribalism which a real c. system necessitates was overlaid by Anglo-Norman feudalism, though it maintained itself in Scotland side by side with the mediæval baronage and then of modern developments down to the XVIII. cent. Owing to the support given by some c's to the Pretender, a determined effort was made to root out the c. system, and the wearing of Highland dress was forbidden. C. feeling, however, still survives among a group of families (not always all of the same name) and the 'chief' is looked up to with veneration.

Scottish Clans and their Tartans, Edinburgh.

CLANRICARDE, ULICK DE BURGH, 1ST EARL OF, s. of Ulick, Lord Clanricarte, of old Anglo-Norman house; cr. Earl of C., 1543; obtained grants of land from Henry VIII.; d. 1544.

CLANRICARDE, ULICK DE BURGH, MARQUESS OF (1604–57 or 1658), succ. his f. as 5th earl, 1635; sat in Short Parliament of 1640; was R.C. and supported Charles I.; commanded royal forces in Connaught; surrendered to Parliament in 1653; believed in religious toleration, and has been described as 'perhaps the most unsullied character in the history of Ireland.'

CLANVOWE, SIR THOMAS, Eng. poet; contemporary of Chaucer, and the supposed author of *The Cuckoo and the Nightingale.*

CLAPARÈDE, JEAN LOUIS RENÉ ANTOINE, ÉDOUARD (1832–70), Swiss zoologist; prof. of Comparative Anat. at Geneva; made biological investigations, especially on Annelidæ, in Norway, the Hebrides, Bay of Biscay, and at Naples.

CLAPPERTON, HUGH (1788–1827), Scot. explorer; from 1822 explored North and Central Africa; crossed the Niger, and d. in Sokoto, 1827.

CLAQUE, body of people who are hired to applaud in Fr. theatres; system dates from ancient times; organised in France beginning of XIX. cent.

CLARE (52° 50′ N., 9′ W.), maritime county, Munster, Ireland; area, 1200 sq. miles; bounded N. by Galway, E. by Tipperary, S. by Shannon estuary, W. by Atlantic; surface generally hilly, with some level tracts; bogs in W.; drained by Shannon and Fergus; chief lake, Lough Derg, on eastern boundary; coast precipitous and much indented; chief islands, Aran Isles; chief town, Ennis; important fisheries round coast; sheep and cattle raised; no important manufactures; chief crops, oats, potatoes. Minerals include iron, manganese, lead; mineral springs occur in several places. There are many old fortified castles. Pop. (1911) 104,064.

CLARE, name of an historic Eng. house, which came to England with the Conqueror, acquired estates in the eastern counties, on the Welsh border, and then in Ireland. EARL GILBERT (d. 1314), was last in male line; the 'Honour of Clare,' owing to marriage of the ultimate heiress with Lionel, s. of Edward III., became vested in the Crown.

CLARE, JOHN (1793–1864), Eng. poet; author of *Poems of Rural Life* (1820), *The Village Minstrel, The Rural Muse,* etc.; d. insane.

CLARE, JOHN FITZGIBBON, 1ST EARL OF (1749–1802); M.P. for Dublin Univ., 1778; cr. baron, 1789, and earl, 1795; at the outbreak of the Irish rebellion he urged strict measures, but in several cases showed clemency afterwards; was strongly against the Catholics and concessions generally, and increasingly so after the Union.

CLARE, ST. (1194–1253), disciple of St. Francis; abbess of San Damiano, Italy, a convent of *Poor Clares* (enclosed, contemplative order), which she, with St. Francis, founded.

CLAREMONT (43° 22′ N., 73° 23′ W.), city, New Hampshire, U.S.A.; manufactures cotton, woollen, and rubber goods. Pop. (1910) 7529.

CLARENCE, DUKES OF.—(1) LIONEL (1338–68), third s. of Edward III.; m. Elizabeth de Burgh (heiress of the Clares, *q.v.*); his dau. and heiress, Philippa, m. Edmund, Earl of March. (2) THOMAS (*c.* 1388–1421), second s. of Henry IV. (3) GEORGE (1449–78), bro. of Edward IV.; perished in Tower. (4) WILLIAM, afterwards William IV. (5) ALBERT VICTOR (1864–92), eldest s. of Edward VII.; cr. duke, 1890.

CLARENCEUX, one of the two Kings-of-Arms in England; has jurisdiction over all England south of Trent.

CLARENDON, CONSTITUTIONS OF, a code of laws, promulgated at Clarendon (1164) by Henry II., for the purpose of settling differences between Church and State.

CLARENDON, EDWARD HYDE, 1ST EARL OF (1609–74), Eng. statesman; s. of Henry Hyde, of Dinton, Wilts; ed. at Oxford, and called to the Bar in 1633. He vigorously opposed the king's attempted absolutism for several years, and supported Strafford's overthrow. He was not, however, prepared to go to the extreme length of the Parliamentary party, and was on the king's side at the outbreak of the Civil War. Though supporting Charles, he did not always see eye to eye with him. He left England in 1648, and was one of Charles II.'s companions and advisers in exile. He was cr. earl at the Restoration, but became unpopular owing to his dau.'s marriage with the Duke of York (afterwards James II.). He was not himself in favour of such measures of religious intolerance as are contained in the *Clarendon Code*, but his idea was comprehension, hardly toleration. He was partly responsible, even if indirectly, for the defeat of the Eng. fleet by the Dutch in the Medway in 1667. He was unpopular with the extreme Royalists (for his support of the 'Act of Indemnity') and with the Presbyterians, and had annoyed the king; fell from power, being deprived of the Great Seal, and went into exile; d. at Rouen, a disappointed man. He is famous both for his political career and his *History of the Great Rebellion*; also wrote an Autobiography.

Sir Henry Craik, *Life of Clarendon* (2 vols., 1911).

CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, 4TH EARL OF (1800–70), Brit. statesman; grandson of the 1st earl of the Villiers creation; app. attaché to Brit. Embassy at St. Petersburg. In 1833 he was minister to the court of Spain, and strongly supported the Liberals there. In 1840 he became Lord Privy Seal and Chancellor of the Duchy of Lancaster, then pres. of the Board of Trade, and Viceroy of Ireland (1847–52), where he ruled very wisely; Foreign Minister (1883); Brit. plenipotentiary at the Congress of Paris (1856). He was Foreign Minister again (1865–70), dying in office.

CLARENDON, HENRY HYDE, 2ND EARL OF (1638–1709), Eng. politician; s. of 1st earl; M.P. for Wilts, 1661; became earl, 1674; Lord-Lieutenant of Ireland, 1685–87; opposed James II.'s Declaration of Indulgence, but was hostile to William and Mary; was imprisoned for intriguing, 1691.

CLARENDON PRESS, old name for Oxford University Press; founded 1672; Bible printing-house.

CLARENDON TYPE, see PRINTING.

CLARET, Eng. name for red Bordeaux wines.

CLARETIE, JULES ARSÈNE ARNAUD (1840–), Fr. dramatist, novelist, historian, and man of letters; director of the Comédie Française since 1885.

CLARI, GIOVANNI CARLO MARIA (*c.* 1745), Ital. composer of church music.

CLARINET, CLARIONET, wooden instrument with a single reed; three varieties: C, A, and B flat.

CLARK, SIR ANDREW, Bart. (1826–93), Scot. physician, practised in Aberdeen and afterwards in London with much success; pres. of Royal Coll. of Physicians (1888); author of several medical works.

CLARK, CHAMP (1850–), Amer. politician; chairman of National Democratic Convention at St. Louis, 1904; congressman, 1893, and from 1897; speaker, 1911–13; his speech in favour of reciprocity with Canada as a step towards annexation instrumental in causing its rejection by Canada.

CLARK, FRANCIS EDWARD (1851–), Amer. Congregationalist divine; founded Young People's Society of Christian Endeavour.

CLARK, GEORGE ROGERS (1752–1818), Amer. soldier; app. lieut.-col. on Amer. frontier, 1778; owing to him much of the North-West became American; his services were scarcely recognised, and he d. disappointed.—**Clark, William** (1770–1838), his bro., entered U.S.A. army, 1792; led an exploring expedition (1803–6) down the Columbia River.

CLARK, SIR JAMES, Bart. (1788–1870), Scot. physician; investigated health resorts and mineral waters of the Continent; author of several medical works.

CLARK, JOHN BATES (1847–), Amer. economist; author of *The Philosophy of Wealth* (1885), *Wages* (1889), *The Control of Trusts*, etc.

CLARK, JOSIAH LATIMER (1822–98), Eng. inventor and electrician, concerned in improvement of telegraphs, submarine cables, etc.

CLARK, THOMAS (1801–67), Scot. chemist; prof. of Chem., Marischal College, Aberdeen (1833); made investigations on the composition of various waters.

CLARK, WILLIAM GEORGE (1821–78), Eng. scholar; founded Clark lectureship, Trinity Coll., Cambridge; one of editors of *Cambridge Shakespeare*.

CLARKE, ADAM (1762–1832), Wesleyan preacher and Oriental student; edited Rymer's *Fœdera*.

CLARKE, SIR ANDREW (1824–1902), Brit. administrator; entered army, 1844; held various appointments in Australia, N. Zealand, Straits Settlements, India, and in army at home; retired, 1886.

CLARKE, CHARLES COWDEN (1787–1877), Eng. author and scholar; author of *Shakespeare's Characters* (1863), etc.—His wife, **Mary Cowden Clarke** (1809–98), compiled a valuable *Shakespeare Concordance* (1844–45), wrote *Girlhood of Shakespeare's Heroines*, etc.

CLARKE, EDWARD DANIEL (1769–1822), Eng. traveller and mineralogist; travelled in Europe, Palestine, and Egypt, collecting valuable statues, manuscripts, etc.; prof. of Mineralogy at Cambridge (1808); pub. works on travel and archæology.

CLARKE, SIR EDWARD GEORGE (1841–), Eng. lawyer and politician; originally a reporter; called to the Bar, and became a counsel of the first rank; entered Parliament (1880); knighted (1886); Solicitor-General (1886–92).

CLARKE, JAMES FREEMAN (1810–88), Amer. Unitarian theologian and vigorous opponent of slavery; a spiritual and learned man; wrote *Ten Great Religions*.

CLARKE, MARCUS ANDREW HISLOP (1846–81), Australian author; wrote *For the Term of his Natural Life*; also dramatic pieces.

CLARKE, MARY ANNE (d. 1852), Eng. courtesan; wife of a stone-mason; became mistress of Frederick, Duke of York, s. of George III.; the *liaison* led to a public scandal; eventually received a pension.

CLARKE, SAMUEL (1675–1759), Eng. divine and philosopher; among most important works are his Boyle Lectures, *On the Being and Attributes of God* (1704), and his correspondence with Leibnitz (1717). In his ethical doctrine he maintains that moral principles are as directly evident to reason as mathematical principles, and he enunciates three 'rules of righteousness' as claiming natural and necessary assent, viz.: (1) that we should venerate God; (2) that we should treat our fellows with Equity and Love; and (3) that we exercise Prudence about ourselves.

CLARKE, WILLIAM BRANWHITE (1798–

1878), Brit. geologist and clergyman; studied the geol. of Suffolk and Dorsetshire; emigrated to New South Wales and became the founder of Australian geol.; he made the first discovery of gold (1841), of tin (1849), and of the diamond (1859) in Australia, and contributed other researches valuable to the development of that country and to science.

CLARKSON, THOMAS (1760–1846), Eng. anti-slavery agitator; travelled to collect evidence on subject, and got bill brought into House of Commons; in 1789 went to France to urge his anti-slavery propaganda, and met with some success; he continued his work till death. See SLAVERY.

CLARKSVILLE (36° 33′ N., 87° 24′ W.), chief city, Tennessee, U.S.A.; important tobacco market. Pop. (1910) 8548.

CLASSES OF SOCIETY.—Solo class arrangement of modern times tends to become that of rich and poor, but historically the four divisions of royal, noble, gentle, and simple are important. First class may be absent; in many countries, as France and Germany, second and third form the one class of nobles, and in others, as England, third and fourth form one class of commoners. Thus the *von* and the *de* employed by every member of Ger. and Fr. territorial families or families that have been ennobled is mark of nobility which the lesser members share with head of family. In England, on the contrary, there is no such thing as nobility of blood: children of peers are commoners as rights of blood go. Foreign idea of nobility of blood is, however, very old; class distinctions, preserved throughout ages, often as deep as racial distinctions, and perhaps in their origin due to conquest of one state by another, as may be seen in mild form by establishment of Norman upper and Saxon lower class in England after Norman conquest; unlikely that such deep cleavages as seen in Greece and Rome should have had origin in mere property differences. History of many Grecian states, Rome, and many modern nations is a long struggle between well-born and base, in which latter establish their political equality. Grecian and Roman nobility represented families who first settled in the state, under whom was democracy composed of descendants of families subjugated by first settlers, brought into the city from towns subsequently conquered, or debased in blood by debt, crime, etc. First democratic reforms were introduced into Athens by *Seisachtheia* of Solon, *c.* 594, and extended by Cleisthenes, *c.* 508 B.C.; many of Ionian cities established democracies, but Dorian states retained oligarchic social and political constitution. Roman plebeians gradually won entire political equality, but could not hold chief religious posts, nor did social distinctions die out; the enlightened Mæcenas, we learn from Horace, would associate with a freedman's son, though not with a freedman, but the *Satires* are full of evidence of strong class feeling. Modern Romance nations inherit idea of nobility of blood, but it is complicated by Teutonic social arrangement, by property, *i.e.*, in early times, land; under feudalism this developed into aristocracy, which is different from nobility; Eng. upper class is an aristocracy rather than a nobility.

CLASSICS.—The term *classic* is generally applied to any standard lit., particularly to that of ancient Greece and Rome. When the so-called 'Classical Age' of Greece was over (about 300 B.C.), the Gk. writers became objects of study as they are to us, and a 'science' of classical scholarship grew up. In the 'Alexandrian Age' (300–1 B.C.), the library at Alexandria became a centre of classical study, and its librarians scholars and editors. Zenodotus edited *Homer*, and Aristophanes of Byzantium other poets besides; later came Didymus, with whom the 'Alexandrian Age' ends. The Alexandrians had a regular canon, beginning with Homer and ending with Polybus. Contemporary with the school of Alexandria was that of Pergamum, during the III. and II. cent's B.C.

When Rome had conquered Greece, Greek was the language of the eastern half of the Empire, and Rome had much to learn from Greece in letters, as the Romans had never been a literary people. Hence Rom. lit. followed Gk. models, and educated Romans of this and succeeding times all knew Greek. The 'Augustan Age' was one which produced not only the greatest Latin lit. but some literary criticism. Longinus wrote *On the Sublime*, and Dionysius of Halicarnassus criticised Demosthenes. In the next five cent's there were several grammarians, among them were Herodian and Theodosius of Alexandria. In Latin scholarship during these cent's, or just before, a great name is that of Varro (116–27 B.C.). Virgil and Horace, who had themselves absorbed so much of Gk. culture, soon became regular authors for critical study. Quintilian was not only a great authority on oratory, but wrote on the lit. of his own country as well. One of Suetonius' works, now lost, was used in the VII. cent. by Isidore of Seville. Later, important work was done by Symmachus, Apollinaris Sidonius and Boethius, who stands on the border-line between classical and mediæval culture.

The Middle Ages are sometimes referred to as if during the whole of that period a total eclipse of classical learning and everything pertaining to ancient civilisation took place, only to be brought to light again at the Renaissance. Though there is much truth in this, it must not be pressed too far, for there never was a period when the study of Greek became totally extinct in the West; nevertheless, Gk. scholars were only few, and while Latin remained the dominant literary language till the XVI. cent., much of the best Latin lit. was entirely forgotten and neglected. Greek was studied in Ireland in the VII. and VIII. cent's, and in England was introduced by Theodore of Tarsus (d. 690), abp. of Canterbury. Owing to the work of Alcuin, there was some classical study at the court of Charles the Great. Aristotle was translated into Arabic in the East, and his works, being taken to Spain by the Moors, were translated into Latin, and then studied by the Schoolmen in Paris and elsewhere. Greek was studied in England by Bp. Grosseteste (d. 1253) and by Roger Bacon (d. 1294), who wrote a *Gk. Grammar*.

The Renaissance began in Italy in the XIV. cent., and ancient MSS. were eagerly sought for, and in the XV. cent. much Greek was read in Italy; but in the XVI. cent. the New Learning found its chief home north of the Alps. The greatest of Renaissance scholars was Erasmus, who taught and studied in England, France, Italy, and Switzerland. Since then classical scholarship has gradually progressed, becoming more scientific, aiming at exact knowledge of the past rather than exact imitation of classical forms of lit. in the present. There have been many famous classical scholars in England, France, and Germany. During the XVI. and XVII. cent's France produced most, in the XVIII. England, and now Germany; but when scholars like Prof. Gilbert Murray and the late Sir R. C. Jebb can be pointed to, there is no cause for fear of the future of classical studies in Britain.

Sandys, *A History of Classical Scholarship*; Jebb, in *Cambridge Mod. Hist.*, vol. i.

Classics in Schools.—The teaching of Classics in schools in England has been regular since the XVI. cent., and the great public schools especially have always maintained since then a tradition of classical scholarship. Much was done by Dr. Arnold of Rugby to widen classical study, but in the last half-cent. there has been continuous debate as to the advisability of devoting so much time to the study of Greek or Latin, or both. Most large schools now have a 'classical' and a 'modern' side. In Oxford and Cambridge Greek is still compulsory, but in the newer univ's it is not so. The consensus of the best opinion seems to be that it is often desirable to teach some Latin to boys where Greek is not so essential. Continental conditions are largely similar to English.

CLASTIDIUM (mod. Casteggio) (*c.* 45° 2′ N., 9° 8′ E.), ancient fortified town, Gallia Cispadana, Italy; scene of victory of Marcellus over Gauls, 222 B.C.

CLAUBERG, JOHANN (1622–65), Ger. philosopher.

CLAUDE, JEAN (1619–87), Fr. Prot. theologian; left France at revocation of Edict of Nantes, 1685.

CLAUDE OF LORRAINE, CLAUDE GELLÉE (1600–82), Fr. landscape artist; examples in Louvre and National Gallery.

CLAUDET, ANTOINE FRANÇOIS JEAN (1797–1867), Fr. scientist; introduced daguerrotype photography into England, and invented several instruments concerned with photography.

CLAUDIANUS, CLAUDIUS (*c.* 396), Latin epic poet; wrote the *Raps of Proserpine*, also panegyrics.

CLAUDIUS, name of a great Rom. *gens*, containing both patricians and plebeians; among well-known members of it were: (1) APPIUS SABINUS REGILLENSIS, founder of the *gens*, *c.* 504 B.C.; (2) APPIUS, patrician consul, 471 and 451 B.C.; (3) APPIUS, patrician consul, 307 B.C.; (4) APPIUS, friend and correspondent of Cicero.

CLAUDIUS, TIBERIUS CLAUDIUS DRUSUS NERO GERMANICUS (10 B.C.–54 A.D.), Rom. emperor; s. of Drusus, and nephew of Emperor Tiberius; became emperor, 41 A.D.; said to have been poisoned by his wife, Agrippina, mother of Nero.

CLAUDIUS, MARCUS AURELIUS, Roman Emperor (268–70 A.D.); defeated Goths—hence called Gothicus.

CLAUDIUS, MATTHIAS (1740–1815), Ger. popular poet (*nom de plume*, ASMUS).

CLAUSEL, BERTRAND, COUNT (1772–1842), Fr. soldier; served in Revolutionary campaign, 1791, and in Peninsular campaign; after Restoration, served under the Bourbons; marshal of France, 1831.

CLAUSEN, GEORGE (1852–), Eng. landscape artist; A.R.A. (1895), R.A. (1908).

CLAUSEWITZ, KARL VON (1780–1831), Prussian general; fought in Rhine campaign, 1793–94; in campaign of Jena, 1806; a prisoner two years; helped to reorganise Prussian army, 1809–12; fought for Russia in 1812, and then served in Prussian army in Waterloo campaign; wrote many military works.

CLAUSIUS, RUDOLF JULIUS EMMANUEL (1822–88), German physicist; prof. of Physics at military school in Berlin (1850), Univ. of Zürich (1855), Würzburg (1867), Bonn (1869); founder of the science of thermodynamics; formulated many new and now-accepted physical theories.

CLAUSTHAL, KLAUSTHAL (51° 48′ N., 10° 20′ E.), mining town, Harz Mts., Hanover, Germany; chief mines, silver and lead. Pop. 9000.

CLAVICHORD, early keyboard musical instrument, precursor of the piano. The keys operated on quills which plucked the strings.

CLAVICLE, see SKELETON.

CLAVIÈRE, ÉTIENNE (1735–93), Fr. politician and financier.

CLAVIJO, RUY GONZALEZ DE (d. 1412), Span. traveller; visited Timur at Samarkand

CLAVIJO Y FAJARDO, JOSÉ (1730–1806), Span. journalist; theme of Goethe's play.

CLAW, term designating horny epidermal end of digits of birds, mammals, etc.; in ungulates c's are flattened into hoofs; applied also to chelæ of arthropods.

CLAY, a soft rock, plastic when wet, of varying composition and character, the principal constituent being an extremely fine-grained hydrous aluminium silicate, such as kaolin and muscovite, decomposition products of felspars. Chlorite, derived from hornblende, augite, or biotite also enters into the formation of clays, together with calcite, epidote, quartz, and other minerals reduced from their position as rock-constituents to a fine-grained state. Most clays are water-borne, and form deposits in lakes and the sea, often in uniform layers (mudstone). Some easily split into leaflets or laminæ, and are known as shales, which frequently contain organic products such as paraffin oil. A few of the more important clay rocks are *red c.*, which forms in the deepest parts of the ocean, and is the most extensive deposit known; *china c.*, consisting mainly of kaolin, is the purest; *brick c.* and *fire c.* vary very much in constitution. Wind-borne, fine calcareous c. is known as loess.

CLAY, CASSIUS MARCELLUS (1810–1903), Amer. politician; took part in anti-slavery agitation; served in Mexican War; minister to Russia, 1861–69; republican, democrat, then republican again.

CLAY, CHARLES (1801–93), Eng. surgeon, introduced the operation of ovariotomy, and did much to advance abdominal surgery generally.

CLAY CROSS (53° 10′ N., 1° 25′ W.), town, Derbyshire, England; centre of coal and iron district. Pop. (1911) 8365.

CLAY, FREDERIC (1838–89), Eng. composer of operas and songs.

CLAY, HENRY (1777–1852), Amer. statesman; entered legal profession, 1797; in 1803 elected to Kentucky legislature, and in 1806 to U.S.A. Senate. In 1811 he was elected to U.S.A. House of Representatives, and served as Speaker several times; helped to urge on the war with Britain of 1812. From 1808 onwards he was a pioneer of Protection. His great idea was the maintenance of the Union, and this led him to try to mediate in the slavery question, so that he was mistrusted by slaveholders and abolitionists alike. He made unsuccessful attempts to be Pres. of the U.S.A. He won renown as a magnificent orator.

C. Schurz, *Henry Clay*, in 'American Statesmen' Series.

CLAYMORE, Highland, cross-hilted, two-edged broadsword.

CLAYS, PAUL JEAN (1819–1900), Belg. marine painter.

CLAYTON, JOHN MIDDLETON (1796–1856), Amer. politician; Chief-Justice of Delaware (1837–39); Sec. of State (1849–50); noted for association with 'Clayton-Bulwer Treaty' (1850).

CLAYTON-BULWER TREATY between the U.S.A. and Gt. Britain about projected canal across Nicaragua; its stipulations were: (1) neither party to obtain exclusive or unequal control; (2) canal to be neutral; (3) powers to extend their protection to other communications across the isthmus; (4) neither to get help of neighbouring states; it was superseded by Hay-Pauncefote Treaty of 1902.

CLAY-WITH-FLINTS, deposits of clay with whole flints or fragments and pebbles, occurring in patches in the south of England, and corresponding to the *argile silex* of the Paris basin, indicating a mingling of lower Eocene beds and chalk.

CLAZOMENÆ, ancient Ionian town, on Gulf of Smyrna, Asia Minor.

CLEANTHES (III. cent. B.C.), poet and philosopher; b. Assos; worked as drawer of water by night to earn fee as Zeno's pupil. See STOICS.

CLEARCHUS (fl. V. cent. B.C.), Spartan leader; gov. of Byzantium when citizens opened their gates to Alcibiades (409 B.C.).

CLEARFIELD (41° 2′ N., 78° 26′ W.), town (and county), Pennsylvania, U.S.A.; iron foundries. Pop. (1910) 6851.

CLEARING-HOUSE (Railways).—An association of which most of the railways of England and Scotland are members. It deals with through traffic, *i.e.* where passengers and goods are carried in one journey over lines belonging to two or more companies, and settles what portion of the fares and charges should be allotted to each of the companies concerned. See also BANKS.

CLEAT, block fastened to upright structure to keep in position slanting support; double-ended peg for attachment of ropes.

CLEATOR MOOR (54° 31′ N., 3° 31′ W.), town, Cumberland, England; coal and iron mines. Pop. (1911) 8302.

CLEAVERS, CATCHWEED, GOOSEGRASS (*Galium aparine*), common plant (order Rubiaceæ), in waste

places and hedges, with a four-sided stem bearing whorls of narrow leaves and white flowers, and covered with short hooked hairs.

CLEBURNE (32° 21′ N., 97° 21′ W.), town, Texas, U.S.A.; large railway workshops; foundries and flour-mills; centre of prosperous farming and fruit-growing region. Pop. (1910) 10,364.

CLECKHEATON (53° 44′ N., 1° 43′ W.), town, West Riding, Yorkshire, England; woollen goods; machinery. Pop. (1911) 12,867.

CLEETHORPES (53° 34′ N., 0° 2′ W.), watering-place, on North Sea, Lincolnshire, England. Pop. (1911) 21,419.

CLEF (Lat. *clavis*, key), mark in musical notation, which determines pitch of notes; two c's in general use, treble or G, bass or F; alto and tenor c's used in orchestration.

CLEFT PALATE, a congenital deformity due to incomplete development of the roof of the mouth, the cleft usually being in the middle; operative treatment should be carried out as early as possible.

CLEGGS, see GAD-FLIES.

CLEISTHENES (fl. 500 B.C.), Athenian statesman, member of the exiled family of the Alomæonidæ. About the year 508 B.C. or soon after he began his democratic reforms, in which his object was to complete the work of Solon, in which the clan organisation, with its disadvantages, still remained. He divided Attica into three regions—the city, coast, and inland, and each of these into ten groups or *Trittyes*. Out of these thirty trittyes he formed ten tribes, taking one group from each of the three regions to form a tribe. Thus the clan system was avoided. He next substituted a new Council of Five Hundred instead of the old Council of Four Hundred, with definite administrative, deliberative, and judical functions. He further carried out franchise reforms, and introduced 'ostracism.' He prepared the way for the glory of Athens under Pericles.

J. B. Bury, *History of Greece*.

CLEITOR, CLITOR (37° 54′ N., 22° 7′ E.), town, Arcadia, ancient Greece; celebrated fountain whose waters were said to give a distaste for wine.

CLELAND, WILLIAM (d. 1689), Scot. soldier and poet; killed at *Dunkeld*.

CLEMATIS, genus of ranunculaceous shrubby climbing plants; many species; c., with large white or violet flowers, in gardens; *C. Vitalba*, 'Traveller's *Joy*,' is common on light chalky soils in England.

CLEMENCEAU, GEORGES BENJAMIN EUGÈNE (1841–), Fr. statesman, journalist, and medical man; member of National Assembly from 1871; edit. *L'Aurore*; radical reformer, supporting Gambetta, Dreyfus, and carrying Separation Bill; Prime Minister, 1906–9, being defeated on naval question after dramatic scene with Delcassé.

CLEMENCÍN, DIEGO (1765–1834), Span. politician and scholar.

CLEMENT, name of fourteen popes and two anti-popes: for **Clement I.**, see separate article below. **Clement IV.**, GUIDO LE GROS (1265–68), Fr. knight, soldier, and advocate; ordained after death of his wife; supported Charles of Anjou against Manfred. **Clement V.**, BERTRAND DE GOT (1305–14), abp. of Bordeaux; consented to suppression of Templars at instigation of Philip the Fair of France, 1311. **Clement VI.**, PIERRE ROGER (1342–52), Fr. Benedictine monk; purchased Avignon; patron of art and letters. **Clement VII.**, GIULIO DE' MEDICI (1523–34), Florentine; pronounced against Henry VIII.'s divorce from Catherine, 1534, after long delay, and excommunicated Henry. Rome was sacked by the Germans, 1527. **Clement VIII.**, IPPOLITO ALDOBRANDINI (1592–1605), Florentine; instituted the Forty Hours' Devotion; Giordano Bruno burnt at Rome, 1600, under his authority. **Clement IX.**, GIULIO ROSPIGLIOSI (1667–69), Lombard; brought about Peace of Aix-la-Chapelle, 1668. **Clement XI.**, GIOVANNI FRANCESCO ALBANI (1700–21), Umbrian; organised the Church in the Philippine Islands, and general missionary work. **Clement XII.**, LORENZO CORSINI (1730–40), Florentine; elected at 78; issued first papal decree against Freemasons, 1738; though stricken with blindness, an indefatigable worker. **Clement XIII.**, CARLO DELLA TORRE REZZONICO (1758–69), Venetian; contended against demand of Fr. government for suppression of Jesuits. **Clement XIV.**, GIOVANNI VINCENZO ANTONIO GANGANELLI (1769–74), Franciscan Italian; humble birth; consented to suppression of Jesuits, 1773.

History of the Papacy, by Barry, Ranke.

CLEMENT I., SAINT, CLEMENT OF ROME, first pope of whom there is definite historical knowledge, one of the Apostolic Fathers; author of an epistle to the Corinthians; d. *c.* 100. A literature (wrongly) bearing his name, and famous for that reason, has come down to history (**Clementine Literature**):—

II. Clement.—It was probably written in Alexandria about 130 A.D. It is generally included in the group of writings loosely called 'Apostolic Fathers.'

Epistles to Virgins (2), written against spiritual unions between members of opposite sexes leading the monastic life—a practice common in Syria in the III. cent.; written in Syriac about this time.

Clementine Homilies and *Clementine Recognitions*, two works evidently related to each other and derived from a common source, the Periodoi (Circuits) of Peter. There was also a letter, attributed to Clement, to James, the Lord's brother. These probably had their origin in Syria about 265 A.D., and were intended to win converts to Christianity. The *Homilies* and *Recognitions* were composed about a century later. They illustrate Jewish Christianity in Syria, a type which soon became swamped by Catholicism. Owing to their attribution to Clement, they became famous, and from them is ultimately derived the legend of Faust. Their importance was exaggerated by the Tübingen school of criticism.

Hort, *Clementine Recognitions*.

CLÉMENT, FRANÇOIS (1714–93), Fr. historian.

CLÉMENT, JACQUES (1567–89), Fr. Dominican; murdered Henri III.

CLEMENT OF ALEXANDRIA, one of the most brilliant of the Gk. Fathers, was head of the Alexandrian school (*q.v.*), *c.* 190–203 A.D.; he wrote a trilogy of connected works: (1) *A Word of Exhortation to Greeks* (*i.e.* Gentiles), in which he dwells on the antecedents to Christianity in the better types of heathenism; (2) *The Schoolmaster*, specially directed to those baptized in their youth, and now under the tuition of the Word; (3) *Clothes-bags* (*Stromateis*), a guide to deeper Christian philosophy. C. also wrote a commentary on the Scriptures, but this survives only in fragments (the others in full). His theological thought is broad and spiritual.

Swete, *Patristic Study*; Bigg, *Christian Platonists of Alexandria*.

CLEMENTI, MUZIO (d. 1832), Ital. composer and pianist.

CLEOMENES I., king of Sparta; reigned 520–488 B.C.; won great victory over the Argives; helped Athenians to expel Peisistratidæ; did much to strengthen power of Sparta.

CLEOMENES II., king of Sparta; reigned 370–309 B.C.

CLEOMENES III., king of Sparta; his reign (235–219 B.C.) was of military and political importance.

CLEON (d. 422 B.C.), Athenian statesman; headed opposition to Pericles in 430; after Pericles' death became democratic leader; displayed enmity against Athenian nobility and against Sparta; captured Spartans in Sphacteria, 425; killed at Amphipolis.

CLEOPATRA (69–30 B.C.), queen of Egypt; succ. her f., Ptolemy Auletes XIII.; fascinated Julius Cæsar and then Mark Antony, at whose death she committed suicide.

CLEOPATRA'S NEEDLE, see OBELISK.

CLEPSYDRA, see CLOCK.

CLERESTORY, upper storey of church over the nave, pierced with windows.

CLERGY, term used for ministers as opposed to laity; its singular is 'clerk,' still formally used in ecclesiastical sense.

CLERGY, BENEFIT OF, see BENEFIT OF CLERGY.

CLERK (Lat. *Clericus*), name first given to a person in religious orders; later, included laymen associated with ecclesiastical buildings. In mediæval times the clergy were practically the only persons capable of secretarial work; hence modern use of term in sense of a penman or bookkeeper.

CLERKE, AGNES MARY (1842–1907), Eng. astronomical writer; author of *A Popular History of Astronomy during the XIX. Century* (4th ed., 1902), *The System of the Stars* (2nd ed., 1905), *Modern Astronomy* (1895); *Modern Cosmogonies* (1906), and numerous other valuable works and articles.

CLERKENWELL, northern parish in borough of Finsbury, London, England; centre of watchmaking and jewellery manufacture. Pop. (1911) 87,976.

CLERMONT (49° 25′ N., 2° 20′ E.), town, on R. Brèche, Oise, France; interesting mediæval buildings; burned by Eng., 1359 and 1415. Pop. 4000.

CLERMONT-FERRAND (45° 46′ N., 3° 5′ E.), city, Puy-de-Dôme, France; Roman *Augustonemetum*; formed by union in 1731 of ancient Clermont and Montferrand; bp.'s see; most notable edifices are XIII.-cent. Gothic cathedral; church of Notre-Dame-du-Port, museums of antiquities and natural history; has famous mineral springs. First crusade was declared here by Pope Urban II. at the ecclesiastical council of 1095. Chief manufactures, preserves, semolina, chemicals, rubber goods; important grain market. Pop. (1911) 65,386.

CLERMONT L'HÉRAULT (43° 38′ N., 3° 25′ E.), town, Hérault, France; manufactures army cloth and woollen goods. Pop. 5300.

CLERMONT-TONNERRE, Fr. historical family, founded in XI. cent.; many members famous; Gaspard de C.-T. cr. duke and peer of France, 1775.

CLERUCHY, an Athenian colony in a foreign country, where former inhabitants were exterminated, conquered, or given pecuniary compensation; the cleruchs kept their rights as Athenian citizens.

CLETUS, another form of Anacletus (*q.v.*).

CLEVEDON (51° 26′ N., 2° 52′ W.), watering-place, Somersetshire, England. Pop. (1911) 6111.

CLEVELAND (41° 29′ N., 81° 39′ W.), city, Ohio, U.S.A., on S. shore of Loch Erie, and on Cuyahoga R., which forms inner harbour; northern terminus of Ohio canal; great railway centre; well laid out, with broad streets crossing each other at right angles. Public buildings include city hall, court-house, post-office, Case Library, various colleges and asylums, R.C. cathedral; great number of beautiful parks, of which Rockefeller Park is largest, extending along valley of Doan, and connecting Wade and Gordon Parks. C. is chief centre in U.S.A. for iron ore; great lumber and coal trade; iron manufacture in all branches, from ships and bridges to sewing-machines and screws; petroleum refineries, meat-packing establishments, manufacture of clothing, paint, chemicals, etc. City is administered by mayor elected every two years, and council. Inhabitants include large number of British, German, and other European nationalities. C. was first laid out, 1796; importance dates from third decade of last cent. when channel was cut across bar at mouth of river. Pop. (1910) 560,663.

CLEVELAND, BARBARA VILLIERS, DUCHESS OF (1641–1709), Eng. courtesan; wife of Roger Palmer (cr. Earl of Castlemaine) and mistress of Charles II., by whom she was cr. Duchess of C., 1670; a very beautiful, but vicious, woman; by Charles II. she had three sons: CHARLES FITZROY, Duke of Southampton, and Cleveland, HENRY, Duke of Grafton, GEORGE, Duke of Northumberland, and one or two daughters.

CLEVELAND, JOHN (1613–58), Eng. satiric poet; devoted adherent of Charles I.; poems had immense vogue in XVII. cent.

CLEVELAND, STEPHEN GROVER (1837–1908), pres. of the U.S.A.; b. New Jersey; s. of a Presbyterian clergyman; called to the Bar, 1859. He became assistant district attorney, 1863, and sheriff, 1869, being Democratic candidate and gov., 1882. C. was elected pres. for 1885–89. He opposed many bills passed by Congress, particularly one which would have enormously swollen the pensions. He next set himself to reform the tariff. Being again nominated for the presidency, he was defeated, and retired till his election again for 1893–97. His term of office was marked by a financial crisis and a dispute with Great Britain. He lived in retirement from 1897 till his death in Princeton, New Jersey.

CLEVES, KLEVE (51° 47′ N., 6° 9′ E.), town, Rhenish Prussia; formerly capital of duchy of C.; ancient ruined castle of the Schwanenburg, former residence of dukes, is associated with legend, 'Knights of the Swan'; warm mineral springs; leather, tobacco. Pop. 16,465.

CLEVES, ANNE OF, see ANNE OF CLEVES.

CLICHTOVE, JOSSE VAN (d. 1543), Catholic theologian; controversialist of Luther.

CLICHY, CLICHY-LA-GARENNE (48° 55′ N., 2° 19′ E.), town, on Seine, France; chemicals. Pop. (1911) 46,676.

CLICK BEETLES, see under POLYMORPHA.

CLIFF-DWELLINGS, habitations in New Mexico and Utah, U.S.A., placed in almost inaccessible positions on rock-faces, sometimes hollowed out of limestone; access by removable ladder, or steps hewn in rock; often invisible from ground.

Nordenskiöld, *Cliff-Dwellers in the Mesa Verde* (1893).

CLIFFORD, Eng. barony; ROBERT DE CLIFFORD summoned to Parliament as baron, 1299; killed at *Bannockburn*, 1314; the barony has now passed out of the original line.

CLIFFORD, JOHN (1836–), Nonconformist minister and politician; ed. Univ. Coll., London; Baptist minister since 1858; well known as Liberal politician, and as a 'passive resister' after Education Act (1902).

CLIFFORD, WILLIAM KINGDON (1845–79), Eng. philosopher and mathematician.

CLIFFORD OF CHUDLEIGH, THOMAS CLIFFORD, 1ST BARON (1630–73), lord treasurer of England; served in navy from 1664; cr. baron, 1672, then lord treasurer; resisted Test Act of 1673, and as a R.C. followed Duke of York into private life. C. was a sincere man, though a bad counsellor.

CLIFTON (51° 27′ N., 2° 37′ W.), western suburb of Bristol, Gloucestershire, England, on Avon; mineral springs; Rom. relics.

CLIMACTERIC, the period of life of a woman known in medicine as the 'change of life' or the *menopause*. It takes place about the age of 45 to 50, and is marked by the involution and loss of function of the generative organs. The word is also used generally as meaning a critical period.

CLIMATE.—It has been known from the earliest times that the atmospheric conditions in different parts of the earth are not the same, and the earth was early divided into zones or belts, each distinguished by certain conditions of temperature, moisture, etc., occupying a particular position with reference to the sun. But when the daily, annual, and monthly variations in the atmosphere are considered these divisions are not satisfactory, for local physical features, mountains, lochs, etc., become important. It has been found that each place has a certain series of atmospheric conditions each of which is termed the *weather*. The average weather is termed the *climate* and the study of weather conditions *climatology*. The facts regarding weather are mostly derived from *meteorology*, which is the study of the physics of the atmosphere. Climatology expresses meteorological data in simpler language so that its facts can be utilised

by the farmer, planter, and breeder. Crops, industry, and health depend on climate, and therefore a study of its variations is important.

Climatology records the temperature, moisture, pressure, winds, and evaporation which occur, and considers the regular and irregular variations from the average conditions. The maximum and minimum temperatures, the rainfalls, the frequency, direction, and velocity of winds and the probability of occurrence of any condition are all important matters to agriculturists. The relationships between climate and plants are being most minutely worked out so that the climate can be deduced from the tissues of plants as these show modifications which enable them to withstand heat, cold, drought, ice, and water. Certain diseases are known to be associated with particular weather conditions because certain insects and parasites flourish in these conditions. If the local physical features are altered by drainage the disease vanishes.

Three chief varieties of climate are recognised: *Marine* or *Oceanic*, where the land warms readily and cools readily. The water warms slowly and little, but does not cool easily. This retards the maximum and minimum changes, giving a cool spring, warm autumn, and only slight seasonal changes. The water thus acts as a source of warmth in the winter months. Abundant evaporation from the surface of the ocean causes higher humidity, larger amount of cloudiness, with a heavier rainfall than is found on continents. Climate is equable, damp, and cloudy. The air is cleaner and purer and moves more rapidly than over continents.

Continental climate is severe. The coldest month is Jan. and the warmest July. The air is drier and dustier than in marine districts. The amount and frequency of the rainfall are diminished, but the diminution depends largely on the local physical features of the place, and on the prevailing winds. Winds are less in velocity, and calms are more frequent. There is abundant sunshine, less humidity, and severe maximum and minimum temperatures, which are borne well on account of the dryness of the air. Weather changes do not occur abruptly as a rule.

Desert climate may be regarded as a type of severe continental climate. High winds are common by day, but the nights are calm and cold. Occasional downpours of rain occur on the borders of the desert, and may cause flooding. The excessive range of temperature causes the rocks to split up. The wind storms drive the sand against them, and the continual friction polishes them. The plants of the region are peculiarly suited to its climate, having a greatly reduced leaf surface, hairs, very thick skin coated with wax, and various other devices to prevent evaporation.

There are several other recognised types of climate. *Coast* climate is intermediate between ocean and continental. The prevailing winds have a very important effect in controlling it. If they come from the ocean the climate inclines towards the ocean type; if from shore it is a modification of the continental. There are three seasons in the *Monsoon* climate—one hot, one cold, one wet, during the summer monsoon. In India the winter monsoon blows off shore, the summer one on shore. A monsoon climate also occurs in Eastern Asia. In a *Mountain* or *Plateau* type of climate the height and obstructive effect of the mountains are very important modifying factors. There is a decreased temperature and humidity, and the wind velocity is higher than on the continent. The air is cleaner, purer, and drier. The night temperature is warm because the cold air collects in the valleys below.

Uniformity of climatic features distinguishes the *Torrid Zone*. There are no seasons. Life is regulated by the rainfall. There is a high uniform temperature. Periodic phenomena depending on the daily and annual march of the sun predominate. Cyclones are the only events which have an important economic result, for the destruction they work often takes years to repair. They are restricted to certain regions and special times. The *Temperate Zone* is characterised by marked changeableness of weather. The mean temperature and physiological effects are intermediate between those of the Torrid and *Polar Zones*. The weather changes are apparently irregular and haphazard, but they occur fairly systematically. The winds are the important controls. The seasons are classified by temperature. Except the rather meagre data brought back by recent Arctic and Antarctic expeditions, there is no account of Polar climate. It may be said that the temperate regions have provided the most highly developed human societies, probably because the climate has required a more strenuous cultivation of plants and animals. In the Mediterranean area early man must have had not only to clear forests before he sowed and planted, but to bring water to his fields.

The British Isles have a very typical maritime climate, because the ocean on the west coast is unusually warm, and the winter winds as a rule blow towards them from the warm region of this ocean. The summer temperature is diminished by winds from the colder northern regions. Brit. weather is unique in its variability. This is ascribed to areas of low pressure, which come from the Atlantic and pass over the islands towards the Baltic. In front of these are warm southerly winds, and behind them are cold northerly winds. The warming of the air lowers the pressure, and the cooling of it raises the pressure, so that there is a continual eastward displacement due to air at high pressure travelling to regions of low pressure. The depression causes a storm, after which the temperature falls. This denotes that the colder winds behind it have reached the islands. If the temperature rises again it denotes that warm southerly winds are sweeping across in front of a depression. There also occur periodically areas of high pressure, which remain stationary till displaced by the areas of low pressure. The effect of these differs according to the season at which they occur. In winter they cause very cold, bright, fine weather. In summer they are warm. The climate of N.W. Europe is greatly influenced by the Gulf Stream. In Januar[illegible] of this region but also of E. Siberia is comparatively high.

Croll, *Climate and Time*; Bartholomew, *Physical Atlas*; Lempfert, *Weather Science* (People's Books, 1912).

Acclimatisation, the process by which animals or plants are gradually adapted to—and so are able to live and thrive in—a climate different from that to which they originally belong. Acclimatisation may be through modification of an individual plant or animal, or by the production of offspring which are better able to thrive in the new climate. A single variation of a plant or animal has been found to flourish better than its fellows under severe conditions of climate, and by careful cultivation of this particular individual and its descendants a type of the species is evolved which is hardier and more adapted to the climate, and which may have actual structural change in the direction of adaptation to new conditions. In order to acclimatise plants or animals most successfully in an extreme climate it is best first to transfer a large number of the species to a climate midway between the old conditions and the new, and select the most healthy individuals at this first stage for transference to the more remote climate, exposing them first to the milder, and then the ultimate healthy selection to the more severe conditions.

Many interesting experiments have been made in America and Australasia. The sparrow has thriven so well in N. America that it is now a nuisance, as is the rabbit in Australia and New Zealand. The camel is well acclimatised in some of the desert districts of N. America and Australia, various species of trout, etc., flourish in the rivers of New Zealand, while the Australian eucalyptus and other trees grow well in California, and the tea-plant thrives in U.S.A.

Similar examples are common in Europe and all over the world.

In regard to man, while sudden transition to an extreme climate may often be harmful, yet there is no doubt that if the transference is gradual, in a few generations man can become acclimatised in every extreme of climate, while sometimes, *e.g.* in some of the pure white races of S. America, the new people may be actually superior in physique to the old stock. Modern sanitation and hygiene have removed most obstacles to man's acclimatisation, which have most often been tropical parasitic diseases that his unaccustomed body was unable to resist, *e.g.* malaria, yellow fever.

Darwin, *Animals and Plants under Domestication*; Waitz, *Introduction to Anthropology*.

CLIMAX, JOHN (525–600), mystical theologian, abbot at Mount Sinai; wrote *Ladder of Paradise*.

CLIMBING FERN, HARTFORD FERN (*Lygodium palmatum*), is a favourite greenhouse ornamental climber, with a long stem bearing palmate fronds.

CLIMBING PLANTS are those which, owing to inability to support themselves on their own stems, seek artificial means; hop, ivy, convolvulus are common examples in Britain, while 'monkey-ropes' and lianes are found all over the tropical world.

CLINCHANT, JUSTIN (1820–81), Fr. soldier; served in Algerian campaigns (1847–52); in Crimean and Mexican Wars; was general of brigade in Army of Rhine (1870); surrendered at *Metz*, but ultimately escaped.

CLINICAL MEDICINE, see MEDICINE.

CLINKER-BUILT, see BOAT.

CLINOCLASITE ($(CuOH)_2AsO_4$), mineral occurring in blue-green crystals as a decomposition product of copper ore, in Cornwall, Devon, Saxony, Utah.

CLINOMETER, apparatus for gauging angle of slope of surface; consists of graduated arc with pendulum; sometimes compass-attachment is used by geologists.

CLINTON (43° 1′ N., 75° 24′ W.), village, New York, U.S.A.; seat of Hamilton Coll.; ironworks. Pop. (1910) 1236.

CLINTON (38° 20′ N., 93° 50′ W.), city, Missouri, U.S.A.; potteries, flour. Pop. (1910) 4992.

CLINTON (42° 27′ N., 71° 42′ W.), township, on Nashua, Massachusetts, U.S.A.; extensive manufactures of ginghams, carpets, machinery. Pop. (1910) 13,675.

CLINTON (41° 50′ N., 90° 19′ W.), city (and county), Iowa, U.S.A.; seat of Wartburg Coll.; numerous mills; furniture, paper. Pop. (1910) 25,577.

CLINTON, DE WITT (1769–1828), Amer. politician; admitted to Bar, 1790; private sec. to his uncle, leader of the Republican party; became member of N. York Assembly, of U.S. Senate; mayor of N. York; opposed slavery, championed education, pressed forward Erie Canal scheme, and ultimately opened canal.

CLINTON, GEORGE (1739–1812), Amer. soldier; fought in war against Britain, 1775–80; gov. of New York; unsuccessful as candidate for Presidentship.

CLINTON, SIR HENRY (*c.* 1738–95), Brit. soldier; fought in Seven Years War and in Amer. War; gov. of Gibraltar, 1794.

CLINTON, HENRY FYNES (1781–1852), Eng. chronologist; pub. treatises on classical chronology.

CLINTONITE, BRITTLE MICAS, group of minerals between micas and chlorites, containing less silica than the former (and no alkalis) and less water than the latter; include margarite, chloritoid, xanthophyllite, brandisite, seibertite.

CLISSON (47° 6′ N., 1° 20′ W.), town, Loire-Inférieure, France; at confluence of Sèvre Nantaise with Moine.

CLISSON, OLIVIER DE (1336–1407), Fr. soldier; fought under Bertrand du Guesclin in campaigns against English, and succ. him as Constable of France (1380); acquired vast wealth and power.

CLITHEROE (53° 53′ N., 2° 23′ W.), market town, on Ribble, Lancashire, England; has remains of XII.-cent. castle; grammar school founded 1554, and a technical school; Stoneyhurst Coll. for R.C. students is 5 miles S.W.; cotton and paper mills; lime-works.

CLITOMACHUS (II. cent. B.C.), Gk. philosopher.

CLITUMNUS (42° 45′ N., 12° 43′ E.), small river, Umbria, Italy; enters Tinia, a tributary of Tiber.

CLIVE, CAROLINE (1801–73), Eng. authoress; several vol's of verse and successful novels.

CLIVE, KITTY (1711–85), Eng. comic actress; acted under Cibber and Garrick at Drury Lane; friend of Horace Walpole.

CLIVE, ROBERT CLIVE, BARON (1725–74), Brit. statesman and general; b. at Styche, Shropshire, Sep. 29. At school he was unruly, and in consequence was sent to India in 1743. C. went by way of Brazil, where he learnt Portuguese, reaching Madras in 1744. He entered the army in 1747, and, after various small actions, he won great distinction at the siege of *Arcot* in 1751. War with the French broke out again in 1756. C. had been in England for three years, and returned as gov. of Fort St. David. Then occurred the famous incident of the *Black Hole of Calcutta* (see CALCUTTA). C. defeated the Nawab's troops, and, after several months spent in negotiations, he won the great victory of *Plassey* (June 1757). He followed this up by other victories, and established Brit. supremacy in Bengal. He returned to England in 1760, and was cr. baron in 1762. He sailed again for India in 1765, and in less than two years accomplished much in the civil administration of India; he raised the salaries of officials, and prohibited the accepting of gifts from natives. His health obliged him to return to England, and there violent attacks were made on his public administration and his private character; these were partly occasioned by his administrative reforms and cutting down of illicit gains. He defended himself vigorously, but morbid depression overcame him and he committed suicide. Despite his faults (which are often exaggerated), C. ranks high as a Brit. empire-builder.

Sir A. J. Arbuthnot, *Lord Clive* (1899); Sir C. Wilson, *Lord Clive* (1890); G. B. Malleson, *Lord Clive* (1890); F. M. Holmes, *Four Heroes of India* (1892); Lord Macaulay, *Essay on Clive*.

CLOACA, Roman sewer; *Cloaca Maxima* (VI. cent. B.C.), is famous.

CLOCK, instrument for measuring time, and showing on a dial hours, minutes, and sometimes also seconds. The earliest time-measurer was undoubtedly some form of sun-dial, in which the progress of the sun was registered by a shadow thrown upon a graduated plate. The sun-dial was followed by the *Clepsydra*, or water-clock, which measured the hours by the quantity of water discharged through a small hole in the containing vessel. The sand-glass worked on the same principle, sand or powdered egg-shells taking the place of water, as in the familiar egg-boiler. The date of the invention of the c. proper is very uncertain, for the references to the early instruments of Boethius, Pacificus, and others are so vague as to leave it doubtful whether they were wheel-and-weight clocks or some form of water-clock.

The earliest c. of which we have a full description was made in 1379 by a German named Henry de Wyck, and erected in Paris for Charles V. In this c. a cylinder was set in motion round its axis by the uncoiling of a cord carrying a weight, this motion being successively communicated to a series of toothed wheels, ending in the escapement wheel. The teeth of the escapement wheel acted upon two small levers called pallets, which projected from and formed part of an upright spindle on which was fixed the regulating balance. The cylinder also set in motion a wheel to which were attached the hands of the c. The balance was loaded with two weights, which resisted the unwinding of the cord, and the c. was regulated by increasing or decreasing the distance of the weights

from the spindle. This construction formed the basis of practically all c's up to the application of the pendulum as a regulating power, which was accomplished by Huygens about 1657. The value of the pendulum as a regulating power lies in the fact that its oscillations all take substantially the same time, and after this date all c's with any pretensions to accuracy were fitted with a pendulum. The accuracy of a pendulum as a regulator depends upon its being always the same length, and with the simple pendulum serious errors arise from its expansion or contraction with variations in temperature. To obviate this defect, *compensating pendulums* were constructed, the most important being the 'gridiron' and the 'mercurial' pendulums. The 'gridiron' pendulum, invented by Harrison in 1726, is made of alternate bars of two different metals. When heated, one set of bars expands upwards and the other downwards, and the lengths of the bars are so proportioned that one expansion exactly counteracts the other. In Graham's 'mercurial' pendulum, invented 1715, the bob consists of a glass cylinder containing mercury. When a rise in temperature causes the metal rod to lengthen, the mercury simultaneously expands upwards, thus raising the centre of inertia and counteracting the lengthening of the rod.

Other great improvements upon Huygens' c. were made, notably in the escapement, or mechanism which transforms the rotatory wheel motion into the oscillatory motion of the pendulum. Huygens' c. required a light pendulum and large arcs of oscillation, and an improved arrangement, known as the 'crutch' or 'anchor' escapement was invented by Hooke about 1666. This device allowed of a much heavier pendulum with smaller arcs of oscillation, and is still largely used. Early in the XVIII. cent. an improved form known as the 'dead beat' escapement was made by Graham. This gives greater accuracy than the 'crutch' escapement, by obviating any recoil. Other escapements have been invented to remedy small errors in the previous forms, but these are used mainly in c's for special purposes where absolute accuracy is required. In small portable c's and watches, where the motive-power is a mainspring, the motion is chiefly regulated by the escapement and balance-wheel, the gradual weakening of the motive force as the spring uncoils being adjusted by a contrivance called the 'fusee.' The balance-wheel is compensated for variations in temperature on the principle of the 'gridiron' pendulum. Various modifications of the escapement in spring c's and watches have been introduced, amongst which may be mentioned the 'lever' escapement so much used in English watches, and the 'detached' escapement as used in chronometers.

Portable c's were first mentioned in the early part of the XIV. cent., but the exact date of their introduction is uncertain.

There is great variety in the striking arrangements of c's, from simple strokes at the hour to most elaborate chimes. Striking c's are technically known as c's, the non-striking ones being called *timepieces*. Performing c's were very popular in the XV. and XVI. cent's, and are still made. In some of these a procession of figures appears at certain intervals, while others have large bronze figures which strike the hours with hammers upon gongs.

In order to facilitate the keeping of a uniform time, the exact astronomical time as ascertained at observatories is very often communicated to the public by means of a time-ball, which is electrically dropped exactly at one o'cock.

[illegible]t in perfect agreement with a standard c. by means of electricity. The method consists essentially in transmitting at regular intervals a current of electricity from the standard c. to the pendulums of the copying c's, which are thus retarded or accelerated as may be required in order to beat with the standard c. The primary c. is as a rule not electrically driven, but is an ordinary astronomical c., the pendulum of which makes and breaks the current in a circuit.

The largest turret c's for public use have hands 8 or 10 feet long, and the hours are struck on a bell which may be heard at a distance of several miles. Illuminated c. dials to show the time at night were first introduced in the early part of the XIX. cent.

David Glasgow, *Watch and Clock Making* (1885); F. J. Britten, *Watch and Clock Makers' Handbook, Dictionary, and Guide* (11th ed., 1907); Cunynghame, *Time and Clocks* (1906).

CLODIUS, PUBLIUS (*c.* 93–52 B.C.), Rom. politician; won notoriety for penetrating into mysteries of 'Bona Dea'; secured banishment of Cicero; became a demagogue; killed in brawl with Milo.

CLOGHER (54° 25′ N., 7° 11′ W.), market village, County Tyrone, Ireland; cathedral.

CLOISTER was originally the general name for an entire conventual building, and in this sense is frequent in Eng. lit. Later applied to the covered ambulatory, the roof of which was supported upon pillars and open arches, surrounding the quadrangle of a monastery, and here many of the duties of a religious house were carried on, *e.g.* copying and illuminating manuscripts, training novices, etc. The cloisters of many Eng. cathedrals are still in a perfect state of preservation, one of the finest examples being Gloucester; they are also to be seen at Eton and Winchester Schools, and in some of the Oxford Colleges.

CLONAKILTY (51° 37′ N., 8° 50′ W.), seaport, market town, County Cork, Ireland; breweries, corn-mills. Pop. 3000.

CLONES (54° 13′ N., 7° 17′ W.), market town, County Monaghan, Ireland; interesting ruins; formerly lace-making centre; agricultural produce.

CLONMACNOISE (53° 20′ N., 7° 59′ W.), town, on Shannon, King's County, Ireland; seat of religion and learning in ancient times; numerous remarkable antiquities.

CLONMEL (52° 22′ N., 7° 41′ W.), market town, on Suir, County Tipperary, Ireland; besieged by Cromwell, 1650; birthplace of Sterne; has flour- and breweries; exports grain, cattle, butter. Pop. 10,000.

CLOOTS, JEAN BAPTISTE DU VAL DE GRÂCE, BARON VON (1755–94), Fr. Revolutionist, known as ANACHARSIS CLOOTS; violent anti-Christian; member of Convention, 1792; guillotined through Robespierre's influence.

CLOQUET (46° 42′ N., 92° 27′ W.), town, Minnesota, U.S.A.; lumber and paper mills. Pop. 3000.

CLOSE, MAXWELL HENRY (1822–1903), Irish clergyman and geologist; leading authority on glacial geol. of Ireland; pres. of Royal Geological Soc. of Ireland (1878).

CLOSE WRIT (*Literæ Clausæ*, letters close), letter from Crown to individual. Closed and sealed outsic's, unlike letters patent (*q.v.*); enrolled on Close Roll.

CLOSURE, expedient for facilitating parliamentary business; any member may move c., which means that division be taken forthwith; introduced into Fr. Chamber, 1882, and House of Commons, 1885, where it has been used systematically since 1911, proceedings being automatically stopped at stated time.

'Kangaroo c.' means that Chairman of Committee selects amendments to be discussed; a dangerous parliamentary device.

CLOT, ANTOINE BARTHÉLEMY, CLOT BEY (1793–1868), Fr. physician; founded hospital and medical school near Cairo; made a bey, and later a general, by Mehemet Ali; app. head of the Egyptian medical administration.

CLOTAIRE, name of four Frankish kings: **Clotaire I.** (d. 561), s. of Clovis; king of Soissons, 511; of all Gaul, 558; also of part of Germany. **Clotaire II.** (d. 629), king, 584; **Clotaire III.**, king, 657–73; **Clotaire IV.**, king of Austrasia, 717–19.

CLOTILDA, ST. (d. 544), dau. of Chilperic, king

of Burgundy; m. Clovis, king of Franks, whom she helped convert to Christianity.

CLOUD, an elevated mist formed by the condensation of aqueous vapour in the air. Several classifications have been brought forward, the following being established by an international committee in 1896: A. *Upper clouds*, average altitude, 9000 metres; (1) cirrus; (2) cirrostratus. B. *Intermediate c.*, 3000–7000 m.; (3) cirrocumulus; (4) altocumulus; (5) altostratus. C. *Lower c.*, 2000 m.; (6) strato-cumulus; (7) nimbus. D. *Clouds of diurnal ascending currents*; (8) cumulus, 1400–1800 m.; (9) cumulo-nimbus, 1400–3000 or 8000 m. E. *High fogs* under 1000 m.; (10) stratus.

Clement Ley, *Cloudland* (1894); A. W. Clayden, *Cloud Studies* (1906).

CLOUDBERRY (*Rubus Chamæmorus*), a kind of raspberry, bearing large white flowers and orange-yellow edible fruit; grows in N. temperate regions; is marketable in Sweden and Denmark.

CLOUDED TIGER, CLOUDED LEOPARD (*Felis macroscelis*), member of cat family living in forests of the E. Indies and S. Asia; the greyish-brown body, up to 4 ft. in length, marked with stripes, rings, and spots.

CLOUET, FRANÇOIS (d. 1572), Fr. miniature artist; s. of Jean C. (*q.v.*); was a painter of eminence, and executed portraits of Henri II., Mary of Scots, and other notables.

CLOUET, JEAN (d. 1541), Fr. miniature artist.

CLOUGH, ANNE JEMIMA (1820–92), Eng. educationist; dau. of a Liverpool cotton merchant; sister of A. H. Clough (*q.v.*); became associated with school started at Cambridge (1871), which developed into the famous Newnham College (1880), of which Miss C. became the first principal.

CLOUGH, ARTHUR HUGH (1819–61), Eng. poet; b. Liverpool; spent his childhood in America; returning to England, was ed. at Rugby, under Dr. Arnold, and at Oxford. He was made a fellow of Oriel, but resigned in 1848, owing to religious difficulties. In this year he pub. his most famous poem, *The Bothie of Tober-na-Vuolich*, the description of an Oxford reading-party in the Highlands, written in hexameter verse. In 1854 he became an examiner in the Education Office; six years later his health began to fail, and he d. at Florence. Arnold's *Thyrsis* was written in his memory.

S. Waddington, *Arthur Hugh Clough: A Monograph* (1883).

CLOVELLY (51° N., 4° 24′ W.), fishing village, N. coast of Devonshire, England; on cliff 400 ft. high.

CLOVER (*Trifolium*), leguminous plant embracing about 300 species, with characteristic leaf with three leaflets (trefoil), important for pasturage and fodder. As a crop (*q.v.*) plant it occupies the third year in the four-course rotation, white c. (*T. repens*), red c. (*T. pratense*), crimson c. (*T. incarnatum*), and alsike (*T. hybridum*) being a few of the more important species. The medick and lucerne (*Medicago*) are closely allied.

CLOVES, the dried flower-buds of the tropical tree *Caryophyllus aromaticus* (order Myrtaceæ), cultivated in the Moluccas, Java, Sumatra, Zanzibar, and the W. Indies; used as a spice and for preparation of the aromatic and pungent *essential oil of cloves*. The latter finds application in cookery, the manufacture of liqueurs, and in dentistry as a local anæsthetic.

CLOVIO, GIORGIO GIULIO (1498–1578), Ital. artist.

CLOVIS (c. 466–511), Frankish king; succ. his f., Childeric I., as king of the Salian Franks, 481; defeated Rom. general Syagrius, 486; m. Christian Burgundian princess Clotilde, 493; conquered Alemanni, baptized a Christian, 496; defeated Visigoths, became champion of orthodox faith against the Arians, and king of all the Franks.

CLOYNE (51° 52′ N., 8° 7′ W.), market town, County Cork, Ireland; seat of R.C. bp.; Prot. see founded by St. Colman, VI. cent., but united to Cork, 1835; has XIV.-cent. cathedral.

CLUB, the name given to an assembly of persons who meet together for the promotion of some common object of interest; also to the building in which such meetings are held. C's existed amongst the ancient Greeks and Romans, the members of which used to share meals, and perhaps the most notable were the religious c's, whose members were pledged to make sacrifice to some particular deity. The earliest known Eng. c. was called 'La Court de Bone Compaignie' in the reign of Henry IV. The poet Occleve was a member. Not until the reign of Elizabeth did the literary or convivial c. become an established institution. The most famous c. of this period was that established by Sir Walter Raleigh at the Mermaid Tavern, of which Shakespeare and most of the other poets and dramatists of the age were members. Ben Jonson founded a similar c. at the Devil Tavern. The next great period of Eng. club-life came into existence with the development of coffee-houses in the XVIII. cent. Prominent amongst the c's of this period were White's (1698), Brooks's (1764), Boodle's (1762), and The Cocoa Tree (1746). The famous *Literary Club* was founded by Dr. Johnson in 1764. The flourishing c's of the present day are too numerous to mention, but it may be noted that 'The Athenæum' was founded in 1824 by Sir Walter Scott and his friends. A notable feature of present-day club-life is the increasing number of ladies' c's.

Col. Ivey, *Clubs of the World* (1880); Nevill's *London Clubs* (1911).

CLUB-FOOT, TALIPES, a general name including several types of deformities of the foot: *talipes equinovarus* is the commonest form, in which the heel is slightly elevated, the foot inverted, and the person walks on the outer border; *talipes equinus*, in which the heel is drawn up, and the person walks on the heads of the metatarsal bones; *talipes calcaneus*, in which the front of the foot is drawn up, and the person walks on the heel; *talipes valgus*, in which the foot is everted, and the person walks on the inner border; *pes cavus*, in which the arch of the instep is greatly exaggerated. There may be combinations of several of these. Talipes may either be congenital, due to faulty development of one or other of the bones at the heel, or acquired, due usually to infantile paralysis. The treatment is persistent care and manipulation, begun as early as possible; operation may be necessary.

CLUNY, CLUGNY (46° 26′ N., 4° 39′ E.), town, Saône-et-Loire, France; formerly seat of celebrated Benedictine abbey, remains of which are Abbot's Palace and ruins of Abbey Church (begun 1089). C. has also two old churches of XII. and XIII. cent's. Pop. c. 4100. The Cluniacs were a subdivision of Benedictine Order, founded here in X. cent.; they eventually had large number of houses (variously estimated at from under 400 to over 2000). At time of suppression of monasteries number had decreased to 32.

CLUPEA, see HERRING FAMILY.

CLUSERET, GUSTAVE PAUL (1823–1900), Fr. politician and soldier.

CLUSIUM (43° N., 11° 54′ E.), town, Siena, Italy; near site of modern Chiusi; ancient capital of Etruria; many sepulchral remains, and some underground passages; several thousand Etruscan inscriptions in district; in museum of antiquities are Etruscan and Gk. vases, etc.; declined after Italy was invaded by barbarians.

CLUWER, PHILIP (1580–1623), Ger. historian and geographer.

CLYDE, river, W. of Scotland; rises in S. borders of Lanarkshire; enters Firth of C. at Dumbarton (106 miles); navigable for liners, up to Glasgow; of great commercial importance and principal ship-building centre in world; has four celebrated falls, near Lanark, where river descends about 250 ft. in few miles; upper valley famous for 'Clydesdale' horses; orchards; iron and coal fields.

Munro and Hunter, *The Clyde* (1907).

CLYDE, BARON, see CAMPBELL, COLIN.

CLYDEBANK (55° 54′ N., 4° 12′ W.), town, on Clyde, Dumbartonshire, Scotland; shipbuilding; sewing-machine works. Pop. (1911) 37,547.

CLYSTER, ENEMA (*q.v.*).

CNIDUS (36° 40′ N., 27° 30′ E.), ancient ruined city, on coast of Caria, Asia Minor; modern Tekir; colonised by Dorians; flourishing commercial centre; temples contained many celebrated works of art; centre of Aphrodite worship; scene of naval victory of Persians over Spartans, 394 B.C.

CNOSSUS, GNOSSUS, KNOSSUS (*c.* 35° 18′ N., 25° 5′ W.), ancient city, Crete, on Cæratus; reputed capital of King Minos; colonised by Dorians; afterwards became Rom. colony; vicinity associated with numerous Gk. legends; since 1900 site of important excavations.

COACHING, favourite mode of travelling from XVII. to early XIX. cent.; first mail-coach between London and Bristol, 1784; rendered dangerous by highwaymen, Hounslow Heath, favourite waylaying-ground; many amateur c. clubs formed, notably the Four-in-Hand Club, founded 1856.

COAHUILA (27° 45′ N., 101° 45′ W.), northern state, Mexico, bordering Texas; rich in minerals; large crops of cotton, Ind. corn; silver and gold mining; area, 62,375 sq. miles. Pop. (1910) 367,652.

COAL.—Scientifically the term coal is confined to a compact black rock containing 75–85 % of carbon. It burns readily with a bright flame, leaving behind it varying quantities of ash and cinder. C. exists as seams or beds, sandwiched between strata of sandstone, shale, and fire-clay in the formations of the Palæozoic, Secondary, and Tertiary ages. It consists of the vegetation of an age when flora was almost entirely represented by forests of club-mosses and ferns reaching a height of 50 ft. and more. Very thin sections of c. show when magnified woody fibres and spore cases. The fire-clay was the soil into which penetrated the roots of the plants. During this period the surface of the earth was sinking and swamps were formed on the débris of these forests. These swamps became filled with mud in which after a time vegetation grew and the process was repeated. Thirty c.-beds have been found in one place of an aggregate thickness of 105 ft., and it has been calculated that each foot of c. represents 500 years' formation. When it is stated that tropical vegetation would give 50 tons of carbon per acre during a growth of 100 years, and that this spread over an acre would not be half an inch thick, the luxuriance of the ancient forests may be understood.

Dead vegetation acted on by water and pressure in the absence of air is converted into lignite and c. The chief gases formed are supposed to be carbon dioxide, which becomes carbonic acid, and carburetted hydrogen. Water is formed during the process. In the first stage the product may be regarded as *peat*, and in the last stage as *anthracite*, for, with the evolution of gas, the proportion of carbon becomes greater. Anthracite has a metalloid lustre, and contains 90 % of carbon. It burns with great heat, giving off no smell or smoke. Probably its gaseous constituents were driven off through the ages. C. is of great economic value, and its distribution is restricted. Holland and Denmark have no coal, Sweden and Italy very little, that in China and Persia is scarcely worked. Four-fifths of the world's c. is produced in Great Britain, the U.S.A., and Germany. It is calculated that all the available Brit. c. will be exhausted in 600 years.

There are six large coal-fields in Britain, and on these are many large manufacturing towns. To the south-east of a line drawn from the Severn to the Wash no c. appears on the surface. There are four well-marked varieties. *Caking* c. from Newcastle fuses together and burns in a compact mass; the *splint* c. from Scotland, difficult to break and to light, gives a clear and lasting fire; the *Staffordshire* c. burns easily, has a white light ash, leaves but few cinders, and does not cake; *cannel* c. burns with a clear flame and crackles as it burns; it is largely employed to manufacture illuminating gas. Anthracite burns with a red heat and is very hard and smokeless, hence its use in war-vessels where concealment is important.

Coal-fields.—Yorkshire produces about 42 million tons; Northumberland and Durham, 33 millions; these fields ship to all parts of the world what is not consumed in the ironworks and shipyards. South Wales supplies anthracite to the coaling stations. Scotland sends to the shipbuilding ports, ironworks, and Ireland. Lancashire is the cotton coal-field. The Staffordshire coal-fields supply the potteries and Birmingham. There are large c. deposits throughout the Brit. empire, especially in Canada and Australia. Coaling stations have been established in all parts of the world, for the convenience of steamers and war-ships.

Coal-mining.—Some coal-pits such as those in Belgium are 3500 ft. deep, and in some districts mines run out far under the sea. Before the introduction of the steam-engine many mines were rendered useless by being flooded with water from the springs they traversed. After the steam-engine gave sufficient power to pump the water out, these shallow excavations were transformed into deep mines. Deep workings require to be very carefully ventilated by steam-fans in order that fire-damp or marsh-gas may be carried away, as it is apt to give rise to explosions. The risk is also reduced by the use of Davy safety lamps, through which the flame cannot pass. Dry c. dust is also a frequent cause of explosion.

C. seams may crop up on a hill or along a valley. Usually they are reached by pits or shafts sunk vertically downwards, from which galleries are excavated to follow each seam. If the c. seam is in a valley the tunnel is made with an upward slope to allow water to drain off. Seams only an inch or so thick may be worked. The average thickness in the Brit. fields is 3 to 5 ft., though they may be from 30 to 60 ft. thick.

C. in the native state is used as fuel for heating and for driving engines, steamboats, and machines. When c. is subjected to destructive distillation, gas, the chief illuminating agent, is obtained, and as a by-product coal-tar. From it the aniline dyes are manufactured, and these have almost replaced the natural dyes while exceeding them in range and vividness. It is said that 2000 distinct shades can be made from a ton of c. Benzene, an organic liquid with great solvent properties, has many industrial and laboratory applications. The phenols are perhaps the most powerful and satisfactory antiseptics which exist. Drugs like antipyrin, acitanilid, and phenacetin, paving substances, coaling preparations, explosives, perfumes, and ammonia are other derivatives.

H. W. Hughes, *Text-Book of Coal-Mining* (1893); R. Meldola, *Coal, and what we get from it* (1891); E. A. Martin, *The Story of a Piece of Coal* (1896); J. A. Phillips, *Metallurgy* (1891).

COALBROOKDALE (52° 37′ N., 2° 27′ W.), town, Shropshire, England; ironworks.

COAL-FISH (*Pollachius carbonarius*), edible fish of the family *Gadidæ*, found on European and American coasts of North Atlantic Ocean.

COALING STATIONS.—Naval warfare requires the means of replenishing vessels with coal, and Britain has secured the best coaling ports in the world. A royal commission was app. to investigate them in 1878. The defence of Brit. coaling stations really lies with the navy—Gibraltar is the only real 'fortress.' It has now become possible to coal a fleet at sea, and hence some prefer the term, 'secondary base,' to 'coaling station.'

COALITION, political term designating the combination for common ends of two or more political factions against another section; examples are the Great C., 1782; and that formed by Liberals, Labour and Nationalists against Conservatives, 1910– ; must be distinguished from non-party system; in c. politicians still retain their party, and, the end aimed at by the c. achieved, may separate once more into opposite factions.

COAL-TAR.—The importance of this substance was realised only when Faraday discovered benzene and Perkin isolated the first aniline dye, mauve. When coal is heated beyond its decomposition point without access of air (destructive distillation), three products are obtained: (1) dried residue, (2) evolved gases, (3) condensed distillate. The last separates into two layers: (1) holds a small portion of the distillate in solution, and consists of water either previously existing in the coal or produced during the destructive distillation; (2) a viscid, dark-coloured oil, sometimes heavier, sometimes lighter than (1). This is c.-t. Its quality and quantity are influenced by the temperature at which the decomposition is carried on. At low temperatures the hydrocarbons produced are mostly fatty, at high temperatures aromatic. The quality of the coal and the shape of the gas retorts are other factors which alter the nature of the products, since if the gas retort is so shaped that the gases are kept in contact with the hot walls much decomposition results.

C.-t. is a complex mixture of chemical compounds, all of which have not yet been isolated. It is employed as a coating for preserving stone, iron, and timber. Mixed with dry lime and clay, it forms asphalt for paving. The dyeing industry consists today of the successful isolation and utilisation of its compounds. It provides excellent antiseptics and analgesics. Commercial ammonia is manufactured as a by-product.

COALVILLE (52° 46′ N., 1° 7′ W.), town, Leicestershire, England; coal mines. Pop. (1911) 18,550.

COAST DEFENCE.—This must always depend on the general naval strength of a power. With the general naval developments of recent years the problem of c. d. has taken on a new phase. Up to the bombardment of Alexandria in 1881 signalling, searchlights, and torpedoes were rudimentary. The improvements in guns have been most important, both in velocity and range, so that it is possible to have fewer guns and greater distances between forts than heretofore. Much has been done too in the strengthening and concealment of forts and the guns which defend them. Two kinds of submarine mines have been adopted, 'observation' and 'contact' mines, also the Brennan torpedo, which is worked from the shore. Various methods of defence against torpedo-boat attack have been devised; there is generally a line of searchlights, then a lighted area defended with quick-firing guns, then timber obstacles fastened with chains. For the communication of information and orders between forts, an elaborate telephone and telegraph system is used. Each fortress has a commander with a staff under him, and large forts are divided into sections; the forts are in communication with naval signal-stations in the neighbourhood.

COASTGUARD, naval force formed to suppress smuggling; used also as naval reserve and to assist shipwrecked vessels.

COAT OF ARMS, see HERALDRY.

COATBRIDGE (55° 52′ N., 4° 3′ W.), town, Lanarkshire, Scotland; large ironworks. Pop. (1911) 43,287.

COATESVILLE (39° 58′ N., 75° 50′ W.), borough, Pennsylvania, U.S.A.; ironworks; silk and woollen mills. Pop. (1910) 11,084.

COATI, COATI MUNDI (*Nasua*), genus of mammals allied to the raccoon, living in Mexico, Central and S. America, and characterised by their long flexible snout; they live on trees and feed on insects and lizards.

COBALT (Co=59), lustrous, greyish-white, ductile, metallic element, M.P. 1530°, occurring chiefly in smaltite or speiss-cobalt ($(Co,Ni,Fe)As_2$), cobaltite (CoAsS), linnæite (Co_3S_4), and skutterudite ($CoAs_3$); obtained by converting the ores into oxides by roasting, and reducing the latter by heating with carbon or aluminium. C. forms two series of compounds, cobaltous and cobaltic, and complex salts with ammonia known as cobaltammines, characterised by their red or blue colour. They are used as stains or pigments in pottery and glass-making.

COBALTITE (CoAsS), mineral occurring in compact masses or in lustrous, metallic, silver white, or greyish-reddish cubic crystals. Found chiefly in Scandinavia, Cornwall, and Westphalia, and used for the preparation of smalt.

COBAN (15° 40′ N., 90° 15′ W.), town, on Cojabón, Guatemala; coffee. Pop. 6351.

COBAR (31° 30′ S., 145° 35′ E.), town, N. S. Wales, Australia; copper and gold mines. Pop. 3371.

COBBETT, WILLIAM (1766–1835), Eng. politician; served in army, 1784–91; in 1792 went to Philadelphia, where he attacked Amer. institutions, for which he was fined; returned to England, 1800; attacked the Irish Government and developed Radical views; imprisoned, 1809–11, for protesting against flogging of militia; was elected M.P. for Oldham in 1830, and again 1834; broke down in health and d. next year; wrote works on history and politics, and contributed extensively to periodicals; a good stylist and vigorous controversialist. *Life*, by E. I. Carlyle (1904); *Life and Letters*, by Melville (1912).

COBBOLD, THOMAS SPENCER (1828–86), Eng. scientist; lecturer on bot. at St. Mary's hospital, London, on zool. and comparative anat. at the Middlesex hospital; Bot. prof. at Royal Veterinary Coll.; an eminent authority on parasites and parasitic diseases.

COBDEN, RICHARD (1804–65), Brit. statesman; s. of a Sussex farmer. His education at Midhurst Grammar School was scanty, and when about fifteen he went into a warehouse in London. He was for some time a commercial traveller, and in 1830 went to Manchester as a cotton printer. He had become interested in political and economic questions, and in 1835 pub. a pamphlet, *England, Ireland, and America, by a Manchester Manufacturer*. He then paid a visit to the U.S.A., and travelled in the East. He returned in 1837, was elected M.P. for Stockport, and devoted all his energies to the anti-Corn-Law agitation. After the repeal of the Corn Laws in 1846, Sir Robert Peel acknowledged Cobden as the man to whom success was due. C. then travelled abroad, and interested himself in the promotion of peace among European nations; protested against the animosity towards France in 1852, and opposed the Crimean War. He then attacked Brit. action in China, and lost his seat. He arranged a commercial treaty between Britain and France in 1860, and was greatly honoured in both countries. In a short time he broke down in health, and died. Great tributes were paid to his memory in the House.

He did not always foresee accurately the results of his own work, but his honesty and ability won him the greatest respect in, as also since, his lifetime.

Morley, *Life of Cobden*; a full biography.

COBET, CAREL GABRIEL (1813–89), Dutch writer on classics.

COBHAM (51° 24′ N., 0° 25′ E.), village, Kent, England; church contains collection of ancient brasses.

COBIJA, PUERTO LA MAR (22° 32′ S., 70° 15′ W.), small seaport town, Antofagasta, Chile; exports gold.

COBLE, lug-sailed fishing-boat used on Eng. coast (N.E.), with rudder projecting below the bottom.

COBLENZ, KOBLENZ, ancient *Confluentes* (50° 21′ N., 7° 35′ E.), fortified city, capital of Rhine province, Germany, at junction of Rhine and Moselle, opposite fortress Ehrenbreitstein. C. has numerous ancient buildings and several churches, including church of St. Castor (founded 836; rebuilt XII. cent.); C. belonged to Treves from 1018 till taken by France, 1794; assigned to Prussia, 1815; made seat of govt. of Rhine province, 1822; wines, pianos. Pop. (1910) 56,478.

COB-NUT, fruit of W. Indian *Omphalea trianda*; large hazel-nut.

COBOURG (43° 58′ N., 78° 15′ W.), city, Ontario, Canada; foundries, woollen mills. Pop. 4000.

COBRA, COBRA DI CAPELLO (*Naja tripudians*),

poisonous snake of tropical Asia, especially India; attains a length of almost 6 ft., and is remarkable for its hood formed by the skin of the neck being expanded by the anterior ribs, bearing a white spectacle-mark on the back. It is exhibited by Ind. snake-charmers. *N. haje* is the African cobra, or spy-slange.

COBURG (50° 15′ N., 12° 59′ E.), manufacturing town, on Itz, Germany; alternate capital with Gotha of Saxe-Coburg-Gotha; chief buildings, Ehrenburg Palace (1549), residence of Duke of Saxe-Coburg-Gotha; ancient castle of Coburg (XI. cent.) contains relics of Luther; various monuments, including statue of Prince Albert, erected by Queen Victoria, 1865; important trade in cattle. Pop. (1910) 23,789.

COCA, Cuca (*Erythroxylon coca*), shrub of order Erythroxylaceæ, growing in S. America. The leaves are a powerful stimulant, and are chewed, with an alkali, by the natives, who, under its influence, can go for several days without food. *Cocaine* (q.v.) is obtained from the leaves.

COCAINE ($C_{17}H_{21}NO_4$), alkaloid obtained from leaves of coca plant (*q.v.*); white crystalline substance, bitter, slightly soluble in water; exceedingly valuable as local anæsthetic; causes dilatation of pupil of eye; strongly poisonous.

COCANADA, Coconada (16° 57′ N., 82° 15′ E.), seaport, Madras, India; rice, cotton, and sugar exported. Pop. 47,866.

COCCEIUS, JOHANNES, Koch (1603–69), Dutch theologian; prof. at Bremen, Franeker, and Leiden.

COCCIDIA, order of Protozoa, belonging to the class Sporozoa, are parasites in cells, mainly of tissues associated with the digestive system, of annelida, arthropoda, mollusca, and vertebrata. They undergo a complex life-cycle, and that of *Coccidium schubergi*, parasitic in the intestine of the centipede *Lithobius forficatus*, is typical for many species. A cyst ('oocyst') containing 'spores' is swallowed by the host along with its food, and dissolved, the liberated spores dividing into two forms, the sickle-shaped adult coccidium ('sporozoite'), which by active movement enters a cell of the intestine, and coming to rest assumes a rounded shape ('trophozoite'), and assimilates the contents of the cell. The nucleus of the trophozoite divides into a number of daughter nuclei, each surrounded by protoplasm. The 'schizonts' thus formed assume a shape like the sporozoites, burst from the exhausted cell, and actively enter fresh cells of the intestine of their host. The 'merozoites,' by which name the parasites are known at this stage of their life-cycle, now repeat the same process while destroying the cells. After a few days, however, instead of becoming schizonts some of the merozoites develop into two different kinds of elements, round passive macrogametes (female) and slender active microgametes (male), bearing a flagellum. Fertilisation (amphimixis) takes place, and the resulting cell ('zygote') surrounds itself with a membrane forming an 'oocyst.' The latter may pass from the host, and the nucleus and the protoplasm of the zygote form four 'spores,' each of which divides into two 'sporozoites,' which are liberated in the intestine of a new host.

COCCINELLIDÆ, see Polymorpha.

COCCULUS INDICUS, name for brown, dried berries of the climbing shrub *Anamirta cocculus*. Its active principle, picrotoxin, is a powerful poison, and is used in an antiparasitic ointment, and internally to check night-sweats in phthisis.

COCCUS, see Bacteriology.

COCCYX (Anat.), the tail end of the vertebral column in man, consisting of four vertebræ—more or less fused.

COCHABAMBA (17° S., 65° W.), central department, Bolivia, S. America; occupies extensive plateaus among offshoots of E. Cordilleras; grain, rubber; area, 23,321 sq. miles. Pop. *c.* 420,000.

COCHABAMBA, Oropesa (17° 25′ S., 65° 45′ W.), city, Bolivia, S. America; bp.'s see; cottons, woollens. Pop. 28,000.

COCHEM (50° 10′ N., 7° 8′ E.), town, on Moselle, Germany; wines. Pop. 3819.

COCHERY, LOUIS ADOLPHE (1819–1900), Fr. statesman; supported revolution of 1870.

COCHIN (*c.* 10° N., 76° E.), native state, India, between Malabar and Travancore, a small portion of S.W. angle bordering Arabian Sea; surface generally occupies sloping plains; watered by numerous rivers forming series of shallow lagoons, subject in wet seasons to sudden swells; communication chiefly by boat; teak forests; rice; capital, Ernakulam; area, 1362 sq. miles. Pop. (1911) 918,639.

COCHIN (9° 58′ N., 76° 17′ E.), seaport town, Malabar district, Madras, India; formerly capital of Cochin State; taken from Dutch by British, 1796; shipbuilding. Pop. *c.* 20,000.

COCHIN, DENYS MARIE (1854–), Fr. Conservative politician and author.

COCHIN-CHINA (8° 35′ to 11° 43′ N., 104° 25′ to 107° 35′ E.), Fr. possession, S.E. Asia; bounded N. by Cambodia and Annam, S.E. by South China Sea, W. by Gulf of Siam; area, *c.* 20,000 sq. miles; surface mainly broad plain; mountainous in N.; watered by Mekong, Dongnai, and other rivers; climate subject to monsoons. Majority of inhabitants are Annamese; religion, Buddhism. Country has gradually come under Fr. control since 1862; education is good, there are many schools, medical and secular; Saigon, the chief town, is lit by electricity, and in other respects is modern; area, 21,988 sq. miles. Pop. (1911) 3,050,785.

H. Russier et H. Brenier, *L'Indochine Française* (1910).

COCHINEAL, reddish dye-stuff, prepared from the hemipterous insect *Coccus cacti*, living on the cactus *Opuntia coccinellifera* of Mexico and Peru. Since carmine and other colouring agents can be obtained from c., the insect has been cultivated, in Algiers, Spain, Canary Islands, for commercial purposes; dye used for confectionery and biological laboratory stains.

COCHLEA, see Ear.

COCHRANE, THOMAS, see Dundonald, Earl of.

COCK, EDWARD (1805–92), Eng. surgeon; pres. Royal Coll. of Surgeons (1869); introduced new and valuable modes of operation.

COCKADE, bunch of ribbon worn in the hat. *Black* c's were worn in George II.'s army; *white* by Jacobites. In 1798 green c's were worn by the Fr. revolutionaries; these were replaced later by the tricolour.

COCKAIGNE, LAND OF, imaginary land where all is idleness and luxury.

COCKATOOS, *Cacatuidæ*, parrot-like birds which differ from the parrots in bearing a crest of feathers, and in their quiet white, grey, and black colouring; found only in the Australian region and the Philippines. The popular name imitates the call of some species.

COCKATRICE, fabulous monster, said to have been hatched by a reptile from a cock's egg; its look was said to cause death. In mediæval art the c. represents sin generally.

COCKBURN, SIR ALEXANDER JAMES EDMUND (1802–80), Lord Chief Justice of England; ed. Trinity Hall, Cambridge; called to Bar, 1829; in 1834 was made member of Commission of Inquiry into corporations of England and Wales; Q.C., 1841; became famous as a counsel; elected M.P. for Southampton, 1847; Solicitor-General, 1850; Attorney-General, 1851; Chief Justice of Common Pleas, 1856; was a brilliant orator.

COCKBURN, ALISON (1713–94), Scot. poet; wrote one version of *Flowers of the Forest*.

COCKBURN, SIR GEORGE, Bart. (1772–1853), Brit. admiral.

COCKBURN, LORD HENRY THOMAS (1779–1854), Scot. judge; shared with Jeffrey the leadership of Scot. Bar; Solicitor-Gen. for Scotland (1830); author of *Life of Jeffrey*, and *Memorials of his Time* (1856),

a fine picture of Edinburgh society; contributed to *Edinburgh Review*.

COCKCHAFER, large subterranean beetle (*Melolontha vulgaris*), very destructive to trees, as it feeds on the roots near which it has been laid; killed by bats and rooks. See CHAFERS.

COCKER, EDWARD (1631-74), Eng. teacher who compiled the famous Cocker's *Arithmetick* (1678); hence the phrase, 'according to Cocker.'

COCKERELL, CHARLES ROBERT (1788-1863), Eng. architect.

COCKERILL, WILLIAM (1759-1832), Eng., afterwards naturalised Fr., inventor; first to establish wool-spinning factories on Continent. — **Cockerill, John** (1790-1840), s. of above, extended former business, established great iron foundries; constructed several continental railways.

COCKERMOUTH (54° 40′ N., 3° 22′ W.), market town, on Derwent, Cumberland, England; ruined castle; Wordsworth's birthplace; woollens. Pop. (1911) 5203.

COCK-FIGHTING, sport of 'cocking' with gamecocks; prohibited in Britain (1849).

COCKLE (*Cardium*), genus of bivalve molluscs containing numerous species, the common c. (*C. edule*) being gathered for food. The shell is rounded, ribbed, and shaped like a heart when viewed from one end.

COCKLE, SIR JAMES (1819-95), Eng. mathematician and lawyer; Chief Justice, Queensland (1863), retiring to England (1879); performed research in higher algebra; pres., London Mathematical Soc. (1888).

COCKNEY, native of London; the 'Cockney school of poetry' was the name levelled at Keats, Leigh Hunt, and others. 'Cockney' accent is the term applied to pronunciation of lower classes; it is illustrated in Albert Chevalier's 'Coster' songs.

COCK-OF-THE-ROCK (*Rupicola*), genus of northern S. American birds (family Cotingidæ), about size of pigeon; orange plumage and high crest.

COCK-PAIDLE, see LUMPSUCKERS.

COCKPIT.—(1) floor of building, surrounded with rising seats, where cock-fighting took place. (2) after-part in one of lower decks of ship, set aside for wounded during a battle.

COCKROACH (*Blattidæ*), family of orthopterous insects, with flattened body and long antennæ. Many species troublesome in houses; have an offensive smell. *Stylopyga orientalis* is the common black 'beetle' common in northern countries. *Periplancta americana* is sometimes found on ships. Fossil c's have been discovered in Carboniferous rocks.

COCK'S-COMB (*Celosia*), herbaceous annual (order Amarantaceæ), cultivated in various species for its large plume-like mass of red or purple flowers.

COCKTON, HENRY (1807-53), Eng. novelist; author of *Valentine Vox* and *Sylvester Sound*.

COCO DE MER, DOUBLE COCO-NUT (*Lodoicea Sechellarum*), variety of palm found chiefly in Seychelles Islands; fruit is extremely large and takes years to ripen.

COCOA, CACAO, pulverised seeds of the evergreen tree *Theobroma cacao*, order Sterculiaceæ; native of tropical America, cultivated in W. Indies, W. Africa, Ceylon, and E. Indies. The fruit, a 'pod' of the shape of a gherkin up to 10 in. in length, contains five cells, in each of which is a row of up to twelve seeds packed in a pulp. The seeds or 'beans' are extracted and fermented in covered barrels or under leaves, thus losing their bitter flavour. When dried and polished they are ready for the market. After roasting are gently crushed, the product being known as '.' The latter contain up to 50 % of fat, which is extracted in powerful hydraulic presses and used for pharmaceutical purposes. Although a rich beverage can be obtained by boiling nibs in water, the ordinary cocoa, consisting of the finely powdered and prepared seeds partly dissolved but the greater part suspended in boiling water, is more palatable. The dietetic value of c. is due to fat, starch, and nitrogenous matters contained and to the stimulating effect of the alkaloid theobromine, allied to the theine and caffeine of tea and coffee.

COCO-NUT PALM (*Cocos nucifera*), palm-tree found growing to as great a height as 100 feet in tropical Asia, Africa, America, and especially the islands of the Pacific. Coco-nut is a pleasant food; 'milk' contained in c.-nut is a refreshing drink; 'arrack,' a spirituous liquor, is produced from flowers; the timber is used in buildings; coir (*q.v.*), copra (*q.v.*), and a valuable oil are obtained from various parts of the nut.

COCOON, silky covering spun by various types of larvæ; silkworms' c. of special commercial value. See SILK.

COCOS ISLANDS, see KEELING ISLANDS.

COCYTUS (*c.* 39° N., 21° E.), river, Epirus, Greece; tributary of Acheron.

COD (*Gadus callarias*), soft-finned fish, typical of the family *Gadidæ*, found chiefly in the N. Atlantic waters, much valued as a food and for the oil obtained from it; usually fished for by hand-lines or trawl. C. weigh generally about 10 lb., but have been found weighing as much as 70 lb. The female is very prolific, sometimes producing eight or nine million eggs in spawning season.

CODE, a compilation, or digest, of laws, often associated with the name of a particular person, such as the 'Justinian C.,' the 'Draconian C.,' the 'Clarendon C.,' the 'Code Napoléon,' etc.; system of rules governing conduct or etiquette ('code of honour'); table of signs, flags, etc., used in signalling ('Morse C.' and others).

CODE CIVIL, CODE NAPOLÉON, is the standing body of law in France; drawn up by Pothier, Cambacérès, and others, and issued under direction of Napoleon, 1804 (who altered several clauses), it unified and simplified local laws and legal procedure.

CODICIL, see WILL.

COD-LIVER OIL, oil obtained from the liver of the cod (*Gadus morrpua*) commercially by a process of steaming; contains some acids not found elsewhere in animals. Taken either pure or in emulsions, it is very easily absorbed, and invaluable in building up the frame after wasting diseases like tuberculosis.

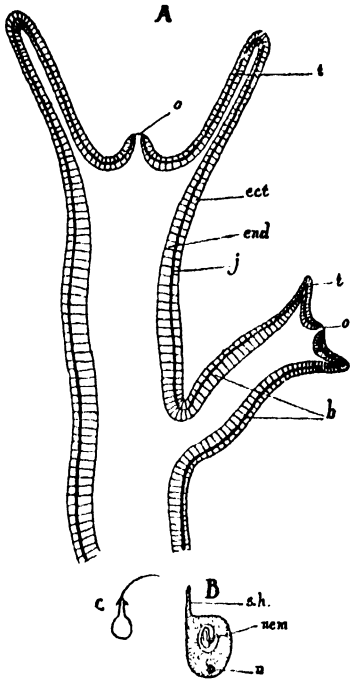
CODRINGTON, CHRISTOPHER (1668-1710), Eng. colonial gov. and soldier; founder of C. Coll., Barbadoes.

CODRINGTON, SIR EDWARD (1770-1851), Brit. admiral; entered navy, 1783; served in war with France, at *Trafalgar*, off Spain, in America, and in Greek War of Independence; cr. K.C.B., 1815; admiral, 1837.

CODRUS, see ARCHON.

CODY, WILLIAM FREDERICK (1846–), Amer. scout and showman; famous shot ('Buffalo Bill').

CODY, COLONEL S. F. (1862–), Amer. aviator; first man to fly in Britain; first in War Office Aeroplane Competition, Aug. 1912.



CO-EDUCATION, see EDUCATION.

COEFFETAU, NICOLAS (1574-1623), Fr. Catholic divine; wrote *History of Rome*.

COEHOORN, MENNO, BARON VAN (1641-1704), Dutch soldier and military engineer; took part in war against France, 1673 onwards; distinguished himself under Marlborough, especially at *Namur*, 1692, and at capture of Bonn and siege of Huy, 1703; wrote works on fortification (*q.v.*).

CŒLENTERA, group of animals including zoophytes, jelly-fish, sea-anemones, corals, etc., being marine, with the exception of a few freshwater species (*e.g. Hydra*). They are characterised by the absence of a body cavity (cœlom) apart from the digestive cavity (enteron), and their body wall consists of two layers of cells (ectoderm and endoderm) with a supporting jelly-like middle layer (mesogloea). They mostly possess stinging cells. Some c. show a polypoid or

tubular and sedentary, often colonial, type and a medusoid or free-swimming type. The principal

CŒLENTERA. *A*, diagrammatic longitudinal section of a simple Cœlenterate with a bud attached; *B*, a stinging-cell (cnidoblast) with a nematocyst inside; *C*, a discharged nematocyst; *b*, bud; *ect*, ectoderm; *end*, endoderm; *j*, jelly; *n*, nucleus; *nem*, nematocyst; *o*, mouth; *s.h.*, sense hair; *t*, tentacle.

classes are: Hydromedusæ, Scyphomedusæ, Anthozoa, Ctenophora (*qq.v.*).

COELLO, ALONSO SANCHEZ (1515-90), Span. artist.

COELLO, ANTONIO (*c.* 1610-52), Span. poet and dramatist.

COEN, JAN PIETERSZOON (1587-1630), gov.-gen. of Dutch East Indies.

CŒNACULUM, room for supper, *e.g.* where Last Supper was eaten.

CŒNURUS, a larval tapeworm (*q.v.*).

CŒNWULF (d. 821), king of Mercia, a division of England (796).

CŒUR, JACQUES (*c.* 1395-1456), Fr. merchant; founder of trade between France and the East; in 1436 went to court of Charles VII. and assisted in purifying the coinage; became very wealthy and powerful; his enemies brought about his overthrow in 1450; C. was imprisoned, escaped, and received by Pope in Rome; d. on expedition against Turks.

COFFEE, the seeds of evergreen shrubby trees of the genus *Coffea* (order *Rubiaceæ*), particularly of the species *C. arabica* and *C. liberica*. The beverage has been known in Abyssinia for probably more than a thousand years, and the plant was introduced into Arabia in the XV. cent. and later became more extensively cultivated in tropical Asia and America. Its white and fragrant flowers grow in clusters in the axils of the leaves. The fruit is a red, fleshy berry resembling a cherry, and containing seeds in a yellowish pulp. The seeds are enclosed in a membrane (endocarp) called the 'parchment,' and each seed in a finer covering known as 'silver skin.' The pulp is removed either after drying the 'cherries' in the sun or in the wet method by water and special machinery; the seeds are subsequently dried, the parchment and silver skin removed by rollers, rubbing, and winnowing, and the beans are ready for shipping. They are sorted out into various grades to ensure uniformity in roasting. Roasting and grinding should be carried out shortly before the decoction is made. The valuable physiological action of c. as a stimulant of the nervous and vascular system is to a great extent due to the alkaloid caffeine. C. is frequently adulterated, chiefly with chicory. The latter is widely used on account of its rich brown infusion with hot water, which gives 'body' to weak c. Arabian c. is called *mocha*. The principal c. exporting countries in order of importance are Brazil, Venezuela, Guatemala, Dutch East Indies, Colombia, Brit. India, Haiti. The consumption of c. per head per annum is approximately: Holland, 15 lb.; Germany, 7 lb.; France, 5 lb.; Austria-Hungary, 2 lb.; U.K., 1 lb.

Look, *Coffee: its Culture and Commerce in all Countries* (1888).

COFFEE-HOUSES, predecessors of the modern club; first opened in Constantinople during XVI. cent.; introduced into England, 1650, France, 1671, and soon into other European countries; they formed a resort for men of fashion, and different houses were patronised by different cliques; Addison patronised Button's, gamblers resorted to Jonathan's in Change Alley, Scotsmen flocked to the British in Cockburn Street. C.-h. were means of circulating news before the introduction of daily papers.

COFFER, chest for valuables; mediæval Ital. marriage-coffers were often carved, inlaid, and otherwise richly decorated; also term for a certain panel in architecture.

COFFERDAM, a water-tight enclosure of clay and piles, from which the water is pumped, in a river, etc., in order to construct foundations for bridges, piers, etc.; also a water-tight appliance on the side of a ship to facilitate repairs under water.

COFFEYVILLE (37° 2′ N., 95° 37′ W.), city, on Verdigris, Kansas, U.S.A.; bricks, flour; ships grain. Pop. (1910) 12,687.

COFFIN, receptacle for the dead. The ancients used c's made of baked clay; stone came later into use, and lead c's were common during Middle Ages. Wooden shells came into general use during the XVII. cent., before which time the poor were buried merely in grave-clothes.

COG, round-bodied, trading ship of mediæval times.

CŌGERS HALL (1755), debating society holding meetings in various London taverns; Wilkes, Dickens, and other public men among members.

COGNAC (45° 41′ N., 0° 19′ W.), town, Charente, France; brandy. See SPIRITS.

COGNITION, term used to denote state of conscious knowledge of anything, whether physical or not.

COGNIZANCE, BADGE, see HERALDRY.

COHN, FERDINAND JULIUS (1828-98), Ger. botanist; prof. of bot., Breslau (1859); founder of the science of bacteriology; did invaluable research on bacteria, algæ, and fungi, and pub. many notes on these and allied subjects.

COHOES (42° 45′ N., 73° 46′ W.), city, at confluence of Mohawk and Hudson, New York State, U.S.A.; cotton and woollen mills. Pop. (1910) 24,709.

COHORT, in Rom. army military body about 600 strong, or tenth part of legion; loosely, a body of armed men.

COIF, part of insignia of serjeants-at-law; white piece of cloth with smaller black portion superimposed, placed on top of wig; formerly used to be skull-cap.

COIMBATORE (10° 59′ N., 76° 59′ E.), district, Madras, India; flat country hemmed in by mountains on N., W., and S.; watered by Cauvery and tributaries; area, 7860 sq. miles. Pop. 2,201,752. Capital, COIMBATORE, on Noyil; ceded to Britain, 1799; exports cotton, cereals, cattle, and hides. Pop. 53,080.

COIMBRA (40° 13′ N., 8° 24′ W.), town, on Mondego, Beira, Portugal; formerly capital of Portugal and burial-place of many early kings; bp.'s see; has two cathedrals; famous univ. (founded 1288); library and military coll.; grain, fruit. Pop. 18,144.

COIN (36° 44′ N., 4° 50′ W.), town, on Séco, Málaga, Spain; marble quarries.

COINS, as legal medium of exchange, replaced metal ingots *c.* 720 B.C.; first struck in Asia Minor, bearing head of lion; Gk. coins bore head of god, or scene from mythology, as well as name of city; some are beautifully designed; gold, silver, copper, brass used; in mediæval times the habit of clipping coins led to much annoyance, as coin was seldom its full face value; William III. permanently introduced milled edges, though milled c. were issued by Charles I., 1637. Modern Brit. gold coins are £5, £2, £1, 10s.

Gardner's *Catalogue of Greek Coins* (1883); Head, *Historia Numorum* (1887).

Coining.—Every person commits a felony who makes, gilds, or silvers any current coin; or who files, clips, or alters any coin with intent to make it pass for current gold or silver coin; or who imports any counterfeit coin from beyond the seas; or has in his possession any of the implements used in coining. The coining of *good* money, without permission of the Crown, is also a crime.

COIR, fibrous substance obtained from external husk of coco-nut; used for making matting, etc.

COIRE, CHUR (46° 51′ N., 9° 31′ E.), town, Grisons, Switzerland; ancient *Curia Rhætorum*; many interesting specimens of mediæval arch.; bp.'s see; centre of transit trade in wine, tobacco, and clocks. Pop. (1912) 15,100.

COKE, the product obtained by depriving coal of volatile constituents through heating it in ovens, air being excluded. It is hard, porous, and of a semi-metallic lustre, and consists essentially of carbon. It is manufactured in ovens of different construction. In the beehive-oven, so-called from its shape, the required heat is supplied by the partial combustion of the coal. The retort and condensing ovens of various patterns are more economical, and permit the collection of the valuable by-products—gas, tar, ammonia. C. is used in metallurgy, chemical industry, for domestic fuel, etc.

COKE, SIR EDWARD (1552–1634), Eng. barrister; ed. Trinity Coll., Cambridge; called to Bar, 1578; his abilities were soon recognised; elected M.P. and Speaker, 1593; Attorney-General, 1594; Crown lawyer in trial of Raleigh, and remembered for brutality to accused; Chief Justice of Common Pleas, 1606; vigorously defended common law against royal prerogative; offended king, and was imprisoned, 1620; retired, 1628; famous as a legal writer.

Johnson, *Life of Sir Ed. C.*; Woolrych, *Life of C.*; Campbell, *Lives of the Chief Justices.*

COKE, SIR JOHN (1563–1644), Eng. politician; Sec. of State (1625–39).

COKE, THOMAS (1747–1814), Anglican clergyman, then follower of Wesley; became Methodist bp. in America, 1787; anti-slavery worker.

COLBERT, JEAN BAPTISTE (1619–83), Fr. statesman. In 1651 he was employed by Cardinal Mazarin, and quickly rose in influence. After Mazarin's death in 1661 he entered the employment of Louis XIV., and was made superintendent of buildings, 1664, controller-general, 1665, and minister of marine, 1669. He reformed the burdensome taxation, making it, to a certain point, juster and more economical. He did much to raise the prosperity of France, strengthened the navy, and was interested too in lit. and art. His sending men to be galley slaves is a serious blot on his character. Owing to the rivalry of Louvois his influence with Louis waned shortly before his death.

Lavisse, *Histoire de France*; and *Cambridge Modern History*, vol. v.

COLBERT DE CROISSY, CHARLES, MARQUIS (1625–96), Fr. diplomatist; Intendant of Alsace, 1658; represented France at conference of Aix-la-Chapelle; ambassador to London, 1668.

COLBURN, HENRY (d. 1855), Eng. publisher; founded *New Monthly Magazine*, 1814.

COLBURN, ZERAH (1832–70), Amer. engineer; nephew of C., the mathematical prodigy; edit. successively of *The Railroad Advocate* (New York), *The Engineer*, and *Engineering* (London).

COLCHAGUA (34° 35′ S., 71° W.), province, Central Chile, between Argentina and Pacific, S. America; capital, San Fernando; stock-raising, mining; area, 3849 sq. miles. Pop. (1910) 159,421.

COLCHESTER (44° 34′ N., 73° W.), town, on Lake Champlain, Vermont, U.S.A.; cotton and woollen goods. Pop. (1910) 6450.

COLCHESTER (51° 53′ N., 0° 24′ E.), market town, river port, on Colne, Essex, England; site of first Rom. colony in Britain (*Camulodunum*); before conquest, seat of Brit. king, Cunobelin (Shakespeare's Cymbeline); ancient Rom. walls almost entire; museum of Rom. antiquities; castle—largest specimen of Norman arch. in England; remains of Augustinian Priory; many churches; grammar school (founded 1539) and a military dépôt; market for oyster fisheries and agricultural produce. C. was besieged by Fairfax, 1648. Pop. (1911) 43,463.

COLCHESTER, CHARLES ABBOTT, 1ST BARON (1757–1829), Eng. politician; Speaker of House of Commons.

COLCHICUM, MEADOW SAFFRON (*Colchicum autumnale*), plant of order Liliaceæ, with purple flowers, growing in rich soils in England, Ireland, middle and southern Europe generally. The dried and powdered corm, or bulbous root used as a drug, causes an increased amount of bile to be poured into the intestine, and is a specific for gout; poisonous in large doses; active principle is an alkaloid *colchicine.*

COLCHIS, ancient name of district of Asia Minor, eastern end of Black Sea, S. of Caucasus; nearly corresponding to former province *Mingreli* (modern Kutais); in Gk. myth. home of Medea and sorcery; land of 'Golden Fleece'; after Mithridatic war, became subject to Rome; annexed by Russia, 1866.

COLCOTHAR, name for reddish-brown ferric oxide obtained as a residue from distillation of ferrous sulphate in the manufacture of fuming sulphuric acid; used as a polishing powder and as a pigment (Ind. red).

COLD, low temperature, a decrease of the rapid molecular vibration which causes heat. The absolute zero or temperature at which there is no heat cannot be obtained practically. It is −273°. The nearest approach to it is liquid helium, which boils at 4°·3 absolute.

COLD HARBOR (37° 36′ N., 77° 16′ W.), Virginia, U.S.A.; scene of battles between Federals and Confederates, 1862 and 1864.

COLDEN, CADWALLADER (1688–1776), Scots-Amer. physician, botanist, and politician; was acting-gov. of New York at outbreak of War of Independence, and supported Brit. Government.

COLDEN, CADWALLADER DAVID (1769–1834), Amer. lawyer and politician; grandson of above.

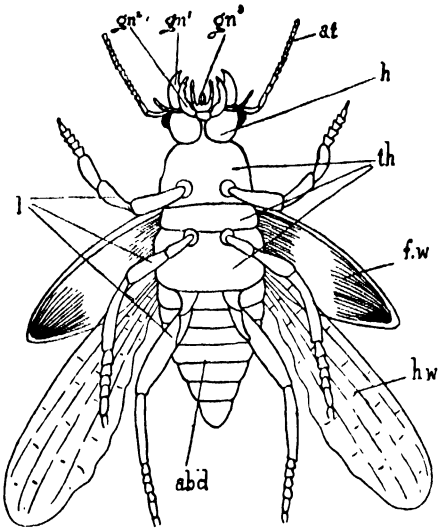
COLDSTREAM (55° 40′ N., 2° 19′ W.), town, on Tweed, Berwickshire, Scotland; 'Coldstream Guards' raised here, 1650, by Gen. Monck.

COLDWATER (41° 54′ N., 85° 2′ W.), city, Michigan, U.S.A.; Portland cement; agricultural implements. Pop. (1910) 5945.

COLE, THOMAS (1801–48), Amer. landscape artist.

COLE, VICAT (1833–93), Eng. artist; A.R.A. (1870); R.A. (1880); *Pool of London*, in Tate Gallery.

COLEBROOKE, HENRY THOMAS (1765–1837), Eng. Orientalist; wrote *Sanskrit Grammar*, etc.



COLEMANITE, $Ca_2B_6O_{11}5H_2O$, Californian mineral occurring massive or in brilliant monoclinic crystals, of commercial value as source of borates and boracic acid. Varieties are priceite, ulexite, and pandermite; the last is found in Asia Minor.

COLENSO (28° 44′ S., 29° 50′ E.), village, Natal, S. Africa; scene of Brit. repulse in Boer War, Dec. 1899.

COLENSO, JOHN WILLIAM (1814–83), Anglican ecclesiastic; bp. of Natal, 1853; translated New Testament into Zulu; pioneer in 'Higher Criticism'; pub. works on Pentateuch and was excommunicated

by bp. of Cape Town, who consecrated a rival bp.; wrote works on math's.

COLEOPTERA, order of insects (Hexapoda) including the beetles and weevils, altogether about 150,000 species, characterised by the modification of the anterior pair of wings into hard horny covers (elytra) for the membranous posterior pair, which are folded underneath when not in use. In species with terrestrial habits the hind wings are greatly reduced in size, and the elytra frequently become fused to form an armour for the abdomen. The jaws are adapted for biting, the mandibles often being powerfully developed, those of the stag-beetle being a well-known example.

A BEETLE VIEWED FROM BELOW. *at*, single pair of antennæ; *abd*, abdomen; *f.w.*, fore wing; *gn*¹, *gn*², *gn*³, the three pairs of gnathites; *h.w.*, hind wing; *h*, head; *l*, walking legs; *th*, thorax.

As a rule the integument of the beetle is hard and horny, and the prothorax is movable on the mesothorax. The c. undergo complete metamorphosis (are holometabolic). The larvæ are more or less active grubs, and the inactive pupæ have their appendages free, not fixed to the body as in the case of butterfly pupæ. The development sometimes occupies many years. Some families are aquatic, as the Dytiscidæ and Hydrophilidæ. Stag-beetles, chafers, weevils, ladybirds, glow-worms, and click beetles are a few of the more representative families.

W. W. Fowler, *Coleoptera of the British Islands* (5 vols., London, 1887-91); J. L. Leconte and G. H. Horn, *Classification of Coleoptera of N. America* (Smithsonian Institute, Washington, 1883).

COLEPEPER, JOHN COLEPEPER, 1ST BARON, CULPEPPER (d. 1660), Eng. politician; at first against the king, but changed for fear of revolution; fought in Civil War; accompanied Charles II. in exile.

COLERAINE (55° 8′ N., 6° 41′ W.), seaport, market town, on Bann, Londonderry, Ireland; linen; salmon fisheries. Pop. 6500.

COLERIDGE, HARTLEY (1796–1849), Eng. poet; e. s. of Samuel Taylor C.; ed. Oxford; became writer for the magazines, and a schoolmaster at Ambleside; lacking stability, he failed in all his occupations. In his poetry he showed a marked kinship to Wordsworth, and left several sonnets of high literary quality; one of the most brilliant conversationalists of his day.

COLERIDGE, JOHN DUKE COLERIDGE, 1ST BARON (1820–94), Lord Chief Justice of England; ed. at Eton and Balliol Coll., Oxford; called to the Bar, 1846; Liberal M.P. for Exeter, 1865; showed ability at the Bar and in the House; took part in the first Tichborne trial; became Chief Justice of Common Pleas and baron in 1873; Lord Chief Justice, 1880; was a great speaker and a refined and scholarly man.

COLERIDGE, SIR JOHN TAYLOR (1790–1876), Eng. judge; nephew of Samuel Taylor C.; f. of the first Baron C., Lord Chief Justice of England.

COLERIDGE, SAMUEL TAYLOR (1772–1834), Eng. poet; b. Ottery St. Mary, Devon, where his f. was vicar; ed. Christ's Hospital, and Jesus Coll., Cambridge; got into debt, and enlisted in the dragoons, but was bought off by his family. C. and Southey married two sisters (Sara and Edith Fricker), and proposed to found a 'pantisocratic' settlement in America, but the scheme was abandoned. At Nether Stowey, Somerset, C. had Wordsworth for neighbour, and there they planned their joint-work, the *Lyrical Ballads* (1798), to which C. contributed *The Ancient Mariner*; here also he wrote the first part of *Christabel*, and *Kubla Khan* (pub. 1816). An earlier vol., *Poems on Various Subjects*, had appeared in 1796. C. had become a Unitarian, and, after the Somerset period, acted for some time as preacher. He spent a year in Germany, where he became interested in metaphysics. In 1779 he was in London, writing for the *Morning Post*; made his home at Keswick (1800), and pub. his trans. of Schiller's *Wallenstein*; went to Malta in search of health (1804); afterwards travelled in Italy. In 1808 he lectured on Shakespeare at the Royal Institution, London. His drama, *Remorse*, was produced at Drury Lane in 1813. His later publications include *Biographia Literaria*, *Sibylline Leaves*, *Aids to Reflection*, *The Constitution of Church and State*; and other works were pub. posthumously. In 1796 he became a victim to laudanum, which wrecked his health and literary faculties. He was long dependent for money upon the generosity of friends and admirers. C. has left us poetry, small in quantity, but of the noblest quality, which ranks him amongst the greatest writers in the Eng. tongue. No finer ballad poetry was ever written than *The Ancient Mariner*; *Christabel* and *Kubla Khan* are works of the highest metrical and imaginative beauty, and several shorter pieces are marked by the most exquisite literary charm.

J. D. Campbell, *Life of S. T. C.* (1894); H. D. Traill, *Coleridge*, English Men of Letters Series.

COLERIDGE, SARA (1803–52), Eng. poetess and miscellaneous writer; dau. of Samuel Taylor C.; pub. several translations from foreign authors; also *Pretty Lessons in Verse*, and a fairy tale, *Phantasmion*.

COLERIDGE-TAYLOR, SAMUEL (1875–1912), Brit. musician; s. of Eng. mother and W. African father; set *Hiawatha* to music; wrote *The Atonement*, a cantata; early death cut short promising career.

COLESBERG (30° 34′ S., 25° 33′ E.), town, C. province, Cape Province, S. Africa.

COLET, JOHN (1467–1519), Eng. Renaissance scholar; lectured on St. Paul at Oxford; one of pioneers of Humanistic movement; refounded St. Paul's School, 1512.

COLET, LOUISE (1810–76), Fr. lady novelist and poet.

COLEUS, genus of tropical herbs or shrubs with labiate flowers and ornamental foliage, for which various species have been cultivated in gardens.

COLFAX, SCHUYLER (1823–85), Amer. politician; member of Congress (Republican), 1855–69; Vice-Pres. of U.S.A., 1869–73; suspected of corruption, he retired into private life, 1872.

COLIC, a vague medical term, applied to sudden spasmodic pain in the abdomen; if the patient seems collapsed, the condition is not really c., and is usually very serious (perforation of an organ, acute intestinal obstruction, peritonitis, etc.), and a doctor must be sent for at once. C. may frequently be accompanied by vomiting or diarrhœa and quickening of the pulse; and it is usually classed under three heads—abdominal, renal, and hepatic c.

ABDOMINAL C. is distinguished by a twisting pain,

mainly round the umbilicus, and is often due to intestinal irritation caused by hard, undigested food. It may be due to lead-poisoning (*q.v.*), when other characteristic symptoms will be present.

RENAL C. is due to the passage of a stone, or *calculus*, along the ureter, which leads from the kidney to the bladder. The pain is very characteristic, and shoots downwards from the loin to the thigh and testicle on the same side.

In HEPATIC C. the pain shoots upwards to the right shoulder and backwards, and is due to the passage of a gall-stone along the bile-duct. Jaundice usually follows H. C.

COLIGNY, GASPARD DE (1519–72), Fr. Huguenot leader; of noble Burgundian family; after much active service in Fr. army, he became colonel-general and was famous as military reformer; made admiral of France (1552); defended Saint-Quentin in siege of 1557, and, on the town's being taken, was imprisoned and finally ransomed. Meanwhile C. had become a Huguenot. On death of Louis, prince of Condé, at *Jarnac*, he became leader of Prot. armies; after Peace of St. Germain he returned to court and became favourite of Charles XI. Huguenot influence at court brought reaction, and result was Massacre of St. Bartholomew, in which C. was slain.

A. W. Whitehead, *Gaspard de Coligny, Admiral of France* (1904); C. Merki, *L'Amiral de Coligny* (1909).

COLIMA, small Pacific state, Mexico; surface mountainous; fertile soil; on N. frontier is volcanic peak Colima (12,750 ft.); stock-raising, coffee; area, 2273 sq. miles. Pop. (1910) 77,704. Chief town is COLIMA. Pop. (1910) 25,148.

COLIN, ALEXANDRE (1526–1612), Flemish sculptor.

COLL (56° 37′ N., 6° 31′ W.), island, Inner Hebrides, W. coast of Mull, Scotland.

COLLAR, neckwear, in modern times usually of linen, but formerly of lawn and lace, succeeding the Elizabethan ruff; also applied to a livery, or decorative badge, as the 'C. of the Garter' and other orders of knighthood. In the Middle Ages a squire was cr. by investiture with a c. and spurs. Great lords and their followers were known by their rich collars, *e.g.* at the time of Wars of the Roses.

COLLAR-BONE, see SKELETON.

COLLATIA (41° 57′ N., 12° 41′ E.), ancient town, Latium, Italy.

COLLÉ (43° 25′ N., 11° 7′ E.), town, Siena, Italy; bp.'s see; cathedral; glass-works. Pop. 5791.

COLLÉ, CHARLES (1709–83), Fr. song-writer and dramatist.

COLLECTIVISM, modern Socialistic term signifying joint ownership and administration of capital by a community.

COLLEGE (Lat., *collegium*), originally a society, body, or corporation of persons engaged in common pursuits; a body of clergy living in common on a foundation; a society of persons joined together for educational purposes (see UNIVERSITIES).

COLLEMBOLA, family of wingless insects, named by Lord Avebury; *Podura*, which frequents stagnant water, is common type.

COLLEONI, BARTOLOMEO (1400–75), Ital. soldier; fought in turn for Venice and Milan.

COLLETTA, PIETRO (1775–1831), Neapolitan general; wrote *History of Naples*.

COLLEY, SIR GEORGE POMEROY (1835–81), Eng. general; killed at *Majuba*. Butler, *Life* (1899).

COLLIER, ARTHUR (1680–1732), Eng. philosopher; held living of Langford Magna, Wilts, from 1704; became student of Descartes; wrote *Clavis Universalis*, denying (1) that because external world seems real, it therefore is so; (2) that it is real. His thought resembles Berkeley's.

COLLIER, JEREMY (1650–1726), Anglican ecclesiastic; staunch Tory and supporter of Stewart cause, for which he got into trouble during reign of William III.; obliged to go into exile some years; wrote numerous works; attacked immorality and profanity of the stage.

COLLIER, JOHN PAYNE (1789–1883), Eng. man of letters; Elizabethan student; notorious as forger of XVII.-cent. annotations to Shakespeare folio.

COLLIN, HEINRICH JOSEPH VON (1771–1811), Austrian dramatist and song-writer.

COLLIN D'HARLEVILLE, JEAN FRANÇOIS (1755–1806), Fr. dramatist.

COLLING, CHARLES (1751–1836), and **ROBERT** (1749–1820), Eng. cattle-breeders, best known for improving the shorthorn breed by scientific breeding.

COLLINGWOOD (44° 30′ N., 80° 20′ W.), town, Ontario, Canada; lumber, grain. Pop. 6000.

COLLINGWOOD (37° 50′ S., 144° 50′ E.), city, on Yarra-Yarra, N.E. suburb of Melbourne, Australia. Pop. 33,000.

COLLINGWOOD, CUTHBERT COLLINGWOOD, BARON (1750–1810), Brit. naval commander; b. Newcastle-on-Tyne; served in Amer. War, 1774; he was at the battle of *Cape St. Vincent*, 1797; made vice-admiral, 1799, and went to the Mediterranean; most celebrated for his part in the victory of *Trafalgar*, where he led one line of ships, in the *Royal Sovereign*. He was cr. baron just afterwards. His health failed, but he remained at sea, dying on board the *Ville de Paris*.

COLLINS, ANTHONY (1676–1729), Eng. deist; b. Hounslow; ed. Cambridge; intimate friend of Locke; advocated free-thinking as a cure for atheism.

COLLINS, JOHN CHURTON (1848–1908), Eng. author; prof. of Eng. Lit., Birmingham; a voluminous writer on literary subjects, and a good critic.

COLLINS, MORTIMER (1827–76), Eng. author; wrote *Sweet Anne Page* and other novels; also light verse.

COLLINS, WILLIAM (1787–1847), Eng. artist; painter of *genre* pictures; A.R.A. (1815); R.A. (1820); f. of Wilkie C., novelist.

COLLINS, WILLIAM WILKIE (1824–89), Eng. novelist; achieved popular success with *The Woman in White* (1860) and *The Moonstone* (1868).

COLLODION, viscid fluid made by dissolving gun-cotton or pyroxylin in a mixture of alcohol and ether; the evaporation of the solvents leaves a tenacious film; used in preparation of photographic films, and in surgery as a coating for wounds.

COLLOT D'HERBOIS, JEAN MARIE (1750–96), Fr. Revolutionary leader; at first an actor; member of the Commune, 1792; pres. of Convention, 1793.

COLLUSION, legal term for compact made by two people that, for improper purposes, one should bring an action against the other.

COLLYER, ROBERT (1823–1912), Amer. divine, Methodist, then Unitarian; famous preacher and anti-slavery worker.

COLMAN, GEORGE (1732–94), Eng. dramatist and scholar; wrote *The Clandestine Marriage*, *The Jealous Wife*, etc.; also trans. from Terence and Horace.

COLMAN, GEORGE, THE YOUNGER (1762–1836), Eng. dramatist; s. of above; author of *The Heir at Law* and other popular and amusing dramas; examiner of plays (1824–36).

COLMAN, ST. (d. 676), bp. of Lindisfarne, 661; then in Iona and Ireland.

COLMAN, SAMUEL (1832–), Amer. landscape artist.

COLMAR, KOLMAR (48° 6′ N., 7° 19′ E.), town, Germany; capital of Upper Alsace; became imperial city, 1226; Fr. possession, 1681–1871; centre textile weaving. Pop. (1910) 43,808.

COLNE (53° 53′ N., 2° 10′ W.), market town, Lancashire, England; textiles. Pop. (1911) 23,693.

COLOCYNTH, BITTER APPLE (*Citrullus colocynthis*), plant belonging to natural order *Cucurbitaceæ*; c. of commerce is prepared from the dried and peeled fruit; acts on the liver and gall-bladder as a biliary stimulant; used, generally combined with other

drugs, as a drastic purgative. The active principle is colocynthin ($C_{56}H_{84}O_{23}$).

COLOGNE, Köln (50° 55′ N., 6° 55′ E.), town, Rhenish Prussia, on Rhine; one of principal western fortresses of Germany. From its position at head of Rhine navigation for sea-going vessels, as centre of rail and river systems, and being near rich coal and iron field, C. has great commercial importance archiepiscopal see; has magnificent Gothic cathedral built between 1248 and 1447, but not completed unti 1880; several other fine churches, Gothic town-hall, Gürzenich Hall, Tempelhaus, and other interesting buildings; zoological and botanical gardens; manufactures cottons, woollens, beet-sugar, chemicals, spirits of wine, eau-de-Cologne, tobacco, machinery, chocolate, carriages, porcelain, soap. C. was Rom. colony in reign of Claudius; taken by Franks in V. cent.; annexed to Ger. empire in IX. cent.; great trading centre in Middle Ages, and powerful member of Hanseatic league; C. University (founded 1389) was famous in XV. cent.; gradually declined, and ceased to exist after foundation of Bonn Univ. (1797); taken by French, 1794; restored to Prussia, 1814. Pop. (1910) 516,167.

Helmken, *Köln und seine Sehenswürdigkeiten* (20th ed., 1903); H. Keussen, *Historiche Topographie der Stadt Köln im Mittelalter* (1906).

COLOMB, PHILIP HOWARD (1831–99), Brit. vice-admiral; b. Scotland; entered navy, 1846; served in Mediterranean, China, Burma, Crimean War, etc.; retired, 1886; did much for the advancement of naval signals and naval tactics; became one of the best naval historians, showing great insight into problems of naval warfare.

COLOMBES (48° 56′ N., 2° 14′ E.), town, 7 miles N.N.W. of Paris, France; petroleum refineries; vinegar. Pop. 23,061.

COLOMBEY (49° 6′ N., 6° 18′ E.), village, Lorraine, Germany; scene of battle between Germans and French, Aug. 1870.

COLOMBIA (12° 25′ N. to 3° S., 68° to 79° 10′ W.), republic, S. America; bounded N. by Panama, Caribbean Sea, Venezuela, E. by Venezuela, Brazil, S. by Ecuador, W. by Pacific; area, c. 480,000 sq. miles; extreme length, 950 miles; width, 640 miles. From Pasto in S.W. corner Cordilleran ranges spread out like ribs of fan; along Pacific coast Cordillera de Chocó is low, and valley to E. is drained S. to Pacific by San Juan R., N. to Atlantic by Atrato. Main ranges are Western, Central, and Eastern Cordilleras; intervening valleys drained by Cauca and Magdalena Rivers. These valleys are richly wooded; coffee, maize, tobacco, and cacao are cultivated. Great plains or *llanos* in E. are drained by head-waters of Orinoco.

Climate varies greatly, ranging from tropical to arctic conditions; rainy season, Oct. to Dec.; dry season, Dec. to Feb. Most of inhabitants live on plateaux, which are treeless but well-watered prairies, of which those of Antioquia and Bogotá are most important. Capital, Bogotá, stands on latter, 8694 ft. above sea-level.

History.—Original inhabitants of C. were Indians, some of whom at time of coming of Spaniards were partially civilised, while others were still in primitive condition. Spaniards first appeared in first half of XVI. cent.; in 1525, Bastida established their first settlement at Santa Marta, and eight years later another was made by Heredia at Cartagena; he made several successful expeditions in search of gold. Quesada took Bogotá (1537), the capital of the Chibcha tribe, and named the surrounding district New Granada. New Granada was at first incorporated with Peru, but attained separate existence in 1564 when it became a Presidency. For nearly two hundred years Indians were cruelly oppressed by Span. conquerors; one-seventh were forced to work in mines as slaves under wretched conditions; but in 1729 slavery was abolished. In 1740, New Granada was for the second time made a viceroyalty—it had been one for short time from 1718—and so continued until it attained independence in 1810. Principal events under Span. rule were introduction of Inquisition; importing of negroes from Africa to supersede Indians in mines; attacks by English, French, and other nations. The Viceroys, by tyrannical and unjust measures, finally drove people to insurrection in 1810, when revolution occurred, Bogotá first declaring independence. War ensued; lasted nine years before Spaniards were finally overcome; leader of rebels being Simon Bolivar, a Spaniard, and liberator of Colombia, Panama, Venezuela, and Ecuador, which he unified as Republic of C. At his death they again separated, and Colombia and Panama became Republic of New Granada. Santander was first pres.; administration of his successor, Obando, was marked by first of succession of civil wars and administrative changes. Panama seceded from republic, 1856; Antioquia, 1857. In 1861 occurred another change, and republic was now called United States of C.; this lasted till 1886, when it again became Republic of C. Revolts occurred in 1895 and 1900, latter resulting in civil war, which lasted till 1903. Panama (*q.v.*) again seceded in 1903, in time of Marroquin's administration. Since 1905 efforts have been made to settle by arbitration the boundary dispute with Peru and Ecuador.

Lower levels produce rice, sugar-cane, bananas, indigo, resins, rubber, copaiba, cocoa, vegetables, ivory, dye-woods, medicinal plants; in more temperate zone are found cinchona tree, coffee, figs, while higher up, wheat, other grains; and potatoes are cultivated; on llanos in E. cattle are reared. Country is rich in minerals, gold, coal, iron, salt, copper, lead, platinum, zinc, antimony, sulphur, cinnabar, rock salt, arsenic, marble, lime, gypsum, petroleum, precious stones; valuable pearl fisheries along coast. Manufactures include pig-iron, rails, castings, sugar, sheeting, candles, soap; exports—coffee, cocoa, hides, cotton, mahogany and other furniture woods, drugs, caoutchouc, cattle, etc.; imports clothes, hats, boots and shoes, machinery, matches, textiles, etc. Railway mileage is over 600. Several rivers are navigable or partly so.

Government is by pres., with Congress consisting of Senate and House of Representatives. Senate has 35 members, House of Representatives, 92 members, who are elected by popular vote for four years. Pres. holds office four years.

Inhabitants include Spaniards, Indians, negroes, and many cross-breeds; there is little race animosity, probably because the gradations between white and coloured are too fine for distinction. Chief religion is R.C.; education free, but not compulsory. Pop. (estimated) *c.* 5,000,000.

Petre, *Republic of Colombia* (1906); Hall, *Colombia* (1871).

COLOMBIER, PIERRE BERTRAND DE (1299–1361), Fr. cardinal.

COLOMBO (6° 56′ N., 79° 59′ E.), capital and principal seaport, Ceylon, on W. side of island; extensive trade; magnificent artificial harbour; port of call for Eastern steamers; coaling station; seat of R.C. and Anglican bp's; many fine buildings; Portug. settlement, 1517; taken by Dutch, 1656; by British, 1796; spices, fibres, tea, and coffee. Pop. (1911) 182,058.

COLON.—(1) Anatomical term denoting the part of the large intestine extending from the cæcum to the rectum; (2) in punctuation, the mark (:) used to separate parts of a sentence complete in themselves, but less independent than a full stop (.) would denote.

COLON, Aspinwall (9° 23′ N., 79° 23′ W.), seaport, Panama, on Limon Bay, W. side of Manzanilla Island; spacious harbour; Atlantic terminus of Panama railway and Panama canal; unhealthy climate; U.S.A. control sanitation and quarantine. Pop. (1910) 19,300.

COLON (22° 43′ N., 80° 45′ W.), town, Cuba; sugar.

COLONEL, see OFFICER.

COLONIA, see URUGUAY.

COLONIAL CONFERENCES held in London, 1887, 1896, 1902, 1907, 1911, to discuss matters of Imperial interest.

COLONIAL OFFICE, THE, DOWNING ST., is the government department in London which transacts all business relating to the Brit. colonial possessions. It is administered by a Sec. of State for the Colonies, parliamentary Under-Sec., and an extensive permanent staff. The office of Colonial Sec. was cr. in 1854, the duties having hitherto been undertaken by the Home Sec., and subsequently by the Sec. for War. In 1907 the administration of the C.O. was rearranged by Lord Elgin under the following divisions: (1) *Dominions Division*, dealing with matters affecting the interests of the self-governing dominions; (2) *Crown Colonies Division*, controlling the administration of the colonies indicated and the Protectorates; and (3) *General Division*, which deals with such matters as education, currency, postal service.

COLONNA, one of the most important families in Rome from the XII. cent. onwards; in frequent strife with other houses; still exists.

COLONNA, GIOVANNI PAOLO (d. 1695), Ital. composer of church music.

COLONNA, VITTORIA (1490–1547), Ital. poet; famous for her amatory and elegiac poems, and blamelessness of her life in a corrupt age; devoted wife of Marquis of Pescara; held in great estimation by Michael Angelo.

COLONSAY (56° 4′ N., 6° 12′ W.), island, Inner Hebrides, Scotland; close to isle of Oronsay, landing-place of St. Columba (563).

COLONY, foreign possessions of any country. The Greeks were enterprising colonists, and their c's extended from the Crimea to Spain; they were virtually independent, and had strong sense of liberty; Rom. c's were military in origin, and consisted of families and troops planted in newly acquired territory.

The modern c. is land inhabited mainly by emigrants and descendants of the early settlers; some of them are almost self-sufficient though their manufactures are still limited. For method of government employed in various c's, see BRITISH EMPIRE.

COLOPHON, ancient city, on coast of Asia Minor; 15 miles N.W. of Ephesus; and reputed birthplace of Homer.

COLOPHON, see BOOK.

COLORADO (37° to 41° N., 102° to 109° W.), west central state of U.S.A.; bounded N. by Wyoming, Nebraska; E. by Nebraska, Kansas; S. by Oklahoma, New Mexico; W. by Utah; area, 103,948 sq. miles. Surface shows two natural divisions, great plains in E., mountains in W., where Rocky Mountains cross the state in several ranges, of which most important are Front, Park, and Saguache; highest peaks—Blanca Peak, Mt. Harvard, Gray's Peak, all over 14,300 ft. Chief rivers are Grand with affluent Gunnison in W., Yampa in N.W., Arkansas and South Platte with their affluents in E. Between some of mountain ranges are valleys called parks, occupying site of former lakes. Capital is Denver. Climate varies with elevation; generally healthy; rainfall slight.

History.—C. was originally inhabited by Indians, traces of whom remain in form of cave-dwellings; explored in part by Spaniards in XVIII. cent.; about half of district bought from France by U.S.A., 1804; explored by Amer. travellers, Pike and Long, in early XIX. cent.; western part belonged to Mexico till 1848, when it was ceded to U.S.A.; almost unknown when discovery of gold in 1859 resulted in great influx of colonists and foundation of towns of Denver and Boulder; organised as territory in 1861; admitted as State to Union (1876).

C. is pre-eminently a mining country; produces immense quantities of gold and silver; large deposits of lead, iron ore, copper, anthracite, and bituminous coal; also produces zinc, petroleum, bismuth, mica, tungsten. Mineral springs occur in various places. Agriculture has improved since development of system of irrigation; wheat, oats, maize, barley, potatoes, hay produced; fruits and vegetables grown; sugar-beet largely cultivated. Horses, cattle, sheep, and pigs raised in considerable numbers. Industries include metal smelting and refining, meat-packing, flour-milling, brewing, dairying, manufacture of machinery, cars, beet-sugar. Railway mileage in 1911 was 7559.

C. has Senate of 35 members, and House of Representatives of 65 members; former elected for four, latter for two, years; executive is in hands of Gov., assisted by Lieut.-Gov. and five officials; represented in Congress by two Senators and four Representatives. Education is state-controlled and compulsory. Chief religion is Roman Catholicism. Inhabitants include whites, Chinese, Indians, negroes (*c.* 12,000). Pop. (1910) 799,024.

James, *Wonders of C. Desert* (1912).

COLORADO BEETLE, potato-destroying insect of the Chrysomelidæ family, found in N. America; hundreds of eggs are laid by the female on the inferior surface of potato leaves; full-grown insect is over a third of an inch long, and of a mottled orange colour; enormous havoc done among potato crops, 1859; killed by Scheele's-green.

COLORADO RIVER (32° 4′ N., 114° 25′ W.), river, South-Western U.S.A.; formed by union of Green and Grand Rivers; Green, the more important headstream, rises in Wyoming, joins Grand S.E. of Utah. C. flows S.W. through elevated tableland and southern part of Utah into Arizona; afterwards separates Arizona on E. from Nevada and California on W.; enters Gulf of California; course forms several remarkable cañons of great depth; *Grand Cañon* of the C. (attaining height of 6000 ft.) extends over 200 miles in length; total length of river, 2000 miles.

C. E. Dutton, *Tertiary Hist. of the Grand Cañon Districts*; Dellenbaugh, *Romance of the C. River* (1903) and *Canyon Voyage* (1908).

COLORADO RIVER (*c.* 39° S., 64° W.), river, Argentine Republic, S. America; rises in eastern slopes of Andes; flows generally S.E. to Atlantic.

COLORADO SPRINGS (38° 48′ N., 104° 50′ W.), city, at foot of Rocky Mountains, Colorado, U.S.A.; fashionable summer and health resort; pleasant climate; Manitou mineral springs in vicinity; seat of C. Coll. (founded 1874). Pop. (1910) 29,078.

COLOSSÆ, city, on Lycus, Phrygia; important in ancient times; site of Early Christian church to which Paul wrote his epistle.

COLOSSEUM, THE, see ARCHITECTURE.

COLOSSIANS, EPISTLE TO THE, one of the Pauline Epistles; early evidence in its favour is supported by critics, who are less inclined than formerly to deny its genuineness. The purpose of writing was to counteract the effects of a heresy which had considerable influence there, but what exactly it was is unknown—probably some Judaising tendency, tinged with Oriental speculation.

Martin, in *Century Bible*.

COLOSSUS, name for statues of immense size, and particularly the bronze statue of Helios, 70 cubits in height (over 100 ft.), which stood near Rhodes harbour. Erected about 280 B.C., it was thrown down by an earthquake some 60 years later.

COLOUR.—Bodies owe their colour to the light which they reflect. White light is made up of many c's, and if it falls on a green body all the coloured rays except green are absorbed by the body, while the green light is reflected. A plate of red glass allows red light only to pass through. Coloured rays differ only in the frequency of ether vibrations which they set up, and the structure of the retina enables the eye to distinguish between these. Blue and yellow paints when mixed

are green, because green rays are the only rays reflected by both and not absorbed by either.

Complementary c's are any two which combine to make white, *e.g.* blue and yellow, red and green. *Primary* c's are the chief c's of the spectrum; they are red, orange, yellow, green, blue, indigo, violet (Newton's theory); red, blue, and green (Young-Helmholtz theory). See LIGHT, SPECTROSCOPY.

COLOUR-BLINDNESS, inability to distinguish between various colours; varies from total c.-b. to a confusion of delicate shades; green and red frequently confused; state generally hereditary and incurable; may be produced by disease. See EYE.

COLOUR-SERGEANT, highest non-com. infantry officer of company; attends the colours on parade; also acts as pay-sergeant.

COLOURS, MILITARY, flags borne by regiments. They correspond to the *vexillum* of Rom. armies, and the 'banner' of the feudal lord. They developed on modern lines in the XVIII. cent. In the Brit. Army each battalion has two colours—the King's and the Regimental. They are not now carried into battle as formerly. The presenting of new colours is an elaborate ceremony. Many foreign regiments have colours similar to those of Brit. regiments.

COLOURS OF ANIMALS are due in some cases to light effects owing to the structure of parts, *e.g.* the metallic lustre of the plumage of certain birds, the scales of wings of some butterflies, and the brilliant tints of some annelida. Again, the c's of animals may be the results of pigmentation—many problems of pigment physiology still await solution; but it is known that some pigments are derived from waste products—uric acid and bile—*e.g.* the pigmentation of the wings of some butterflies. Others are respiratory pigments, *e.g.* the hæmoglobin of the red blood corpuscles of mammals, and hæmocyanin occurring in molluscs and many crustacea giving rise to a green coloration (*e.g.* in oysters). Most of the pigments of a yellow, orange, or red colour are 'lipochromes' occurring chiefly in crustacea, but also in echinoderma, fishes, and birds. Chlorophyll (*q.v.*) occurs in some protozoa, sponges, and cœlentera, and has the same function as in plants. The uses of colours in animals may be classified as due to protective purposes in the struggle for existence and as secondary sexual characters. Protective coloration may serve for concealment either for defence or aggression. The arctic ermine, hare, fox, and polar bear are inconspicuous owing to their resemblance to snow; the desert animals, antelopes, camels, lions, are also typical examples of protective colouring. Animals not possessing the latter could not hide from their enemies or their prey, and the species would become extinct. Certain butterflies and caterpillars resemble leaves and twigs in colour, and are thus likely to escape the notice of predatory birds. Some animals (*e.g.* toads, insects) are very conspicuous by a vivid, mostly yellowish coloration which would seem disastrous, but as they are unpalatable, their colour serves as a protection. One species of tropical Amer. butterfly survives because of its resemblance to an unpalatable species in form and manner of flying. The preference for the 'fittest' and most brightly coloured males by the females during courtship has led to the bright plumage of birds and the coloration in certain fish, while the females on whom the care of the offspring devolves have no conspicuous colouring. The colour of certain animals change with the season, *e.g.* the ptarmigan and the Alpine hare become white in winter. In a very cold winter the weasel and stoat may become pure white in coat.

E. B. Poulton, *The Colours of Animals* (1890); M. I. Newbigin, *Colour in Nature* (1898); Geddes and Thomson, *Evolution of Sex*.

COLSTON, EDWARD (1636–1721), Eng. philanthropist; a Bristol merchant who made enormous sums of money, much of which he devoted to charitable foundations; a strong high churchman and Tory.

COLT, SAMUEL (1814–62), Amer. inventor of the revolver, the first model for which he made as a boy. Patented and put on the market in 1837, the weapon only began to be appreciated in 1847, when, through General Zachary Taylor, the Amer. Government ordered a supply for the Mexican wars; subsequently millions were manufactured in Colt's factories.

COLT'S-FOOT (*Tussilago Farfara*), plant of order Compositæ, with yellow flowers, common in England; leaves are sometimes smoked for asthma.

COLUGO, FLYING LEMUR (*Galeopithecus*), order of arboreal vegetarian mammals of the Malay Archipelago and Philippines, about the size of a cat, and sometimes classified with the Insectivora. Their fore- and hind-limbs are connected with a broad fold of skin which serves as a parachute with which the animals can effectively glide through the air from tree to tree.

COLUMBA, ST. (521–97), spent his early life in Ireland; in 563 came to evangelise Scotland, founding a monastery at Iona, where he d.; he did noble work among the Picts, though his life has been overgrown with myth.

COLUMBAN, ST. (543–615), b. Ireland; preached in Switzerland and Italy.

COLUMBIA (40° 2′ N., 76° 23′ W.), town, on Susquehanna, Pennsylvania, U.S.A.; manufactures machinery, silk goods, etc. Pop. (1910) 11,454.

COLUMBIA (39° N., 92° 23′ W.), city, Missouri, U.S.A.; seat of Univ. of Missouri; other colleges are the Agricultural Coll., Christian Coll., and Stephen's Coll. (for women); C. is market for grain and farm products. Pop. (1910) 9662.

COLUMBIA (34° 2′ N., 80° 57′ W.), city, capital of S. Carolina, on Congaree R. at head of navigation; seat of Univ. of S. Carolina; various colleges; cotton-mills; ironworks. Pop. (1910) 26,319.

COLUMBIA (35° 38′ N., 87° 2′ W.), city, on Duck R., Tennessee, U.S.A.; important live stock centre; manufactures cotton and woollen goods. Pop. 5754.

COLUMBIA, BRITISH, see BRITISH COLUMBIA.

COLUMBIA, DISTRICT OF, see WASHINGTON (D.C.).

COLUMBIA RIVER, OREGON (46° 10′ N., 123° W.), large river, N. America, 1400 miles long; rises in Brit. Columbia, on western slope of Rocky Mountains; flows irregularly, generally S.W., through Washington; forms part of N. boundary of Oregon and Washington; enters Pacific; principal affluents, Clark's Fork and Snake River; navigation interrupted by numerous falls and rapids, but by steamers and intermediate railways goods can be conveyed a distance of 500 miles up; salmon fisheries.

COLUMBIA UNIVERSITY, New York City, first founded as King's Coll. in 1754; called Columbia Coll., 1784; various other institutions founded from time to time have been amalgamated with it; schools of med., law, applied science, chem., engineering, arch., journalism, and pharmacy; connected also with theological coll's; called 'Columbia Univ.,' 1896.

COLUMBIDÆ, see PIGEON FAMILY.

COLUMBINE (*Aquilegia*), perennial herbaceous plant (order Ranunculaceæ) with divided leaves and long-stalked white, red, or blue drooping flowers with five spurred petals.

COLUMBINE, Harlequin's dau. in early Ital. comedy.

COLUMBITE ($(FeMn)(NbTa)_2O_6$), mineral occurring in black lustrous crystals in N. America, Greenland, the Urals, and Bavaria, and of interest on account of the element columbium (niobium) having been discovered in 1801 as one of its constituents.

COLUMBIUM, original name, used chiefly in U.S.A., given by its discoverer, Hatchett, to the element niobium so called by A. Rose, who rediscovered it.

COLUMBUS (32° 23′ N., 84° 59′ W.), city, on Chattahoochee, Georgia, U.S.A.; extensive cotton factories. Pop. (1910) 20,554.

COLUMBUS (39° 10′ N., 85° 51′ W.), city, Indiana,

U.S.A.; has extensive tanneries; manufactures agricultural implements and furniture. Pop. (1910) 8813.

COLUMBUS (33° 27′ N., 88° 47′ W.), city, Mississippi, U.S.A.; cotton-mills and cotton-seed oil factories. Pop. (1910) 8988.

COLUMBUS (39° 59′ N., 83° W.), capital, Ohio, U.S.A., on Scioto R.; important commercial and industrial centre; trades in grain, live stock, wool, coal, iron; manufactures carriages, machinery, shoes, regalia, soap, etc.; has State Univ., Lutheran Univ., medical colleges, various hospitals and charitable institutions, public parks; became capital of Ohio, 1816. Pop. (1910) 181,511.

COLUMBUS, CHRISTOPHER, Cristoforo Colombo or Cristobal Colon (*c.* 1446 or 1451–1506), discoverer of America; b. Genoa; s. of a wool-comber; C. was in trade, and in 1474 went to Chios, and in 1476 to England. He gradually formed the idea of discovering a western passage to Asia; like others of his time, he did not know the girth of the earth, and believed Asia stretched farther eastwards than it does. After gaining the support of Queen Isabella of Castile, he set sail on his first voyage on Aug. 3, 1492, with three ships. On Oct. they first came to land at the Bahama Islands, and spent three months in the West Indies. C. then returned and was welcomed by Ferdinand and Isabella. On a second voyage in 1493 he discovered more islands, and founded the city of Isabella in Hispaniola. Returning to Cadiz in 1496, C. again set sail, 1498, discovering Trinidad, and the estuary of the Orinoco. C., however, had failed dismally in governing his new Span. colonies, and for a while fell from court favour. But on his return in 1500 he was welcomed again. He set out on his fourth and last voyage in 1502, sailing, among other places, to Cuba and Jamaica. He returned in 1504, and *d.* two years later. His remains, transferred from one place to another, are now in Seville Cathedral.

C. was a tall and good-looking man. He accomplished much, but his subsequent voyages added comparatively small discoveries to his first achievement. He never realised that he had discovered a new continent.

C.'s elder bro., **Bartolomeo** (d. 1514), was deputy-gov. of Hispaniola and a geographer; the second bro., **Diego** or **Giacomo** (d. 1515), was a Castilian statesman. Christopher's s., **Diego** (c. 1480–1526), accompanied him on his second voyage, and became gov. of the Indies; his s., Luis (1520–72), was for a time Duke of Veragua. **Fernando** (1488–1539), illegitimate s. of Christopher, accompanied him on his fourth voyage, and is supposed to have written the *Vida del Almirante.*

E. J. Payne, *History of the New World called America* (1902); Markham, *Life* (1892).

COLUMELLA, LUCIUS JUNIUS MODERATUS, writer on agriculture; b. Gades, Spain; flourished in Rome in I. cent. A.D.

COLUMN, ARMY, march-formation of troops; c. of fours in which men are four abreast; battalion in c. has companies two deep, separated by distance equal to front of company; quarter c. signifies interval of six paces.

Fighting in c., a favourite device of Napoleon, is now in disfavour owing to range and speed of loading of modern artillery.

COLURE (astron. and geog.), either of two great circles of the celestial sphere intersecting at right angles at the poles, one passing through the equinoxes, the other through the solstices.

COLVILLE, JOHN (*c.* 1540–1605), Scot. Presbyterian theologian, then (probably) R.C.

COLVIN, SIR SIDNEY (1845–), Eng. literary and art critic; keeper of prints, Brit. Museum; edit. R. L. Stevenson's letters and works, etc.

COLWYN BAY (53° 17′ N., 3° 43′ W.), watering-place, on Irish Sea, Denbighshire, N. Wales.

COLZA OIL, obtained from the seed of a variety of cabbage (*Brassica campestris*), cultivated chiefly in France, Belgium, Holland, Germany; used as lubricant for machinery, and in lamps; the seed, after expression of oil, used as food (oil-cake) for cattle.

COMA, prolonged loss of consciousness in which the beating of the heart and the breathing, which is usually slow and difficult, are the only signs of life; the person cannot move, cannot be made to feel or hear anything, and the limbs fall back helplessly when lifted. The most usual causes are: injury to the head, apoplexy, heatstroke, various brain affections, diabetes, anæmia, poisoning by opium or alcohol. C. is distinguished from syncope (*q.v.*) by being much more severe and prolonged.

COMA BERENICES, Berenice's Hair, small constellation of N. hemisphere between Leo and Boötes.

COMANA (*c.* 40° 20′ N., 36° 56′ E.), city, Pontus, Asia Minor; celebrated temple, dedicated to the moon goddess.

COMANA, Chryse or Aurea, *i.e.* the golden (*c.* 38° 40′ N., 36° 34′ E.), ancient city, Cappadocia, Asia Minor; celebrated temple, dedicated to Ma, Nature goddess; chief priests took rank next after the king.

COMANCHES, N. Amer. Indian tribe now living in Oklahoma; formerly very warlike.

COMAYAGUA (14° 27′ N., 87° 39′ W.), town, Honduras, Central America, on Ulua R.; has cathedral and coll.; declined since 1827; was capital up to 1880. Pop. 6000.

COMBACONUM, see Kumbhakonam.

COMBE, ANDREW (1797–1847), Scot. physician and physiologist; younger bro. of George Combe (*q.v.*), the phrenologist, whom he supported in his theories; author of several works on physiol

COMBE, GEORGE (1788–1858), Scot. phrenologist and educationist; wrote *The Constitution of Man* (1828).

COMBE, WILLIAM (1741–1823), Eng. humorist; wrote *Tours of Dr. Syntax.*

COMBERMERE, STAPLETON COTTON, 1ST VISCOUNT (1773–1865), Brit. soldier; saw service in Flanders, India, Peninsular War, etc., till 1826; cr. baron, 1814; viscount, 1826; field-marshal, 1855.

COMBINATORIAL ANALYSIS. — Early work on this subject is given by Euler in *De Partitione Numerorum.* Considerable advances were made by Jacobi, by Warburton, who utilised the theory of finite differences, and by Sir John Herschel, who introduced the idea and notation of the circulating function. Cayley, Sylvester, and MacMahon made notable additions, to the latter being due the method of symmetric functions, which has important applications to the theory of permutations and combinations; he also gave us the 'Partition Analysis,' applying it to the solution of special problems in arithmetic and algebra. MacMahon's method of differential operators has for its leading idea the designing of a function and of an operator so that, when the operator is performed upon the function, a number is reached which enumerates the solutions of the given problem. The problems dealt with by this method are usually connected with lattices. Combinatorial analysis deals mainly with the distribution of objects, either all unlike, or consisting of groups of like objects, into classes.

Permutations and Combinations thus form one branch, and the formulæ for these may be deduced from the general theory; but they may be obtained directly. The different arrangements (regard being had to the order of such arrangement), each containing r things, which may be made from n unlike things, are known as the *permutations* of the n things r at a time. The different ways of making a selection of r things from n unlike things (without regard to the order of selection or arrangement) are called the *combinations* of the n things r at a time. The former is denoted by the symbol ${}_nP_r$, the latter by ${}_nC_r$.

${}_nP_r = n(n-1)(n-2) \ldots (n-r+1)$; for in making up any arrangement of r things, the first place may

be filled in n ways, the second in $(n-1)$ ways, the third in $(n-2)$ ways, and so on; and since each way of filling up any one place may be associated with *any* of the ways of filling the remaining places, the total number of the possible arrangements is the product $n(n-1)(n-2) \ldots (n-r+1)$.

Denoting by $\lfloor n$ or $n\,!$ (read as 'factorial n') the product $n(n-1)(n-2) \ldots 3.2.1$, we have ${}_nP_n = n\,!$. Hence we deduce ${}_nC_r = \frac{n(n-1)(n-2) \ldots (n-r+1)}{r\,!}$; for each combination of r things gives rise to $r\,!$ permutations, and $\therefore {}_nP_r = {}_nC_r \times r\,!$. It is easily seen that ${}_nC_r = \frac{n\,!}{r\,!\,(n-r)\,!}$, from which it is obvious that ${}_nC_r = {}_nC_{(n+r)}$.

If the n things are p of one kind, q of another, r of another, etc., the number of permutations of the n things, all being taken, is $\frac{n\,!}{p\,!\,q\,!\,r\,!\ldots}$. The number of combinations $\propto$ together in this case is the coefficient of $x^\propto$ in the expansion of $(1+x+x^2+\ldots+x^p)(1+x+\ldots+x^q)(1+x+\ldots+x^r)\ldots$

P. A. MacMahon, *Combinatory Analysis.*

COMBUSTION, or burning, a chemical process associated with light and heat, or the union of different substances with oxygen. Animal life may thus be considered a c. of protoplasm.

COMÉDIE FRANÇAISE, see THÉÂTRE FRANÇAIS.

COMEDY (Gk. *kômos*, a village festival, *aeidein*, to sing), refined humour as distinct from the broadness of farce and burlesque, and generally applied to plays of a light character which end happily; often a humorous criticism of the foibles of society, and consequently didactic; formerly applied to a tale, or narrative, cf. Dante's *Divina Commedia.* See DRAMA.

COMENIUS, JOHN AMOS, KOMENSKI (1592–1671), educationist; s. of Moravian parents; ed. Herborn and Heidelberg; bp. of Moravians, 1632; wrote *Didactica Magna, Orbis Sensualium Pictus*, a child's picture book; an evangelical realist.

COMET, a nebulous body consisting of a bright 'nucleus' surrounded by a haze or 'coma' with a long luminous train or 'tail,' and moving in an elongated orbit round the sun. The tail is usually directed away from the sun, and increases as the comet approaches perihelion. About 800 c's are known, some moving in elliptical orbits and, therefore, reappearing at certain intervals, for instance, *Halley's* c. in periods of 76 years, *Encke's* in periods of 3 years, *Tuttle's* in 14 years, etc., while others seem to describe a parabola or hyperbola and do not return. Shooting stars and some meteorites seem to be the result of disintegration of c's. Spectroscopic observation has revealed the presence in c's of hydrocarbons, also of sodium and iron.

G. F. Chambers, *Comets* (2nd ed., 1911).

COMFREY, see BORAGINACEÆ.

COMILLA, KUMILLA (23° 28′ N., 91° 7′ E.), chief town, on Gumti, Tippera district, Bengal, India. Pop. 19,169.

COMINES, COMMINES (50° 46′ N., 2° 59′ E.), town, Flanders, on borders of France and Belgium, divided by river Lys; spinning of flax, wool, and cotton. Pop. 7294.

COMINES, PHILIPPE DE, COMMINES (*c.* 1445–*c.* 1511), Fr. hist. writer; b. Flanders; at the court of Duke of Burgundy, and of Louis XI. and Charles VIII. of France; author of *Memoirs* (1464–83 and 1494–95).

COMISO (36° 57′ N., 14° 36′ E.), town, Syracuse, Sicily; site of ancient fountain of Diana; pottery and cotton manufacture. Pop. 22,000.

COMITIA, name applied to the popular assemblies of ancient Rome (as distinct from a *concilium*, any kind of meeting, and *contio*, an assembly for an announcement), summoned for official or legislative purpose. The earliest was the *comitia curiata*, in which the people assembled according to 'curiæ,' or parishes; later, it was only formal, and called together for the ratification by the people of certain official acts; the *comitia centuriata*, assembled on a military basis, elected the magistrates and declared war; the *comitia tributa*, assembled by territorial tribes, performed much of the work of government; the *concilium plebis* contained plebeians only.

Greenidge, *Roman Public Life*; Abbot, *Roman Political Institutions.*

COMITY OF NATIONS, recognition of the laws of one country by another for purposes of convenience and necessity, *e.g.* an English firm in France must conform to Fr. laws.

COMMANDER, officer in Brit. navy between rank of 1st lieutenant and captain. **C.-in-Chief**, supreme acting officer of Brit. army until 1904, when office was abolished. **C. of the Faithful**, title of Caliphs; first assumed by Omar I. (634–44).

COMMANDERY, a division of land in the property of the Knights of St. John.

COMMEMORATION, ENCÆNIA, annual celebration at Oxford, marking completion of degrees, presentation of honorary distinctions, recitation of prize essays, etc.; usually held on third Wednesday after Trinity Sunday.

COMMENSALISM, zoological term indicating the dwelling together of organisms of different species; good example is anemone, which affixes itself to the acquired shell of the hermit-crab, and defends it by stinging-threads in return for the current-producing powers of hermit-crab, which enable it to obtain its food; c. occurs also in bivalves; frequently develops into parasitism.

COMMENTRY (46° 15′ N., 2° 45′ E.), town, Allier, France; coal-fields. Pop. 8084.

COMMERCE.—From very early times there has been traffic between nations, and at any rate some communication between distant countries can be traced almost in prehistoric times. The records and remains of ancient Assyria show a highly developed commercial intercourse with neighbouring lands. Nevertheless, as compared with modern times, ancient c. was always scanty and uncertain. Thus there were trade routes between Europe and India, but the traffic cannot have been great. The Phœnicians were the great naval and commercial people of early times, in contrast to the Romans, who hated the sea. Later the commerce of the Mediterranean all fell under the sway of Rome, and the 'pax Romana' made trade at long distances possible. With the break-up of the Empire and the decay of the old civilisation, everything was disorganised, and when mediæval commerce developed it was on different lines. The position of Venice at the head of the Adriatic, and the enterprise of her inhabitants, made her a commercial centre between Western Europe and the Levant. In the North, the Hansa towns and the Netherlands were the chief carriers of the mediæval world.

The discovery of America opened up wide possibilities, and at first the wealth of the New World went to Spain and Portugal. Spain, however, declined, for her prosperity was not really on a firm basis, and the bulk of commercial activity now fell to other peoples. Britain took the lead in opening up N. America, and also in the trade with India. The XIX. cent. witnessed an enormous development, not only of Brit. commerce, but of that of many other nations besides.

Webster, *A General Hist. of Commerce* (1903); Cunningham, *Growth of Eng. Industry and Commerce* (4th ed., 1907).

COMMERCIAL TREATIES.—In classical times treaties of trade and commerce were made. Agreements were made frequently in the Middle Ages about commercial transactions. Commercial treaties more like those now made appear from the XII. cent., for then several European cities, the most important, perhaps, Venice and Genoa, rise into prominence. England made a treaty with Norway in 1217, and then others with various countries.

Naturally, a treaty was generally simply an arrangement between two states, and sometimes it took the form of granting to another nation privileges already enjoyed by one—the 'most favoured nation' principle. Of modern developments the most important is that of the intimate connection of commercial treaties with tariffs, whereby the tariff is a means of bargaining between two countries. International trade in Europe has been regulated by a series of tariffs since 1906. Commercial treaties are generally only made for a few years.

COMMERCY (48° 46′ N., 5° 35′ E.), town, on Meuse, France; iron-working, embroidery, etc. Pop. 5109.

COMMERS, social gathering amongst Ger. students.

COMMINATION, ancient service of Anglican Church, said on Ash Wednesday; announces God's judgment against sinners.

COMMISSARIAT, army department responsible for the supply of provisions, forage, clothes, etc.

COMMISSION, the entrusting of a duty to any person, or the document containing the authority to do so; the term is also used for a body performing the duty of an individual. To give a commission, *i.e.* a bribe to the agent of any person, is a criminal offence punishable by fine or imprisonment. A 'Royal Commission' is a body app. by the Crown to inquire into some special subject. A c. in the army is a certificate raising to rank of **Commissioned Officer**, *i.e.* an officer of or above rank of sub-lieutenant. Sergeants and corporals are NON-COMMISSIONED OFFICERS (N.C.O.), while schoolmasters, etc., are Warrant Officers.

COMMISSIONAIRE, member of a corps of pensioned soldiers who performs service as doorkeeper, messenger, etc., in banks and business offices; corps founded by Sir Edward Walter, 1859.

COMMITMENT, the written instrument instructing the removal of a prisoner to a place of custody; 'committal' is the court's decision or sentence.

COMMODORE, temporary rank given in the Brit. navy to captain in command of a squadron.

COMMODUS, LUCIUS ÆLIUS AURELIUS (161–92), Rom. emperor; s. of Marcus Aurelius; succ., 180; became a tyrant.

COMMON LAW, the body of Eng. customary law, as distinct from that embodied in Acts of Parliament. It is derived from the customary laws which prevailed in Saxon times, viz. the Dane Law, Mercian Law, Wessex Law. During the Norman period the king's court selected such of these customs as were generally applicable to the whole country, and rejected the rest. Some of this common law is as ancient as the Early Britons, and Blackstone has pointed out that 'however compounded, and from whatever fountains derived, it has subsisted immemorially in this kingdom.' Judges have always sought to apply to new combinations of circumstances, as they arose, the rules of law which were found in these ancient legal principles and judicial precedents.—THE COURTS OF COMMON LAW were three in number—Court of Common Pleas, Court of King's Bench, Exchequer Court. By the Judicature Acts (1873–76) the three became divisions of High Court of Justice, and now form the King's Bench Division, presided over by Lord Chief Justice.

COMMONS, waste lands whose proprietor has his title limited by rights of other persons who enjoy pasturage of their animals, heath, turf, soil, etc., in what is generally described as a 'reasonable amount'; but these rights may comprise the whole of certain products. C. illustrate the union of township and manorial organisations in development of England. In primæval Saxon townships householders held arable, meadow, and waste land in common, dividing products, but while separate ownership developed in respect to other land the 'waste' remained common. After the development of manors, the right of commoners clashed with the lord of manor's claims, and the *Statute of Merton* (1235) enacted that the owner of manor should be lord of the woods, wastes, and pastures of the township, but must observe commonable rights of his under-tenants, these rights being fixed by amount of their holdings and henceforth regarded as appurtenant to the holdings. Attempt of lords of manors to oust commoners by inclosure of c. has been of economic and political importance to present day. Common-field system was attacked in XVI. cent. by landowners who wished to make fortunes from large sheep-farms, and in XVIII. and XIX. cent's largely disappeared through introduction of farming on larger scale. Parliament lent its aid, Inclosure Acts being passed, 1709–1801, when there was a general Inclosure Act, and again until 1845 when the present Act (since amended) was passed. In latter half of XIX. cent., however, the Commons Preservation Soc. was formed, with result that parliamentary aid is now given to protection of c. as open spaces for public recreation.

G. Williams, *On Rights of Common* (1880); Sir W. Hunter, *The Preservation of Open Spaces* (1896).

COMMONWEALTH, system of popular government; the term is applied to Eng. state between death of Charles I. (1649) and Restoration (1660), during which parliament and the army were supreme. In U.S.A. any one of the United States is a c., *e.g.* the C. of Virginia. C. of Australia (*q.v.*) was formed on Jan 1, 1901, by federation of separate colonies.

COMMUNE, small Fr. administrative division.

COMMUNE, mediæval term applied to municipal corporations which developed in Middle Ages; in many particulars exempt from common law, some of them became city-states. The various barbarian tribes which overran the Rom. Empire often left fortified towns standing, and in these mediæval c. sprang up; sometimes, however, an artificial town was organised, generally to be distinguished by its symmetrical planning—central market-place, relation of streets, etc.

For development of c. in England, see BOROUGH. In Germany, fortified Rom. towns were usually in X. cent. seats of bishoprics and ruled by bp's with civil and military as well as ecclesiastical jurisdiction over town and district. The chief liberty of the town was that its inhabitants could not be impleaded outside its bounds, and an important enactment for the country at large was that runaway serfs who dwelt in town for a year and a day became free. Corporations developed XI. to XIII. cent's, obtaining imperial charters of liberties; town council (*Rat*), composed of burghers and burgomasters, imposed fines for breach of peace and levied duties, while merchants became incorporated in guilds. Encroachment of towns on privileges of bp's and nobles led to wars and establishment of many imperial cities, under immediate control of emperor; these were nearly all disfranchised, 1815, having decayed.

In Italy, c. was also head of bishopric, but important difference was that it was also seat of nobles, inhabitants being classified as *capitani*, chief nobles, *valvassori*, landowners dependent on the *capitani*, and the industrial class (*popolo*, the people). Lombard merchants were important in VIII. cent.; their cities obtained imperial charters, and in XII. cent. defeated emperor in war, using quarrels between papacy and empire to consolidate their power. C. was composed of popular assembly, council, and executive body of 12 *consules*. Establishment of *podestà* as head of the city led to tyrannies of Visconti of Milan, Scala of Verona, Carrara of Padua, etc. Florence saw many battles between her democracy and nobles and final establishment of rule of Medici; Venice became ruled by small oligarchy of nobles and merchants; Rom. municipal freedom was overthrown by popes and not reinstated until modern times.

Fr. municipalities in south resembled those of Italy in constitution, but generally remained *villes consulaires*; those of north resembled Ger. c. or Eng.

borough, often having *mayeur, burgenses*, etc. Span. towns became of importance through acting as outposts against Moors.

Commune of Paris (1871), see FRANCE (*History*).

COMMUNION, see EUCHARIST.

COMMUNISM, name given to scheme of political organisation based on holding of property in common, and intended as remedy for social inequality. Its teaching is to be found in Plato's *Republic*, where equality of opportunity is advocated, and provision of necessaries by state puts an end to competition. War of poor against rich began in England in XIV. cent., and grievances of poor found expression in XVI. cent. in writings of Latimer and Sir Thomas More, the *Utopia* of the latter following Plato's *Republic* in communistic teaching. Various communities have been founded in New World on communistic principles; earliest was settlement at Watervliet (1776) by the 'Shakers' (*q.v.*), imitated by other religious bodies, and in the XIX. cent. by followers of social reformers. Extreme communists oppose social organisation in families. See SOCIALISM.

W. A. Hind, *Amer. Communities* (2nd ed., 1902); Nordhoff, *Communistic Societies of the United States* (1875).

COMMUTATION, act of exchange, particularly the exchange of one penalty for another.

COMNENUS, name of family which ruled Byzantine Empire from mid-XI. cent. to beginning of XIII. cent., and Trebizond from beginning of XIII. cent. to mid-XV. cent.

COMO (45° 48′ N., 9° 3′ E.), city, capital of prov. Como, Lombardy, Italy, at S.W. extremity of Lake Como; ancient *Comum*; bp.'s see; chief edifices—cathedral (1396–1732) and town-hall, both of marble; number of fine churches; interesting Rom. relics; destroyed by Milanese, 1127; rebuilt by Barbarossa, 1155; birthplace of two Plinys; district rich in orange groves and olives; manufactures silk, satin, gloves. Pop. (1911) 44,146.

COMO, LAKE OF (46° N., 9° 15′ E.), lake, Lombardy, Italy; ancient *Larius Lacus*; traversed by river Adda N.E. to S.W.; beautiful scenery; *c.* 30 miles long; tourist resort.

COMORIN, CAPE (8° 4′ N., 77° 35′ E.), in Travancore; southern extremity of India.

COMORO ISLANDS (11° 30′ S., 43° 30′ E.), group of volcanic origin belonging to France, in Mozambique channel, between E. coast of Africa and N.W. coast of Madagascar; area, *c.* 800 sq. miles; principal islands, Great Comoro, Anjuan, Mayotte, and Mohéli; mountainous; loftiest heights, 8500 ft.; fertile soil; inhabitants, Arabs, Malagasy, negroes; religion, Muhammadan; coco-nut palm oil; discovered 1591, by Eng. navigator Lancaster; chief exports, cane sugar and vanilla. Pop. *c.* 96,000.

COMPANIES, CHARTERED, see CHARTERED COMPANIES.

COMPANIES, LIABILITY.—A **Joint-Stock Company** is an association of seven or more persons who contribute an amount of capital, in the same or different proportions, for carrying on a particular business with a view to profit. Such a company is either limited or unlimited:—

UNLIMITED COMPANIES.—In these the liability of the members is unlimited, each shareholder being liable, to the full extent of his property, for debts incurred by the company. Moreover, should any shareholders prove unable to pay their fair proportion of the loss, the other shareholders are bound to make up the deficiency so long as any property remains to them. The liability, however, of each member ceases at the end of a twelvemonth from the time he withdraws from the company. Such companies are now rare.

LIMITED COMPANIES.—These are limited either by (*a*) guarantee or (*b*) shares. In (*a*) each member of the association makes himself responsible for an amount not exceeding a certain fixed sum. In (*b*) the liability of each shareholder is limited to the nominal value of the shares that he holds. When his shares are once fully paid up, he has no further liability.

A limited company differs from a *partnership* in the following particulars: (1) The property of the company is not the property of the members, and their goods cannot be seized for the debts of the company; while in a partnership firm, the property of the firm is the property of the partners in common, and their private property can be seized for the debts of the firm. (2) A shareholder in a limited company is not an agent of the company, and it is in no way liable for the acts of the shareholders; but a partner is the agent of his fellow-partners, and they are liable for his contracts or for his fraud or other things done by him in the scope of the partnership business. (3) Shares in a limited company are as a rule transferable, unless the regulations of the company restrict transfer; but a partner cannot transfer his share without the consent of his fellow-partners. (4) On the death of a partner the partnership is dissolved, but the death of a shareholder does not terminate the existence of a limited company. (5) Lastly, the number of persons forming a partnership must not exceed twenty (ten in banking), whereas in a limited company the number of members must never be less than seven, but they may be as many as the number of shares into which the capital is divided.

COMPANIES, LIVERY, see LIVERY COMPANIES.

COMPARATIVE ANATOMY, the science which treats of the structure of animals (including man), and at the same time compares the structure of different animals with one another. The term is being gradually abandoned, since all biological science now adopts comparative methods.

COMPARETTI, DOMENICO (1835–), Ital. philologist; Hon. D.C.L. (Oxon.).

COMPASS, a magnetised needle balanced on a fine point above a card. The needle will set itself so as always to point in the same direction—to the magnetic N. and S. Owing to this property, it is of great value to the navigator. In a modern ship's c. the *needle* consists of eight light magnetised strips of steel, placed parallel to each other like the steps of a ladder, and fastened together by silk threads. Such a compound needle is more reliable, and is also steadier in a heavy sea than is a single needle. The *card* is frequently a thin aluminium rim, on which a paper scale divided into the 32 *points* of the c. is fixed. The c. (consisting of needle and card) is contained in a copper bowl, supported on gimbals (concentric rings), which keep it horizontal no matter how the ship pitches. The iron and steel of which the ship is built affect the c.; this is corrected by a process known as 'swinging the ship,' as a result of which masses of soft iron or magnets are distributed near the c. so as to counteract the ship's magnetic effects. In the *Liquid* or *Spirit* c., the card floats on a mixture of water and alcohol. Card and needle turn together. Very great steadiness is obtained with this form of instrument.

In the latest form of c.—the *Gyro* c.—the gyrostatic principle is applied (see GYROSTAT). By means of a gyro wheel the axis of the whole combination is kept parallel to the earth's axis, and the instrument thus shows both latitude and the ship's course. The c. is unaffected by the ship's magnetism or by surrounding masses of iron, and may be used to control a number of suitably placed dials. The c. is supposed to have been used in China about 3000 years ago, but it was not heard of in Europe until the XII. cent. About the beginning of the XIV. cent. Flavio Gioja, an Italian, invented a c. of eight points. Columbus discovered the magnetic declination (1492) of the c.

Scoresby's *Compass in Iron Ships* (1855); **Towson, *Practical Information on Deviations of the C.*** (1886).

COMPASS PLANT (*Silphium laciniatum*), N. Amer. prairie plant, the leaves of which point N.

and S. so as to avoid the midday heat. The name is also applied to *Lactuca scariola*, the ancestor of the cultivated lettuce.

COMPAYRÉ, JULES GABRIEL (1843–), Fr. educationist.

COMPENSATING PENDULUMS, see CLOCK.

COMPENSATION is money paid as reparation for injuries received or other losses by reason of sickness, accident, etc. In Britain it can be claimed under the Workmen's Compensation Act (1906) by employees who have been injured in the course of their employment; it can also be claimed against railway companies, tramway corporations, by others who have received personal injuries. C. is also paid for extinction of liquor licences; and for land or property taken over by public for improvement purposes.

COMPIÈGNE (49° 25′ N., 2° 50′ E.), town, on Oise, France; formerly fortified; favourite residence of Fr. kings; chief building is Royal Palace, erected by Louis XV. and now used as a museum of antiquities; there are some interesting churches and a fine Gothic hôtel de ville; Joan of Arc made prisoner of the English at siege of C. (1430); canvas, rope-making, boat-building, and distilling are chief industries. Pop. 13,439.

COMPOSITÆ, the largest order of flowering plants. Their florets are packed into heads (*capitula*) surrounded by an involucre of bracts. In some (*e.g.* dandelion) the florets are alike, in others (*e.g.* daisy) the outer ray-florets are larger than the inner disk florets. The capitula are a remarkable adaptation for pollination by insects, a great number of florets being pollinated by a single insect. The sunflower, dahlia, chrysanthemum, Michaelmas daisy, cornflower, chicory, hawkweed, colt's-foot, thistle, and golden-rod are common examples.

COMPRESSIBILITY, see ELASTICITY.

COMPRESSION (astron. and geog.), the ellipticity or polar flattening of the earth and other planets; (engineering) the compressing of remaining steam or gas in the cylinder of an engine after the exhaust to reduce the velocity of the piston on its return stroke.

COMPROMISE, MEASURES OF (1850), agreement between N. and S. States of America by which five questions concerning slavery were settled: two to satisfaction of N., two to satisfaction of S., while the fifth was balanced.

COMPTON, HENRY (1632–1713), Anglican divine; bp. of Oxford, 1674, of London, 1675.

COMPULSORY SERVICE, see CONSCRIPTION.

COMPURGATOR, the precursor of the modern juryman. Under the Anglo-Saxon law an accused person could produce twelve persons to declare on oath their belief in his innocence.

COMTE, AUGUSTE, ISIDORE AUGUSTE MARIE FRANÇOIS XAVIER (1798–1857), Fr. philosopher; b. Montpellier, where he worked in the École Polytechnique, but quarrelled with his master; went to Paris (1816), where he lived on very slender means; came into friendly relations with Saint-Simon in 1818, but after a time rebelled against him, thinking Saint-Simon tried to keep him too much under his influence. C. married Mlle Caroline Massin in 1825, but the marriage was not happy; in 1826 had attack of insanity, but recovered; pub. first vol. of *Positive Philosophy* in 1830, the sixth and last coming out in 1842; then ceased to live with his wife but gave her an allowance; became acquainted with Mme Clotilde de Vaux in 1845, and was deeply affected by her death a year later; pub. his *Positive Polity* and *Positivist Calendar*, the latter in imitation of the Catholic Calendar of Saints. In his lectures C. promulgated his new 'Religion of Humanity.' The *Catechism of Positivism* came out in 1852.

C.'s work, despite its diverse elements, can be regarded as a unity. He had written a *Plan of the Scientific Works necessary to reorganise Society* in 1822, in which he pointed out the coexistence of two tendencies, one to the break-up of old institutions, the other to new forms of social evolution. He became imbued with great admiration for the Catholic Church, and wanted to adapt the methods and principles of the mediæval Church to new social conditions, for a Religion of Humanity. He desired to imitate closely the organisation and rites but not the doctrines of Catholicism. He formulated the *Law of the Three States*, according to which knowledge was (1) theological (belief in supernatural government of the world), (2) metaphysical (objects are ruled by external but abstract force), (3) positive (law explains everything). He arranged the sciences in order, beginning with math's and ending with sociology; each depended on the one preceding, and sociology, the most advanced, was the last to be understood. This arrangement was adversely criticised by Herbert Spencer and others. In his later works he raises Humanity to the place held by God in Monotheism. Amongst other ideas, he believed in the enormous importance of women in the social state. His system, despite its brilliance and suggestiveness on many points, has not as a whole won very wide acceptance. Positivist societies exist in England and France; among prominent Eng. Positivists is Mr. Frederic Harrison.

H. D. Hutton, *Comte's Theory of Man's Future* (1877), *Comte, the Man and the Founder* (1891), *Comte's Life and Work* (1892); J. Watson, *Comte, Mill, and Spencer* (1899).

COMUS (classical myth.), divinity (son of Bacchus and Circe); supposed to preside over festive proceedings; the title of a masque written by Milton.

COMYN, JOHN (d. 1306), Scot. baron, known as *Red Comyn*; murdered by Robert Bruce in Dumfries Church.

CONANT, THOMAS JEFFERSON (1802–91), Amer. baptist theologian; author of works on Old Testament; prof. in several theological coll's.

CONATION, according to some, same as feeling; to others, a mental state caused externally, or one leading to action. See PSYCHOLOGY.

CONCA, SEBASTIANO (1679–1764), Florentine artist.

CONCARNEAU (47° 53′ N., 3° 53′ W.), seaport, on Bay of La Forêt, France; sardine fisheries. Pop. 7631.

CONCEALMENT OF BIRTH, see BIRTH.

CONCEPCIÓN (*c.* 37° S., 72° 15′ W.), important province, S. Chile, between Argentine and Pacific; has splendid commercial position; is an agricultural and cattle-raising district; produces wheat, flour, and wool; its wines are famous; has also valuable coal mines; principal port, Talcahuano. Area, 3311 sq. miles. Pop. (1910) 225,054.

CONCEPCIÓN (36° 49′ S., 72° 3′ W.), city, S. Chile; bp.'s see; has noteworthy cathedral; is centre of rich agricultural region; flour-mills, furniture factories, distilling and brewing. Pop. 62,000.

CONCEPCIÓN, VILLA CONCEPCIÓN (23° 33′ S., 57° 30′ W.), town and river-port of Paraguay, on Paraguay R., S. America; tea is chief export. Pop. (1910) 15,000.

CONCEPT, an idea, without particular details; more generally, any idea.

CONCEPTION, see REPRODUCTIVE SYSTEM.

CONCEPTUALISM, scholastic philosophical term denoting position intermediate between Nominalism and Realism.

CONCERTINA, small wind instrument, with two rectangular keyboards and bellows; invented by Sir Charles Wheatstone (1829).

CONCERTO, musical term for a composition designed to display the skill of the performer and the capabilities of his instrument; is accompanied by full orchestra; consists of three movements of different character, its form being derived from the Sonata.

CONCH, term for the shells of marine molluscs, particularly [illegible] often used as a horn or for ornamental purposes;

name is applied to natives of the Florida Keys and Bahamas, who feed on shell-fish.

CONCILIATION BOARD, see ARBITRATION.

CONCINI, CONCINO, MARSHAL D'ANCRE (d. 1617), Florentine adventurer; gained wealth and dignity under Louis XIII. of France; eventually assassinated.

CONCLAVE (Lat. *conclave*, apartments locked with one key).—(1) Term applied in original sense until middle of XVIII. cent. (2) Assembly held for solemn or secret purpose, this meaning arising from (3). (3) Technical term for sitting of coll. of cardinals in Rom. Church to elect Pope. Bp. of Rome was elected by people in earliest times; this led to bloodshed, erections of anti-popes, and invocation of state interference; gradually Emperor became chief influence at papal appointments and insisted on power to ratify elections; Pope Clement II. confirmed right of election by lay prince (1046). In latter half of XI. cent., however, Hildebrand's reforms resuscitated papacy, and in 1059 a papal bull enacted that cardinals with advice of clergy should elect pontiff and people should ratify their choice; Lateran Council (1179) gave election to cardinals alone, enacting that Pope could not be app. without consent of two-thirds of college; to prevent prolonged vacancies cardinals were shut up until decision was made; Council of Lyons, 1274, established system (which later became law) of allowing cardinals in c. no private apartment, no communication with outside world; moreover, their food-supply was cut down gradually, so that starvation might force them to make a decision.

CONCORD (43° 10′ N., 71° 30′ W.), town, capital of New Hampshire, U.S.A.; extensive manufactures; textiles, machinery; celebrated granite quarries. Pop. (1910) 21,497.

CONCORD (42° 23′ N., 71° 23′ W.), town, on Concord R., Massachusetts, U.S.A.; favourite residence of Emerson, Hawthorne, Thoreau, the Alcotts; scene of opening conflict of Amer. War of Independence, April 19, 1775. Pop. (1910) 6421.

CONCORD (35° 25′ N., 80° 23′ W.), city, on Rocky R., N. Carolina, U.S.A.; seat of cotton manufactures. Pop. (1910) 8715.

CONCORD, BOOK OF, name given to five Lutheran Confessions, the last, issued 1580, being *Formula Concordiæ*.

CONCORDANCE, term used of compilations (generally of the Bible) which give all words or phrases arranged alphabetically with a list of passages where they occur. The first one was compiled in XII. cent. A.D.; a Hebrew one by a Rabbi appeared in XV. cent. The most famous English C. is Cruden's, first pub. 1737 and frequently revised.

CONCORDAT, the term applied to agreements between the ecclesiastical and secular powers, specially between the R.C. Church and the State in different countries in mediæval and modern times. When Church and State were practically coterminous, as they were in the Middle Ages, and the Church claimed not only sacred and spiritual but other authority besides, *e.g.* jurisdiction over all offences committed by clerics, clash between the religious and secular arm was inevitable. This reached a height in the famous Investiture Controversy between the popes and emperors, terminated by the *Concordat of Worms*, 1122. Another famous concordat was that between Pope Pius VII. and Napoleon in 1801. This was repudiated by the Fr. Republic in 1905. Agreements have been made between the Roman See and various European countries. The right of the State to nominate to important benefices is sometimes recognised, or at any rate the right of objection.

CONCORDIA (classical myth.), Rom. divinity, representing peace and friendship.

CONCORDIA (45° 44′ N., 12° 52′ E.), small ancient town, Venetia, Italy; important under the Romans; cathedral; the see was transferred to Portogruaro, 1339.

CONCRETE, a solidified mixture of sand, gravel, and stone fragments with cement or lime used in engineering and architecture. The pebbles, sand, etc., called the *aggregate*, are thoroughly mixed with the *matrix* (the best being Portland cement) and a certain amount of water. The result is a plastic mass which can be moulded into any shape and size, such as slabs for paving, blocks for breakwaters weighing hundreds of tons, foundations of buildings, floors, walls, tanks, conduits, etc. It sets very hard, and is one of the most durable materials known; it is, therefore, much used for sea-walls. Its lack of tensile strength essential for beams, arches, columns, piles, etc., is overcome by introducing into the mould steel bars or a network of bars according to the purpose for which it is required, and when set the steel c., *i.e.* armoured or *reinforced* c., beats masonry for stability, fireproof qualities, and economy. In the case of thin walls, however, the boarding necessary for moulding and the better quality aggregate necessary makes the construction more expensive than brickwork. The invention of reinforced concrete has revolutionised civil engineering and architecture.

Taylor and Thompson, *A Treatise on Concrete, Plain and Reinforced* (1905); Warren, *Handbook of Reinforced Concrete* (1906).

CONCRETE, philosophical term meaning something which can be seen or felt, as opposed to abstract, which is only supposed. Thus 'blind man' is concrete; 'blindness' is abstract.

CONCRETIONS (geol.), rounded or irregular masses formed in sandstones, impure limestones, shales, and other sedimentary rocks, by the aggregation of calcium carbonate, calcium phosphate, silica, round fragments of shells, bone, or other material; (med.) pathological solid secretions in the human body, *e.g.* gall-stones and bladder-stones.

CONCUSSION, see BRAIN.

CONDE, JOSÉ ANTONIO (1766–1820), Span. Orientalist.

CONDÉ, LOUIS DE BOURBON, PRINCE OF (1530–69), Fr. Huguenot leader; murdered at *Jarnac* after having surrendered.

CONDÉ, LOUIS II. DE BOURBON, PRINCE OF (1621–86), Fr. general known as *the great Condé*. As Duc d'Enghien, at age of 22, C. won decisive battle of *Rocroy* against Spain, an important step towards ascendancy of France (1643), and great victories against Empire, 1644–46; succ. as prince, 1646, and his great territories and abilities made him a dangerous noble; supported regency against Fronde, 1649, but was arrested, 1650; new Fronde obtained his release, and he led armies against government forces, 1651–58. C. was pardoned by Louis XIV., and distinguished himself in his wars; not deficient as strategist, but fame chiefly rests on spirited conduct of a battle and absolute control of men.

Lord Mahon, *Life of Condé* (1845); Duc d'Aumale, *Histoire des Princes de Condé* (Eng. trans., 1872).

CONDÉ, PRINCES OF, Fr. house of Bourbon assumed this title XVI. to XIX. cent's, from their estate of Condé-sur-l'Escaut.

CONDÉ-EN-BRIE (49° 1′ N., 3° 33′ E.), small town, Aisne, France; ruined castle.

CONDENSATION, see LIQUEFACTION OF GASES.

CONDENSER, apparatus for compressing gases; instrument for concentrating an electric charge; a lens or system of lenses to concentrate light, especially in a microscope or optical lantern; appliance used in manufacturing woollens; appliance for condensing exhaust steam of steam-engine.

CONDÉ-SUR-L'ESCAUT (50° 27′ N., 3° 24′ E.), town, on Scheldt, Nord, France; industries—boat-building, tanneries, brewing, etc. Pop. 4960. See CONDÉ, PRINCES OF.

CONDÉ-SUR-NOIREAU (48° 53′ N., 0° 33′ W.), town, at confluence of Noireau and Drouance, Calvados, France; cotton-spinning. Pop. 6591.

CONDILLAC, ÉTIENNE BONNOT DE (1715–80), Fr. philosopher; took orders, but devoted all

his time to study of philosophy; follower of Locke and friend of Rousseau; wrote *Essai sur l'origine des connaissances humaines*; *Traité des sensations* is his greatest work. C. contends that everything is due to sensation, and nothing to heredity. Though himself religious, his thought, while clear, is hard and unspiritual; his work influenced subsequent Eng. philosophers, but owing to Romantic Movement and other causes he is no longer accepted as guide.

CONDITION, legal term implying a provision that in unforeseen circumstances certain changes regarding a previous obligation shall be made; in logic, denotes the necessary antecedent of a cause, *e.g.* in affixing a postage stamp the moistening of the gum is the cause, the adhesive property of the gum is the condition.

CONDITIONAL FEE, term in common law for a fee, or estate, granted to particular heirs.

CONDITIONAL LIMITATION, the grant of an estate to a person for a particular period; or on condition of his fulfilling certain requirements.

CONDOM (43° 57′ N., 0° 22′ E.), town, S.W. France; trades in grain and brandy. Pop. 4056.

CONDOR (*Sarcorhamphus gryphus*), large bird of prey inhabiting the Andes of S. America. It can fly at great altitudes (over 20,000 ft.), and sail in the air without flapping the wings, which may measure 10 ft. between the tips. The head and neck are devoid of feathers. C's are exceedingly voracious, and gorge themselves with carrion—sheep, calves, etc.—till they are dazed, when they can be easily caught.

CONDORCET, MARIE JEAN ANTOINE NICOLAS CARITAT, Marquis de (1743–94), famous Fr. *doctrinaire* and distinguished mathematician; assisted with Fr. *Encyclopédie*; became member of Academy of France, 1782; wrote (1785) on laws of chance, *Vie de Turgot*, 1786, *Vie de Voltaire* (whose disciple he in many ways was), 1787; and while concealed in Paris during Terror gave complete expression to political views in *Progrès de l'esprit humain*, which pictures existing states and churches as greatest enemies of society. Chosen member of Legislative Assembly, 1790, C. advocated educational system since adopted (1792); drew up memorandum for suspension of king and calling of National Convention of which he was member; opposed execution of king and many other acts of Convention, and was proscribed.

Lord Morley, *Critical Miscellanies* (1871–77); Ellis, *The Centenary of Condorcet* (1894).

CONDOTTIÈRE (Ital.), military commander who hired out the services of himself and band. Mercenary forces played important part in warfare from XIII. to XVI. cent., especially in wars of Ital. communes by whom name was bestowed.

CONDUCTION, ELECTRIC, when the terminals of a galvanic cell are connected together by a metallic wire, an electric current passes through the wire, and the wire is said to *conduct* electricity. The case is analogous to the flow of water in a pipe which connects two cisterns at different levels. The amount of water flowing per second will be greater in proportion to the difference of levels, and will be less in proportion to the resistance to flow, which is offered by the pipe. Similarly, in the case of an electric current, the difference of electromotive forces at the ends of the wire, and the resistance of the wire, are the all-important factors. The relationship is expressed by *Ohm's Law*, which states that the amount of current is proportional to the electromotive force acting, and inversely proportional to the resistance, and is symbolically expressed by the equation $C=\frac{E}{R}$, where C is the current in amperes, E the electromotive force in volts, and R the resistance. The unit of resistance is known as the *ohm*, and is defined as the resistance of a uniform column of pure mercury, 106·3 centimetres long, and weighing 14·4521 grams, the measurements being taken at 0° C. The *specific resistance* of a substance at any given temperature is the resistance, expressed in ohms, between two opposite faces of a centimetre cube of the substance at the given temperature. The reciprocal of the specific resistance is known as the electric *conductivity* or *conductance*.

The resistance of metals depends on a number of conditions. Firstly, on the chemical purity of the specimen: in general, small admixtures of other metals increase the resistance. Secondly, on the temperature: resistance of a pure metal increases nearly proportionally to the absolute temperature, although there is evidence to show that it vanishes before the zero of absolute temperature is reached. Thirdly, on the physical state of the substance: annealing of a metal generally alters its specific resistance. Fourthly, the resistance generally changes when the material is subjected to stresses such as compression or torsion. Fifthly, it also changes in certain cases when the substance is exposed to magnetising forces. Alloys have, as a rule, a greater resistance than any of their constituents, and with increase of temperature their increase in resistance is much smaller than in pure metals. The passage of a current through any conductor is accompanied by the development of heat. *Joule's Law* states that the rate at which heat is developed is jointly proportional to the square of the current strength and the resistance; *i.e.* if a current of strength C flows through a conductor of resistance R, the heat developed is C^2R per unit time.

With regard to conduction in liquids, the chief fact is that when it takes place chemical changes are always produced. For example, if a current be made to pass through a solution of sodium chloride (common salt), chlorine gas appears at the point where the current (according to the usual convention) enters the solution, while the sodium, liberated at the point where the current leaves the solution, is acted on by the water present so as to form hydrogen, which is thus set free at that point. This process is known as Electrolysis (*q.v.*), and the species of conduction involved is known as *electrolytic conduction* in order to distinguish it from *metallic conduction* referred to above.

Both forms of conduction may be satisfactorily explained by the electronic theory which has been brought forward prominently in recent years. According to it, a conductor of pure metal contains atoms which carry a charge of positive electricity and also contains a large number of negatively charged particles, termed *electrons*, which are free to move among the atoms. The motions of the electrons may be regarded in the same way as that of the molecules in a gas are regarded by the kinetic theory of gases. Taken on the average, they will have a certain mean velocity, will collide with each other and with the positively charged atoms, and between two successive collisions each will have traversed a certain mean free path in a certain time. In the ordinary condition of the conductor, when no current is passing through it, the velocities of the electrons will be distributed equally in all directions in space; but if the conductor be included in a galvanic circuit, the electromotive force thus applied induces them to travel, on the whole, in the direction of that force. The positively charged atoms are, however, not free to move except through small distances from their mean positions, and hence the electrons move relatively to the atoms. It is this motion of the electrons which constitutes a current of electricity. The theory shows that the conductivity is proportional to the number of electrons in unit volume of the substance and to the length of their mean free path. Apart from the influence—supposed to be small—of the second of these two factors, it follows that good or bad conductors of electricity differ by having more or fewer electrons, respectively, per unit volume. As a rule, substances which conduct electricity well also conduct heat well, and this is quite in agreement with the electronic theory, according to which the ratio of the two conductivities, thermal and electric, should be the same for all pure metals. Experiment shows that

this is the case, at least for all the better conducting metals. For an explanation of the mechanism of conduction in liquids, see ELECTROLYSIS.

In ordinary circumstances gases do not conduct electricity. But a gas may easily be rendered conducting in a variety of ways. If it is exposed to the action of Röntgen rays, cathode rays, rays from uranium or radium, ultraviolet light, electric spark discharge, contact with incandescent metals, or if it is mixed with the products of combustion from flames, it can conduct electricity for some time after the action which produced conductivity has ceased, but this conducting power always diminishes and finally disappears. When in the conducting state the gas is said to be *ionised*. Conduction in such cases presents certain peculiarities. In the first place, it does not follow Ohm's Law unless the electromotive force is very small. Second, the conducting power may be removed by various methods, such as filtration of the gas through glass-wool, bubbling it through water, passing it through a metallic tube, or passing a current of electricity through it. These and other facts show that conduction in an ionised gas is due to the presence of particles, that these particles are electrified, and that their electrifications are both positive and negative. The diminution and ultimate disappearance of conducting power is due to the recombination (and, therefore, neutralisation) of oppositely charged particles, or *ions* as they are called. It has been found that the electric charge on a negative ion is the same as the charge on a hydrogen ion in electrolytic conduction, and that the mass of a negative ion or particle is about $\frac{1}{1000}$ of a hydrogen atom.

The principles of electric conduction in metals find their widest application in the distribution of electric energy for the purposes of lighting, heating, and power.

Russell, *Theory of Electric Cables and Networks*; Campbell, *Modern Electrical Theory*; J. S. Thomson, *Electricity and Matter*; Clark, *Mathematical and Physical Tables*; Munro and Jamieson, *Electrical Rules and Tables*; Kempe, *Electrical Rules and Tables*.

CONDUCTION OF HEAT is the propagation of heat from one body to another, with which it is in contact, or from molecule to molecule in a homogeneous substance. Heat is considered to increase the vibration of the molecules of a substance, but no visible motion of the matter takes place. The increased vibration of the warmer molecules must be by impact handed on to the neighbouring colder molecules, so that heat flows from the part of higher temperature to that of lower temperature. Gases, liquids, and solids conduct heat. Solids can be shown to conduct heat by heating one end of a long iron bar in which thermometers are placed at intervals. The thermometer nearest the source of heat rises first, and the others follow in succession. From this method the conductivity, *i.e.* the quantity of heat which passes through a section in unit time, can be calculated. This varies for different substances, but there is no substance which is a total non-conductor of heat. Substances which are good conductors feel cold, because they conduct the heat rapidly away from the body. Wood is not a good conductor. It does not feel as cold as iron, for instance, and a blazing stick can be held quite comfortably, even with the flame close to the hand, whereas an iron rod, held in the fire, grows uncomfortably hot in a minute or two. Wool is used for clothing because it is a bad conductor of heat, and the spaces in it are filled with air, also a bad conductor.

The difference in conducting power can be shown by fixing studs with wax on to two rods of the material to be tested. These are jointed and heated at the junction. The stud drops off the best conductor first.

Liquids possess poor conductivity, and this is important for animal and plant life in lakes. Water is cooled from the top. The surface water cools to 4°, and sinks till the whole of the water is at 4°. As it cools still further, it grows lighter and floats, finally freezing, but owing to the poor conductivity the water at the bottom is rarely colder than 4°. It is difficult to estimate the conductivity of liquids, because the process is interfered with by connection. As a rule, good conductors of electricity are good conductors of heat. The conduction in gases is almost negligible.

CONDYLURA, see under MOLE FAMILY.

CONE (geom.), solid bounded by a circular or other closed curving base and a surface obtained by connecting every point on the circumference of the base with a point outside, called the vertex. A *right circular* c. is obtained by rotating a right triangle round one of the sides enclosing the right angle.

CONECTE, THOMAS, Fr. monk who denounced prevailing corruptions; burnt as heretic, 1434.

CONEGLIANO (45° 53′ N., 12° 17′ E.), town, Venetia, Italy; cathedral; manufactures silk and woollen fabrics; noted for its wine. Pop. *c.* 6000.

CONEY ISLAND (40° 39′ N., 74° W.), island (favourite watering-place) at entrance to New York Harbour, at S.W. extremity of Long Island.

CONFALONIERI, FEDERICO, COUNT (1785–1846), Ital. patriot; opposed Austria's annexation of Lombardy; implicated in revolt of Piedmont against Austria, 1821; imprisoned till 1836; exiled till 1840.

CONFARREATIO, most ceremonious form of marriage amongst patrician ancient Romans.

CONFEDERATE STATES OF AMERICA.—Title assumed by Southern States of America—Alabama, Arkansas, N. Carolina and S. Carolina, Florida, Georgia, Louisiana, Mississippi, Texas, Tennessee, Virginia (excluding W. Virginia)—when seceding from United States, 1860–61. The secession was not regarded in South as revolution, but exercise of right of individual states to withdraw from compact of Union, the great doctrine of Southern party being 'State rights.' Chief reasons of secession were: (1) legislation of Congress against slavery, which Southern States could not afford to abandon; (2) superiority of North in population, and, as a result, (3) superiority in House of Representatives and consequent Northern control of politics and commerce of South (protective legislation, beneficial to North but harmful to South, was the rule). On election of Pres. Lincoln, the Northern nominee (1860), S. Carolina declared for secession. United States refused to acknowledge Confederate States (1861), and after four years of war recovered seceded States for the Union. The constitution of Confederate States, though allowing large amount of State rights, was, like that of United States, government by central Congress (held at Richmond, in Virginia) composed of Pres. (elected for 7 years, a longer time than in Union), Executive Council (the members of which had greater power than Upper House in Union), and House of Representatives. Anti-slavery legislation was forbidden. See UNITED STATES: *History*.

Cambridge Mod. Hist., vol. vii. chs. 14–19 (1903); J. E. Chadwick, *Causes of the Civil War*; J. K. Hosmer, *The Appeal to Arms*; J. W. Burgess, *The Civil War and the Constitution*.

CONFEDERATION, term signifying alliance of independent communities, *e.g.* North German Confederation; C. of the Rhine (1805) was alliance of Bavaria, Württemberg, and other states with France; later (1806), sixteen states joined Napoleon in a c., which lasted till 1813. See also FEDERATION, UNITED STATES, CANADA.

CONFESSION, tomb of a confessor or martyr (e.g. *Confession of St. Peter*), or generally now sacramental c. of sins in R.C. Church. It is held to be necessary for the remission of grievous sin. C. is of various kinds, but it is commonly defined as the avowal of one's own sins made to a duly authorised priest for the purpose of obtaining their forgiveness through the power of the keys. The 4th Lateran Council, 1215, laid down a precept that once a year should be the minimum of confession. The necessity of c. is denied by Prot.

Churches, but its use, under certain circumstances (i.e. for relief of mind when sick), is encouraged by the Church of England.

CONFESSIONAL, like confession, may mean the tomb of a martyr; or more generally, the place for the hearing of auricular confession in the R.C. Church; generally a slight wooden structure. It has two (or three) doors and a partition. The priest, seated, hears the pentitent's confession through a small grating of wire or zinc.

CONFESSOR, one who hears a confession, in R.C. Church necessarily a priest; or one who testifies to his faith.

CONFIRMATION, the rite in the Christian Church which follows baptism, a giving of the Holy Ghost; in Western Christendom performed by the laying on of hands (and in the R.C. Church anointing with chrism) by the bp. In the Eastern Churches the bp. only consecrates the oil with which the parish priest anoints candidates.

C. of Bishops, the consent of a superior authority to their appointment; according to the Council of Nicæa the sanction of the Metropolitan was required; from XII. cent. onwards it was declared to belong to the pope. The popes gradually came also to present to all bishoprics, instead of the older mode of election and confirmation. In the Anglican Church confirmation is merely formal.

CONFOLENS (46° 1′ N., 0° 39′ E.), town, at confluence of Vienne and Goire, Charante, France; gloves.

CONFUCIUS—Romanised form of K'UNG TSZE—(*c.* 550–478 B.C.), Chin. philosopher and reformer; b. in state of Lu, part of modern province of Shan-tung; descended from famous prehistoric Chang monarch Hwang-ti, and s. of Shuh-liang Heih, a distinguished officer, over 70 years of age at birth of C. C. passed youth of poverty, became teacher at twenty-two; child pupils were gradually replaced by band of disciples, whom he gave voluntary instruction; made chief magistrate of city of Chung-tu about 498; wonderful virtue and power exercised universal influence, but he fell before the machinations of external foes, and was forced to withdraw from Chung-tu, and abandon attempt to carry out political theories. His attempts to persuade princes to become model rulers also failed, and, although he wandered throughout China and won great fame, he remained in private life until his death.

No philosophical writings by C. are known of, but his disciples and descendants collected his sayings, the most important of their works being *Ta-hio* (The Great Subject), *Tchoung-young* (The Invariable Mean), and *Lun-yii* (Philosophical Discourses). These form three of the four classics learned by heart in the state schools of China. C. taught veneration of past and imitation of antique virtues, superiority to ambition (saying that the fool complained of not being known by men, the wise man of not knowing men), charity, forgiveness, repentance, example in preference to preaching. He founded Chin. philosophy, although his teaching was practical, not abstract, and his disciples complained that he left them no word on the nature or end of man. He annotated and arranged the chronicles and lit. of China, and his *Spring and Autumn*, a brief abridgment of Chin. history, is regarded as a Chin. classic, though judged of little merit by European scholars. He lies buried in K'ung cemetery, adjoining city of K'iuh-fow, where his descendants (said to number 50,000) live. This spot is Mecca of China.

E. H. Parker, *Life and Labours of C.*; Alexander, *C., the Great Teacher* (1890); Legge, *Religions of China* (1880); Degroot, *Religion of the Chinese* (1910).

CONGÉ D'ÉLIRE (Fr.), leave to elect; technical term for royal licence to dean and chapter of cathedral church to elect bp. to vacant see.

CONGER, see EELS.

CONGESTION, superfluity of blood in an organ due to pathological reasons; may be venous (passive), *e.g.* c. caused by ligaturing arm and preventing veins from returning blood to the heart, or arterial, active caused by dilatation of arteries, as in blushing; may also occur in cases of debility to back and posterior portion of lungs, when it is called *hypostatic* c.

Treatment usually takes the form of gentle friction and pressure to induce freer circulation, or removal of cause of obstruction and internal administration of drugs.

CONGLETON (53° 10′ N., 2° 14′ W.), market town, Cheshire, England; principal manufacture, silk; several coal mines and iron foundries in district. Pop. (1911) 11,310.

CONGLOMERATE, name for rocks consisting of rounded shingle or pebbles of hard material (granite, gneiss, limestone, etc.), embedded in a fine-grained matrix (sand). They are a typical shore formation and are imperfectly stratified, their age being sometimes determined by fossils found in the pebbles. Rocks composed of angular fragments cemented together are known as breccias.

CONGO (6° 4′ S., 12° 15′ E.), largest river in Africa; formed by union, in lat. 6° 25′ S., of two streams, Luapula, which issues from Lake Bangweulu and flows through Lake Mweru, and Lualaba, which has its source in Lokinga Mountains. C. then flows N. as far as equator, when it curves to N.W. as far as lat. 2° N., after which it turns S.W., entering sea at Banana; length, *c.* 2500 miles; drains area of *c.* 1,600,000 sq. miles. Basin is depressed region bordered by mountains, and not improbably represents former inland sea. Principal tributaries are Lukuga and Aruwimi from E., Ubangi and Sanga from N., Lomami and Kassai from S. Lukuga is outlet from Tanganyika, and joins C. near its formation by union of head-streams. Kassai, the chief southern tributary, has numerous affluents, and joins C. near Ngato. From its mouth the C. is navigable to Matadi (*c.* 100 m.), from Matadi to Stanley Pool (*c.* 200 m.), rapids make navigation impossible; from Stanley Pool to Stanley Falls (*c.* 1200 m.) it is navigable for boats of small draught.

Livingstone discovered upper reaches, called by natives the Luapula and Lualaba (1871). H. M. Stanley, five years later, proved these upper reaches to be part of the C., and in 1880 explored the river with Belgian expedition.

H. M. Stanley, *Congo and its Free State* (2 vols., 1885), *Through the Dark Continent* (2 vols., 1878); M. Roby, *My Adventures in the Congo* (1911); Sir H. Johnston, *George Grenfell and the Congo* (1908), *River Congo from Mouth to Bolobo* (1895).

CONGO, BELGIAN, CONGO BELGE (6° S., 14° 40′ E.), Belg. colony, comprising practically basin of river Congo; bounded N. by French Equatorial Africa, Sudan, E. by Brit. and Ger. E. Africa, S. by Rhodesia, Angola, W. by Atlantic, Fr. Equatorial Africa; area, *c.* 909,654 sq. miles. Surface generally is depression, which not improbably was formerly occupied by inland sea; great part covered by trackless forests, and surrounded by highlands and hills. Chief river is Congo (*q.v.*), with affluents, Kasai-Sankurru, Chuapa, Lolongo, Boloko, and others; chief lakes, Leopold II., Tumba in W.; Tanganyika, Mweru, are on E. boundary; chief settlements, Boma (capital), Banana, Leopoldville, Vivi, Matadi. Climate is tropical. Congo is controlled by colonial ministry of Belgium; administered by gov.-gen., who represents king, and is assisted by vice-governors-general; divided for administrative purposes into twelve districts, each under commissioner.

History.—CONGO FREE STATE was founded by Leopold II., king of the Belgians, as a neutral independent state. The work of exploration of district had been carried out chiefly by Stanley; who was financed by Leopold II. Various treaties were concluded with natives whereby Belgium acquired considerable amount of territory, and the districts thus acquired were combined as state, which was recognised by other powers in 1884–85, when, as the

result of the Berlin Conference, Leopold II. of Belgium was app. king, promising to keep country open to trade of all nations and to put down slavery. Leopold's first action was the war against the Arabs, who carried on trade in slaves and ivory; having expelled them, he obtained permission from other powers to levy taxes on pretext of carrying out various improvements; taxes he levied were so heavy that traders of other nations were all ruined and gave up business. Leopold then proceeded to organise the state as a great rubber-producing private estate; rubber had to be produced by natives as no other race could stand the intense heat of the forests; and Leopold's system was one of payment by results, consequence being that agents had great incitement to enrich themselves at expense of natives; who in some cases were treated with horrible cruelty. By 1904 public opinion on the subject had become so strong that a commission was app. to inquire into the matter. Since then atrocities have ceased, at least in more accessible districts. The State was annexed to Belgium, 1908.

There are many tropical fruits; rubber and palm oil produced in large quantities; coffee, tobacco, maize, rice, corn, and cacao are grown, and cattle are bred. Other products are ivory, palm kernels, gums, copal, beeswax, sorghum, camwood. Principal exports are rubber, gold, ivory, palm oil, cocoa, copal, coffee. Among imports are arms, machinery, wines, spirits, provisions, clothing, etc. Rich copper mines are now being extensively worked in Katanga district. Communications include railway from Matadi to Stanley Pool, another in Mayumbe, and one from Rhodesian frontier to Elizabethville (the copper district); while others are being made. The Congo and its tributaries are navigable to an extent of 5500 miles.

Natives are of Bantu-Negroid stock, and include many tribes, of which most important are Warua and Manyema; some natives are cannabalistic, and there are several pigmy tribes. Each tribe has its own dialect. Native religion is animism; there are many Christian missions. Pop. *c.* 15½ millions, of which about 3400 are Europeans (Belgians, British, Portuguese, Italians, Swedes, etc.).

Davis, *Congo and Coasts of Africa* (1908); Descamps, *New Africa* (1903); Alexis, *Notre Colonie en 1910*.

CONGO FREE STATE, see CONGO, BELGIAN.

CONGREGATION, assembly of worshippers in any church; term used variously of some religious orders (not taking solemn vows) or assemblies in the R.C. Church.

CONGREGATIONALISM, see FREE CHURCHES.

CONGRESS, literally, an assemblage, term used especially in diplomacy. Its chief non-diplomatic use is for the U.S.A. Congress, a legislative assembly corresponding to Parliament. In diplomacy the term is applied to an assembly of the representatives of sovereign states, particularly the Great Powers, such as the C's of Vienna, 1814–15, and Berlin, 1878; their work really comes under the sphere of International Law.

CONGREVE, RICHARD (1818–99), Eng. Positivist.

CONGREVE, WILLIAM (1670–1729), Eng. dramatist; b. Bardsey, Yorkshire; plays include: *Old Bachelor* and *The Double Dealer* (1693), *Love for Love* (1695), *The Mourning Bride* (1697), *The Way of the World* (1700); defended morality of stage against Jeremy Collier (*q.v.*); wrote some masques and artificial lyrics.

C. was the greatest of Restoration dramatists; a master of dialogue and intrigue; a fine tragedian. Gosse, *Life* (1888).

CONGREVE, SIR WILLIAM, Bart. (1772–1828), Eng. inventor; invented the war rocket (1805), formerly much used, a hydro-pneumatic canal lock, and many other mechanical contrivances; M.P. for Plymouth (1820); controller of the Royal Laboratory.

CONIBOS, MANOAS, Amer. Indian tribe in Peru.

CONIC SECTION, curve in which a plane intersects a cone. All the possible resulting curves obtained thus, are: *pair of intersecting straight lines, circle, ellipse, parabola,* and *hyperbola*. Geometrically, the last three curves are defined as: the locus of a point moving so that the ratio of its distance from a fixed point, called the *focus*, to its distance from a fixed straight line, called the *directrix*, is constant. This ratio, called the *eccentricity*, is less than, equal to, and greater than, unity, for the ellipse, parabola, and hyperbola respectively. The circle is a particular case of the ellipse. Analytically, a conic section is represented by an equation of the second degree of the form $ax^2+by+cy^2+dx+ey+f=0$.

See books by Smith (1898), Macaulay (1906, 2nd ed.).

CONIES, see PROCAVIA.

CONIFERS, see GYMNOSPERMS.

CONINE, CONIINE ($C_8H_{17}N$), alkaloid obtainable from the hemlock plant; oily liquid with characteristic and penetrating taste and smell; B.P. 166° C.; a powerful poison.

CONINGTON, JOHN (1825–69), Eng. scholar; trans. Vergil's *Æneid*.

CONISTERIUM, room in which ancient wrestlers were sanded after being anointed.

CONJEEVERAM, KÁNCHIVARAM (12° 50′ N., 79° 45′ E.), town, Chingleput district, Madras, Brit. India; one of most sacred cities of Hindus; several large temples, numerous pagodas; captured by Clive, 1752. Pop. 46,164.

CONJUGAL RIGHTS, RESTITUTION OF.—Where one party to a marriage has withdrawn from cohabitation without lawful cause, the other may petition for 'the restitution of conjugal rights.' If the Court grants a degree, and the respondent disobeys it, the petitioner can then obtain a decree of judicial separation on the ground of desertion.

CONJUNCTION (astron.), the apparent nearest approach of two heavenly bodies having the same longitude or right ascension. It is termed *inferior* when two planets are between the sun and the earth, and *superior* when on the side of the sun most distant from the earth.

CONJURING is the art of performing tricks which mystify the observer, but are merely due to sleight of hand or skilfully devised apparatus. Many of these, such as fire-eating, swallowing molten metal, and similar tricks, were performed in very early times, but, whereas the old magicians laid claim to supernatural powers, the modern performer does not scruple to admit that all his mysteries are entirely the result of trick. Amongst the most successful performers of the past may be named Comus (late XVIII. cent.), Jules de Rovère, Préjean, Olivier, and Robert Houdin. Of late years the conjurer has been greatly assisted by the increased knowledge of science, and has availed himself of the use of electricity, magnetism, and optics—such performers as J. N. Maskelyne and David Devant being especially notable for their success.

J. N. Maskelyne, *Oriental Magic* (1891); Devant, *Conjuring*.

CONKLING, ROSCOE (1829–88), Amer. politician; fine orator; quarrel with Blaine divided Republican party in Congress.

CONNAUGHT (53° 44′ N., 9° W.), province, W. Ireland, comprising counties of Mayo, Galway, Leitrim, Roscommon, and Sligo; mountainous in west; principal river, Shannon; fine scenery; formerly one of Irish kingdoms, ruled by O'Connors; divided into counties about 1580. Area, 6845 sq. miles. Pop. (1911) 609,966.

CONNAUGHT, DUKE OF, ARTHUR WILLIAM PATRICK ALBERT (1850–), s. of Queen Victoria; has held various military appointments; app. Gov.-Gen. of Canada, 1911.

CONNEAUT (41° 57′ N., 80° 34′ W.), city, Ohio, U.S.A.; mills, tanneries. Pop. (1910) 8319.

CONNECTICUT (41° to 42° 3′ N., 71° 55′ to 73° 50′ W.), state, U.S.A.; one of New England states of Union; bounded N. by Massachusetts, E. by Rhode Island, S. by Long Island Sound, W. by New York; area, 5004 sq. miles. Surface generally consists of three great river-valleys, Connecticut flowing through middle of state, Thames through E., and Housatonic through W. Other rivers are affluents of these. In E. and W. are hilly districts; highest peaks, Bear and Gridley Mountains. Chief towns are Hartford (capital), New Haven, Bridgeport. Climate is temperate.

History.—Dutch settlement was established at Hartford in 1633, and soon afterwards an Eng. trader founded trading station at Windsor. Wethersfield was settled by colonists from Massachusetts Bay in 1634, and in 1639 united with Hartford and Windsor as Connecticut colony. Meantime, in 1635 fort was established at Saybrook, called after Lord Saye and Sele, who had obtained patent for this district in 1631. In 1637 the Pequot Indians were subdued, and in 1638 Puritan colonists made settlement at New Haven. Saybrook was united to C. in 1644. Charles II. granted autonomy by charter in 1662, when New Haven was annexed to C. C. repudiated allegiance to Mother Country in 1776, and became independent state. New constitution was framed in 1818, whereby Church and State were disunited. C. has greatly developed since Civil War, in which it supported Union.

River valleys are fertile, especially that of Connecticut R.; produce maize, rye, oats, potatoes, wheat, buckwheat, and great quantities of hay; tobacco largely cultivated; fruits produced, including apples, peaches; horses, cattle, sheep, and pigs raised; dairying carried on; fine lobster fisheries along coast. Minerals include brownstone, iron ore, copper, lead, tungsten, nickel, lime, cobalt, trap-rock. Mineral springs occur in various places. C. is great industrial state, manufacturing cottons, woollens, silks, paper, machinery, clocks, brass goods, rubber articles, hosiery, leather, etc.; watch-making at Waterbury, firearms and machinery at Bridgeport, hats at Danbury. Chief harbours are Stonington, Mystic, New London.

Executive is in hands of Gov., assisted by Lieut-Gov. and three officials; legislative power vested in General Assembly, consisting of Senate of 35 and House of Representatives of 255 members, elected for two years. C. sends two Senators and five representatives to Congress. Education is free and obligatory. Chief religion is Roman Catholicism. Inhabitants include whites, negroes (c. 16,000), Asiatics, Indians; whites comprise persons of Brit., Ger., and Canadian birth. Pop. (1910) 1,114,756.

Johnston, *Connecticut* (1887); Palfrey, *History of New England* (1890).

CONNECTICUT RIVER (43° 35′ N., 72° 20′ W.), river, New England, U.S.A.; rises extreme N. of New Hampshire, flows S., forming boundary between New Hampshire and Vermont, through Massachusetts and Connecticut, and enters Long Island Sound at Saybrook.

CONNECTIVE TISSUES, tissues of the body which support and hold together the other tissues, composed of a large proportion of intercellular compared with cellular elements. This intercellular material may consist mainly of white fibres with a varying number of elastic fibres, or it may be cartilaginous or bony. Where the white fibres predominate, running closely together, the tissue is called *fibrous tissue*; found in positions where strength is required to resist strain, *e.g.* joint ligaments. When the fibres interlace, leaving more or less space between each other, the tissue is known as *areolar tissue*; found, *e.g.*, just beneath the skin, joining it to the deeper structures. There may be fat deposited to a considerable extent in the cells of the tissue, which is somewhat dense, with the cells close together, and it is then called *adipose tissue*; found beneath the skin, around certain organs, etc. Where the fibres which predominate are elastic fibres, *i.e.* composed of a substance *elastin*, which makes them springy or elastic, the tissue is named *elastic tissue*; found, *e.g.*, in the *ligamentum nuchæ* at the back of the neck.

Cartilage (q.v.) and *Bone* (q.v.) are also examples of connective tissue.

CONNELLITE ($Cu_{19}(ClOH)_4SO_{16}.15H_2O$), rare mineral occurring in tufts of blue needle-shaped crystals with other copper minerals, in Cornwall and S. Africa.

CONNELLSVILLE (40° 2′ N., 79° 36′ W.), town, on Youghiogheny, Pennsylvania, U.S.A.; coke, iron manufactures. Pop. (1910) 12,845.

CONNEMARA (53° 23′ N., 9° 30′ W.), wild, picturesque district, W. division, County Galway, Ireland.

CONNERSVILLE (39° 38′ N., 85° 9′ W.), city, Indiana, U.S.A.; wagons, carriages. Pop. (1910) 7738.

CONNOR, BERNARD, O'Connor (1666–98), Irish physician and author; physician to the king of Poland.

CONNOTATION, in logic signifies all the attributes implied by any term, as distinguished from its *denotation* (q.v.).

CONODONTS, sharp conical fossils said to be teeth of fish of lamprey species, or of denticles annelid type; found in Palæozoic strata.

CONOID (geom.), solid or surface formed by revolution of a conic section about its axis; a circle, ellipse, parabola, and hyperbola generating the solids or surfaces known as sphere, spheroid, paraboloid, and hyperboloid respectively.

CONOLLY, JOHN (1794–1866), Eng. physician; founded an association along with two others (1832) which afterwards became the British Medical Association; while resident physician at Hanwell (1839) introduced modern treatment of non-restraint of the insane.

CONON, celebrated Athenian general who defeated the Lacedæmonians at *Cnidus* (394 B.C.).

CONON of Samos (fl. III. cent. B.C.), Gk. mathematician and astronomer; friend of Archimedes; compiled a calendar; wrote seven books on astronomy, and was an authority on curves (conic sections). He is credited with having given the name *Coma Berenices* (q.v.) to that constellation.

CONQUEST, total defeat of enemy, often followed by annexation of whole or part of his territory. International law recognises title of conqueror; only pretext for interference of neutral states is that their interests are affected, directly or by alteration of 'balance of power.'

CONRAD (d. 955), Duke of Lorraine; the 'Red Duke.'

CONRAD, or **CONRADIN,** the Younger (1252–68), king of Jerusalem and Sicily; last of Hohenstaufens; excommunicated, 1267; beheaded by Charles of Anjou.

CONRAD II. (c. 990–1039), Emperor of Holy Roman Empire (1027); great-grandson of Otto I., reviver of Rom. Empire; extended boundaries of Germany, completing absorption of 'Middle Kingdom' by winning Burgundy, 1032; reunited Italy and Germany; fought against Poles and Hungarians; a strong ruler, but encouraged later disunion by granting smaller tenants under empire their lands in fee; founder of line of Salian or Franconian emperors.

CONRAD III. (1093–1152), first Hohenstaufen king of Germany; elected, 1127; king of Italy, 1128; displaced by rival Lothair, but restored, 1138; faced by rebellions in both Germany and Italy; able ruler, but failed to establish unity in realms because of overwhelming difficulties; started on Second Crusade, but returned, sick.

CONRAD IV. (1228–54), Ger. king.

CONRAD, JOSEPH (1856–), novelist, naturalised Englishman; full name, J. C. Korzeniowski; b. Bland; holds mate's certificate; wrote *The Nigger of the Narcissus*, and popular sea and other stories.

CONRAD OF MARBURG (1180–1233), Ger. ecclesiastic, renowned as preacher, particularly against 'heretics,' at court of St. Elizabeth of Hungary.

CONRART, VALENTIN (1603–75), Fr. scholar; one of founders and first sec. of Fr. Academy.

CONSALVI, ERCOLE (1757–1824), Ital. statesman and ecclesiastic; chamberlain of pope, 1783; organised papal army to meet armies of Fr. revolution; imprisoned in Castle of St. Angelo, 1798; deported to Naples and escaped; made cardinal-deacon and chief minister on instatement of Pope Pius VII., 1800; by his diplomacy offensive articles were omitted by Napoleon from *Concordat* between France and Rome; resigned on account of further steps of Napoleon against Church; plenipotentiary at Congress of Vienna; reorganised Papal States.

CONSANGUINITY, blood relationship, distinct from affinity, which is marriage relationship; direct c. is between parents and children, collateral between brothers, sisters, etc.; Roman and papal law prohibited marriages between relatives within certain limits; custom relaxed after Reformation; a table of kindred and affinity still appears in the Prayer Book. See MARRIAGE.

CONSCIENCE, term generally used to describe that sense which enables man to differentiate between right and wrong.

CONSCIENCE, HENDRIK (1812–83), Flemish novelist; b. Antwerp; wrote *Lion of Flanders* and numerous popular romances.

CONSCIOUSNESS, word implying full mental power and perception; opposed to unconsciousness (produced by sleep, drugs, or accident), in which mental powers are in abeyance. See PSYCHOLOGY.

CONSCRIPTION, choosing by lot men for national army; system obtained in Europe from Napoleon's time; now practically superseded by UNIVERSAL SERVICE, which demands service from all men with exception of physically unfit, only sons of widows, etc. The peace strength of the army is first settled (in Germany as early as 1871 this was arranged on a percentage of the general population), then when youths present themselves automatically at the legal age, a sufficient number is chosen to balance the time-expired soldiers. Under c. a conscript could find a substitute or pay for exemption. Among European armies still recruited by c. are (1913) Belgian and Dutch. All the Powers except Britain and U.S.A. have universal compulsory service; Australia has adopted it, and Lord Roberts heads a movement to introduce it into Britain. See also ARMY.

CONSECRATION, the making holy any person, place, or thing, has been common in most religions. The idea is that he or it is specially set apart for divine [illegible]s; a person or thing may likewise be 'devoted' to evil. Holiness is therefore a sort of supernatural quality which can be conferred by ceremonial. More loosely, c. is used of devoting to a special purpose without a necessary supernatural or sacramental element. Thus we speak of a person 'consecrating' his life to certain work. In the R.C. Church bp's are 'consecrated,' whereas priests are 'ordained.'

Frazer, *Golden Bough*; Robertson Smith, *Religion of the Semites*.

CONSEIL DE FAMILLE, in France, seven persons chosen to conduct a minor's affairs.

CONSERVATION OF ENERGY, see ENERGY.

CONSERVATIVE PARTY, in Gt. Britain, the political party which seeks to preserve unity of existing institutions; 'Conservative' first applied to *Tory* Party, 1830; the UNIONIST PARTY, formed by a split in Liberal Party owing to Home Rule, supported C. P. in power and in opposition from 1886; the two formed an alliance, 1895, and united their organisations, 1911–12. The party's programme (1913) includes Preservation of the Union, Tariff Reform and Imperial Preference (many Free Traders dissenting), strong navy. During period 1837–1913 Liberals held office for 47 and the Conservatives for 29 years. C. Premiers who have held office are Disraeli, 1868, 1874–80; Salisbury, 1885, 1886–92, 1895–1900, 1900–2; Balfour, 1902–5.

CONSERVATOIRE, school of music; c. established in Italy in V. cent.; modern c. at Milan (founded 1808); C. de Musique, Paris (1795).

CONSETT (54° 51′ N., 1° 52′ W.), town, Durham, England; collieries; ironworks. Pop. (1911) 11,209.

CONSHOHOCKEN (40° 7′ N., 75° 22′ W.), town, on Schuylkill, Pennsylvania, U.S.A.; cotton and woollen mills. Pop. (1910) 7480.

CONSIDÉRANT, VICTOR (1808–93), Fr. socialist; founded a community, La Réunion, Texas.

CONSIDERATION, legal term used in contract law for an act of concession.

CONSISTORY, at first the audience chamber of the Rom. emperors, then the audiences themselves; used later of episcopal tribunals, but now practically only of the Papal C., consisting of the pope and the coll. of cardinals. These meetings are mostly formal, their deliberative functions having been dropped.

CONSISTORY COURTS, held in England by bishops to try offences against ecclesiastical law; archbishop is court of appeal.

CONSOLS, CONSOLIDATED ANNUITIES, stock issued by government in return for money lent; made uniform by Consolidated Annuities Act (1749). See NATIONAL DEBT.

CONSORT (Lat. *consors*, partner), associate, particularly spouse, applied to husband or wife of Brit. sovereign; queen c. has position regulated by law.

CONSPIRACY (Lat. *conspiratio*), illegal agreement between two or more persons to act unlawfully or to commit acts which become unlawful when performed by more than one person. Such acts fall under these headings: (1) Conspiracy to commit actionable offence. (2) False charging of another with actionable offence from malice or wish to blackmail. (3) Conspiracy for injuries, such as raising price of goods in markets, etc., and obtaining goods under false pretences. (4) Conspiracy to pervert course of justice. (5) Attempts to profit corruptly by working of the law.

CONSTABLE (M.E., from O. Fr. *conestable*, from Late Lat. *comes stabuli*, count of the stable).—(1) Title of head groom of stable under later Rom. emperors, applied early by Frankish kings to chief household official; this usage became general. (2) Different national usages in nearly all of which there is military idea: (*a*) In France, title of commander-in-chief of army, regulator of tournaments, etc., until 1627; office revived for short period under Napoleon. (*b*) Prominent Eng. mediæval military official, keeper of a fortress; former officer of 'hundred' and township; member of police force. (*c*) Hereditary Scot. official with legal powers.

CONSTABLE, ARCHIBALD (1774–1827), Scot. publisher; pub. a number of Sir Walter Scott's works.

CONSTABLE, HENRY (1562–1613), Eng. poet; best known for his sonnets.

CONSTABLE, JOHN (1776–1837), Eng. artist; b. East Bergholt, Suffolk; f. was a miller, and in this employment many of C.'s earlier years were spent; first exhibited at Royal Academy (1802); A.R.A. (1819) and R.A. (1829). C. became one of England's greatest and most individual landscape artists. Amongst most famous works are *Flatford Mill*, *The Leaping Horse*, *The Cornfield*, and *Dedham Vale*.

Hind, *Constable* (Masterpieces in Colour).

CONSTABLE, SIR MARMADUKE (d. 1518), Eng. military leader; fought at *Flodden*.

CONSTANCE, KONSTANZ (47° 39′ N., 9° 11′ E.), town, Baden, Germany, at exit of Rhine from Lake Constance; fragments of ancient walls (IV. cent.); chief edifices, cathedral (founded XI. cent.), old Dominican convent (now a hotel), XIV.-cent. Kaufhaus; 'Council of Constance' met here, 1414–18; textiles. Pop. (1910) 27,591.

CONSTANCE, COUNCIL OF, an irregular council of the Church, held at Constance (Baden) from Nov. 1414 to April 1418, to end the dissensions in the Church, and repress the doctrines of Wycliff and John Huss. Pope John XXIII. was deposed by the

Council, and his rivals Gregory XII. and Benedict XIII. were forced to resign. Martin V. was then elected to the Papacy, and as he did not unreservedly approve the acts of the Council, it is held to be only partly œcumenical. Wycliff's teaching was condemned, and Huss and Jerome of Prague burnt at the stake, in spite of safe conducts from the emperor.

CONSTANCE, LAKE, BODENSEE (47° 35′ N., 9° 25′ E.), between Switzerland and Germany; traversed by Rhine S.E. to N.W.; area, *c.* 205 sq. miles; Rom. *Lacus Brigantinus.*

CONSTANT, BENJAMIN (1845–1902), Fr. artist noted for his portraits, and studies of Eastern subjects.

CONSTANT DE REBECQUE, HENRI BENJAMIN (1767–1830), Fr. publicist and orator, of Swiss origin; adopted democratic ideal of society in default of better; member of côterie of Madame de Staël, with whom he had long *liaison*; supported Directory by writings; afterwards enemy of Napoleon, but drew up *L'Acte additionnel aux constitutions,* 1814; won fame as orator in Chamber of Deputies, 1819.

CONSTANTIA (34° 3′ S., 18° 27′ E.), district, Cape of Good Hope, S. Africa, on N.N.E. slopes of Table Mountain; wine.

CONSTANTINE, name of many Rom. emperors.—**Constantine I.,** FLAVIUS VALERIUS CONSTANTINUS (*c.* 288–337), *the Great*; illegitimate s. of Emperor Constantius I. Already famous as general, he was proclaimed *Augustus* by army at his f.'s death (306), but waited six years before seizing supreme power; epoch-making rule; Christianity not only tolerated but made state religion; an incorrect tradition ascribes C.'s conversion to his mother, Helena; capital removed, 326–30, from Rome to Byzantium (*Constantinople*); reign shows completion of process by which Rom. republic became absolute despotism, C. entailing rule on his family, creating new nobility, and leaving mere shadow of power to senate; period of prolific legislation. His s., **Constantine II.** (317–40), acquired name *Alemannicus* from victories over Alemanni.—**Constantine IV.** (emperor, 668–85) repulsed attacks of Arabs and extorted tribute from them, but was forced to allow Bulgars to colonise modern Bulgaria, 679. He summoned 6th Œcumenical council, which condemned Monothelitism.—**Constantine V.** (emperor, 740–75), iconoclast; held synod, 754, forbidding image-worship, and exiled monks as upholders of same, with result that Rom. Church permanently severed connection with Constantinople; able soldier and general.—His grandson, **Constantine VI.** (emperor, 780–97), aged 10 at his accession, was completely ruled by mother, Irene, and blinded after disastrous rule.—**Constantine VII.** (905–59), '*Porphyrogenitus*' (born in the purple), Byzantine emperor and writer of important books of history, war, law, agriculture, etc.—**Constantine VIII.** (joint-emperor, 976–1025, sole ruler, 1025–28), decadent; empire controlled by eunuchs.—**Constantine IX.** (1042–54) lost Lombardy. Turks made appearance.—**Constantine X.** (1059–67) finally lost Ital. possessions; inroads of Turks and Magyars.

CONSTANTINE (d. 410 A.D.), Rom. soldier in Britain, who usurped the purple during reign of Honorius; afterwards defeated and put to death.

CONSTANTINE (36° 20′ N., 6° 33′ E.), fortified town, Algeria; situated on rocky hill, with ravines surrounding it on three sides; episcopal see; has citadel, mosques, Bey's palace; manufactures woollens, leather goods; Rom. remains; was important city of Numidia; sacked, 311 A.D.; rebuilt by Constantine; taken by French, 1837. Pop. (1911) 65,173.

CONSTANTINE, PAVLOVITCH (1779–1831), Russ. grand-duke; second s. of Tsar Paul I. of Russia; commander-in-chief in Poland; hated by Polish nationalists; aimed at founding Polish dynasty; renounced claim to succeed bro., Alexander, as tsar; reorganised army; forced to fly during military insurrection at Warsaw, 1830.

CONSTANTINOPLE (41° 2′ N., 28° 58′ E.), capital of Turkey and Ottoman Empire; built on several hills; uniquely situated, and one of most beautiful cities in Europe. C. is surrounded on three sides by water; Sea of Marmora and Bosporus on S. and E.; W. side is walled; and on the N. side, the inlet called the *Golden Horn* separates C. Proper (called by Turks *Istambol* or *Stambol*) from Christian C., forming a safe, spacious, and deep harbour, about five miles long and half a mile broad, bridged at two points. Christian C. is on the N., and comprises: (1) Galata, the merchants' quarter (in which is the Genoese Tower of Galata, used for giving fire-alarms); (2) Pera, the aristocratic quarter containing embassies and consulates, the ill-paved Grande Rue with its fine shops, cafés, restaurants, hotels; Pera is reached by tunnelled railway; (3) Top-hane (with cannon factory), mostly inhabited by Turks; it embraces the beautiful Palace of Dolma-bagche on banks of Bosporus. Stambol lies to the S., and contains most of the finest buildings, *e.g.* the Mosque of St. Sophia built in Byzantine style and originally intended for a Christian church, but converted into mosque by Muhammad II.; outside it is plain, but interior, with its dome, marbles, mosaics, is of marvellous beauty. There are scores of other mosques, a magnificent one being that of Sultan Muhammad, the Conqueror, standing on the site of Church of the Holy Apostles. In Stambol is Hippodrome with remains of Gk. architecture. In extreme N.E. stands the Seraglio, within whose high walls were the Divan and Harem of former sultans, and whose famous gate (*Sublime Porte*) has given its name to the Sultan's government; a new Seraglio was built by Abdul Mejid N. of the old one. The streets are mostly ill-paved and crooked; the houses are low and small, and business is transacted in bazaars.

C. was founded, as *Byzantium* (q.v.), in VII. cent. B.C.; rebuilt and made capital of Rom. Empire by Constantine the Great—hence the name; capital of Byzantine or Eastern Empire for over 1000 years; captured by Venetians and Crusaders (1203–4); taken and made capital of Ottoman Empire by Muhammad II. in 1453—'Fall of C.' (see RENAISSANCE); in course of history besieged by Sassinians, Persians, Saracens, Russians, Romans, and Turks. Pop. *c.* 1,200,000.

Grosvenor, *Constantinople* (1895); Pears, *Destruction of Gk. Empire and Capture of Constantinople* (1903); Hutton, *Constantinople* (1900).

CONSTANTINOPLE, COUNCILS OF.—The chief are: (1) the second œcumenical council, 381, confirming articles of Nicene Creed and granting metropolitan status to bishoprics of Alexandria, Antioch, Thrace, Pontus, and Ephesus.—(2) The fifth œcumenical c., 553, condemning the 'Three Chapters.'—(3) The sixth œcumenical c., 680–81, condemning Monothelitism.—(4) Synod of 869, considered by Latin Church as eighth œcumenical c.; declared in favour of Ignatius against Photius for bishopric of Constantinople.—(5) Synod of 879 regarded by Gk. Church as eighth œcumenical c.; declared for Photius.

CONSTANTIUS, FLAVIUS VALERIUS (*c.* 250–305 A.D.), Rom. emperor.

CONSTANTZA, KUSTENDJI (44° 12′ N., 28° 41′ E.), seaport, on Black Sea, Rumania; near ruins of Tomi; Ovid's place of exile; large transit trade in grain and petroleum through railway to Bucharest.

CONSTELLATION, group of stars. From the earliest times stars have been segregated by man into artificial groups, which have been given names, chiefly derived from animals and Gk. mythology. Northern c's are Andromeda, Aquila (Eagle), Auriga (Charioteer), Boötes (Ploughman), Camelopardus (Giraffe), Canes Venatici (Hunting Dogs), Cassiopeia, Cepheus, Coma Berenices (Berenice's Hair), Corona Borealis (Northern Crown), Cygnus (Swan), Delphinus (Dolphin), Draco (Dragon), Equuleus (Foal), Hercules, Lacerta (Lizard), Leo Minor (Little Lion), Lynx (Lynx), Lyra (Lyre), Ophiuchus or Serpentarius (Serpent-

Holder), Pegasus, Perseus, Sagitta (Arrow), Serpens (Serpent), Triangulum (Triangle), Ursa Major (Great Bear), Ursa Minor (Little Bear), Vulpecula et Anser (Fox and Goose). **Zodiacal c's**: Aquarius (Water-Carrier), Aries (Ram), Cancer (Crab), Capricornus (Goat), Gemini (Twins), Leo (Lion), Libra (Scales), Pisces (Fishes), Sagittarius (Archer), Scorpio (Scorpion), Taurus (Bull), Virgo (Virgin). **Southern c's**: Antlia [Pneumatica] (Air-Pump), Apus (Bird of Paradise), Argo (Ship), Calum (Sculptor's Tool), Canis Major (Great Dog), Canis Minor (Little Dog), Carina (Keel), Centaurus (Centaur), Cetus (Sea-Monster), Chamæleon, Circinus (Compasses), Columba Noachi (Noah's Dove), Corona Australis (Southern Crown), Corvus (Crow), Crater (Bowl), Crux Australis (Southern Cross), Dorado (Sword-Fish), Eridanus, Fornax Chemica (Chemical Furnace), Grus (Crane), Horologium (Clock), Hydra (Sea-Serpent), Hydrus (Water-Snake), Indus (Indian), Lepus (Hare), Lupus (Wolf), Malus (Mast), Mons Mensæ (Table Mountain), Microscopium (Microscope), Monoceros (Unicorn), Musca Australis (Southern Fly), Norma (Rule), Octans (Octant), Orion, Pavo (Peacock), Phœnix, Pictor (Painter), Piscis Australis (Southern Fish), Puppis (Stern), Reticulum (Net), Sculptor, Scutum Sobieskii (Shield of Sobeski), Sextans (Sextant), Telescopium (Telescope), Toucan, Triangulum Australe (Southern Triangle), Vela (Sails), Piscis Volans (Flying Fish). See ASTRONOMY.

Royal Hill, *Stars and Constellations* (1910).

CONSTIPATION, condition in which the fæces are retained unduly in the bowels, through interference with the digestive functions, due frequently to sedentary habits, change of diet or habits, nervous diseases, diseases affecting the general system, *e.g.* anæmia, Bright's disease, and to other similar causes. The treatment is to take a glass of water before breakfast, and occasionally a teaspoonful of liquid cascara sagrada at bedtime; the diet is regulated so as to include plenty of fruit and vegetables, regular exercise is advised, and the attempted evacuation of the bowels daily at a fixed time.

CONSTITUTION (Lat. *constitutio*, regulation, especially imperial order. Equivalents of imperial *constitutiones* are to be found in Eng. mediæval 'Constitutions' of Clarendon, etc.).—Political organisation; founded not merely on law, but custom. Chief forms are: monarchical, aristocratic, and democratic. The commencement of theorising as to their relative advantages is to be found in Aristotle's *Politics*.

'Constitution of Athens,' a treatise written on papyrus, found in Egypt, and now in Brit. Museum, is considered by scholars to be a copy of a work on the Athenian C. written by Aristotle (d. 322 B.C.). It has been edit. and pub. (1891).

U.S.A. and France are examples of written c's, U.K. of unwritten c. 'Constitutional' action is action in accordance with c.; 'constitutional' party, party which strives to keep c. intact, but 'constitutional' government has acquired different meaning from use of Brit. politics. It signifies limitation of power of head of government by representatives of the governed in similar manner to limitation of power of Brit. crown by Parliament.

Lord Courtney, *The Eng. Constitution* (1910); Bryce, *The Amer. Commonwealth* (new ed., 1911).

CONSUBSTANTIATION, doctrine promulgated by Martin Luther, that the body and blood of Christ are present with the substance of the bread and wine in Holy Communion; opposed to transubstantiation (*q.v.*).

CONSUETUDINARY.—(1) Legal term for customary law; (2) name of a book of ritual.

CONSUL.—(1) Title of two chief magistrates of Rom. republic. The office was established at fall of the monarchy; power of monarch remained to consuls, but was limited by their only holding office for one year, their responsibility to people at end of office, and the fact that one C. could nullify acts of his partner. They had command of army, control of foreign affairs, appointment of treasurers. Dates were given by naming the C's of the time. Twelve lictors carried before them *fasces* and axe, symbols of supreme judicial power. With aristocratic constitution of early republic, C's, who were chosen by retiring C's and confirmed by people, were always patricians. *Lex Licinia* (367 B.C.) ordained that one C. should always be plebeian. Enactments granting right of appeal from decisions of C's, codification of laws, establishment of tribunate of *plebs*, *censors*, *prætor*, and *curule ædiles* marked gradual transition of Rom. constitution from oligarchy to democracy. In crises they either received extraordinary powers or were superseded by a *dictator*. Retired C's governed provinces as *pro-consuls*. Under Empire their election was transferred first to senate, then to emperor; their numbers were increased; their powers lost. Napoleon revived title, being called FIRST CONSUL till his coronation, 1804.

(2) Representative of a state in a foreign country to protect trade of its subjects, collect commercial information, and carry out further printed instructions. He has powers of public notary, and in some countries holds consular courts for Brit. subjects in accordance with 'capitulations.' This use of word C. originated in mediæval trading cities of Italy, which commenced to send C's far afield at close of XI. cent.; the system was speedily imitated, and became universal in XVI. cent.; organised in XIX. cent.

'CONSULATE OF THE SEA' (or *Book of the Consulate*), Catalan treatise on maritime customs, first pub. in XV. cent.

CONSUMPTION, term popularly used for the process of destruction of the tissue of the lung due to tuberculosis (*q.v.*); in political economy, that part of the subject dealing with the use of wealth as [illegible] of wealth.

CONSUS (classical myth.), Rom. agricultural deity.

CONTAGION, term designating communication of disease-germs by contact or from breathing or excretions; C. Diseases Acts, 1865, 1867, 1868, providing medical supervision of prostitutes living in certain naval or military centres to prevent spread of venereal diseases, have since been repealed.

CONTANGO, Stock Exchange term for a system of deferred payment, as when a dealer agrees to buy stock (which he does not want) at a fixed price in the hope that the price will rise before the purchase is completed. If the price rises he will make a profit, since it must be delivered at the price originally agreed upon. The contract, however, is usually one not for delivery of stock, but for the payment of 'difference' between the contract and the market price.

CONTARINI, Venetians, who through several cent's were distinguished for public service, several holding office of Doge.

CONTAT, LOUISE FRANÇOISE (1760–1813), Fr. actress.

CONTÉ, NICOLAS JACQUES (1755–1805), Fr. painter and inventor; introduced military balloons; invented pencils of mixture of graphite and clay, a barometer, and many other contrivances; showed prolific inventive genius on Napoleon's expedition to Egypt.

CONTEMPT OF COURT is an insult to a Court of Justice, or any defiance or resistance to its authority. If the attempt be committed in the face of the Court, the offender may be instantly apprehended and imprisoned at the discretion of the judges, without any further proof or examination. Doing anything calculated to prejudice a fair trial of any case, or the disobedience of a judicial order, or the interference with the due course of justice, amounts to contempt of court. Commenting in a newspaper on the facts of a case which is proceeding at the time, especially if it be in a way calculated to influence the jury, and writing letters about such a case to the judge and jury

who are trying it, are instances of gross contempt of court.

CONTI, NICOLO DE' (early XV. cent.), Venetian traveller; explored India, Malay Archipelago, etc.; returned by 'Ciampa,' possibly Indo-China, Aden, Jidda, and Cairo; arrived at Venice, 1444; gave valuable account of S. Asia.

CONTI, PRINCES OF.—Fr. title taken from estate of Condé family at Conti-sur-Selles; held by many distinguished members of family of Condé. FRANÇOIS (1558–1614), 1st marquis and prince, supported League against Guises; ARMAND DE BOURBON (1629–66), general and writer, bro. of great general, Condé, was leader of Fronde, but became reconciled to Mazarin; his c. s. married dau. of Louis XIV., but younger, FRANÇOIS, also distinguished soldier, satirised king as '*roi du théâtre*' and was banished; last prince, LOUIS FRANÇOIS JOSEPH (1734–1814), exiled by Revolution.

CONTINENT, term in physical geog. for each of the larger continuous masses of land on earth's surface; recognised in modern geog. as six—Eurasia, Africa, N. and S. America, Australia, and Antarctica; formerly reckoned as two, the Old and New; the former comprising Eurasia and Africa, the latter N. and S. America. C. in a wider sense includes outlying islands, *e.g.* the British Isles and Iceland form part of C. of Europe. In Britain the term 'the Continent' is applied to the rest of Europe.

CONTINENTAL SHELF, submarine plain, not more than 600 ft. below sea-level, surrounding most continents, especially of the N. hemisphere; narrow round the S. continents except between Tasmania, Australia, and New Guinea, and between S. America and the Falkland Islands. The steep descent from the c. s. to the ocean depths is termed the continental slope.

CONTINENTAL SYSTEM, see BERLIN DECREES.

CONTOUR LINE, on maps, line where (horizontal) plane at a certain elevation intersects surface of the land.

CONTRABAND (Ital. *contrabando*, action contrary to law).—(1) Smuggling; (2) goods smuggled; (3) 'contraband of war,' *i.e.* goods forbidden by international law to be supplied by neutrals to belligerents and liable to confiscation. Jurists disagree as to nature of such goods, and their liability to confiscation on way to neutral port, but destined for enemy. At second Hague Conference agreement was made that postal correspondence, whether on neutral or belligerent ship, was inviolable, and must be dispatched except when from or to a blockaded port. Opinion was given by Institute of International Law, 1896, that *conditional* c. should be abolished, but belligerent should have right to seize articles which might serve for war or peace on way to enemy's port; and, as to destination, goods were liable to confiscation if neutral port was only stage to enemy's port. *International Conference of London*, 1908–9, includes foodstuffs under conditional c., if shipped to a fortified place or hostile base, and not consigned direct to a neutral port.

CONTRACT, an agreement entered into between two or more persons sanctioned by law, by which agreement each undertakes to do, or to abstain from doing, a specified act or acts, in consideration of the other or others doing, or abstaining from doing, some other act or acts. It is true that every c. is an agreement, but not every agreement is a c. The law demands before an agreement becomes an enforceable c. that certain requirements shall be fulfilled, such as the legal capacity of the parties, the legality of the object aimed at, and, in some cases, the way in which the c. is evidenced. C's may be divided into three classes: (1) c's by matter of record; (2) c's under seal, which are sometimes spoken of as *specialities*; and (3) c's not under seal, which are called *simple*, or *parole*, c's. (1) are those founded on the authority of a court of record; (2) those made by deed—generally speaking, they require no consideration to support them; (3) those made simply in writing, or by word of mouth.

Sir W. R. Anson, *Eng. Law of Contract* (1910); Bell, *Principles of Scots Law* (1899).

CONTRACTILE VACUOLE, in one-celled organisms, spherical cavity with liquid or minute radiating canals, periodically formed and discharged; acts like kidney as conveyor of waste matter in metabolism of Protozoa.

CONTRADICTION, PRINCIPLE OF, one of laws of thought regulating all valid reasoning; that the same attribute cannot be at the same time affirmed and denied of the same subject (Aristotle). See LOGIC.

CONTRAFAGOTTO, DOUBLE BASSOON, wood-wind instrument of the double reed order, the use of which dates back to very early times.

CONTRALTO, the lowest or deepest musical voice among boys and women.

CONTREXÉVILLE (48° 9′ N., 5° 51′ E.), village, Vosges, France; mineral springs; health resort.

CONVENT, society of persons living a religious life in a monastery or nunnery. To apply word to a building is erroneous.

CONVENTION, military term signifying temporary truce, as C. of Cintra (1008); also used for custom which has grown out of practice and experience of society; the C. Parliament was assemblage of M.P's after James II.'s flight, 1688.

CONVENTION, THE NATIONAL, Fr. assembly (1792–95) for drawing up republican constitution; elected by suffrage of all self-supporting Frenchmen of legal age; app. fresh pros. every fortnight; gradually assumed executive powers; had famous committees of Public Safety, General Security, Education, etc., which reorganised army and internal administration.

CONVERSANO (40° 58′ N., 17° 7′ E.), town, Apulia, Italy; bp.'s see; cathedral (XI. cent.). Pop. 14,000.

CONVERSION, term used in theol., logic, and law. Under the first heading it refers to the acceptance of Christianity by a heathen mind, or the change from one faith to another; under the second, the act of interchanging the terms of a proposition; under the third, the unauthorised transference of another's property into a different medium.

CONVEX, term for exterior of curved surface, opposed to *concave*.

CONVEYANCING, legal term employed in the transfer of real property by means of written instruments. There were formerly several ways in which freehold land might be conveyed, but since the Real Property Act (1845) the usual method is by deed of grant. The deed must be 'signed, sealed, and delivered' by the parties to the conveyance. The 'seal' is frequently nothing more than a wafer stuck on to the deed; and to effect 'delivery' all the person need do is to touch the seal with one finger, and say, 'I deliver this as my act and deed.' Witnesses are not absolutely necessary, but it is better to have them. The deed must bear a stamp in accordance with the Stamp Act (1891). The deed itself is a very important and formal document, and under no circumstances can a layman be advised to draw it up. If the property transferred is leasehold, it should also generally be conveyed by deed, but in this case the deed is called a 'lease,' or an 'assignment of lease,' according to the circumstances.

CONVEYORS, appliances for moving materials such as grain, coal, coke, minerals, etc., chiefly in a horizontal or slightly inclined direction. The earliest known form of c. is probably the Archimedean screw (*q.v.*); and *worm* c's are built on the same principle, usually consisting of a steel spiral blade or set of blades revolving in a pipe or trough. They are economical for short distances, and may also be used for mixing dry substances, *e.g.* cement and sand. For conveying grain over long distances in granaries, etc., *band* c's are very efficient, consisting of endless bands of rubber or canvas running over two terminal and various intermediate rollers. The speed varies between 400 and 600 ft. per minute, according to the weight of the different materials which would be

blown off at higher speeds. For delivering material at any point, 'throw-off carriages' are used, consisting of a frame with rollers which raise the band and then lower it to form an S curve, shooting the grain, etc., over the top roller into a hopper or chute. For conveying coals the band is usually curved to form a trough along the upper (loaded) side by two guide rollers inclined towards the central, horizontal roller. Linked steel plates are used as belts when hard or hot material, such as ore, clinker, or coke are to be conveyed. A modification of band c. are bucket c., which can be used as elevators, and consist essentially of endless ropes or chains to which buckets are attached at suitable intervals, either rigidly or free-moving, being suspended above their centre of gravity. They are chiefly used for coke, grain, and as dredgers. The simplest forms of c. are *rope-* and *cable-ways*, which are economical and efficient, especially in circumstances where a permanent way is impracticable, as in transporting material in broken and mountainous country or in coaling ships at sea. A variation is *telpherage*, in which a two-wheeled truck is suspended from and running on a monorail or steel cable, propelling itself by an electromotor taking the current from a wire or live rail. The chief advantages of telpherage are: no obstruction of the ground by trucks, high speed, and easy combination with hoisting and tipping methods. See CRANE, ELEVATORS.

CONVOCATION (Lat. *convocatio*, calling together). —(1) Act of summoning assembly, or assembly so summoned. (2) Name of provincial synods in Church of England, which sit contemporaneously with Parliament, being summoned by respective abp's by virtue of royal writ; composed of upper house of bp's and lower house of deans, archdeacons, and representatives of cathedral chapters, provost of Eton, two proctors elected by beneficed clergy from each diocese of southern province, and two proctors elected by archdeacon from each see in province of York; origin is obscure; important in history of Eng. constitution as opponent to tyranny of crown; refused under Edward I. to assemble unless summoned through abp., or to pay 'aids' not granted by c.; clergy in XIV. cent. refused to attend Parliament instead of c.; often summoned c. without royal writ; Henry VIII. obtained 'Act of Submission,' putting an end to independent legislation of c.; used to reform Church in XVI. and XVII. cent's; separate taxing abolished, 1665; XVIII.-cent. period of faction, prorogation 1741-1852, reform 1852 onwards.

CONVOLUTA, a Turbellarian worm (*q.v.*).

CONVOLVULACEÆ, order of herbaceous, shrubby, or twining plants, comprising about 1000 species in 40 genera, widely distributed, mainly in the tropics. The bindweed, with tubular flowers (*Convolvulus arvensis*), *Calystegia soldanella* (the sea bindweed), and the parasitic dodder are the common Brit. representatives. A Madagascar type, *Humbertia*, forms a tree (*Ipomœa Batatas*), produces sweet tubers, and is an important food plant in some tropical countries.

CONVULSIONS, violent and spasmodic contractions of the body, either continuous or alternating with relaxations, symptomatic of epilepsy (*q.v.*), uræmia (*q.v.*), and other diseases, or in infants due to nervous irritation from teething, gastro-intestinal troubles, rickets, etc. During the c. a few inhalations of chloroform are often given, or the infant is plunged into a hot bath, or an emetic (*q.v.*) is administered if caused by overloading the stomach, and the cause is treated on general principles.

CONWAY (53° 17′ N., 3° 50′ W.), market town and seaport, on estuary of Conway, Carnarvonshire, Wales; surrounded by high walls with battlements and towers; river crossed by fine bridges; C. castle (built by Edward I., 1284), is famous ruin. Pop. (1911) 5242.

CONWAY, HENRY SEYMOUR (1721-95), Eng. general and statesman; deprived of army command for supporting popular party in Wilkes case; constitutional question being raised as to legality of this. Crown withdrew from its position; opposed North's Amer. policy and brought about his resignation; field-marshal, 1793.

CONWAY, HUGH (1847-85), Eng. novelist; *nom de plume* of F. J. Fargus, author of *Called Back* (1883) and other successful novels.

CONWAY, MONCURE DANIEL (1832-1907), Amer. preacher, lecturer, and man of letters.

CONWAY, SIR WILLIAM MARTIN (1856-), Eng. mountaineer and writer on art.

CONYBEARE, WILLIAM DANIEL (1787-1857), Eng. geologist; grandson of John C., bp. of Bristol; first to describe *Plesiosaurus*, discovered by Mary Anning; pub. numerous research memoirs and *Outlines of the Geology of England and Wales*; F.R.S.; Wollaston Medallist, Geol. Soc., 1844.

CONYBEARE, WILLIAM JOHN (1815-57), Eng. clergyman and scholar.

COODE, SIR JOHN (1816-92), Eng. engineer; superintended construction of Portland and Colombo harbours; consulted by Colonial governments; member of Suez Canal Commission, 1889-91; pres. of the Institution of Civil Engineers; K.C.M.G.

COOK, ALBERT STANBURROUGH (1853-), Amer. scholar; prof. of Eng. Language and Lit., Yale.

COOK, EDWARD DUTTON (1829-83), Eng. dramatic critic and novelist.

COOK, ELIZA (1818-89), Eng. popular poet.

COOK ISLANDS, HERVEY ISLANDS (20° 45′ S., 159° W.), group in Pacific Ocean, S.W. of Society Islands; principal islands are Rarotonga, Mangaia, Aitutaki, Atiu; dependency of New Zealand; discovered by Capt. Cook, 1777; chief products, coffee, fruits, cocoa-nuts. Pop. (1911) *c.* 7000.

COOK, JAMES (1728-79), Eng. navigator; apprenticed to shipowners of Whitby; entered navy, 1755; lieut. of *Endeavour*, which sailed for S. Pacific, 1768; explored coasts of New Zealand and Eastern Australia, of which he took possession in name of Britain, naming New South Wales; returned by Cape of Good Hope; sent out as commander of *Resolution*, 1772; marvellous voyage of discovery, in which old idea of southern continent was destroyed, and anti-scorbutic precautions prevented usual heavy death-roll of expedition; slain on last voyage (1776-79).

Kitson, *Capt. James Cook, the Circumnavigator* (1907).

COOK, THOMAS (1808-92), Eng. excursion agent; commenced, 1841; extended excursions over Europe by 1865; U.S.A. and Palestine, 1869; Egypt and Sudan later. Son, John Mason, became partner, and grandsons now carry on business.

COOKE, GEORGE FREDERICK (1756-1811), Eng. Shakespearean actor; rival of Kemble.

COOKE, JAY (1821-1905), Amer. banker; floated war loan (1861) for Union; organised national banks and kept up government credit.

COOKERY, the preparation of food by heat, is said to date from Neolithic times. Before fire was known, the only way of dressing meat was by exposing it to the sun; but after its discovery fire was used first for drying and afterwards for cooking flesh. The chief disadvantage of this primitive method was that those parts of the meat which came in direct contact with the fuel were blackened and besmirched, and to obviate this, spits were passed through it and it was raised to a height above the fire—the method of grilling or broiling, the chief mode known to the ancient Greeks of the Homeric epoch, being thus invented.

The Greeks gave considerable attention to gastronomic pleasures, and Athenian travellers were constantly introducing new dishes, and improved methods of cooking, from other lands. Their system of cooking and dressing food was in turn copied by the Romans. The era of modern cooking dates back to the period of the Ital. Renaissance. Ital. methods were introduced into France by Catherine de' Medici, who brought cooks from her own country. Under Louis XIV. and Louis XV. cooking became an art. Fr. methods soon found their way into England, and

cookery books began to appear as early as the first half of the XVI. cent.

In ROASTING, whereby the nutritive qualities are best preserved, the meat is exposed to the direct influence of the fire by placing it before an open grate, basting it frequently, and keeping it in motion to prevent scorching of any part. Owing to the now general disuse of open grates, roasting is now practically superseded by BAKING, *i.e.* cooking in the oven, the chief difference from roasting being that the fumes are not carried off.

BOILING is cooking by means of hot water, which, according to Liebig, should be boiling before the meat is immersed. STEWING is simmering in a small quantity of water in a closed vessel, and requires less heat than boiling. BROILING or GRILLING is cooking on a gridiron directly over a bright clear fire, and resembles roasting in effect. FRYING is cooking in boiling fat; there are two methods, *sauté* or dry frying in a shallow pan with a small quantity of fat, and deep frying in a large quantity. STEAMING is carried out by placing meat in a double cooker or in a jar placed in a saucepan of boiling water. BRAISING is stewing meat slowly with vegetables in a covered pan. A modern system, practised and taught by M. Soyer, is cooking by 'paper bag.'

Florence B. Jack, *Domestic Arts* (8 vols.), *Cooking for Invalids.*

COOKSTOWN (54° 39′ N., 6° 45′ W.), market town, County Tyrone, Ireland; manufactures linen. Pop. 4000.

COOKTOWN (15° 27′ S., 145° 25′ E.), seaport, on Endeavour, Queensland, Australia; gold and tin mining in district.

COOKWORTHY, WILLIAM (1705–80), Eng. potter; discoverer of Eng. china clay.

COOLGARDIE (30° 57′ S., 121° 10′ E.), town, W. Australia; gold-fields are among richest in colony. Pop. 4000.

COOLIE, an Ind. or Chin. unskilled labourer or porter. After the abolition of slavery there was an extensive demand for c. labourers, and they are employed in large numbers in many Brit. colonies. See ASIATIC QUESTION.

COOMA (36° 13′ S., 149° 9′ E.), town, N. S. Wales, Australia; large trade in furs; small gold-field in district.

COOMASSI, see KUMASI.

COOPER, ABRAHAM (1787–1868), Eng. artist; R.A. (1820); battle scenes and animals.

COOPER, ALEXANDER (d. 1660), Eng. miniature artist.

COOPER, ASHLEY, see SHAFTESBURY.

COOPER, SIR ASTLEY PASTON (1768–1841), Eng. surgeon; practised with great success in London; prof. of Comparative Anat. to Royal Coll. of Surgeons (1813); pres., Royal Coll. of Surgeons (1827 and 1836); performed famous operation of tying the abdominal aorta for aneurism (1817); author of several surgical and anatomical works, the best known on hernia.

COOPER, CHARLES HENRY (1808–66), Eng. antiquary; wrote *Annals of Cambridge,* etc.

COOPER, JAMES FENIMORE (1789–1851), Amer. novelist; famous for his *Leather-Stocking* series of tales, including *The Pioneers* (1823), *Last of the Mohicans, The Prairie, The Pathfinder,* etc.; translated into many languages.

COOPER, PETER (1791–1883), Amer. inventor, iron manufacturer, etc.; introduced new processes for getting iron; constructed first steam-engine in America; established (1859) COOPER UNION in New York for advancement of art and science.

COOPER, SAMUEL (1609–72), Eng. miniature artist.

COOPER, THOMAS (1805–92), Chartist poet and lecturer; wrote his *Purgatory of Suicides* in gaol.

COOPER, THOMAS (1517–94), Eng. ecclesiastic and author.

COOPER, THOMAS (1759–1840), Amer. prof. of Chem., dismissed for materialistic views; student of philosophy and economics.

COOPER, THOMAS SIDNEY (1803–1902), Eng. artist; R.A. (1867); famous for cattle studies.

COOPERAGE, name given to a traffic at sea in liquors and tobacco among North Sea fishermen; rendered illegal by Acts of 1888 and 1893.

COOPERAGE, the trade of making wooden casks to contain liquids or dry goods, dates back to very early times. Casks intended to contain wine, spirits, beer, etc., are made of oak.

CO-OPERATION, system of working together of a number of persons for the cheapening of goods, or for promoting some branch of industry, founded by Robert Owen (1771–1858). The term embraces two distinct ideas: (1) c. in consumption, and (2) c. in production. (1) This is the system by which the worker seeks to spend his income to the best advantage, the system in which the proprietors of a shop are its customers, thus doing away with the middleman, and enabling the consumer to get cheaper commodities. (2) The unity of capital and labour by such means that the employer is unnecessary. The workers, either by means of their own, or borrowed capital, become their own employers. The profits which would otherwise be annexed by the employer go to swell the wages of the labourer, who is thus stimulated to exert himself to the utmost.

The Eng. 'Co-operative Wholesale Society' (founded 1863) is a combination of smaller societies, all of which hold members' shares. This extensive trading concern owns steamships and tea plantations; manufactures boots, clothes, hosiery, furniture, grocery, and practically everything required in domestic life. The 'Scottish Wholesale Society,' founded 1869, follows similar lines, and engages extensively in production. Under the co-operative system in its retail working, all customers, as shareholders, receive their share of the profits in the form of dividends.

The Agricultural Organisation Society (founded 1901) promotes agricultural co-operation, and has met with considerable success in the formation of local societies, and generally in supplying information and other help in regard to the best methods of management. The co-operative movement in relation to agricultural products has perhaps been most markedly successful in Denmark, where the articles of export include butter, bacon, eggs, and meat—butter being by far the most important article of produce. Beginning in a quiet way amongst the smaller agriculturists, the system quickly spread, and now includes many of the largest holders of land. Co-operative banks which afford capital to small producers are common on the Continent, especially in Italy and Germany, and have now been introduced into India, England, Ireland, and other parts of the Brit. Empire.

Holyoake's *History of Co-operation* (1906); Beatrice Potter, *The Co-operative Movement in Great Britain* (1910); Pizzamiglio, *Distributing Co-operative Societies* (trans. by Snell, 1910).

COOPERSTOWN (42° 42′ N., 75° W.), village, New York State, U.S.A., on Susquehanna, at exit from Otsego Lake; summer resort. Pop. (1910) 2484.

COORG (11° 56′ to 12° 45′ N., 75° 25′ to 76° 13′ E.), province, Brit. India; area, 1582 sq. miles; bounded N. and E. by Mysore, S. and W. by Madras; capital, Merkara. Most of surface is covered by forests; crossed by W. Ghats; watered by Cauvery and its affluents. C. produces coffee, rice, cinchona, cardamom. Natives are called Kodagas; most of them are Hindus; other religions, Muhammadanism, Animism. C. is administered by chief commissioner; was a native princedom and was annexed to Britain in 1832; has many ancient ramparts. Climate is comparatively cool; abundant rainfall. Pop. (1911) 174,976.

COORNHERT, DIRCK VOLCKERTSZOON (1522–90), Dutch politician and theologian.

COOT (*Fulica atra*), bird belonging to rail family,

frequents inland waters and estuaries of the Old World; expert swimmer, diver, and flier; builds its nest between reeds; favourite water-fowl for shooting; other species in America, Africa, and Australia; *F. newtoni*, in Mauritius, extinct.

COOTE, SIR EYRE (1726–83), Brit. general; distinguished himself in India in Seven Years War, and (1781) defeated Hyder Ali at Porto Novo.

COPAIBA, COPAIVA, aromatic acrid balsam or oleo-resin procured from trunk of *Copaifera Lansdorfii*, a tree of N. South America; oil used therapeutically as urino-genital antiseptic, and formerly as expectorant in bronchitis.

COPAL, hard, brown to colourless resin, obtained from *Trachylobium* and other trees of S. America and Africa; on the mainland coast of Zanzibar a wide deposit of valuable fossil c. is being exploited by digging it up from the soil in lumps of various sizes; used as chief constituent of varnishes.

COPALITE, COPALINE, hard yellow resinous substance found near Highgate in London Clay.

COPÁN (14° 41′ N., 89° 28′ W.), ruined Ind. city, on Rio Copán, W. Honduras.

COPARCENARY, TENANCY IN, legal term relating to joint inheritance of an estate by two heirs. The heir at law is usually an eldest son, but for females there is no rule of primogeniture, and when an estate is left to daughters they hold the property as *coparceners*.

COPE (O.E. *cape*), a vestment worn by R.C. and by some Anglican clergy, in processions, at vespers and on other ceremonial occasions of lower importance than the Mass. It is composed of a semicircular piece of material draped over the shoulders and fastened in front; the name *pluviale* (rain-cloak), by which it is known in the Rom. Church, shows its origin, and the shield-shaped cloth on the shoulders has developed from original hood.

COPE, EDWARD DRINKER (1840–97), Amer. palæontologist; curator, Academy of Natural Sciences; served on U.S. Geological Survey, subsequently prof. of Geol., Univ. of Pennsylvania; discovered more than 500 species of extinct vertebrates.

Memoir by H. D. King, *Amer. Geologist* (Jan. 1899).

COPELAND, HENRY (fl. 1760), famous Eng. cabinet-maker.

COPENHAGEN, KJÖBENHAVN (55° 41′ N., 12° 37′ E.), capital of Denmark; situated on E. shore of Zealand (large island in the Sound), with suburbs, called Christianshavn, on island of Amager, connected at two places. The channel between C. and Slottsholm Island forms a spacious harbour and great naval station, which, with forts to seaward and fortifications with canals for flooding land approaches, renders C. an important stronghold; promenades on site of old fortifications and extensive suburbs outside; ancient citadel in N.E. Frederikshavn is now useless. Portion of town, cut off by canals, forms Castle Island or Slottsholm, with public buildings including Royal Palace of Christiansborg, Ministry buildings, Univ. (founded by Christian I., 1479), Royal Library, Thorwaldsen Museum. Other important buildings are a cathedral (with statue of Christ and Apostles and a baptismal font, partly executed by Thorwaldsen), Trinitatiskirke (with round tower and spiral incline), Rosenborg Castle (*c.* 1610–24; with Regalia), Charlottenborg Palace (1624; used as Academy of Arts), and museum (with unrivalled northern antiquities); the new Town Hall and the Sculpture Museum; Eng. Church. Principal public square—where twelve streets meet (statue of Christian V. in centre)—constitutes heart of city.

C. started as a fishing village (*c.* 1043); haven erected by Bp. Absalon (*c.* 1100) as a refuge from northern pirates; made capital by King Christopher (1443); partially burned in 1788–94 and 1795; at C. Nelson defeated the Danes (1801), and in 1807 Lord Cathcart captured C. and the Dan. fleet after four days' bombardment. Free port established, 1894. Exports include dairy produce, grain, porcelain, pianos, clocks, mathematical instruments, chemicals, sugar, and beer. C. is centre of Scandinavian lit. and learning. Pop. without suburbs (1911), 462,161.

Rasmussen, *Copenhagen and Environs* (1893).

COPEPODA, see ENTOMOSTRACA.

COPERNICUS, NICOLAUS, KOPPERNIGK (1473–1543), Polish astronomer; studied at Cracow, Bologna, Padua, and Ferrara; undertook the duties of physician administrator of a diocese and various other political work. At the same time he created a new conception of astron., enunciated in his treatise, *De revolutionibus orbium cœlestium* (pub. 1543). His theory that the earth and other planets revolve round the sun, now a truism, at the time gave rise to a keen controversy, especially among the Rom. clergy.

Leopold Prowe, *Nicolaus Coppernicus* (Berlin, 1883–84).

COPIAPÓ (27° 21′ S., 70° 32′ W.), town, on Copiapó, Chile; important mining centre. Pop. 9301.

COPING, crowning, or capping, course of a wall.

COPLAND, ROBERT (fl. 1515), Eng. author and printer.

COPLESTON, EDWARD (1776–1849), Eng. ecclesiastic; bp. of Llandaff.

COPLEY, JOHN SINGLETON (1737–1815), Anglo-Amer. artist; portraits and hist. subjects.

COPPÉE, FRANÇOIS EDOUARD JOACHIM (1842–1908), Fr. author; was a prolific writer of poetry, plays, and novels, some of his work being marred by excessive sentimentality.

COPPÉE, HENRY (1821–95), Amer. author and educationist.

COPPER (Cu=63·6), reddish, lustrous, tenacious, malleable, ductile metallic element, with high conductivity of heat and electricity. Sp. G., *c.* 8·9; B.P. *c.* 1085°; M.P. *c.* 2100°. It tarnishes (oxidises) in the air, especially on heating, from red to dark brown and black, and imparts a green colour to the Bunsen flame. Its salts are whitish when anhydrous, otherwise blue or green, and are poisonous. Copper sulphate is used medicinally as a caustic, astringent, and emetic. C. has been known and utilised from the earliest times, and is widely used for domestic utensils (not without danger), boiler tubes, fire-boxes, ships' bottoms (formerly), in engraving, for electrical appliances, wires, etc., and in alloys (bronze, brass, gun-metal, etc.).

It is found in the pure state in ores, soils, mineral waters, in seaweed and in animals, particularly in the blood of molluscs. Pure C. occurs in crystals of the cubic system or dendritic masses, the largest known deposits being near Lake Superior. The principal ores are chalcopyrite ($CuFeS_2$), c. glance (Cu_2S), indigo c. (CuS), purple c. ore (Cu_2FeS_3), cuprite (Cu_2O), malachite ($CuCO_3Cu(OH)_2$).

There are three principal methods of extracting c. from its ores and compounds. In the *dry methods* the sulphide ores containing up to 15 % of c. are roasted to eliminate impurities, such as antimony and arsenic, then smelted to a mixture known as 'matte.' This is smelted with coke and siliceous matter to slag off the iron contained, and re-smelted in reverberatory furnaces, blast furnaces, or Bessemer converters. The product is termed 'coarse c.' (75 % to 95 %), which is refined by oxidation and subsequent 'poling' or reduction process by means of the carbon formed by stirring the molten metal with wooden poles. The greater part of refining, however, is nowadays performed electrolytically. The *wet methods* are used for extracting c. from poor ores (under 1 %), and mainly consist in converting them into chlorides by roasting them with common salt, which are dissolved out. Refining is carried out by the processes mentioned above. The steadily increasing demand for pure c. in electrical industry has stimulated the perfection of *electrolytic methods*. The main principle underlying the latter is that, when two pieces or plates of metal (*e.g.* copper) dipping in a solution of c. salts are connected with an electric current, pure metallic c. is deposited on one of the plates, the cathode.

The principal copper-producing countries are the U.S.A. (with more than 60 % of the world's total), the Brit. Empire, Spain, Mexico, Japan, the Ger. Empire, Chile, Russia, and Belg. Congo. See METALLURGY.

H. J. Steven, *Copper Handbook* (annual); *The Mineral Industry* (annual); E. D. Peters, *Principles of Copper-Smelting* (New York, 1907); M. Eissler, *Hydrometallurgy of Copper* (London, 1902).

COPPER GLANCE (Cu_2S), soft dark grey mineral, also occurring in six-sided, frequently twinned crystals; ore found in the upper parts of copper deposits.

COPPERAS ($FeSO_4.7H_2O$), green vitriol or ferrous sulphate, blue-green crystals, used for manufacture of ink, in tanning and dyeing.

COPPERHEADS, opprobrious term applied to the democratic party during Amer. Civil War.

COPPERMINE (66° 40′ N., 115° 30′ W.), river, Canada; rises in Lake Providence, flows N.W., and enters Coronation Gulf, in Arctic Ocean; not navigable; discovered by Hearne, 1771.

COPPER-PYRITES, CHALCOPYRITE ($CuFeS_2$), important copper ore, brass-yellow tetragonal crystals, often mixed with iron pyrites, occurring in N. America, Spain, S.W. England, Central Germany, and elsewhere. When tarnished with a blue iridescence the mineral is known as 'peacock ore.'

COPRA, broken, dried kernel of cocoa-nut exported from Pacific islands for manufacture of cocoa-nut oil.

COPROLITES, fossilised dung often containing bones and teeth of extinct animals, mainly reptiles and fishes, occurring in Lias and younger formations. When found in large quantities, as in Cambridgeshire and Suffolk, they are exploited for fertilising purposes as phosphates.

J. J. H. Teall, *The Natural History of Phosphatic Deposits*, Proc. Geol. Assoc., xvi. (1900).

COPTOS (*c.* 26° N., 32° 53′ E.), ancient city, on Nile, Egypt; modern Kuft; starting-point of several routes to Red Sea; had extensive trade with Arabia and India in perfumes and incense; site of excavations by Petrie, 1894.

COPTS (from Arab. *Kibt*, from Gk. *Aigyptioi*, Egyptians), Christian sect of modern Egyptians, descended from ancient Egyptians; probably, except for early Gk. intermixture, pure race, as religious differences prevented intermarriage with Arabs. They constitute less than $\frac{1}{15}$ population of Egypt, greater number of inhabitants embracing Muhammadanism after Arab invasion and losing appellation 'Egyptians'; distinguished from Muhammadan inhabitants, who also preserve Egyptian type with Arab intermixture, by smaller build and pallor, due perhaps to their refusal to perform rougher kinds of labour, and their employment as fine craftsmen, clerks, etc. Egypt was Christianised at an early date; the religious difference which made C's distinct people broke out in V. cent.; Council of Chalcedon, 451, condemned Monophysitism. C's clung to this heresy, and have ever since made it cardinal doctrine; separated from general progress of Church, their ritual is interesting as preserving ancient forms; influence of Brit. occupation has been to modify Coptic characteristics in dress, customs, and religious conservatism. Language is ancient Egyptian modified by Gk., there being formerly many dialects; not employed in Lower Egypt since X. cent., nor Upper Egypt since XIV.; preserved in lessons of Christian service, but afterwards explained in Arabic, their present tongue; handwriting keeps Gk. uncial; lit. chiefly patristic; modern movement to revive Coptic led by C., Claudius Labib.

Dowling, *The Egyptian Church* (1909); Butler, *Coptic Churches of Egypt* (new ed., 1910); J. Leipoldt, *Geschichte der Christlichen Literaturen des Orients* (1907).

COPYHOLD is customary tenure in which the copyholder is entitled to the property subject to the performance of certain duties. The rights and duties of copyholders vary according to the particular manor to which they are attached. The owners can generally dispose of their property by will, and if they die intestate, it descends to the customary heir, who may, or may not, be the same as the heir-at-law. On the death of a copyholder intestate, and without heirs, the property escheats, not to the crown, but to the lord of the manor.

COPYRIGHT is the sole and exclusive right to produce or reproduce copies of an original literary, musical, dramatic, or artistic work. By the British Copyright Act of 1842 the duration of c. in literary, dramatic, and musical works was the term of the author's life, and seven years after his death, or forty-two years from the date of the first publication, whichever was the longer period; for engravings and prints, twenty-eight years; for paintings, drawings, and photographs, the life of the author, and seven years afterwards. With regard to dramatic work, under this Act, it may be noted that the author of a novel was somewhat unfairly dealt with. Thus any person was at liberty to dramatise a work of fiction for his or her own benefit without obtaining the consent of the original author, provided that the latter had not already produced a dramatic version of his story. By the Copyright Act of 1911 it is, however, provided that the c. in a literary, dramatic, musical, or artistic work shall subsist during the full term of the author's life and a period of fifty years after his death. In the case of photographs, musical records, perforated rolls, and similar productions, it is provided that the c. shall subsist for a period of fifty years from the making of the negative, plate, or other medium from which the contrivance was derived. The Act also reserves to an author or dramatist the sole right to turn his novel into a play, or his play into a novel. In joint authorship, c. endures for the lifetime of the author who dies first, and for fifty years after his death, or during the life of the author who dies last, whichever period is the longer. Where wife and husband are joint authors in any work, the wife's interest becomes her separate property. With regard to the fifty years' reservation of c. after an author's death, there is, however, a clause which provides that if a work is withheld from the public, or pub. at a prohibitive price, a licence may be obtained for publication or performance, subject to the payment of royalties to the proprietors of the c.

INFRINGEMENT.—C. may be infringed by the unauthorised publication or sale of an exact and complete copy of an original work, a trans. of the same, a colourable imitation, or, indeed, by making excerpts from it. There is no c. in an idea, and none in news; but forms of expression used to describe the idea or news are capable of c. Again, there can be no c. in the title of a work; but if any one uses for his own work a title calculated to lead other people to believe that it is the work of some one else who has pub. something under the same name, he may be liable to an action for fraud. There is no c. in facts, but if originality of statement or treatment is accorded to the facts, such statement or treatment is capable of c. An author cannot escape the consequences of infringement by the fact that in his work there is some original matter in addition to the matter which has been copied. An *abridgment* of a c. work need not necessarily be an infringement; it would, however, be an infringement if it were a mere colourable imitation of the original work, and calculated to injure the sale of such work. Quotations, again, from a c. work may, or may not, constitute infringement. They would be looked upon as infringements if used merely as a cloak to the utilisation of the labours of another. Where c. has been infringed the owner of the same may seek redress in an injunction to restrain further infringement, an action for damages, or both means. The Courts will not grant injunctions where the infringements are trivial in character, and the amount of damages recoverable would depend largely on the extent to which the plaintiff had been injured by the infringement. The costs of all parties in any legal proceedings in respect of infringement of c. are in the absolute discretion of the Court; and an action cannot be commenced after the

expiration of three years from the date of infringement.

G. S. Robertson, *Law of Copyright* (1912); H. A. Hinkson, *Copyright Law* (1910); William Brigg, *Law of International Copyright* (1906).

International C.—By Convention of Berlin, 1908, a Copyright Union was signed by Britain, Germany, France, Belgium, Denmark, Italy, Norway, Sweden, Spain, Portugal, Switzerland, Monaco, Luxembourg, Japan, Hayti, Liberia, Tunis. A native of one of these countries enjoys in the others the privileges obtaining under c. laws there.

In U.S.A. by Act of 1909 c. is granted to an author for 28 years from date of publication, and then for another 28 years to him or his widow and family. All c. works must be printed and bound in U.S.A. A foreigner secures Amer. c. if his country extends to Amer. authors the rights of c. it grants to its own citizens.

COQUELIN, BÉNOÎT CONSTANT (1841–1909), the greatest Fr. actor of modern times. His bro., **Ernest Alexandre Honoré, Coquelin Cadet** (1848–1909), also won fame as an actor and writer of monologues.

COQUEREL, ATHANASE JOSUÉ (1820–75), Fr. Prot. preacher and author.

COQUEREL, ATHANASE LAURENT CHARLES (1795–1868), Fr. Prot. preacher and author.

COQUEREL, CHARLES AUGUSTIN (1797–1851), Fr. man. of letters.

COQUES, GONZALEZ (1614–84), Flemish artist.

COQUET (55° 20′ N., 1° 35′ W.), river, Northumberland, England; rises in Cheviot Hills; enters North Sea at Alnwick Bay.

COQUIMBO (29° 50′ S., 71° 20′ W.), seaport (and province), Chile; chief industry, copper-mining. Pop. of town, 12,106; province, c. 181,000.

COR ANGLAIS, alto or tenor oboe, with a range one-fifth lower than the ordinary variety.

CORACLE, ancient Brit. boat made of a wicker frame covered with skin.

CORAÈS, ADAMANTIOS (1748–1833), Gk. patriot and scholar.

CORAL, the hard, chiefly limy skeletons of certain Cœlentera (*q.v.*), notably the millepores, the madrepore or reef corals, the horny Antipatharia, and the Alcyonaria, which include the dead-men's-fingers (*Alcyonium*), the organ-pipe c. (*Tubipora*), the sea-pen (*Pennatula*), the red c. (*Corallium*) and blue c. (*Heliopora*). The most important c's are the Madreporaria, which form c. rocks, reefs, and islands in tropical seas ordinarily between 30° N. and S. of the equator. Reefs may either be fringing an island or be separated from the land by a shallow lagoon channel (barrier reef), or from a ring-shaped *atoll* with a central lagoon. As c's are killed by fresh water and deposits of mud and sand, they find more food and grow fastest on the seaward side of the reef, and a channel is left opposite to the mouth of a creek or river. Since c. cannot live below a certain depth, c. islands must have been formed on submarine peaks rising to about 40 fathoms below sea-level (Chamisso's theory), or raised to that height by the constantly falling débris of marine organisms (Sir J. Murray), or by volcanic action. Another explanation (Darwin's) holding good for a few atolls is that islands have gradually subsided, the fringing reef c. growing accordingly, and thus forming an atoll. It is certain, however, that the rate of growth of c. is considerable, under favourable conditions up to 9 in. per annum.

C. Darwin, *The Structure and Distribution of Coral Reefs* (1889); J. Murray, *On the Structure and Origin of Coral Reefs and Islands* (1879–80); W. Savile Kent, *The Great Barrier Reef of Australia* (illustrated) (1893).

CORALLIAN, a not very clearly defined subdivision of the Middle Oolite of the Jurassic (*q.v.*) period, consisting chiefly of grits and limestone composed of coral (Coral Rag); well developed in the cliffs near Weymouth.

CORAM, THOMAS (1668–1751), Eng. philanthropist; established the Foundling Hospital.

CORATO (41° 8′ N., 16° 25′ E.), city, Apulia, Italy. Pop. 41,739.

CORBEIL (48° 36′ N., 2° 26′ E.), town, department of Seine-et-Oise, France; has important flour-mills, printing-works, and paper-works. Pop. 9632.

CORBEL (arch.), term for stone bracket supporting a superincumbent weight.

CORBET, RICHARD (1582–1635), Eng. poet and bp.; held sees of Oxford and Norwich; wrote satires.

CORBIE, a raven. **Corbie-steps,** or *crow-steps,* term in arch. for gable decoration, by which the sloping sides of the gable mount stepwise to the apex.

CORBRIDGE (54° 58′ N., 2° 1′ W.), market town, on Tyne, Northumberland, England; market gardens.

CORBULO, GNÆUS DOMITIUS (fl. I. cent. A.D.), Rom. general; made canal between Meuse and Rhine, and won great successes against Parthians; committed suicide at Nero's order.

CORCYRA, ancient name of Corfu (*q.v.*).

CORDAY, D'ARMONT, MARIE ANNE CHARLOTTE (1768–93), heroine of Fr. Revolution. Of noble family of Normandy; carefully educated; absorbed Rom. republican ideas and, emulating Brutus, assassinated Marat as the tyrant who had overthrown the Girondins; guillotined.

CORDELIERS, CLUB OF THE, a prominent organisation at time of Fr. Revolution; its leaders were Danton, Marat, Hébert, Camille Desmoulins; when Robespierre executed leaders (1794) the club declined.

Cambridge Mod. Hist., vol. viii. (1907).

CORDES (44° 3′ N., 1° 58′ E.), town, Tarn, France.

CORDILLERA, Span. term for chain or ridge of mountains; first applied to chains of the Andes, S. America; now applied to ranges in N. and Central America.

CORDITE, smokeless, buff-coloured, heat-and damp-resisting explosive consisting of 58 % nitro-glycerin, 37 % gun-cotton, and 5 % mineral jelly (mark I.), used in cartridges for small-arms and ordnance in the Brit. army and navy. A modification known as cordite M.D., 65 % gun-cotton, 30 % nitro-glycerin, and 5 % mineral jelly, is also used on account of its higher velocity, more even pressure, and less erosion of the bore of a gun. C. is manufactured by working pulped gun-cotton and nitro-glycerin together with acetone, a volatile substance, into 'paste,' and then with mineral jelly into 'dough.' This is pressed through dies of the diameter required; the thinner cords thus formed (hence the name) are dried slowly and wound up on reels, and cut up later for small-arms cartridges. The thicker varieties (up to half an inch) are cut into lengths of about 3 ft. and used for guns of large calibre. See Explosives.

CÓRDOBA (*c.* 31° S., 65° W.), province, Argentine Republic; chiefly pampa land; watered by Primero, Segundo; metals found; chief industry is cattle-rearing. Area, 62,160 sq. miles. Pop. (1910) 572,894.

CÓRDOBA (31° 24′ S., 64° 6′ W.), city, capital of C. province, Argentine Republic, on Rio Primero; founded 1573; has handsome cathedral and univ. (1613); formerly centre of Jesuit learning. Pop. (1910) 60,000.

CÓRDOBA (18° 42′ N., 96° 50′ W.), town, Vera Cruz, Mexico; important coffee-producing centre. Pop. (1911) *c.* 70,000.

CÓRDON, cord, band, sash, etc., used in personal adornment; thus the *Cordon bleu* was the ribbon of the Fr. Order of the Holy Spirit. The word is also used to describe the defences of a protected area.

CORDOVA (38° N., 5° W.), province, S. Spain; occupies fertile valley on slopes of Sierra Morena; traversed by Guadalquivir; industries, sheep-farming; fruit- and olive-growing; chief town, Cordova. Area, 5299 sq. miles. Pop. (1910) 490,647.

CORDOVA, Córdoba (37° 52′ N., 4° 48′ W.), town, Spain, capital of province C., on Guadalquivir; with Moorish walls, VIII.-cent. bridge, gorgeous cathedral (VIII. cent.; formerly mosque), and other

fine churches; remains of Moorish palace; arena, library, museum; once famed for *Cordovan* (goat leather), now textile fabrics, silverware, etc. Roman *Corduba* was founded II. cent. B.C.; magnificent city under Moorish rule, VIII.–XIII. cent.; taken by Ferdinand of Aragon, 1236; birthplace of Senecas, Lucan, and Averroës. Pop. (1910) 64,407.

CORDOVA, GONZALO FERNANDEZ DE (1453–1515), Span. soldier; figured in subjugation of Portugal and of the Moors under Ferdinand and Isabella; sent (1495) to recover Naples from France, and restored Ferdinand of Naples (1498), winning title of 'Great Captain' (*El Gran Capitan*); led Span. forces in conquering Naples for Spain and France. C.'s methods mark an epoch in history of war.

CORDUS, AULUS CREMUTIUS, Rom. historian under Tiberius; wrote on Augustan Age.

CORDYLOPHORA, see HYDROMEDUSÆ.

COREA, see KOREA.

COREGONUS, see SALMON FAMILY.

CORELLI, ARCANGELO (1653–1713), Ital. composer and violinist.

CORELLI, MARIE (1864–), Eng. novelist; her first story was *A Romance of Two Worlds* (1886), and her later stories have achieved wide popularity.

CORENZIO, BELISARIO (d. 1643), Ital. artist.

CO-RESPONDENT, in divorce petition person charged by husband with having committed adultery with latter's wife.

CORFE CASTLE (50° 37′ N., 2° 3′ W.), town, Isle of Purbeck, Dorsetshire, England; ruined castle was scene of murder of Edward the Martyr, 978; besieged by Roundheads, 1643.

CORFINIUM, chief town of the Peligni, Samnium, ancient Italy; capital of Allies in Social War (90 B.C.).

CORFU (39° 35′ N., 19° 50′ E.), island of Greece; largest and most important of Ionian group, in Mediterranean, separated from Albanian coast by strait about 2–14 miles broad; length, 40 miles; breadth, 20; area, 277 sq. miles; divided into three districts by mountain ranges; highest point, 3000 ft.; beautiful scenery; large olive groves, vineyards, cypress plantations, oranges, citrons, figs, silk, salt, sulphur, honey, marble, etc. Ancient *Corcyra* was a Corinthian colony, founded VIII. cent. B.C.; quarrel with Corinth led to Peloponnesian Wars (*q.v.*); under Venice, XV.–XVIII. cent.; under Brit. protection, 1815–64, when joined kingdom of Greece. Pop. *c.* 100,000.—**Corfu**, seaport on E. coast; good harbour, royal palace, library, etc. Pop. 30,000. See IONIAN ISLANDS.

CORI (41° 38′ N., 12° 53′ E.), town, Rome province, Italy; ancient *Cora*; many Rom. antiquities exist. Pop. 7363.

CORIANDER, fruit of *Coriandrum sativum*, an umbelliferous plant. The extracted oil is used as a stomachic stimulant, the young leaves in cookery.

CORINGA (16° 50′ N., 82° 15′ E.), small seaport, on N. mouth of Godavery, Madras, Brit. India.

CORINNA (fl. 500 B.C.), Gk. poetess; rival of Pindar; famed for her beauty.

CORINTH (37° 55′ N., 22° 57′ E.), ancient and modern city, Greece, on Gulf of C., S.W. of Isthmus of C. (*q.v.*). New C. has arisen since destruction of old town by earthquake, 1858; lies some 3 miles distant from ancient site; and, notwithstanding completion of Isthmian Canal (1893), has regained little of C.'s historic prosperity and splendour; exports currants, oil, wax, honey, wheat, etc.

History.—From earliest times C. played a leading rôle in Gk. history; its geographical situation gave it great maritime and commercial importance; its industries (copper-work, dyeing, weaving, etc.) brought it riches; its colonies (*e.g.* Corcyra and Syracuse) spread its fame abroad; its architecture constituted the most decorative order of Gk. architecture; its luxuriance was proverbial. Amer. archæologists have recently excavated some of its famous fountains, temples, theatres, etc. The lofty Acrocorinthus (ancient natural fortress) overlooks the ruins. A long-established oligarchy was overthrown, *c.* 650 B.C., by Cypselus, who, followed by Periander (*q.v.*), maintained a beneficent tyranny till *c.* 585, and raised C. to pitch of prosperity and power. C. took creditable part in Persian War; joined Sparta against rival Athens in Peloponnesian War (*q.v.*), 431; joined Thebes, Athens, and Argos against Sparta in *Corinthian War*, 395–392; sacked by Romans, 146 (works of art removed to Rome); rebuilt by Cæsar, 46 B.C.; St. Paul's visit, *c.* 50 A.D.; taken by Alaric, 396; by Normans, 1147; by Turks, 1459; Venetians, 1687; Turks again, 1715; finally recovered by Greeks, 1822. Pop. 4000.

CORINTH, ISTHMUS OF (37° 50′ N., 23° E.), separates Gulf of C. from Gulf of Ægina; connects Morea with Attica; ship canal opened, 1893.

CORINTH (34° 55′ N., 88° 33′ W.), city, Mississippi, U.S.A.; played important part in Civil War campaigns. Pop. (1910) 5020.

CORINTHIANS, EPISTLES TO THE.—Letters by St. Paul to Christians of Corinth, forming two books of New Testament. Clement of Rome makes mention (*c.* 95) of Epistle of Paul to C's, and these books are quoted by various writers in II. cent. Modern 'Dutch school' questions authorship and puts forth theory, for which there seems little evidence, that it was written by miscellaneous writers in II. cent. General difficulty is felt in accepting *II. Corinthians* 6^{14}–7^{1} and chapters 10–13 as part of original epistle, although written by St. Paul. Epistles are important as adding to biography of St. Paul in *Acts*, for contemporary picture of early Church, and for doctrinal points. First Epistle was written (54–58) during St. Paul's stay at Ephesus after he left Italian-Gk. city of Corinth, where he founded Christian Church in middle of I. cent.; it deals with advisability of celibacy, mixed marriages, lawfulness of eating meat offered to idols, status of women, and political position of Christians. Second Epistle was written a year later for building up Church after internal dissensions and preaching of 'false prophets.' Pseudo-Epistle of C's to St. Paul and reply of apostle, not included in Bible canon, were recognised by Church of Syria in IV. cent., but discovered to be part of II.-cent. compilation of *Acts of St. Paul*.

Prof. Massie, *I. and II. Cor.* (1910); Lias, *I. Epistle of Cor.*; Plummer, *II. Epistle of Cor.*

CORINTO (12° 28′ N., 87° 2′ W.), seaport, Nicaragua, Central America; large export trade.

CORIOLANUS, GAIUS (GNÆUS) MARCIUS, general in mythical period of Rom. history. The legend, probably invented to explain capture of Corioli, is recounted in Plutarch's *Lives* and Shakespeare's *Coriolanus*.

CORIOLI, ancient city, Latium; capital of the Volscians; taken by Coriolanus, 493 B.C.

CORIPPUS, FLAVIUS (VI. cent. A.D.), Rom. epic poet.

CORISCO (0° 50′ N., 9° 30′ E.), bay, Coast of Guinea, West Africa.

CORISCO (0° 55′ N., 9° 22′ E.), small island, belonging to Spain, at mouth of Corisco Bay (*q.v.*); exports ebony and logwood.

CORK (51° 54′ N., 8° 28′ W.), maritime county, Munster; largest and farthest S. in Ireland; generally hilly—in the W. mountainous and boggy, and in the E. rich and fertile. A mountain range divides C. into parallel basins through which flow the rivers, Cork, Blackwater, Lee, and Bandon. There are many small lakes in the W. The coast, which is exceedingly indented, is about 250 miles long, has many beautiful bays, some of which run from 3 to 25 miles inland. The chief are Bantry, Dunmanus, Baltimore, Glandore, and Cork Harbour; large number of islands off the coast, the most notable being Cape Clear Island, most southerly point of Ireland. Dairy-farming is extensively carried on. Minerals include coal, iron, and copper; at Mallow there is a thermal magnesian spring. Most important manufactures are leather, tweeds, whisky, and porter. Principal towns are Cork,

Queenstown, Kinsale, and Youghal. Area, 2890 sq. miles. Pop. (1911) 391,190.

CORK, outer layer of the bark of the cork tree (*Quercus suber*), growing in W. Mediterranean countries, cultivated in Spain and Portugal. It is cut every eight or ten years, and is used for many purposes on account of its lightness, elasticity, and relative imperviousness to air and liquids; not used to stop bottles till XV. cent.

CORK, RICHARD BOYLE, 1ST EARL OF (1566–1643), Eng. statesman; bought in 1602 Sir Walter Raleigh's Irish lands (12,000 acres), in Cork, Waterford, and Tipperary, and developed their resources, building roads and fortresses, and encouraging manufactures, mining, and agriculture; Earl of C., 1620; app. Lord Justice, 1629; Lord High Treasurer, 1631; predominance in Ireland ended with Strafford's appointment as Lord Deputy under Charles I.; f. of Robert Boyle, the natural philosopher (*q.v.*).

CORK AND ORRERY, MARY, COUNTESS OF (1746–1840), Irish lady, famous for her literary *salons*.

CORLEONE (37° 49′ N., 13° 17′ E.), town, Palermo, Sicily; two mediæval castles and some interesting churches; also mineral springs. Pop. 14,803.

CORMENIN, LOUIS MARIE DE LA HAYE, VICOMTE DE (1788–1868), Fr. jurisconsult and democratic politician; wrote legal works, including *Questions de droit administratif*; advocated universal suffrage and election reform.

CORMON, FERNAND (1845–), Fr. artist.

CORMONTAIGNE, LOUIS DE (1697–1752), Fr. military engineer. See FORTIFICATION.

CORMORANT (*Phalacrocorax*), large water-bird of the order Ciconiiformes, widely distributed. The common c. (*P. carbo*) breeds on the Brit. coasts, and is used for catching fish in Japan and China, also formerly in Britain. The green c., or shag (*P. graculus*), is smaller, and does not often venture inland.

CORN, originally meaning grain, now seed of cereals, wheat (England), oats (Scotland and Ireland), maize (U.S.A.).

CORN, horny outgrowth of epidermis due to pressure, especially on the toe. Well-fitting foot-gear will prevent the growth, and the general treatment consists in paring off the corn after soaking with hot water, and painting afterwards with collodion solution of salicylic acid. In case of suppuration the treatment is the same as in case of abscess (*q.v.*).

CORN LAWS, State regulations of traffic in corn. The principle of intervention in trade was approved in England until XIX. cent., and has been advocated in late years by Tariff Reformers. Earliest legislation was directed against export in order to ensure home supply. In XV. cent. government had already begun to legislate against consumer in interest of producer; corn law of 1436, 1st statute with avowed aim of raising prices, allowed exportation when corn fell below fixed price; followed by statute, 1463, forbidding import when prices were below price at which export was permitted. Dearth of corn, consequent high price and low rate of wages maintained by statute caused permanent discontent of labourers; social reformers of XVI. cent. preached against exploitation of poor consumer in favour of farmer and landlord. Statute of 1436 was re-enacted, 1554, modified, 1562; export, almost prohibited, 1570, again allowed conditionally, 1603. High prices after Civil War compelled reduction of duties, 1663, but system of keeping up prices was subsequently reverted to. Great collapse of prices after Napoleonic wars caused Act of 1815, placing prohibitive duties on imported corn to relieve agricultural distress and with idea of making Britain self-sufficing in this necessary article. Agriculture improved, other nations retaliated, and manufacturing interest became stronger than agricultural in politics. Dearth, 1826, caused suspension of import duty and commencement of Anti-Corn Law agitation; *Anti-Corn Law League* formed, 1838, by Cobden and others; supported by Peel, who passed Bill, 1846, by which corn duties above 1s. ceased, 1849; all duties abolished, 1869.

Mary A. Marks, *The Corn Laws: A Popular History* (1910).

CORNARO, CATERINA (1454–1510), queen of Cyprus by bequest of husband, James III., who died 1473; Venetian republic compelled her to abdicate, and annexed Cyprus, 1489.

CORNARO, LUIGI (1467–1566), Venetian writer on health.

CORNBRASH, rubbly fossiliferous limestones forming thin band of rocks from Yorkshire to Weymouth, of Bathonian series of Eng. Jurassic formation.

H. B. Woodward, *The Jurassic Rocks of Britain*.

CORNCRAKE, see RAIL FAMILY.

CORNEA, see EYE.

CORNEILLE, PIERRE (1606–84), Fr. dramatist and poet; b. Rouen; s. of a legal official; ed. for the Bar, but eventually devoted his attention to playwriting, his earlier pieces meeting with little success. Then he entered the service of Cardinal Richelieu as one of the 'five poets' of the great minister, who employed some of his leisure in making indifferent plays, in which he was assisted by his literary staff. C.'s independent spirit, however, could not long rest satisfied with such mean employment, and he left the Cardinal's service. His *Médée* appeared in 1635, and met with some acceptance, but *Le Cid* (his masterpiece), produced in the following year, achieved immediate success, notwithstanding the underhand efforts of Richelieu to damn the play. It was followed by *Horace* (1639) and *Cinna* in the same year; *Polyeucte* (1640); and *La Mort de Pompée* (1641). In 1642 appeared *Le Menteur*, a comedy, which is the equal of many of Molière's. Other plays produced by him were: *Heraclius*, *Don Sanche d'Aragon*, *Andromède*, *Œdipe*, *Attila*, *Tite et Bérénice*, etc. He was associated with Molière and Quinault in the writing of the opera *Psyché* (1671), which contains some of his finest lyrical work. He was the father of Fr. drama; one of the greatest, if not the greatest, of Fr. tragic writers, and a pioneer of Fr. comedy. In breaking with the stilted style of earlier writers of tragedy, C. led the way towards the later romantic drama. His great work brought him little monetary return, and in his later years he was superseded in public favour by Racine.

Lanson's *Corneille* (Grands Écrivains Français) (1898).

CORNEILLE, THOMAS (1625–1709), Fr. dramatist; bro. of Pierre C.; wrote about forty plays, including *Ariane*, *Comte d'Essex*, *Timocrate*, etc.

CORNELIA (II. cent. B.C.), famous as 'the mother of the Gracchi'; dau. of Scipio Africanus.

CORNELIUS, CARL AUGUST PETER (1824–74), Ger. poet and composer.

CORNELIUS, PETER VON (1784–1867), Ger. artist; founder of the modern Ger. school; famous for his frescoes.

CORNELL UNIVERSITY, educational establishment at Ithaca, New York. When public grant of lands to separate states for technical educational purposes was made (1862), EZRA CORNELL, a New York senator, added 500,000 dollars to the New York fund on condition it was applied to foundation of only one institution, and gave his home and lands at Ithaca for site; incorporated, 1865; opened, 1868; beautifully situated on hill overlooking New York, with Cayuga Lake to north and hills to south; fine grounds, library, and museum; does good work in chemistry and engineering; non-sectarian; non-resident professors among whom have been Louis Agassiz, James Russell Lowell, George William Curtis, and Theodore W. Dwight.

CORNET.—(1) During XVI. and XVII. cent's was the name applied to the junior officer who carried the colours in a cavalry troop, also to the troop itself, hence 'cornet of horse.' (2) Brass wind-instrument fitted with pistons which, being depressed, either singly

or in combination, produce with the natural notes of the tube a complete scale.

CORNETO TARQUINIA (42° 16′ N., 11° 46′ E.), town, Rome province, Italy; occupies site of ancient Tarquinii; has Romanesque church of XII. cent. and a museum of Etruscan antiquities. Pop. 7219.

CORNFLOWER (*Centaurea cyanus*), blue flower, order Compositæ.

CORNICE, in arch. topmost moulded projection of a column, or wall.

CORNIFICIUS, supposed author of work, *Rhetorica*, written during dictatorship of Marius.

CORNING (42° 9′ N., 77° 9′ W.), city, on Chemung, New York State, U.S.A.; has extensive glass-works. Pop. (1910) 13,730.

CORNING, ERASTUS (1794–1872), Amer. publicist.

CORN-SALAD (*Valerianella olitoria*), or LAMB'S LETTUCE, annual plant, substitute for lettuce in France and Italy.

CORNU, MARIE ALFRED (1841–1902), Fr. physicist; improved methods for determining velocity of light; received numerous scientific honours.

CORNUCOPIA, 'the horn of plenty,' symbolical of prosperity.

CORNUS (*c.* 40° 7′ N., 8° 32′ E.), ancient city, W. coast of Sardinia; taken by Romans, 215 B.C.

CORNWALL (45° 3′ N., 74° 48′ W.), town, port of entry, on St. Lawrence River, Ontario, Canada; has cotton and woollen mills; celebrated lacrosse club. Pop. 6704.

CORNWALL (50° 26′ N., 4° 40′ W.), most south-westerly county of England; great promontory, bounded N. and N.W. by Atlantic; E. by Devon; S. and S.W. by Eng. Channel; most southerly point, Lizard Point; most westerly, Land's End; area, *c.* 1350 sq. miles; 25 miles W. by S. lie *Scilly Islands*, included in C. Scenery is diverse; in W. are broken and picturesque hills and *tors*; remarkable pile of rocks called the Cheese-wring; Cornish moors, bare, dreary, desolate. Long well-wooded valleys descend moorlands with small rivers. The Tamar (bounding C. in N.), Exe, Camel, and Taw are most important rivers. Coast is almost entirely rockbound, with unsurpassed cliff scenery. About 70 % of land is cultivated, chiefly oats; large numbers of cattle reared; market-gardening in Penzance district. Most important minerals are tin, mined extensively from very early times (largest mine, Dolcoath), copper, granite, fine slate, and pitchblende for radium. Principal ports are Falmouth—in large estuary—Penzance and Hayle; important fisheries and brisk coasting trade. C. is exceedingly rich in prehistoric antiquities. Cromlechs called *quoits* are largest and most important known; monoliths, circles, avenues of stone, hut-dwellings, caves, cliff-castles, hill-castles, and ancient Christian crosses, most of these antiquities being near Land's End. St. Michael's Mount, with castle (1047) on its summit, is a granite rock in Mount's Bay, not far from Penzance. Pop. (1911) 328,131.

Baring-Gould, *A Book of Cornwall*.

CORNWALL, EARL OF, RICHARD PLANTAGENET (1209–72), 2nd s. of King John; commander-in-chief of Crusaders, 1240–41; elected king of the Romans, 1256, but speedily overthrown; aided Eng. king against barons.

CORNWALLIS, CHARLES, 1ST MARQUESS (1738–1805), Brit. general; with his surrender of Yorktown, 1781, Amer. War of Independence ended.

CORNWALLIS, SIR WILLIAM (1744–1819), Brit. admiral; served under Hood and Rodney, and distinguished himself in wars against Fr. Revolution; vice-admiral, 1794; admiral, 1799.

CORO (11° 23′ N., 69° 40′ W.), city, Venezuela, near Bay of C.; important commercial centre for coffee, hides, tobacco, timber, and dyewoods. Pop. 9000.

COROLLA, see FLOWER.

COROMANDEL COAST (13° N., 80° E.), name formerly given to part of eastern seaboard of India (approximately what is now the province of Madras), on west shore of Bay of Bengal.

CORONA (astron.), luminous envelope round the sun outside the chromosphere, only observable during total solar eclipses; c. borealis and australis, constellations in N. and S. hemispheres; (meteor.) halo round the moon or sun due to diffraction by particles of moisture or dust; (arch.) projecting part of cornice, protecting the wall from weather; (bot.) appendages on inner side of corolla of flowers like daffodils and jonquils.

CORONACH, Gaelic dirge for the dead in Scot. Highlands; known in Ireland as 'keening.'

CORONADO, FRANCISCO VASQUEZ DE (*c.* 1500–*c.* 1545), Span. discoverer; in 1540–42 led Span. force to explore New Mexico, and made settlements in Kansas.

CORONATION (O. Fr. from Lat. *corona*, crown), ceremony of crowning sovereign as symbol and consummation of investiture with rule. Rom. emperors received no crown at accession owing to faint lingering of republican feeling. Barbarian states which grew up on ruins of Rom. empire retained, until Christianised, Teutonic custom of elevating ruler on shield, bearing him thrice round assembled tribes, placing spear in his hand and fillet ('diadem') round his head: Eng. c. procession, etc., and practice under Fr. monarchy of showing king to people, are relics of this custom. Mediæval and modern anointing and crowning are derived from *Old Testament* through Christian Church. Service set forth in *Liber Regalis* was followed in England at c. of Edward II. and until Reformation; translated and retained with exception of substitution of communion service for Mass; modified, 1685, and considerably changed, 1689; since shortened.

CORONER, important civil officer whose duty is to inquire into the cause of death of any person suspected of having come to a violent, or unnatural, end. He holds office for life; must be a 'fit person,' but not necessarily a medical man; and must appoint a deputy. In Scotland the duties are performed by a procurator-fiscal.

CORONIUM, unknown element in sun's corona, with characteristic green spectroscopic line.

COROT, JEAN-BAPTISTE CAMILLE (1796–1875), Fr. artist; one of the most individual and poetical of landscape painters; fine examples of his work are in the Louvre, the Wallace Collection, and the Glasgow Gallery.

Allnutt, *Corot* (Masterpieces in Colour).

CORPORAL, non-commissioned military officer, below sergeant; 'ship's c.' is petty officer under master-at-arms.

CORPORAL PUNISHMENT.—The infliction of punishment by one person on the body (*corpus*) of another is not permitted in the U.K., except in particular cases. These exceptions include c. p. by parents and guardians, teachers, and employers of apprentices. In any case the chastisement must not be excessive, otherwise the person concerned would be guilty of a serious offence. Punishment aboard ship is subject to the Merchant Shipping Act (1894).

CORPORATION in Eng. law consists of two kinds—sole and aggregate. A c. *sole* consists of one person, the holder of a public office, and his successors, *e.g.* abp. or vicar. A c. *aggregate* is a society of persons authorised to act as one person. A corporate body must always bear a corporate name by which it sues and is sued, and it must possess a common seal to be applied to its legal documents. It can inherit property, and hold it in perpetuity, being unaffected by the death of its individual members, if only care be taken to fill vacancies according to its constitution.

CORPULENCE, OBESITY, abnormal accumulation of fat in the body under the skin or around certain of the organs, where normally there is a certain small amount of fat. The condition is often hereditary, and also due to habits of over-feeding or over-drinking,

especially heavy alcoholic liquors, or to too little exercise and sedentary habits. C. may be reduced by a diet eliminating starchy foods, meat and fish being substituted, reducing the amount of liquid, alkaline waters being taken, along with regular exercise. Extract of thyroid gland has considerable effect in many cases.

CORPUS CHRISTI (27° 50′ N., 97° 32′ W.), seaport, Texas, U.S.A., on Corpus Christi Bay; shipping centre; exports fruit and fish. Pop. (1910) 8222.

CORPUS CHRISTI, FEAST OF, *i.e.* feast of the Body of Christ, on first Thursday after Trinity; observance enjoined by R.C. Church in XIII. cent. in connection with doctrine of transubstantiation.

CORPUSCLE, see BLOOD.

CORRAL, word used in parts of America for horse or cattle enclosure; also for a waggon defence against Indian raids.

CORREA, genus of Australian evergreen shrubs cultivated in European gardens.

CORREA DA SERRA, JOSÉ FRANCISCO (1750–1823), Portug. scientist and politician.

CORREGGIO, ANTONIO ALLEGRI (1494–1534), Ital. artist, head of the Parma school of painters; distinguished by wealth of invention, boldness of design, clever treatment of light and shade; unequalled in flesh-painting; works mostly executed at Padua, Parma, and at Correggio, whence he derived his professional name. Padua and Parma have still some of his magnificent frescoes. The National Gallery contains his *Ecce Homo, Cupid, Mercury, and Venus,* and other pictures; fine examples can be seen in the Louvre, at Dresden, Naples, Berlin, and Vienna.

Sturge Moore's *Correggio*; Meyer's *Antonio Allegri*; Ricci's *Life and Times of Correggio.*

CORRENTI, CESARE (1815–88), Ital. revolutionary politician.

CORRÈZE (45° 20′ N., 1° 45′ E.), department, Central France; formed from southern part of old province Limousin; surface hilly and mountainous; chief rivers, Dordogne, Vezère, and Corrèze; soil poor; climate variable; coal, iron, granite, wine, and timber; agriculture and cattle-raising; capital, Tulle. Area, 2273 sq. miles. Pop. (1911) 309,646.

CORRIB, LOUGH, lake, W. Ireland, in counties of Galway and Mayo; drains by river Corrib to Galway bay; length, 27 miles; extreme breadth, 7 miles.

CORRIE, name given in Scot. Highlands to a circular or semicircular hollow in a mountain-side, generally surrounded by steep cliffs. A stream usually issues from lower part.

CORRIENTES (28° S., 58° W.), province, Argentine Republic, S. America, between rivers Paraná and Uruguay; forms vast plain; northern districts largely covered by swamps and lagoons; exports include timber, cotton, tobacco, cattle, and horses. Area, 32,580 sq. miles. Pop. (1911) 395,268. Capital is CORRIENTES, on Paraná; port and commercial town. Pop. 20,000.

CORRIGAN, MICHAEL AUGUSTINE (1839–1902), Amer. R.C. abp. and scholar.

CORROSIVE SUBLIMATE, MERCURIC CHLORIDE ($HgCl_2$), white small rhombic crystals, fairly soluble in hot water; M.P. 288°; B.P. 303°; powerful poison and antiseptic.

CORRUPT PRACTICES, offences against the Corrupt and Illegal Practices Prevention Act (1883), which regulates parliamentary and municipal elections. These offences include bribery, treating, undue influence, personation, and false declaration of election expenses. The offence, however, must be committed with a corrupt motive; otherwise it is an 'illegal' practice. The commission of c. p. by a candidate, or his agents, makes the election void.

Jeaf, *Corrupt and Illegal Practices Prevention Acts* (1910).

CORRY (41° 57′ N., 79° 40′ W.), city, Pennsylvania, U.S.A.; district rich in petroleum; famous mineral springs. Pop. (1910) 5991.

CORSAIR, Barbary sea-rover of former days, authorised by Saracen government.

Stanley Lane-Poole, *The Barbary Corsairs* (1890).

CORSICA, ÎLE DE CORSE (42° 11′ N., 9° E.), island belonging to France; fourth largest in Mediterranean; separated from Sardinia in S. by Strait of Bonifacio; over 100 miles long and 50 miles broad; area, *c.* 3370 sq. miles. Capital is Ajaccio (*q.v.*). E. coast is exceedingly regular, but W. deeply indented by series of gulfs—Valinco, Ajaccio, Sagone, Porto, Calvi, and Santo Fiorenzo. The interior is overrun with mts., which reach greatest height in centre; chief summits—Cinto (*c.* 8880 ft.), in N.W.; Rotondo (*c.* 8600 ft.), in centre; Pagli-Orba (*c.* 8280 ft.) A large plain, fertile but marshy, extends from E. coast to foot of mts. Immense tracts of splendid forests—notably of chestnut trees and olives—have been reduced. Higher up are Alpine pastures with many sheep and goats. Most important agricultural products are grain, olives, wines, fruits (notably lemons), and potatoes. Agriculture is a staple industry; timber largely exported; important fisheries, also coral-fishing; several small lead, copper, and antimony mines; minerals include granite, porphyry, jasper, serpentine, alabaster, and marble. Climate is salubrious, except on E. coast, where the plain is malarious. Chief ports are Bastia, Ajaccio, and Calvi; C. is an important torpedo-station of Fr. navy. Although a department of France, its pop. is almost entirely Italian; vendetta long prevailed. C. was colonised by Phocæans, then by Phœnicians (VI. cent. B.C.), and in III. cent. B.C. Romans superseded Carthaginians; invaded by Vandals (456 A.D.), Goths, Saracens (852), and Lombards; for a time part of Frankish kingdom; passed to Pisans (*c.* 1100); after long struggle, mastered by Genoese (*c.* 1560), who sold C. to France in 1768; temporarily liberated by Paoli (*q.v.*), and occupied by British (1794–96); restored to France, 1815. Napoleon was a native of Corsica. Pop. (1911) 288,820.

L. H. Caird, *Hist. of Corsica* (1899); Renwick, *Romantic Corsica* (1909).

CORSICANA (32° 2′ N., 96° 19′ W.), city, Texas, U.S.A.; centre of wheat- and cotton-growing district. Pop. (1910) 9749.

CORSINI, family of Florentine nobles, dating from XII. cent.

CORSSEN, WILHELM PAUL (1820–75), Ger. philologist.

CORT, CORNELIS (1533–78), Dutch engraver.

CORTE (42° 17′ N., 9° 9′ E.), town, Corsica; seat of Paoli's government in XVIII. cent.; marble quarries. Pop. 5425.

CORTE-REAL, JERONYMO (1533–88), Portug. epic poet.

CORTES, name given to Span. Parliament; composed of Senate and Congress, of equal authority. Senate consists of (1) hereditary senators; (2) life senators nominated by Crown; (3) senators elected by people. Members of Congress are elected by people, and their number is in proportion of one member to 50,000 people. Portug. legislative chambers are also called the Cortes.

CORTES, HERNANDO (1485–1547), Span. Conquistador; took charge of colonists sent to Mexico (*q.v.*), 1519; founded Vera Cruz; was worshipped as god by subjects of Montezuma, emperor of Mexico; seized Montezuma and finally subdued Mexico, 1521; granted by Charles V. large province with title of marquis; discovered Lower California, 1536; d. in disgrace. Grasping and cruel, but with military genius and initiative, C. was an important extender of Span. colonial empire.

Prescott, *History of the Conquest of Mexico* (1903); MacNutt, *Life of Cortes* (1909).

CORTLAND (42° 36′ N., 76° 11′ W.), city (and county), New York State, U.S.A.; chief manufactures, wire and wire-cloth, wire-netting, carriages, and wagons. Pop. (1910) 11,504.

CORTONA (43° 17′ N., 11° 59′ E.), town, Arezzo,

Italy; enclosed by ancient Etruscan walls; principal buildings are a XII.-cent. cathedral (with fine works of art), several interesting churches, and a museum of Etruscan antiquities; C. was one of the twelve leading cities of Etruria. Pop. 3667.

CORUMBÁ (19° S., 57° 20′ W.), fortified town and port, on Paraguay, Brazil, S. America. Pop. 10,000.

CORUNDUM (Al_2O_3), the hardest mineral except the diamond, occurring in several varieties — the ruby, sapphire, Oriental amethyst, topaz, emerald. Common c. is found in grains in sand (India), and in igneous rocks in U.S.A., and is used for bearings in watches and scientific apparatus, and for grinding. Emery (*q.v.*) is impure c.

CORUNNA, Coruña (43° 22′ N., 8° 25′ W.), fortified seaport, capital of C. province, Spain, on small bay, N.W. coast; commodious harbour; has two old churches (XII. and XIII. cent.), two hospitals, arsenal, barracks, cigar factory; sailing port of Armada, 1588; burned by English under Drake, 1598; scene of battle, Jan. 16, 1809, in which Sir John Moore fell after defeating the French; exports wine, fish, and agricultural produce; imports coal and manufactured goods. Pop. (1910) 46,570.

CORUNNA, Coruña (43° N., 8° 30′ W.), N.W. province, Spain; bounded N. and W. by Atlantic Ocean; district is mountainous and generally fertile; extensive fisheries; chief exports—farm produce, fish; area, 3051 sq. miles. Pop. (1910) 658,201.

CORVÉE, unpaid labour due from tenant to noble in feudal times; tax in form of compulsory labour (road-making, etc.).

CORVEY, ancient Benedictine abbey, on Weser, 1 mile N.E. of Höxter, Westphalia, Germany; founded 228; first occupied by monks from Corbie in Picardy.

CORVIDÆ, Crow Family (*q.v.*).

CORVINUS, JÁNOS (1473–1504), prince of Slavonia; natural s. of Hungarian king, Matthias Hunyadi.

CORVUS, Crows (*q.v.*).

CORVUS, MARCUS VALERIUS (370–270 B.C.), Rom. general.

CORWEN (52° 59′ N., 3° 24′ W.), market town, on Dee, Merionethshire, Wales. Pop. (1911) 7375.

CORWIN, THOMAS (1794–1865), Amer. statesman.

CORY, WILLIAM JOHNSON (1823–92), Eng. poet; *Ionica* (1858).

CORYATE, THOMAS (1577–1617), Eng. poet; noted pedestrian; *Coryate's Crudities* (1611).

CORYBANTES (classical myth.), attendants upon Rhea, mother of Zeus, and associated with her orgiastic worship.

CORYDON (38° 13′ N., 86° 6′ W.), town, Indiana, U.S.A.; has sulphur springs; health resort.

CORYPHÆUS, chorus-leader in Gk. drama.

COS, Stanchio (36° 50′ N., 27° 10′ E.), island, Ægean Sea, W. of Asia Minor, belonging to Turkey; surface partly mountainous, partly fertile and well cultivated; fine climate. Chief town, Cos (pop. 4000), on N.E. coast, near site of temple of Æsculapius; small harbour; birthplace of Appelles, Ptolemy Philadelphus, and Hippocrates; exports wine and raisins. Pop. 10,000.

COSA, ancient city, Etruria, S.W. coast of Italy.

COSEL, Kosel (50° 20′ N., 18° 10′ E.), town, on Oder, Prussian Silesia, Germany; tanneries. Pop. 7499.

COSENZ, ENRICO (1812–98), Ital. general.

COSENZA (39° 19′ N., 16° 17′ E.), town (and province), Italy, at junction of Crati and Busento; has a Gothic cathedral, a fine court-house, and a ruined castle; trades in wine, oil, silk, etc.; in XVI. cent. was centre of persecution by Inquisition of the Waldenses. Pop. 14,921.

COSHOCTON (40° 18′ N., 81° 52′ W.), city (and county), on Muskingum, Ohio, U.S.A.; iron foundries. Pop. (1910) 9603.

COSIN, JOHN (1594–1672), Anglican divine and theological writer; forced to fly in Civil War; made bp. of Durham, 1660.

COSMAS (1045–1215), Bohemian historian.

COSMAS, Indicopleustes (VI. cent. A.D.), noted traveller of Alexandria who upheld Ptolemaic theory of geographical configuration of earth.

COSMATI, Rom. family of craftsmen noted in XIII. cent.; their architecture, sculpture, and mosaics can be seen in many churches at Rome.

COSMIC, relating to the universe. Cosmic physics is applied to the wider issues of astrophysics, including terrestrial phenomena.

COSMOGONY, term designating theory regarding origin of the universe; Jewish account found in *Genesis* 1 is paralleled by Zoroastrian conception of creation on basis of mere volition of supreme deity; Egyptians thought universe sprang from egg; Greeks ascribed world to work of Creator, but Lucretius (*q.v.*), the most advanced Rom. cosmogonist, advanced an atomic theory. In modern times there is a strong tendency to admit or waive belief in original guiding power, but to explain actual creation scientifically. In Nebular Theory, supported by Kant, Herschel and others laid stress on rotation of earth and stars to suggest probable formation. The question is still open to speculation.

COSNE (47° 26′ N., 2° 58′ E.), town, Nièvre, France; has woollen mills and iron manufactures. Pop. 5653.

COSSA, LUIGI (1831–96), Ital. economist.

COSSA, PIETRO (1830–80), Ital. dramatist; wrote tragedies on classical subjects and Ital. history.

COSSACKS, Russ. subjects who are bound to do military service of twenty years per man, and in return have received large grants of land on frontiers and considerable amount of autonomy; they inhabit the S. and E. of Russia, and are divided into two main branches, the C's of Little Russia and C's of the Don; because of defending frontier they pay no taxes; the best Russ. cavalry, and the strong arm of Russ. autocracy; notorious for brutality in quelling social disorder.

COSSIMBAZAR, Kasimbazar (24° 8′ N., 88° 19′ E.), decayed city, on Bhagirathi, Murshidabad district, Bengal, India; site now a swamp; former important centre of cotton- and silk-weaving; chief Eng. agency in Bengal at end of XVII. cent.

COSTA, GIOVANNI (1826–1903), Ital. landscape artist.

COSTA, LORENZO (1460–1535), Ital. artist.

COSTA, SIR MICHAEL ANDREW AGNUS (1808–84), composer and conductor; b. Naples; settled in England, 1829.

COSTA RICA (10° N., 84° W.), republic of Central America, stretching from sea to sea, and bounded by Nicaragua and Panama; capital, San José; area, *c.* 23,000 sq. miles. The country is generally mountainous, with many volcanoes; coast is flat, with dense forest-lands on Atlantic slopes. Principal products are coffee and bananas. Other exports include cocoa, tortoise-shell, and hides. New rubber plantations are proving productive. C. yields valuable timber—dye-woods, cedar, mahogany, fustic, etc. Sugar and rice are cultivated. Gold is mined in places; silver, copper, and other metals also found. Railway system connects San José with Atlantic and Pacific ports; branch lines run N. and S., and connect the 'Banana Lands.' C. R. is divided into seven provinces. There are *c.* 3500 aborigines; religion, R.C. C. R. (Rich Coast) was taken by Spaniards early in XVI. cent. C. R. revolted against Span. rule, and became an independent state (1821); formed part of Confederation of Central America (1824–29); now governed by Pres. and Congress; in May 1910 an earthquake destroyed city of Cartago. Pop. (1911) 388,266.

Calvo, *Republic of Costa Rica* (1890).

COSTAKI, ANTHOPOULOS (1835–1902), Turk. diplomatist.

COSTANZO, ANGELO DI (1507–91), Ital. historian and poet; wrote valuable history of Naples; lover of Vittoria Colonna.

COSTELLO, DUDLEY (1803–65), Eng. novelist and journalist.

COSTELLO, LOUISA STUART (1799–1870), Eng. poetess and hist. writer; sister of above.

COSTERMONGER, itinerant street trader; corruption of 'costard-monger,' seller of 'costard' apples.

COSTS, legal term for expenses incurred, and for professional help given by a lawyer to client.

COSTUME (Med. Lat. *costuma*, from Lat. *consuetudo*, custom), term which meant at first any fashion, but in modern use is only applied to personal clothing and adornment. The motives of wearing clothes for ornament and as a protection for the vital parts seem to be coeval, although, as ornament requires less apparatus of civilisation than clothes, even skins, tattooing, etc., probably preceded the primitive loin-cloth; the idea of decency seems only to be evolved by agelong covering of the body. The loin-cloth, tied in front, was worn by the ancient EGYPTIANS. It was succeeded by a close-fitting, frock-like garment, reaching below the knees, leaving both arms free, and the right shoulder uncovered. The BABYLONIANS wore a short skirt, suspended from the waist, leaving the upper portion of the body exposed, a style of dress also adopted by some of the Egyptians. A later development amongst these Eastern peoples was a close-fitting, embroidered garment, reaching down to the ankles, often with sleeves, but sometimes without. The footwear consisted of sandals. The hair was generally full and long, and often confined with a fillet. The earliest kind of headgear was a close-fitting circular cap, succeeded by a high conical bonnet, sometimes with ear-flaps.

Greek.—The Gk. men of the Mycenæan Age wore the loin-cloth, but the women developed a complete dress with flounced lower part. The most characteristic garment of the succeeding Greeks was the *peplos*, or 'Doric dress,' a large square of cloth, folded, and fastened on the right shoulder with a brooch; the waist was generally encircled by a girdle through which the long folds might be drawn up to prevent trailing, giving a characteristic overlap. Another garment of importance was the Ionian *chiton*, a close-fitting linen shift, or tunic, which in some cases reached only to the knees, but generally to the feet. The *pallium*, a loose mantle, is also found. Peasants' and herdsmen's garments were of sheepskin or leather. Sandals were the usual foot-gear; high boots were favoured for travelling and the chase. For hair, see separate article. Much use was made of rings, bracelets, necklaces, brooches, and ear-rings of precious metals, enamel, or bronze, and jewelled.

Roman dress differed little from the Gk. The Etruscan sarcophagus in the Brit. Museum shows the Ionian dress; the *subligaculum*, or loin-cloth, was early superseded by the *tunica*, similar to the Gk. *chiton*, which became the everyday wear of both sexes, but later only of men. The *toga*, full-dress garment for special occasions, was in early times the habit both of men and women. It was a large, almost circular, piece of woollen cloth, draped round the form similarly to the *peplos*, with one end thrown over the left shoulder and fastened by brooch and girdle. Both the *tunica* and *toga* were, as a rule, plain white, but stripes of purple and scarlet marked the rank of senators and others. An embroidered *tunica* and purple *toga* were adopted by Julius Cæsar as the permanent imperial costume. Women abandoned both *tunica* and *toga* for the *stola*, a long tunic with ornamental border and neck; at first sleeveless. Cloaks were worn in bad weather, sometimes with hoods. Sandals and shoes and high boots of red or black leather, according to rank, are found as in Greece. Hats were not used; hair was dressed in the Gk. fashion; jewellery was worn by both sexes.

Ancient British.—When Cæsar landed on the shores of Britain he found the more uncivilised tribes clad in skins; they are said to have smeared their bodies with woad. But the inhabitants of Kent wore striped or checkered frocks, or kilts, so that their dress was very similar to the Highland costume, which is still called 'the Garb of Old Gaul.' Their winter garments consisted of dyed tunics, close-fitting *bracæ*, or trousers, which now make almost their first appearance, and short cloak (*sagum*). The female dress may be judged from Dio Cassius' description of Boadicea, who wore her light hair flowing about her shoulders; was clad in a dyed tunic, over which was draped a coarse robe, fastened with a *fibula*. The Druids wore full robes of white; the Bards, blue; the Ovates (medicine-men and astronomers), green. Later the Brit. chiefs adopted the Rom. habit; and the women assumed a long under-tunic reaching to the feet, and a short outer one, with loose, half-sleeves.

Anglo-Saxon and Anglo-Danish.—The dress of the Anglo-Saxon kings and leaders was a plain tunic, short cloak, fastened with a *fibula*, long hose, drawn up over short trousers, and cross-gartered. Better-class women wore a long gown with loose sleeves, over which a super-tunic was worn. The ordinary dress was a linen shift and plain gown for women; tunic and belt for men. Cloaks and caps were for bad weather; all wore shoes, except slaves, who went barefoot. As regards ecclesiastical dress, the c. of an abp. of this period consisted of chasuble, pall, dalmatic, stole, and alb. With the coming of the Danes little change took place. Their favourite colour was black; their national emblem, the raven. Later they adopted tunics of white linen or coloured cloth, and furred mantles were not uncommon.

Norman and Plantagenet.—There was practically no change in the habits of the people under the rule of William the Conqueror. Under William II., however, extremes of fashion set in; men began to wear long cloaks, trailing gowns with loose sleeves, and fantastically pointed shoes. Women affected a tightly laced bodice, and a gown with hanging sleeves. The labouring class still kept the loose tunic, cloak pinned at the shoulder, caps, brimmed hats, and flat bonnets. The *dalmatic*, a wide-sleeved, lengthy gown, became the regal costume under Henry I., and remained so through several reigns. Henry II. introduced the short Angevin mantle; rich furs began to be popular with the wealthy classes, and the long gowns, though of simple design, were made of cloth of gold and rich damasks. Under Edward III. (1327–77) great changes took place. Amongst the nobles the long robes and tunics gave place to the long hose and *cote-hardie*, a close-fitting garment reaching to the mid-thigh, and buttoned down the front, with half-sleeves, to display the long sleeves of an under-vest. This was worn by both sexes. The use of furs and the more expensive cloths was regulated by rank and wealth. Ermine was the royal fur, while few of the nobility were permitted other than miniver. The *Order of the Garter* was instituted in this reign. In place of the *cote-hardie*, women sometimes wore a short spencer-jacket, edged with fur, according to rank. Sartorial luxury made many steps forward under Richard II., the greatest fop of his day. Parti-coloured c's were introduced as early as the reign of Edward II., but under Richard II. they became the prevailing fashion. It was during this reign, too, that the long, pointed shoes, called *crackowes*, reached ridiculous length, and were fastened about the knees with chains. Details of the extravagant fashions of the period may be found in Chaucer's *Canterbury Tales*, written towards the close of Richard's reign. Little further change took place until the time of Henry VI., when the male c. included short, tight jackets, pleated down the back, sleeves very full at the shoulders, and girded round the waist. Sometimes a long, low-necked gown with hanging sleeves was worn. Tight-fitting long hose was the general wear; hats of many shapes. These fashions continued under Edward IV., but the men's short jackets became exceedingly short. The long steeple head-dresses of the women, sometimes three-quarters of an ell in height, were amongst the more extravagant fashions of the period.

Tudor.—With the accession of Henry VII. a much simpler style of c. became the vogue. Henry himself wore a simple, short furred gown, long hose, and flat, wide cap. Shoes were very broad-toed; embroidered lawn shirts became popular, and to display these the slashing of doublets and hose became fashionable. Women wore gowns cut square at the neck, with stomachers and rich girdles, from the front of which hung long pendants. The Eng. dress in the time of Henry VIII. is familiar from Holbein's portraits. The 'bluff' king is represented with short hair, trimmed whiskers, flat, round cap, with plume at one side, puffed and slashed upper-stocks, cloth hose, velvet jerkin, and handsome outer-coat of cloth of gold or other rich material. And the fashion set by the king prevailed generally. It may be noted that the flat, round cap worn in this reign was still fashionable under Edward VI. and Mary, and survives as the headgear of the 'Blue-Coat' boy; the waistcoat is first mentioned during Henry's reign, and was then a sleeved garment, like that worn by the railway porter of the present day. Under the Stowarts and Georges the waistcoat reached to the knees. In Elizabeth's time the upper-stocks developed into 'trunk hose'; the doublet was deprived of its skirts, and took the shape of a peascod; the shirt, with embroidered neck, gave place to the ruff, the flat cap to the conical hat. The characteristic feminine garments were the enormous starched tiers of ruff and frill (imitated by men) round the neck, the stomacher, and the Span. farthingale introduced by Mary and now become immense. Men, influenced by these, brought tightly fitting coats to a point over baggy, padded breeches.

These fashions remained pretty constant under the **Stewarts**. Puritan influence was directly small, but indirectly may have helped to refine fashionable taste. The grotesque ruff gave place to deep 'Vandyke' collars of lace, and many Elizabethan distortions were succeeded by really becoming modes. The plumed cavalier, however, loved to emphasise the difference between himself and the Roundhead in his simple apparel of sober colour. In the reign of Charles II. 'petticoat breeches,' worn for some time in France, were a common mode; they were wide, puffed, beribboned garments, tapering down to just above the calf, where they were fastened; high-heeled shoes and steeplechase hat with coronal of feathers are characteristic of the courtier of this period. Women's bare shoulders sloped down beneath ringlets to a short, tight bodice, which expanded at the high waist into the amplitude of a slightly hooped skirt. Collars over the shoulders had become usual by the close of the century, when the long waist and even the stomacher had reappeared.

Georgian dress for men shows knee-breeches appearing slightly below 'three-quarters' coat, buttoned with many buttons, without collar, and with deep, wide cuffs; under the coat is the waistcoat on which much fancy was expended, surmounted by the long, soft cravat; shoes, usually square-toed, were adorned by buckles which were an important feature. The hoop of women's dress had attained immense size by the middle of the century. The classical influence of the Fr. Revolution (see HAIR) brought in, on the contrary, clinging robes, sometimes damped in order to show the limbs, the high 'Empire' waist, sandals, etc., and had an important permanent effect in an ideal of simplicity of fashion.

Men's dark-coloured clothes, which became usual in the **XIX. cent.**, are perhaps ascribable to the continued mourning worn in Europe through the slaughters of the Napoleonic wars, but black was a favourite colour of Beau Brummel. The frock-coat, waistcoat, and top-hat, from which the present articles are derived, are first to be seen in the arbiter of taste, Count d'Orsay, although his lightly starched linen neckcloth, rising to the ears and almost engulfing the chin, has given way to the narrow, stiffly starched variety.

Linen shirts were worn by both sexes from a time preceding the Conquest, poor folks wearing coarse canvas, or dowlas. In the days when silk stockings were the fashion, three pairs were often worn in cold weather; and false calves were by no means uncommon. Folding fans have been in use since the days of Elizabeth. The modern woman's *blouse* was copied from the famous Garibaldi Red Shirt (c. 1846). The *crinoline* was first worn in 1856. The *petticoat* was originally a man's outside coat, later an under-tunic, and a 'petticoat of red damask' was worn by Henry V. 'An apron' is a corruption of 'a napron.' A 'bodice' is a corruption of 'bodies,' stays being originally called a 'pair of bodies.' Men's loose collars were introduced about half a cent. ago. The evening, or 'swallow-tail,' coat is merely a 'cut-a-way' garment developed from the frock-coat. The 'trews,' or tartan trousers, are an essential part of the Highland dress, and were worn by 'Prince Charlie.' 'Cossack' trousers were first worn in England about 1816, but tight-fitting trousers continued in favour for long afterwards. In the earlier years of the XIX. cent. the wig became rare; and the soldiers abandoned their pigtails in 1808. The first umbrella used in England was in 1750, but it was not generally adopted until about a quarter of a cent. later. The first silk 'top-hat,' as the successor of the 'beaver-hat,' was seen in London in 1797.

Robes, or official costume.—The origin of domestic and official livery is obscure, but by the XIII. cent. the magnate gives his official 'a robe of the robes of his esquires,' usually twice a year (the *roba hibernalis* and *roba æstiva*), at fixed times. Numerous stipulations to do so are to be found in charters of XIV. cent., when payments for robes of royal servants frequently occur in Exchequer accounts. Whether robes at that date were considered as livery or robes of state, they were the parent of livery and possibly of robes of state. The peer's 'vesture of honour' is mentioned at the close of the XIV. cent., and 50 years later king and peers are found wearing 'Parliament robes' of scarlet trimmed with miniver (now ermine); and strips of fur, in number according to rank, already appear on the peer's right shoulder. The custom of wearing Parliament robes became gradually disused, and they are now donned only at the opening of Parliament and on some other special occasions. The ordinary members of the Lower House have no Parliament robes, but the Speaker always wears a black silk gown (damask, with gold lace, on special occasions) and a full-bottomed wig; and the clerks at the table wear barrister's gowns and wigs.

CORONATION robes do not appear until the XVI. cent. At Henry VII.'s coronation, when the king wore crimson velvet and ermine (then an exclusively royal fur), the peers dressed according to their fancy. At Anne Boleyn's, however, nearly all the peers wore crimson velvet furred with ermine, powdered according to their degree; and state dresses of scarlet trimmed with lettice had already appeared for peeresses. By the close of the XVII. cent. STATE robes were regulated by the Earl Marshal. The robes of the ORDERS OF CHIVALRY originated like those of City companies, as symbols. Those of the Order of the Garter (founded c. 1348) were originally a blue cloth mantle with surcoat and hood embroidered with garters; after many changes they are now a mantle of deep blue velvet lined with white taffeta, fastened by cordons of blue and gold, the star embroidered on the left breast; hood of crimson velvet; hat of black velvet lined with white taffeta, plumed with white ostrich feathers, and a tuft of heron's feathers in the centre, all fastened to the hat by a band of diamonds. The robes of the Order of the Thistle are surcoat and hood of cloth of silver under mantle of dark green velvet; of St. Patrick, azure blue lined with white satin, with trunk hose of white satin; of the Bath, crimson lined with white satin, with white satin trunk hose, and white boots topped with red. The robes of the Order of the Star of India are mantle of light blue satin fastened

at the neck with tassels of light blue silk and silver bullion; the mantle of St. Michael and St. George is of Saxon blue satin, lined with crimson silk, fastened by cordons of blue and scarlet silk with gold bullion; the mantle of the Order of the Indian Empire is of imperial purple satin, lined with and fastened by a cordon of white silk, with purple silk and gold tassels attached.

LEGAL ROBES.—Lawyers appear to have had no distinctive robes until the XIV. cent., when the coif, the old symbol of the Bar, had become appropriated to them. It was a white bonnet tied under the chin, and worn by judges and serjeants-at-law until the adoption of the wig by judges in the late XVII. cent., after which it passed out of use, an amusing attempt to represent it by a white patch on the wig being for some time made. The present use of the black cap is found in the middle of the XVI. cent. The parti-coloured robes worn by serjeants-at-law from the XIV. to the XVIII. cent. disappeared before the abolition of that rank. The judge from the first might not wear a parti-coloured gown; he wore a cloak in place of the serjeant's hood, and his cape was furred with miniver instead of budge. The present judges of High Court wear wig, scarlet gown and casting-hood, black belt, and on ceremonial occasions tippet furred with ermine, and full-bottomed wig. The robe of the Lord Chief Justice is trained. The judges of the King's Bench have black or blue gown furred with ermine, and scarlet casting-hood. The Lord Chancellor has a black gown with train. The gown of the barrister is thought to have originated at the same time as the wig—the close of the XVII. cent.

ACADEMIC robes are found in the XIV. cent., and differ according to univ. and degree taken. MUNICIPAL robes appear in the XIII. cent., and various London gilds had liveries by the XIV. cent., when scarlet became the usual colour for the robes of mayor and aldermen, though violet and black were sometimes worn, as they still are. The Lord Mayor of London has now a crimson velvet state robe worn in presence of the sovereign, a black state robe with gold lace worn at special city functions, and scarlet robes for most ceremonials; aldermen, sheriffs, and recorders usually wear scarlet.

Shaw's *Dresses and Decorations of the Middle Ages*; Planché's *Cyclopædia of Costume*; Fairbolt's *Costume in England*.

COSWAY, RICHARD (1742–1821), Eng. artist; most distinguished miniaturist of his day.

CÔTE D'OR (47° 30′ N., 4° 40′ E.), department, E. France, formed of part of old province of Burgundy; surface elevated and well wooded in N.; chief rivers, Seine, Saône, and Armançon; good pastures; important vineyards; famous Burgundy wines produced; fertile valleys and plains; chief industries, sheep and cattle rearing; iron and steel manufactures; capital, Dijon. Area, 3392 sq. miles. Pop. (1911) 350,044.

COTENTIN, THE, peninsula (length, *c.* 55; breadth, *c.* 26), formed by Bay of St. Michel and Gulf of Carentan, France; fertile and good pasture ground for cattle; in mediæval times was owned by Dukes of Normandy; is now part of department of La Manche; chief town, Cherbourg.

COTES, ROGER (1682–1716), Eng. mathematician; friend of Newton; first Plumerian prof. of Astron. and Natural Philosophy, Cambridge.

CÔTES-DU-NORD (48° 25′ N., 2° 50′ W.), department, France, bordering Eng. channel, forming part of ancient province of Brittany; traversed by chain of hills, running S.E. to N.W.; coast much indented; rivers short and navigable; good pastures; chief occupation, fishing; capital, St. Brieuc. Area, 2786 sq. miles. Pop. (1911) 605,523.

COTGRAVE, RANDLE (fl. 1611), Eng. lexicographer; sec. to Lord Burghley.

CÖTHEN, KÖTHEN (51° 45′ N., 11° 58′ E.), town, Anhalt, Germany; formerly capital of duchy of Anhalt-Köthen; industries include iron-founding and manufacture of machinery. Pop. (1910) 23,416.

COTMAN, JOHN SELL (1782–1842), Eng. landscape artist.

COTONEASTER, genus of rosaceous shrubs bearing red berries, cultivated in gardens.

COTOPAXI (0° 48′ S., 78° W.), mountain, Andes, Ecuador, S. America; loftiest active volcano in world (*c.* 19,600 ft.). Earliest recorded eruption occurred in 1533; most disastrous, 1768; first complete ascent made by Reiss, 1872; later by Whymper, 1880.

COTRONE (39° 8′ N., 17° 8′ E.), seaport and episcopal see, Catanzaro, Italy; ancient *Crotona*; has old castle; exports oranges and olives. Pop. 7902.

COTSWOLD HILLS (51° 50′ N., 2° 5′ W.), range, Gloucestershire, England, extending S.W. to N.E. for upwards of 50 miles, separating basin of Lower Severn from sources of Thames; highest points—Cleeve Cloud, 1134 ft., and Broadway Hill, 1086 ft.; famous breed of sheep raised.

COTTA, BERNHARD VON (1808–79), Ger. geologist; pro. of Geol. at the Bergakademie in Freiberg. The translation of his *Treatise on Lithology* (1866) stimulated Brit. research.

COTTA, GAIUS AURELIUS (*c.* 124–73 B.C.), Rom. democratic statesman, one of foremost orators of age of Cicero; consul, 75 B.C. His bro., LUCIUS AURELIUS COTTA, was also democratic statesman.

COTTA, JOHANN GEORG (1631–92), Ger. publisher; founder of a firm which flourished through several generations; since transferred.

COTTABUS, ancient Gk. game, very popular at convivial gatherings, several cent's B.C. The object was for a person, whilst in a reclining position, to throw a quantity of wine from his drinking-cup, which, without scattering, should strike a given object.

COTTBUS, KOTTBUS (51° 44′ N., 14° 21′ E.), town, on Spree, Prussia; important railway junction and trading centre; chief industry, cloth manufacture. Pop. (1910) 48,643.

COTTENHAM, CHARLES CHRISTOPHER PEPYS, EARL OF (1781–1851), Eng. Lord Chancellor.

COTTET, CHARLES (1863–), Fr. artist; portraits, landscapes, Breton fisher scenes.

COTTIN, MARIE, 'SOPHIE' (1770–1807), Fr. novelist; wrote *Élisabeth, ou les Exilés de Sibérie*, etc.

COTTINGTON, FRANCIS, BARON C. (1578–1652), Eng. statesman and diplomatist; exercised great influence with James I., and encouraged Span. alliance; made Chancellor of Exchequer, 1629; Master of Court of Wards, 1635; encouraged exactions of Charles I., and followed king in Civil War.

COTTLE, JOSEPH (1770–1853), Eng. bookseller; friend of Coleridge and Southey; bought poems from them, including Southey's *Joan of Arc*; wrote interesting *Early Recollections* (1837), and some verse.

COTTON.—Great Britain leads in c. manufacture, and the chief centre is in Lancashire, where the atmosphere possesses the exact amount of moisture all the year round necessary for spinning. Raw c. is imported at Liverpool, spinning takes place around Manchester, weaving near Preston; *c.* £100,000,000 worth of c. is annually converted into cloth in Lancashire.

The raw material is a vegetable fibre of the cotton plant. The flower, resembling that of the hollyhock, leaves a green pod which grows to the size of a hen's egg; bursting, it discloses a mass of white material resembling wool, which protects the seeds. This woolly mat is the raw c. There are several varieties of cotton plant; some are bushes of from 3 to 4 ft. high, while others grow much larger. One variety—known as the c. tree—may be from 15 to 20 ft. Some of the plants are annuals, others biennials or perennials. They grow in India and Egypt, but N. America supplies most of Britain's c. Microscopically, c. fibres resemble hollow and flattened reeds. They are about 2 in. in length, the length being known as the 'staple'; 1 lb. of raw c. can make a thread of 1000 miles in length.

In N. America the annual c. shrub is most cultivated. The seeds are sown each spring in rows about 4 ft.

apart, and in June the flower appears; in July or August the 'bolls' burst. Formerly *picking* was done by slave labour. The fibres are gathered by hand and placed in a sack slung round the picker's neck; some gather 100 to 300 lb. daily, including the seeds. The removing of the seeds, *ginning*, is carried out by a machine called a *gin*. The saw gin, invented by Whiteley (1792), consists of 60 or 70 circular saws mounted on a shaft. Each saw moves in a slit through which the teeth draw the fibres, leaving the seeds to fall into a pan. The seeds when pressed afford c. *oil*, and the husks and pulp are made into cakes for cattle food.

After ginning, the c. is pressed, by hydraulic power, into bales of about 480 lb., which are wrapped in sacking and bound with iron hoops. At the mills the raw c. is thrown into a 'bale-breaker,' where spiked rollers tear it apart. It is passed on to the *cleaning-room*, where seeds, dead leaves, dust, and other impurities are removed by the opening-machine. The scrutcher further cleans the c. and rolls it into a thick sheet, the 'lap,' which weighs about 40 lb. Before spinning, the c. fibres must be straightened into line by the *carding*-machine, which gives the cotton a further cleaning. The carding-machine is a wheel about 3 ft. broad and 4 ft. in diameter, covered with strips of canvas in which are set fine-pointed steel wires, about 600 to sq. inch, above this are iron strips (also covered with pointed steel wires) called *flats*, as long as wheel is broad, and forming an endless chain, 1½ in. broad. Whole chain is passed round rollers at each end and revolves more slowly than the cylinder. Thistles (Lat. *carduus*) were formerly used for straightening the fibres.

From the carding-machine the c. emerges in a flat ribbon *c.* 1 in. wide and ¼ in. thick, the 'sliver.' It is still compressed, and has to be lengthened out by a *drawing*-machine consisting of several sets of rollers, revolving at different speeds, *i.e.* the second pair moves faster than the first, the third faster than the second, and so on. The sliver is consequently stretched slightly. Were the sliver pulled out to its finished length by one set of rollers only, it would break. Should a sliver break in lengthening, the machine is immediately stopped by an electrical device. Drawing is carried out 6 times before the sliver is of uniform thickness and strength; it is then passed through a *slubbing* frame, which again draws it out, winds it on a bobbin, and gives it a slight twist.

Before spinning, the c. has to pass through an intermediate frame and a roving frame, which repeat the process of the slubber, making the finished 'roving,' free from all inequalities, resemble a coarse and twisted thread. It has yet to be twisted and drawn many times before being ready for weaving.

A *fabric* consists of the 'warp,' or length-wise threads, and the 'weft,' or top and bottom threads, which cross and intersect the warp threads. The warp threads are wound on to the warper's bobbin, and at this stage may be dyed. From these bobbins the thread is wound on to a slasher's beam some 4 ft. broad. In fixing, the threads are passed through the teeth of a comb the width of the beam. When the beam is filled, the threads are strengthened by being sized — by passing through boiling paste of flour and water. The threads from four slasher's beams are then taken and rewound on a weaver's beam, and after sizing are passed through rollers and dried by steam. The slasher's beam contained 500 threads $\frac{1}{10}$th in. apart and therefore the weaver's beam has 2000 threads $\frac{1}{40}$th in. apart, the distance varying according to the fineness of the cloth desired.

The processes preparatory to weaving may be carried on in storeyed buildings, but *weaving* is always done in 'sheds,' with glass roofs to allow the maximum amount of light to fall on the looms. A shed may contain as many as 2000 looms, on each of which mechanical 'picking-sticks' jerk backwards and forwards — shooting the shuttle across the warp — some 200 times per minute. The whole principle of weaving depends on the placing of weft threads alternately over and under the cross-threads. Later operations include washing, boiling (in soda-ash solution), bleaching, souring, squeezing, opening, starching, drying, wetting or calendering, folding, and pressing. If the cloth is to be printed it is done after the 'opening' process, and then steamed to 'fix' the colours. See Wilkinson, *The C. Plant*; Taggart, *C. Spinning*; Lister, *C. Manufacture*.

COTTON, CHARLES (1630–87), Eng. poet and translator; was friend of Isaak Walton, and wrote second portion of *The Compleat Angler*; also produced the standard trans. of *Montaigne's Essays*.

COTTON, GEORGE EDWARD LYNCH (1813–66), Eng. educationist; head of Marlborough Coll.; bp. of Calcutta.

COTTON, JOHN (1585–1652), Anglo-Amer. puritan; vicar of Boston, Lincoln, 1612–32; forced to emigrate, and became minister of First Church of Boston, New England; great influence on religious development in New England.

COTTON, SIR ROBERT BRUCE (1571–1631), Eng. antiquary and politician. 'Cotton House,' on site of present House of Lords, was meeting-place of antiquarian soc. C. was associated with researches of Camden and Speed; his MSS. now in Brit. Museum.

COTTON-GRASS (*Eriophorum*), member of *Cyperaceæ* family, so called from cotton-like processes developed from the perigone which encloses the ovary; used, but not extensively, for stuffing cushions, etc.; of little value as fodder.

COTYLEDON, see DICOTYLEDON.

COTYS (fl. 382–358 B.C.), king of Thrace; notorious tyrant.

COUCH-GRASS (*Triticum repens*), tough, many-rooted plant; grows well in sandy soil and makes moderate hay, but oftener becomes a weed.

COUCY-LE-CHÂTEAU (49° 31′ N., 3° 19′ E.), village, Aisne, France; ruined feudal castle (XIII. cent.), now state property.

COUCY, LE CHÂTELAIN DE (XII. cent.), Fr. *trouvère*.

COUES, ELLIOTT (1842–99), Amer. naturalist, writer on ornithology and theosophy; founder of Amer. Ornithologists' Union.

COUGAR, see under CAT FAMILY.

COULOMB, CHARLES AUGUSTIN DE (1736–1806), Fr. physicist; b. Angoulême; served in corps of engineers, Martinique; invented *Torsion Balance*; wrote *Théorie des Machines Simples* (1779).

COULOMMIERS (48° 50′ N., 3° 5′ E.), town, Seine-et-Marne, France; chief industry, printing; large trade in cheeses. Pop. 4876.

COUMARIN ($C_9H_6O_2$), organic compound extracted from tonka bean and sweet woodruff; M.P. 67°; B.P. 290°. Artificial c. occasionally used in perfumery.

COUNCIL (Lat. *concilium*, assembly), assembly summoned to settle disputed ecclesiastical points; useful in early days of Church for codification of doctrine, and important later in adjustment of relations of Church and State. Chief forms of c. held are general, patriarchal, provincial, papal, national, and diocesan. C. held at Jerusalem, mentioned in *Acts* and *Galatians*, is considered as parent and precedent; in later II. cent., Churches of Asia Minor assembled to discuss doctrines of Montanus, and system speedily developed. General (*œcumenical*) C's originated in IV. cent., Constantine summoning synods to Rome and Arles to discuss Donatism, and C. of Nicæa (325) to dispose of Arianism. A dispute arose later as to the authority of C's: the papal party denying the validity of its decisions until ratified by pope, who in XI. cent. acquired sole right to summon General C. During the schism (1378–1417), cardinals held C. of Pisa (1409); papal or ultramontane party attacked at C. of Constance (1414–18) and later at C. of Basel, reformers asserting that General C. was superior to pope; ultramontanists triumphed at C. of Florence (1439), and confirmed papal position at Lateran C. of 1616.

H. R. Percival, *The Ecumenical Councils* (1900); *Hist. of Christian Councils*, trans. from German of Hefele and Hergenröther; Kaye, *The Council of Nicæa* (1910).

COUNCIL BLUFFS (41° 18′ N., 95° 58′ W.), city, Iowa, U.S.A.; railway centre; manufactures iron, bricks and tiles, and agricultural implements. Pop. (1910) 29,292.

COUNT (Lat. *comes*), Eng. word to express foreign title equivalent to 'earl.' Rom. emperors' councillors were called *comites*, and councillors entrusted with special departments of administration received titles such as C. of Africa, or C. of the Saxon Shore. The title was retained by the Franks, whose kingdoms rose on the ruins of the Rom. Empire. Besides c's of various territorial divisions, there were c's of palace, stable, etc., *comes stabuli* degenerating into 'constable.' These offices, though they often became hereditary, were not necessarily so. In France from X. cent., c. became generic title of nobility. In Germany in XII. cent. the c. (*graf*) received definite status, modified by other considerations, such as his rank as a landowner. There are now many degrees of *graf*, the lowest being little more than acknowledgment of noble birth. The same is the case in Italy, but its use is more strict in Spain.

COUNTERFEITING, the crime of making and uttering sham coin or paper money with intent to defraud.

COUNTERPOINT, musical term for one melody played against another; point is old term for note; 'plain c.' consists of melody with one of five types of variation; in 'double c.' two melodies are employed.

COUNTERSCARP, the besiegers' side of a ditch, in fortification.

COUNTERSIGN.—(1) Military password to be given when sentry challenges; (2) additional signature to a document.

COUNTY, administrative division in U.K., U.S.A., and Brit. colonies. After the conquest, this Norman appellation replaced in many cases Saxon 'shire.' Some of modern c's originated in Saxon, others probably in Dan. times, and others in I. cent. after Norman conquest.

COUNTY COURT.—This court is derived from a petty court instituted in Alfred the Great's reign, but reconstituted under the County Courts Act (1846). Several later Acts have extended its powers, notably the County Courts Act (1903), which came into operation Jan. 1, 1905. Hitherto, in most cases, its jurisdiction had been limited to cases in which the amount claimed did not exceed £50. But now the C. C. may deal with all personal actions where the debt, demand, or damage claimed is not more than £100, or where the debt or demand claimed is reduced by an admitted set-off to £100. A C. C. judge must be a barrister of seven years' standing.

COUP D'ÉTAT, successful attempt made by ruling power to gain supreme control; a good example is Louis Napoleon's effort in 1851.

COUPLET, two consecutive lines of verse which rhyme with each other; more especially lines in which sense is complete with end of second line. *Heroic Couplet* (decasyllabic), greatly favoured from Restoration onwards, was perfected by Dryden and Pope.

COUPON (Fr. *couper*, to cut off), document entitling holder to some benefit; warrant attached to bonds, etc.

COURANTE, dance of Fr. and Ital. origin. In the Suite it is generally found with 'doubles' or variations.

COURAYER, PIERRE FRANÇOIS LE (1681–1776), Fr. R.C. theologian.

COURBET, GUSTAVE (1819–77), Fr. artist; celebrated for landscapes and seascapes, including *The Valley of the Loire*, *The Wave*, *Bathers*, etc.; met with much popular success as an artist, but incurred trouble by the cultivation and expression of democratic theories.

COURBEVOIE (48° 51′ N., 2° 19′ E.), town, on Seine, France; bleaching and wagon-building. Pop. 25,330.

COURCELLES (50° 27′ N., 4° 22′ E.), town, Hainault, Belgium; coal and iron. Pop. 17,000.

COURCELLE-SENEUIL, JEAN GUSTAVE (1813–92), Fr. economist.

COURCI, JOHN DE (d. *c.* 1219), Anglo-Norman employed by Plantagenet kings in Ireland; subdued and fortified large part of Ulster.

COURIER, PAUL LOUIS (1773–1825), Fr. author and democratic politician; imbibed ideals of Gk. republics, and laid aside his noble title 'de Méré'; works valuable for style and record of manners.

COURLAND, KURLAND (*c.* 55° 45′ to 57° 40′ N., 21° to 27° E.), province, Russia, between Gulf of Riga on N., Kovno on S. Surface generally level; is drained by nearly 100 rivers; numerous lakes and forests. Majority of inhabitants are Letts and Protestant; chief occupations, agriculture and stock-raising. In XIII. cent. C. formed part of Livonia; later became independent duchy; finally united with Russia, 1795; capital, Mitau. Area, 10,435 sq. miles. Pop. (1910) 741,200.

COURNOT, ANTOINE AUGUSTIN (1801–77), Fr. mathematician; advocated mathematical consideration of economic problems.

COURSING, the ancient sport of hunting the hare, by sight, with greyhounds.

COURT, ANTOINE (1696–1760), Fr. Huguenot; reorganiser of Fr. protestantism after persecution by Louis XIV.; established important seminary at Lausanne.

COURT BARON, O.E. manorial administration, now usually directed by steward of estate.

COURT DE GÉBELIN, ANTOINE (1728–84), Fr. scholar.

COURT LEET, Old Eng. court for punishment of criminal and petty offences.

COURT OF ARCHES, see ECCLESIASTICAL (JURISDICTION).

COURT OF COMMON PLEAS, department of High Court of Justice now vested in King's Bench Division.

COURTENAY, name of noble Devonshire family, which presumably drew origin from Courtenay in France. REGINALD (d. 1194), who m. heiress of Okehampton, Devonshire, is first ancestor of Eng. line whose existence can be proved; his great-great-grandson, HUGH, inherited earldom of Devon, 1293; was summoned to Parliament as baron, 1299; and confirmed as Earl of Devon or Devonshire, 1335. The family held the earldom of Devon with short intervals until 1556, when, on death unmarried of Edward, Earl of Devon, the title was considered extinct. In 1831, however, House of Lords decided that it had merely been dormant, and declared WILLIAM, Viscount C. of Powderham, earl, as heir of above Edward, Earl of Devon, and earldom has descended to Sir Charles Pepys C. Members fought at *Crécy* and *Agincourt*, and on Lancastrian side in Wars of Roses. On marriage of WILLIAM C. with dau. of Edward IV. they became Yorkists, entertained hopes of Crown under Tudors, and incurred attainder. Among most prominent of the house were WILLIAM, abp. of Canterbury, 1381–96, great opponent of Lollards; his s., RICHARD, bp. of Norwich, who, as chancellor of Oxford, prevented archiepiscopal visitation of univ.; and PETER, bp. of Exeter (1478–87), who assisted in overthrow of Richard III.

COURTHOPE, WILLIAM JOHN (1842–), Eng. man of letters; prof. of Poetry, Oxford (1895–1901); has pub. *History of English Poetry* (6 vols.).

COURT-MARTIAL, court composed of army or navy officers to try offences against army or navy rules, or to administer martial law. Martial law (codified, 1879) is now administered by virtue of annual Army Act.

COURTNEY, LEONARD HENRY (1832–), BARON C. OF PENWITH (1906), Brit. politician and

political writer; prof. of Political Economy, Univ. Coll. London (1872-75); Under-Sec., Home Office (1880-81); Under-Sec. for Colonies (1881-82); Sec. to Treasury (1882-84); deputy-Speaker (1886-92). A Unionist until Transvaal War, when he showed pro-Boer sympathies; later opposed Tariff Reform and joined Liberal party; strong advocate of proportional representation. His bro., JOHN MORTIMER, is a Canadian statesman; another bro., WILLIAM PRIDEAUX, author and compiler of bibliographies.

COURTOIS, JACQUES (1621-76) and **GUILLAUME** (1628-79), Fr. artists.

COURTRAI (50° 49′ N., 3° 15′ E.), town, on Lys, West Flanders, Belgium; ancient *Cortoriacum*; chief buildings, Hôtel-de-ville (1527), churches of Notre Dame and St. Martin; linen, lace; here French were defeated by Flemings in *Battle of Spurs*, July 11 1302. Pop. 36,000.

COURVOISIER, JEAN JOSEPH ANTOINE (1775-1835), Fr. politician.

COUSIN, JEAN (1500-90), Fr. artist; famed for subject pictures, including *The Last Judgment* (Louvre); painted glass in Sainte Chapelle, Vincennes; also a sculptor and wood-engraver.

COUSIN, VICTOR (1792-1867), Fr. philosopher; founder of modern *Eclectic School*; b. Paris; ed. under Royer-Collard and Maine de Biran; lectured in Sorbonne, Paris, 1815; identified with struggles of his country for civil and intellectual liberty; contributed to settlement of social problems then agitating men's minds. In 1820 C. was suspended from chair for liberal opinions; replaced, 1827, and lectured on Hegel to crowded assemblies; chief works, *Translations of Plato*, in thirteen vols., essays on Abelard Pascal, Locke, *History of Philosophy*.

C. sought to incorporate the truths of all schools in one system; borrowed from Leibnitz the maxim, 'Systems are true by what they affirm, false by what they deny.' All philosophical systems may be classed under four heads—Idealism, Sensationalism, Scepticism, Mysticism. The Scot. thinkers deny all metaphysics, the Germans founded an *à priori* metaphysics on the notion of the Absolute; a middle way is to base metaphysics on psychology, avoiding the defects of sensationalism by reflection into the depths of the soul, rigorous examination of every fact of consciousness and deduction of all that appears logically warrantable. In psychology, Kant's arguments are employed against Locke's empiricism. But Kant affirmed our necessary ideas and *à priori* conceptions due to the subjective laws of our minds. C. maintained an impersonal reason, something common in all men, not variable like the will, or relative like the senses. Reason is subjective only when reflective; when spontaneous, the Absolute with which it is identified is immediately grasped; subjectivity disappears in the spontaneous act of the pure reason. This theory is distinguished from Schelling's *Intellectual Intuition* by the psychological point of approach. In the lectures of 1828 C. advances further towards Absolute Idealism; history is the development of three ideas, the Infinite, the Finite, the Relation between them. Afterwards, his speculations are remodelled on Cartesian lines, with psychology as his basis; philosophy becomes a struggle against erroneous doctrines rather than a pure science, and to be allied with religion; the authority of Common Sense is more and more admitted.

J. Simon, *Victor Cousin* (Eng. trans. by Masson); Barthélemy St. Hilaire, *Victor Cousin* (1895).

COUSTOU, NICOLAS (1658-1733), **GUILLAUME**, *père* (1677-1746), and **GUILLAUME**, *fils* (1716-77), Fr. sculptors.

COUTANCES (49° 2′ N., 1° 26′ W.), town, on Soulle, Manche, France; bp.'s see; has famous cathedral of Notre Dame of XIII. cent. Pop. 7000.

COUTANCES, WALTER OF (d. 1207), Eng. ecclesiastic and diplomatist.

COUTHON, GEORGES (1755-94), orator of Fr. Revolution; as member of National Convention voted for death of Louis XVI.; advocated arrest of Girondists; was guillotined with Robespierre in the 'Terror.'

COUTTS, THOMAS (1735-1822), Eng. banker; founder of Coutts & Co.

COVELLITE (CuS), blue earthy copper ore, formerly termed indigo-copper, also occurs in hexagonal crystals; found in copper veins as alteration product of copper glance in Chile, Montana, Wyoming, Saxony.

COVENANT, an agreement between states or persons; the written instrument containing the terms of agreement; in Old Testament God's promises to man, on the condition of man's obedience and faith.

COVENANTERS, Scot. political party which held principles laid down by Scot. covenants (*q.v.*); persecuted after Restoration of 1660; defeated at *Rullion Green* (1666); won battle against Claverhouse at *Drumclog* (1679), but were defeated at *Bothwell Brig*, three weeks later.

Mathieson, *Politics and Religion in Scotland* (1902); Hewison, *The Covenanters* (1910).

COVENANTS, SCOTTISH, the *National Covenant* (1581) and the *Solemn League and Covenant* (1643). The former was a declaration of Prot. as against R.C. principles, but in 1638, when it was attested in Greyfriars' Churchyard, Edinburgh, the point of issue was the rejection of Laud's Episcopal Prayer-Book. The latter was the agreement the Scot. Estates and General Assembly made with the parliamentary forces of England during the Civil War; its main object was the establishment of Presbyterianism in Scotland, England, and Ireland. Charles II. signed both o's.

COVENT GARDEN, near Charing Cross, London; originally 'convent' garden, Westminster Abbey; now one of the most important fruit, flower, and vegetable markets in England.—**Covent Garden Theatre**, opened in 1732, became rival of Drury Lane; there Mrs. Siddons took leave of stage, and Macready first acted; through it Wagner's music was introduced to London; destroyed by fire (1808), and second building also destroyed (1856); present building is centre of grand opera in London.

Wyndham, *Annals of Covent Garden Theatre* (1906).

COVENTRY (52° 26′ N., 1° 30′ W.), market town, on R. Sherbourne, Warwickshire, England; the ruined abbey, once a magnificent Benedictine monastery, was founded XI. cent. by Earl Leofric and Lady Godiva (*q.v.*); has several fine old churches; noted since Middle Ages for wool and dyeing trade; now chief seat in U.K. for manufacture of motor-cars and bicycles, also ribbons and watches. Pop. (1911) 106,377.

COVENTRY, SIR JOHN (*c.* 1640-82), Eng. politician; made a slighting remark about Charles II., and was waylaid by a band of ruffians who slit his nose. This incident led to passing of *Coventry Act*, forbidding mutilations.

COVENTRY, THOMAS (1578-1640), 1st BARON (*c.* 1628), Eng. lawyer; attorney-general, 1621, lord keeper, 1625; in king's name reprimanded Commons, 1626; advocated levy of ship-money (1634), and other arbitrary acts, but on whole supported moderation; ability extolled by Clarendon.

COVENTRY, SIR WILLIAM (*c.* 1628-86), Eng. statesman; s. of Thomas, 1st Baron C. Although very young, commanded force for king in Civil War; app. sec. to Duke of York at Restoration; commissioner of navy, 1662; lost favour of Duke of York through opposing Clarendon; sent to Tower for challenging Buckingham to duel; refused to return to public life; ability and virtue praised by Burnett, Pepys, Evelyn, Temple, and Marvell; firm opponent of Cabal, and father of moderate political school. The *Character of a Trimmer* was dedicated to him by its author (his nephew), being a description of his position.

COVERDALE, MILES (*c.* 1488-1569), Eng. translator of Bible; Yorkshireman, probably from Coverdale; one of band of Cambridge scholars who

met at White Horse Tavern to discuss theology. His translation of Bible (far inferior to Tyndale's) was pub., 1535; parts subsequently incorporated in *Authorised Version*; prohibited, 1542; famous preacher under Edward VI.; made bp. of Exeter, 1551. See BIBLE.

Conant, *Hist. of Eng. Bible Translation* (1910).

COVILHÃO (40° 17′ N., 7° 31′ W.), town, Castello Branco, Portugal; manufactures cloth and hats. Pop. c. 15,000.

COVILHÃO, PERO DE, COVILHAM, Portug. traveller of late XV. and early XVI. cent's; sent out by government to explore Abyssinia ('the land of Prester John') and made many discoveries in Africa and India.

COVINGTON (38° 59′ N., 84° 28′ W.), city, at junction of Ohio and Licking Rivers, Kentucky, U.S.A.; manufactures cotton and tobacco; important agricultural and live stock trading centre. Pop. (1910) 53,270.

COWBRIDGE (51° 28′ N., 3° 27′ W.), market town, Glamorganshire, Wales; has cattle fairs.

COWDENBEATH (56° 7′ N., 3° 20′ W.), town, Fifeshire, Scotland; principal industry, coal-mining. Pop. (1911) 14,029.

COWELL, JOHN (1554–1611), Eng. jurist.

COWEN, SIR FREDERIC HYMEN (1852–), Eng. composer and conductor; operas, oratorios, etc.; knighted, 1911; Mus. Doc. (*honoris causa*), Cambridge and Edinburgh.

COWES (50° 46′ N., 1° 17′ W.), seaport town, watering-place, on N. shore of Isle of Wight; headquarters of Royal Yacht Club; celebrated regattas. Pop. (1911) 9635.

COWLEY, ABRAHAM (1618–67), Eng. poet; supported the Royalist cause, and afterwards lived in France some years as sec. to Henrietta Maria. He is chiefly remembered by virtue of his *Pindaric Odes* and some fine elegies; and his prose essays continue to hold a high place in Eng. lit. Like other transition poets, C. enjoyed immense but unenduring popularity.

COWLEY, HANNAH (1743–1809), Eng. dramatist and poet; wrote *The Belle's Stratagem* (1782) and other successful plays.

COWLEY, HENRY RICHARD CHARLES WELLESLEY, EARL (1804–84), Eng. diplomatist.

COWLEY FATHERS, Anglican religious society of devotees, founded (1865) at Cowley St. John (Oxford).

COWPENS (c. 35° 2′ N., 81° 50′ W.), town, South Carolina, U.S.A.; scene of defeat of British by Americans, Jan. 17, 1781.

COWPER, WILLIAM (1731–1800), Eng. poet; s. of a clergyman; ed. for the Bar; early developed symptoms of brain weakness, which rendered a settled occupation impossible. He subsequently retired to the village of Olney (Bucks), where the good genius of his life was Mary Unwin, widow of a friend. He collaborated with the Rev. John Newton in writing the *Olney Hymns*. In this environment he amused himself with his tame hares and other pets; wrote *The Task* (1785), the ballad of *John Gilpin*, and other poems. His verse fills the transition period between the classicism of Pope and the nature poetry of Wordsworth, and therefore C. stands as a landmark in Eng. lit. In addition he was a great letter-writer.

Life, by Southey (1836), Goldwin Smith (E.M.L., new ed., 1910), Thos. Wright (1896).

COWPER, WILLIAM (c. 1665–1723), 1ST EARL C. (1718), Eng. lawyer and politician; app. Lord Keeper, 1705; first Lord Chancellor, 1707–10 and 1715–18; showed ability and fairness; helped to conduct impeachment of Sacheverell and approved impeachment of Earl of Oxford.

COWPER-TEMPLE, WILLIAM FRANCIS (1811–88), s. of Earl Temple; M.P., 1835; vice-president of Committee on Education; prominent in debates on Education Act of 1870; created baron, 1880.

COWRY (*Cypræa*), genus of marine gasteropoda; shells of *C. moneta* and *C. annulus* used as currency in Pacific and Eastern seas, other species as ornaments.

COWSLIP, common European plant, *Primula veris*, with small and delicate flower; appears early in spring, and is somewhat like primrose (*q.v.*), though differing in the umbelliferous arrangement of its flowers; *c. wine* is distilled from the flowers.

COW-TREE (*Brosimum galactodendron*), Venezuelan tree of order Moraceæ, allied to bread-fruit tree; exudes nourishing milky juice when incision is made.

COX, DAVID (1783–1859), Eng. landscape artist; s. of a blacksmith; found most of his best subjects in N. Wales.

COX, SIR GEORGE WILLIAM, Bart. (1827–1902), Eng. clergyman and author.

COX, JACOB DOLSON (1828–1900), eminent lawyer, historian, politician, and general; formed one of 'Radical Triumvirate' of Ohio State, especially advocating women's rights; gov. of Ohio, 1866–67; commanded troops in Union service, 1860–64.

COX, RICHARD (c. 1500–81), Eng. divine; engaged to obtain vote of Univ. of Oxford for king's divorce, 1530; subscribed the *Institution of a Christian Man* (1537); reformer under Edward VI.; made bp. of Ely by Elizabeth, but resigned, 1580; intolerant, even daring to oppose the queen.

COX, SAMUEL (1826–93), Eng. Baptist preacher; founded *The Expositor*.

COX, SAMUEL HANSON (1793–1880), Amer. Presbyterian preacher.

COXCIE, MICHAEL (1499–1592), Flem. artist.

COXE, HENRY OCTAVIUS (1811–81), Eng. clergyman and scholar; librarian of Bodleian, Oxford.

COXE, WILLIAM (1747–1828), Eng. historian.

COXWELL, HENRY TRACEY (1819–1900), Eng. aeronaut; encouraged ballooning for meteorological and military purposes.

COYOTE (*Canis latrans*), prairie wolf of western N. America; with heavy fur; hunts in packs, and possesses characteristic howl.

COYPEL, ANTOINE (1661–1772), Fr. artist; member of distinguished family of painters.

COYPU (*Myopotamus coypu*), S. American aquatic rodent.

COYSEVOX, CHARLES ANTOINE (1640–1720), Fr. sculptor.

CRAB, term for decapod crustaceans with a short abdomen (tail) inturned under the thorax, which is covered by a more or less flattened shell or carapace. This sub-order, Brachyura, also includes forms with a soft (uncalcified) tail, such as the hermit-crabs. C's are generally adapted for life at the sea-bottom, but shore and land c's (*Gecarcinidæ*) can spend a large part of their lives outside the sea, having modified gill cavities acting as lungs. *Cancer pagurus* of European coasts and *Callinectes sapidus* of the Atlantic coast of N. America are economically important as edible c's. Most c's pass through a free-swimming larval stage called a *Zœa*, which through successive moults develops into the adult. See MALACOSTRACA.

CRABBE, GEORGE (1754–1832), Eng. poet; after early struggles he was befriended by Burke, Fox, and others, took orders, and, receiving patronage of the Duke of Rutland and Lord Thurlow, devoted his leisure to production of poetry. His *Parish Register*, *The Borough*, *The Village*, *The Library*, and other works are marked by homely realism, in which he was a master.

René Huchon, *George Crabbe and his Times* (Eng. trans., 1907); *Life*, by George Crabbe, his son (1834), Canon Ainger (E.M.L., 1902).

CRACOW, KRAKAU (50° 4′ N., 19° 56′ E.), city, on Vistula, Galicia, Austria; formerly capital and still chief intellectual and art centre of Poland. Notable buildings include Gothic cathedral, on Wawell (a hill), where Polish kings were crowned and buried; St. Mary's (founded 1226); royal castle; univ. (founded 1364), museums, etc.; chief industries—chemicals, tobacco, cloth, leather, agricultural imple-

ments, etc. C. was capital of Poland (*q.v.*), 1320–1609; fell to Austria, 1795; made capital of small free state, 1815; annexed by Austria, 1846. Pop. (1910) 151,886.

Lepszy, *Cracow* (London, 1912).

CRADDOCK, CHARLES EGBERT (1850–), Amer. novelist; pseudonym of MARY NOAILLES MURFREE.

CRADOCK (32° 11′ S., 25° 52′ E.), town, Cape Province, S. Africa; centre of wool industry; large trade in ostrich feathers. Pop. (1911) 6500.

CRAG, Celtic word applied to isolated rocks and jutting peaks of rocky headlands.

CRAIG, JOHN (*c.* 1512–1600), Scot. Calvinist; became Knox's colleague, 1562, and took important part in abolition of Episcopacy and drawing up of National Covenant, 1580–81.

CRAIG, SIR THOMAS (d. 1608), Scot. poet and jurist.

CRAIGIE, PEARL MARY TERESA (1867–1906), Eng. novelist and dramatist; wrote under name of JOHN OLIVER HOBBES.

CRAIK, DINAH MARIA, *née* MULOCK (1826–87), Eng. novelist; wrote *John Halifax, Gentleman* (1857), and numerous popular stories.

CRAIK, GEORGE LILLIE (1798–1866), Eng. scholar; wrote *History of English Literature and the English Language* (1861), which is still valued.

CRAIL (56° 16′ N., 2° 37′ W.), coast town, Fife; summer resort; fisheries. Pop. (1911) 1592.

CRAIOVA, KRAJOVA (44° 19′ N., 23° 50′ E.), town, formerly capital of Little Walachia, Rumania; chief commercial town, west of Bucharest; principal trade is in cereals, cattle, fish, and leather. Pop. (1910) 46,000.

CRAMBO, old Eng. rhyming game, described in Strutt's *Sports and Pastimes.*

CRAMER, JOHANN BAPTIST (1771–1858), Ger. composer, pianist, and music-publisher; settled in England.

CRAMER, JOHN ANTONY (1793–1848), Eng. scholar and geographer.

CRÄMER, KARL VON (1818–1902), Bavarian politician.

CRAMP, painful spasmodic contraction of muscles, usually of the limbs, the calf of the leg being most frequently affected; due to some obscure nervous derangement. Generally it occurs when the muscles are fatigued, and it is common in parturition, in cholera, and in persons of a gouty tendency. When the calf is attacked by c. the leg should be straightened and the foot turned forcibly upwards, to stretch out the calf muscles. *Writer's c.* affects the fingers so that they cannot be used, and should be treated by massage and electricity, and exercise of the affected parts. *Bather's c.* is a term used incorrectly to cover a number of causes of a swimmer's sinking, heart failure being the most likely and most general.

CRAMP-RINGS, rings blessed by Edward the Confessor and his successors, and supposed to cure epilepsy and cramp.

CRANACH, LUCAS (1472–1553), Ger. artist; court painter at Wittenberg, of which town he became burgomaster; formed a friendship with Luther, of whom he painted several portraits. His subjects are chiefly scriptural, marked by force and originality; he excelled in portraiture, and has been ranked only below Dürer. Examples of his work are to be seen at Berlin, Munich, and the National Gallery.

Wilmot Buxton, *German, Flemish, and Dutch Painters* (1879); Muther, *Lucas Cranach* (1902).

CRANBERRY (*Oxycoccus* or *Vaccinium Oxycoccus*), genus of prostrate evergreen shrubs with edible berries, growing in peaty or marshy districts of N. and Central Europe and N. America, cultivated for its fruit, especially in U.S.A., where an acre has been made to yield up to $300 annually.

CRANBROOK (51° 6′ N., 0° 32′ E.), market town, Kent, England; large trade in malt and hops. Pop. (1911) 6393.

CRANBROOK, GATHORNE GATHORNE-HARDY, EARL OF (1814–1906), Brit. statesman.

CRANDALL, PRUDENCE (1803–89), Amer. educationist.

CRANE (*Grus communis*), large wading bird of the family *Gruidæ,* popularly confused with the heron; performs extensive migrations, and is gradually disappearing from civilised countries. During courtship and flight it utters sonorous trumpeting sounds, probably facilitated by the trachea curving underneath the hollow of the breastbone.

CRANE, machine by which a load may be raised or lowered vertically and moved horizontally. When the machine lifts vertically only it is called a winch, hoist, or lift, and when coal, cereals, and other materials are moved, not in loads, but continuously, the appliance is termed a *conveyor* (*q.v.*). Cranes may be classified as revolving or non-revolving. Manual, hydraulic, steam, and electric power is used, the latter especially in travelling c's. The jib and derrick c. consist mainly of a revolving pillar or mast for the slewing movement, a jib which may be lowered or raised for the vertical movement, and the tackle passing from a winding drum along and over the end of the jib, and provided with a hook for attaching the load. Davits are an example of c. where jib and mast are in one piece. Portable c's are mounted on trucks or gantries, *e.g.* running on rails alongside harbour quays. Travelling c's consist of a bridge resting on wheels running on rails, say on two opposite walls of a shed, and the jenny or crab carrying the hoisting mechanism which runs on rails along the bridge. Many varieties of c. have been constructed, *e.g.* the Titan crane, a combination of the travelling and revolving type, used in constructing piers and breakwaters.

A. Böttcher, *Cranes* (trans. by A. Tolhausen, London, 1908).

CRANE, STEPHEN (1870–1900), Amer. author and journalist.

CRANE, WALTER (1845–), Eng. artist; chiefly famous for decorative work and book illustrations, all marked by strong individuality; also successful writer and lecturer upon art.

CRANIOMETRY, the measurement of skulls, for comparison of the skulls of men with those of monkeys and other animals, or for comparison of the skulls of different races and different branches of the races of mankind. There are various methods of comparing skulls, the chief being (*a*) by comparison of length, breadth, and height of the skull, the standard of maximum length being taken at 100, so that $100 \times \frac{\text{breath}}{\text{length}}$ is the *breadth* or *cephalic index,* and skulls are termed, according as the cephalic index is above 80, between 75 and 80, and below 75, *brachycephalic, mesaticephalic,* and *dolichocephalic*; (*b*) by comparison of the amount of cubic capacity of the skull cavity, the average being 85 cubic inches; (*c*) by comparison of the degree of the angle of projection of the jaws, prominent jaws signifying a lower type, the degree being termed the *gnathic index.* Modern anthropologists in many cases regard a very great number of skull measurements necessary for proper comparison, and various delicate instruments have been devised for taking the measurements with exactness. Peter Camper (1722–89), the Dutch anatomist, was the first to institute scientific c., and his standard of comparison was the *facial angle,* obtained by drawing one line from the centre of the forehead to the most prominent part of the upper jaw, immediately above the incisor teeth, and another to make an angle with it, from the entrance to the ear to the base of the opening of the nose.

Duckworth, *Morphology and Anthropology*; Keane, *Ethnology.*

CRANIUM, see SKULL.

CRANK, arm or U-shaped part fixed at right

angles to a shaft or axle by which circular motion may be converted into reciprocating motion and *vice versa*. Originally meaning crooked, the term is also popularly applied to extreme faddists or monomaniacs.

CRANMER, THOMAS (1489–1556), Eng. ecclesiastic; b. at Aslacton, Nottinghamshire; became fellow of Jesus Coll., Cambridge; m. a relative of landlady of Dolphin Inn (which caused later report that he was an innkeeper), who soon d.; became reader of divinity lecture in Jesus Coll., and univ. examiner in Theol.; expressed opinion that king should take advice of univ's as to validity of his marriage with Katharine of Aragon instead of depending on papal decision. Summoned by king, C. was ordered to draw up his view of case, and employed in obtaining opinions in favour of divorce; made Archdeacon of Taunton; took advanced step for churchman of marrying, 1532; like many Eng. abp's, was consecrated Abp. of Canterbury (1533) without having previously held high office in Church; held court and pronounced king's marriage invalid, May 23, 1533; helped to enforce king's supremacy over Church; declared king's marriage with Anne Boleyn invalid, 1536; opposed Six Articles, 1539; carried out his Prot. views under Edward VI.; after signing recantations under Mary, died a brave death, thrusting offending hand first into flames. Of bold views but personal timidity, C's great title to fame is his part in Book of Common Prayer of Church of England.

Life, by Innes (1899), Pollard (1905), Mason (1910).

CRANNOG, name applied to stockaded islands, numerous in ancient times in Ireland and Scotland; two in Bute were the first discovered in Scotland, and C. of Lagore first in Ireland; similar to Swiss lake-dwellings; relics indicate occupation in Iron Age; wooden huts (with log floors and layers of earth) built and fortified on islands in lochs.

CRANSAC (43° 31′ N., 2° 19′ E.), town, Aveyron, France; coal and iron-mining centre. Pop. 5000.

CRANSTON (*c.* 41° 15′ N., 71° 28′ W.), town, Rhode Island, U.S.A.; includes several manufacturing villages. Pop. (1910) 21,107.

CRANWORTH, ROBERT MONSEY ROLFE, BARON (1790–1868), Eng. Lord Chancellor.

CRAPE (Fr. *crêpe*), silk fabric, finished both in soft and crisp forms; there is also an imitation c., made from cotton.

CRASH, technical name for roller-towel cloth.

CRASHAW, RICHARD (1613–50), Eng. poet; s. of a Puritan preacher, but later joined R.C. Church; his *Steps to the Temple* (1646) and other religious poems show much genuine, almost great, poetry, but his work is marred by over-indulgence in the conceits of the 'metaphysical school.'

CRASPEDOTE, see HYDROMEDUSÆ.

CRASSULACEÆ, order of herbs or small shrubs, living in dry or rocky parts, with succulent stems and leaves, which provide a water store against drought. *Sedum*, *Sempervivum*, and *Cotyledon* are Brit. representatives of the order, which comprises about 15 genera and 500 species; widely distributed, chiefly in S. Africa.

CRASSUS, surname in Rom. plebeian *gens* Licinia. Important members are PUBLIUS, consul, 131 B.C., noted as scholar and orator; LUCIUS, also orator; PUBLIUS, consul, 97 B.C., author of sumptuary law; MARCUS is best known as *Dives* ('the rich'), because of his skill in acquiring wealth. In 60 B.C. he with Cæsar and Pompey formed the 'First Triumvirate'; he was killed in war with the Parthians (53 B.C.).

CRATER, see VOLCANO.

CRATES (fl. 470 B.C.) Athenian comic writer and actor.

CRATINUS (fl. 423 B.C.), Gk. comic poet.

CRATIPPUS, Gk. historian who supplemented Thucydides.

CRAU (43° 36′ N., 4° 50′ E.), stony district, S. France, occupying western part of Bouches-du-Rhône.

CRAUCK, GUSTAVE (1827–1905), Fr. sculptor.

CRAUFURD, QUINTIN (1743–1819), Scot. antiquary and historian.

CRAUFURD, ROBERT (1764–1812), Scot. commander; distinguished himself in Peninsular War, leading march of 'Light Brigade' (1809), and after battle of *Fuentes d'Onoro* (1811) made major-general; slain at *Ciudad Rodrigo*.

CRAVAT, laced neckcloth worn during XVII. and XVIII. cent's.

CRAVEN, WILLIAM (1608–97), EARL OF C. (1664), Eng. Royalist; s. of lord mayor of London; inherited large fortune; cr. Baron C. of Hampstead Marshall, 1627; fought for Elector Palatine in Thirty Years War; assisted Charles I. with money; received honours and emoluments from Charles II.; of small ability.

CRAWFORD, EARLDOM OF.—Scot. family, Lindsay of C., in Clydesdale, has held this earldom (premier in Scotland) since 1398, when rights of Earls Palatine were attached to fee of C. DAVID, 3rd earl, excommunicated by bishop of St. Andrews; ALEXANDER, 4th earl, called 'the Tiger' and 'Earl Beardie'; DAVID, 5th earl, cr. Duke of Montrose, 1488, but lost title same year, fighting for James III.; ALEXANDER, e.s. of 8th earl, disinherited, 1537, for numerous crimes; known as 'the wicked Master of C.'; DAVID, 12th earl, called 'the prodigal earl,' imprisoned to prevent ruin of race, and also called the captive earl'; strong royalists in Civil War, but advocated Revolution, 1688; JOHN (1702–49), the 'gallant earl,' distinguished soldier and 'finest nobleman of his time'; ALEXANDER WILLIAM (1812–80) wrote *Lives of the Lindsays*, etc. JAMES LUDOVIC (1847–1913), distinguished scientist and philatelist. Earldom united with that of Balcarres in XIX. cent.

CRAWFORD, FRANCIS MARION (1854–1909), Amer. novelist; b. in Italy, and long residence there made him thoroughly Ital. in literary spirit; he was a journalist in India for a time, and in early novels paints Oriental life.

CRAWFORD, WILLIAM HARRIS (1772–1834), Amer. lawyer and political leader; pres. of U.S. Senate, 1812–13; author of law limiting term of service of public officials to four years.

CRAWFORDSVILLE (40° 3′ N., 86° 50′ W.), city, Indiana, U.S.A.; seat of Wabash Coll.; manufactures machinery, wagons, carriages, etc.; valuable mineral springs in district. Pop. (1910) 9371.

CRAWFURD, JOHN (1783–1868), Scot. Orientalist.

CRAYER, GASPARD DE (1582–1669), Flem. artist.

CRAYFISH (*Astacus*), widely distributed freshwater crustaceans of the order Macrura, resembling lobsters. *A. pallipes* is an omnivorous inhabitant of Eng. and Irish rivers. The *Parastacidæ* are equatorial crayfishes.

CRAYON, coloured chalk used for drawing. Crayon, or pastel drawing, first came into use during XVII. cent.

CREASY, SIR EDWARD (1812–78), Eng. historian.

CREATIONISM, the theory that each individual human soul is separately created, as opposed to *Traducianism*, the doctrine that human souls are propagated by generation.

CRÉBILLON, PROSPER JOLYOT DE (1674–1762), Fr. tragic dramatist; wrote *Atrée et Thyeste*, *Rhadamiste et Zénobie*, *Pyrrhus*, *Catilina*, *Le Triumvirat*, etc. His s., CLAUDE (1707–77), was a novelist.

CRÉCY (50° 16′ N., 1° 52′ E.), village, Somme, France, near Abbeville; famous for victory of English under Edward III. and Black Prince over Philip VI.'s forces, Aug. 26, 1346; Fr. army suffered terrible losses.

CREDENCE TABLE, small side-table, used in churches, upon which the Eucharistic vessels and unconsecrated elements are placed.

CREDENTIALS, letters of authority which ambassadors and similar officials carry to foreign courts.

Freese, *A Short Popular History of Crete* (1897); Mitchell, *The Greek, the Cretan, and the Turk* (1897).

CRETINISM, disease due to congenital absence of the thyroid gland or of its functions, arising in early childhood. It is endemic in certain districts, especially in some of the valleys of Switzerland, Derbyshire being the part of England where it is most common, and it is found all over the world. Unhealthy surroundings and food, a family history of insanity, intemperance, goitre, or cretinism predispose to it. The disease has very characteristic features: the affected child is small and stunted, the face round and stupid, the eyes heavy, the mouth open with the tongue hanging out, the voice squeaky. The hair is coarse and abundant, the skin dull-coloured, thick, and in folds, the abdomen hanging like a bag; hernia is common, while the genital organs are undeveloped. The child walks in a waddling and clumsy manner, and, although it may live for twenty or thirty years at most, its intelligence does not develop beyond that of a child of two or three. Under suitable treatment, however, a rapid improvement, physically and mentally, takes place, especially when the treatment is begun at an early stage, and the cretin usually becomes quite normal. Extract of thyroid gland is given either in the liquid form or in tabloids, in very carefully regulated doses, and this is continued for the whole of the life of the affected individual, taking the place of the normal secretion of the gland. The environment should be changed for a more favourable one, and plenty of nutritious food given.

CRETONNE, printed cotton cloth, similar to chintz, but heavier.

CREUSE (46° 2′ N., 2° E.), department, Central France; chief river, Creuse; surface hilly; climate cold and damp; soil poor, except in valleys, where leading industry is cattle- and sheep-rearing; coal found; principal products—chestnuts, potatoes, fruit. Area, 2164 sq. miles. Pop. (1911) 266,188.

CREUTZ, GUSTAF FILIP, COUNT (1729–85), Swed. poet.

CREUZER, GEORG FRIEDRICH (1771–1858), Ger. philologist.

CREVASSE, deep fissure in a glacier; breach in the bank of a river, especially 'levee' of the lower Mississippi.

CREVIER, JEAN BAPTISTE LOUIS (1693–1765), Fr. hist. writer.

CREVILLENTE (38° 15′ N., 0° 47′ W.), town, Alicante, Spain; famed for melons. Pop. 10,726.

CREWE (53° 7′ N., 2° 27′ W.), town, Cheshire, England; important junction station of London & N.W. Railway; has extensive railway workshops. Pop. (1911) 44,970.

CREWE, EARL OF, ROBERT OFFLEY ASHBURTON CREWE-MILNES (1858–), Brit. statesman (Liberal); s. of Lord Houghton; Lord Lieut. of Ireland (1892–95); Lord Pres. of the Council (1905–8); Sec. of State for Colonies (1908–10); Sec. of State for India (1910–).

CREWKERNE (50° 53′ N., 2° 48′ W.), town, Somersetshire, England; manufactures cloth and webbing. Pop. (1911) 3939.

CRIB, child's bed, with raised sides; a trans., or key, of a school text-book; slang term for stealing, and also for a post or employment.

CRIBBAGE, game played with a complete pack of fifty-two cards, a c. board, and four pegs for scoring. It is usually played between two persons, and the game is 61 up.

Mair's *Short Rules for Cribbage.*

CRICCIETH (52° 56′ N., 4° 14′ W.), watering-place, Cardigan Bay, Carnarvonshire, Wales.

CRICHTON, JAMES, 'THE ADMIRABLE CRICHTON' (1560–c. 1582), Scot. scholar, whose versatility has become proverbial; s. of Robert C., Lord-Advocate of Scotland; tradition states that he successfully carried on a debate in twelve languages in Paris, and next day won a match in a tournament; outstanding philosopher, mathematician, theologist; composer of Latin verses; a fine swordsman; a man of great beauty; killed in a street brawl.

Sir Thomas Urquhart, *Discovery of a Most Excellent Jewel*; Tytler, *Life of Crichton.*

CRICKET (Gryllidæ), family of Orthopterous insects allied to the Locustidæ; long hind legs used for jumping; the males give their characteristic chirp by rapidly rubbing ridges of the nervures of the wing cover across nervure of opposite wing; varieties are the field c., house c., and mole c., the latter adapted for burrowing with its strong shovel-like fore legs.

CRICKET, open-air game played by two sides of eleven players each, with bats, ball, and wickets, a batsman defending the wickets against the ball bowled by a player on the other side, while the other members of the bowler's side are in different positions in the field to catch the ball. The object of the batsman is to make as many runs as possible between the wickets after he has struck the ball, before his wickets are put down by the ball on its being returned by one of the opposing players. The game in its present state has been developed from an old game played in England in the XIV. cent., and the game is mentioned—from the middle of the XVI. cent. under the name of 'cricket'—in a number of works up to the commencement of the XVIII. cent., from which time its history can be easily followed. At this period wagering on the game was common, large sums of money changing hands over the results of matches. Public opinion gradually discountenanced such betting. The famous Hambledon Club was founded in 1750, and lasted until 1791. Earlier clubs were the St. Albans Club (1661) and the London Club (1700), the latter playing its matches at the well-known Artillery Ground in Finsbury, where Kent played All England in 1746. The Marylebone Cricket Club (M.C.C.) arose on the breaking up of the White Conduit Club in 1787, and played matches on the first ground known as Lord's, at what is now Dorset Square, in Marylebone, removing afterwards to near Regent's Park, and later still to St. John's Wood, the present *Lord's* ground.

The first laws of the game were drawn up by the London Club in 1744 and revised by the M.C.C. in 1788; the latter club remained thenceforth the ruling authority of the game up to the present day, the rules having been revised and altered by it from time to time.

The first bats used in the game were curved like a hockey stick, this type being used up to the first years of the XIX. cent. when the blade of the bat was made straight so as to defend better against the newer style of bowling. The present style of bat is made in two parts; handles made of several pieces of cane and other material are spliced into a blade of willow, the length of the whole being not more than 38 in., the width of the blade 4¼ in., while the weight is generally about 2 lb. 4 oz. or 2 lb. 5 oz. The ball is made of a centre of cork with layers of twine and cork shavings around it, with a covering of red leather sewn on, the weight being not more than 5¾ oz. and not less than 5½ oz. The wicket was in the early stages of the game merely a hole in the ground into which the fielders tried to put the ball before the batsman could get to it, then two stumps with a cross-stick were used instead of the hole, another stump in the middle being added later. According to the present rules the wicket is 8 in. wide, composed of three stumps 27 in. in height, while the old cross-stick is now composed of two parts, called the bails, each 4 in. in length, balanced in grooves on the top of the stumps, and, when in position, projecting not more than ½ in. above the stumps. There are two wickets, opposite and parallel to one another, 22 yds. apart. Four feet in front of the wicket, and parallel with it, is a line marked with whitewash, the 'popping crease,' defining the batsman's ground,

within which he cannot be put out by being stumped or run out. In a line with the wickets is another whitewashed line 4 ft. on each side of the wicket, with short lines at right angles at the ends, the 'bowling crease,' outside the limits of which the bowler must not bowl.

Two batsmen are sent in at a time by the batting side, one retiring when he is put out to give place to the next, until ten of the side have been put out, when, there being no partner left for him, the last man retires also, being said to be 'not out.' The game is won by the side which scores the greatest number of 'runs,' each side having two innings alternately (in less important matches frequently only one innings each), but a side, with a lead of 150 runs in a three-day match, or 100 runs in a two-day match, or 75 runs in a one-day match, may insist on the other side's playing its second innings after its first. A run is scored by a batsman hitting the ball to such a distance that he and his partner can run across to the opposite wickets and reach the respective popping creases before the wicket is put down by the fielders returning the ball.

There are a number of different ways in which a batsman can be put out: (1) he may be 'bowled' by the bowler striking his wicket and dislodging a bail; (2) 'caught' by a fielder catching the ball before it touches the ground after the batsman has hit it; (3) 'stumped' by the fielder behind the wicket, or wicket-keeper, striking his wicket and dislodging a bail when the batsman is out of his ground, *i.e.* beyond the popping crease; (4) out 'leg-before-wicket,' by obstructing a ball, which would have struck the wicket, by any part of his body except the hand and forearm; (5) 'run out' by a fielder striking the wicket and dislodging a bail when the batsman is out of his ground, usually in attempting a run, the batsman nearer the wicket which is struck being out; (6) 'hit wicket,' by the batsman striking the wicket and dislodging a bail; (7) by the batsman 'handling the ball'; (8) hitting the ball twice in the attempt to score; (9) 'obstructing the field.'

The side opposing the batting side is arranged on the field in different positions for the purpose of keeping down the number of runs and getting the batsmen out. One is the bowler; one fields immediately behind the batsman's wicket, mainly to catch the balls missed by the batsman, and is protected with pads adapted to the legs and padded gloves; while the other nine are arranged by the bowler or the captain, in a manner depending on the style of bowling and, to some extent, on the batsman. Formerly there were stereotyped positions which the fielders took up, but, mainly owing to the influence of the early Australian teams visiting Britain, these have been abandoned to a great extent. Thus a fast bowler will usually have, in addition to the 'wicket-keeper' behind the wickets, a 'point' at right angles to the pitch, on the batsman's right, three 'slips' behind the batsman between point and wicket-keeper, a 'third man' farther out in the field between point and the slips, 'cover-point' farther out than point and about midway between the wickets, 'mid-off' between cover-point and the bowler, 'long-off' behind and on the left of the bowler, with generally only one fielder on the batsman's left, usually at 'mid-on,' opposite mid-off. The fielders change position at the end of every 'over' of six balls, when another bowler bowls from the opposite end of the pitch. In former times the only style of bowling permissible was underhand; 'jerking' was not allowed, and the arm had to be kept away from the side. Round-arm bowling, in which the arm was held out horizontally, was introduced about the beginning of the XIX. cent., and over-hand bowling, developing from round-arm, was legalised in 1864, being the method in practically invariable use to-day. There are various methods of producing 'break' by twisting the ball as it leaves the hand so that it changes direction immediately it touches the ground.

County cricket began to gain its present importance some time after the middle of the XIX. cent., and first-class cricket includes the matches of the first-class county elevens, the Oxford and Cambridge univ. elevens, the M.C.C. eleven, the Gentlemen's and the Players' representative elevens, the eleven representing England, and such more or less representative matches as are recognised as first-class by the M.C.C. The first-class counties include Derbyshire, Essex, Gloucestershire, Hampshire, Kent, Lancashire, Leicestershire, Middlesex, Northamptonshire, Notts, Somerset, Surrey, Sussex, Warwickshire, Worcestershire, and Yorkshire, while there is also a second-class county championship competition. A player is qualified to play for the county of his birth, or for that in which he has resided for at least two years.

With the appearance of professionalism interest in village and club cricket has declined to some extent, and the game has become much more spectacular, particularly since the introduction of international cricket. In 1859 a team was taken out to America by George Parr, while in 1861 a professional team under H. H. Stephenson visited Australia, and by 1876 three teams had visited America and four Australia. In 1878 a representative Australian team came over to England and defeated a very powerful M.C.C. eleven by dismissing them for 33 and 19 runs in the two innings, as a result of which the 'test matches' were instituted between the full strength of Australia and England, the first taking place in 1880. Since that time visits have been exchanged every year or two between Australia and England, and the representative eleven of Australia is recognised as being at least equal to the representative eleven of England. In 1894 and 1901 teams from South Africa also visited England and met with some success, while Eng. teams returned the visits, and the South African side which came over in 1904 was so decidedly powerful that test matches were arranged for the 1907 team. In 1912 teams from Australia and South Africa engaged in a triangular contest with England in the mother-country, England being triumphant. Teams from the U.S.A., from the West Indies, and from India have also visited this country from time to time, and in addition to those countries Eng. sides have toured in New Zealand, Argentina, Portugal, and Holland.

Cricket flourishes in Scotland, where there is a county championship, and where representative elevens have met Australian and other touring elevens on almost equal terms; and in Ireland, where county cricket is also in a very healthy state and touring elevens have met strong opposition, while one or two Irish cricketers have played for the Gentlemen of England and representative M.C.C. elevens; and in Denmark, Sweden, and other European countries, as well as in every Brit. colony, the game has much popularity.

Cricket, in the Badminton Library, by A. G. Steel and Hon. R. H. Lyttelton; *Jubilee Book of Cricket* (1897), by K. S. Ranjitsinhji; *Cricket in Many Climes*, by P. F. Warner; *Cricket Scores and Biographies*, by Lillywhite, with *Marylebone Cricket Club Scores and Biographies*; and the *Rules* of the game are pub. yearly in various annuals.

CRICKHOWELL (51° 52′ N., 3° 39′ W.), market town, Brecknockshire, Wales.

CRICKLADE (51° 38′ N., 1° 51′ W.), market town, on Thames, Wiltshire, England; agricultural produce.

CRIEFF (56° 22′ N., 3° 50′ W.), town, summer resort, on river Earn, Perthshire, Scotland; manufactures woollen goods; Drummond Castle, famous for beauty of its gardens, is in neighbourhood. Pop. (1911) 5571.

CRIMEA (45° 20′ N., 34° 15′ E.), peninsula of Russia between Black Sea and Sea of Azov, joined by isthmus of Perekop; area, c. 10,000 sq. miles. Balaklava and Sebastopol have good harbours. C.

is divided into two regions by the Salghir, its largest river; in N. pastureland; in S. forests and mild health-resorts; capital, Simferopol; famous for *Crimean War*. Products include grain, tobacco, wines, and fruit. C. was held by Turks from 1475; taken by Russians, 1783.

Crimean War (1853–56), European war so-called from seat of final actions. Russia proposed to Britain (1844) division of territories of Turkey, 'the sick man of Europe,' and seized Moldavia and Walachia, 1853, with result that Turkey declared war; Brit. and Fr. fleet sailed to Bosporus to overawe Russia; Turk. fleet destroyed at *Sinope*, 1853, and Britain and France declared war, 1854; Sardinia joined Allies, 1855. Baltic campaigns took place, 1854–55; coasts blockaded. Russ. fleet took refuge in Sebastopol harbour on Black Sea. As Turks were found able to defend European Turkey, where first allied contingents were sent, it was decided to attack Sebastopol by land allies landed, Sept. 1854, 30 miles N. of Sebastopol after victory above heights of river *Alma*, where Russ. force blocked way, flank march was made to Balaklava harbour within sight of Sebastopol and connection with allied fleet; battle of *Balaklava* in Oct. memorable for heroic charge of Brit. Light Brigade, two-thirds of which were slain; battle of *Inkerman* in Nov. called the 'soldiers' battle' from disorganised fighting; heavy losses but total defeat of Russians; army closed on *Sebastopol*; siege of nearly a year; wretched commissariat conditions prevailed; nursing arrangements were organised by FLORENCE NIGHTINGALE (*q.v.*); French stormed *Malakoff* fort, Sept. 1855, and Russians streamed out of Sebastopol; war ended with *Peace of Paris*, 1856, by which Russia restored conquests and engaged to build no arsenals and have no warships in Black Sea.

Kinglake, *The Invasion of the Crimea* (9 vols., 1890).

CRIMINAL LAW, the code of enactments for the punishment of crimes of commission or omission which affect the safety of the state, its sovereign head, or individuals; also offences against public justice, peace, trade, morals, and health. A *crime* is an act which is punishable by law. As an example of a crime by simple omission the neglect of children by their parents or guardians may be mentioned. For an act to be a crime it is necessary that the doer shall have a genuine intention to do the act. This criminal intention is generally referred to as 'the guilty state of mind,' and unless this is present the law does not regard the act as a crime, except in certain cases where the law says that the doing of an act is a crime irrespective of the intention of the wrong-doer, *e.g.* offences against the licensing laws, committing nuisances, and the like. When a criminal intention is present, we say the person is actuated by malice. Breaches of the c. l. are divisible into (1) offences punishable upon summary conviction, *i.e.* without the intervention of a jury, and (2) indictable offences, *i.e.* such crimes as can only be adequately punished after trial by jury. Such crimes are called indictable because the accusation must be formally set down in writing as preliminary to a trial before jury. The charges thus preferred in writing constitute an *indictment*, and the *counts* of an indictment are its several parts, charging distinct offences. Indictable offences are tried at quarter sessions, at the assizes, or in the King's Bench Division of the High Court. No act committed by a lunatic is a crime; but a person is presumed to be sane and responsible for his acts until the contrary is proved.

In Eng. law crimes are divided into 'Felonies' and 'Misdemeanours.' The difference between them does not depend upon their gravity or seriousness; it is purely historical. Before the Felony Act (1870) certain crimes at Common Law brought with them the loss or forfeiture of goods. Felony was in past times an act for which a man lost or gave up his 'fee' or estate. The only practical distinction between felony and misdemeanour is that for felony arrests may be made by private persons acting without judicial authority. The chief felonies are murder, treason, arson, rape, and theft. The word 'misdemeanour' may be said to apply to all those crimes and offences for which the law has not provided a particular name.

In U.S.A., while criminal procedure is generally founded upon the Brit. system, c. l. is milder and the accused has more safeguards. Prosecution is by public official at public expense; but criminal appeal was allowed long before it was in Britain. In some states capital punishment is abolished.

Sir J. F. Stephen's *History of Criminal Law* and *Digest of the Law of Criminal Procedure* (1883); Kenny, *Outlines of Criminal Law* (1905).

CRIMINOLOGY, term applied to a science which is a branch of sociology and anthropology, dealing with crime and criminals. It owes its origin to the researches of CESARE LOMBROSO (1836–1909), prof. of Forensic Medicine and Psychiatry at Turin, who, after long investigation of imprisoned criminals, developed the theory of the criminal type, a class of individual predestined to crime and recognisable by physical, psychical, and moral characteristics. His theories have been disputed, and they cannot be said to be proved, but they have at least been the means of calling attention to the subject and of introducing more logical and more humane treatment of criminals. C. is now being approached by the biometrical statistical methods introduced by the Eugenics school, and there is hope that definite and trustworthy results will thus be obtained.

Lombroso, *L'Uomo Delinquente* (5th ed., 1897) and *The Female Offender* (1910); Havelock Ellis, *The Criminal* (new ed., 1910); Ferri, *Criminal Sociology* (1910); Douglas Morrison, *Female Offenders* (1910).

CRIMMITZSCHAU, KRIMMITSCHAU (50° 49′ N., 12° 28′ E.), town, on Pleisse, Saxony, Germany; chief industries, manufacture of buckskin and wool-spinning. Pop. (1910) 28,818.

CRIMP, one who undertakes to supply men for the army and navy without authority; extortionate keepers of sailors' lodging-houses; formerly applied to persons who decoyed, drugged, and kidnapped men for the sea or military service.

CRINAGORAS OF MYTILENE (fl. 45–26 B.C.), Gk. epigrammatist.

CRINOIDEA, see ECHINODERMATA.

CRINOLINE, originally horse-hair cloth used to stiffen women's skirts; later a bell-shaped underskirt with steel hoops; became fashionable about 1856.

CRINUM, genus comprising many species of bulbous tropical plants of order Amaryllidaceæ; can be cultivated in moist hothouses.

CRIPPLE CREEK (40° 44′ N., 105° 8′ W.), city, Colo., U.S.A.; is gold-mining centre. Pop. (1910) 6206.

CRISA, CRISSA (*c.* 38° 28′ N., 22° 27′ E.), city, Phocis, ancient Greece, S.W. of Delphi.

CRISPI, FRANCESCO (1819–1901), Ital. statesman; took popular part in Sicilian revolution, 1848, in Mazzini plot at Milan, 1853, and in Garibaldi movement, which he organised, 1860; minister of interior, 1877; supported monarchy as means of Ital. unity, and worked to make Rome real capital; became chief minister, 1887, and as such opposed firm front to France; gave balance to Ital. politics at critical moment, and obtained consideration of foreign powers.

CRISPIN, the patron saint of shoemakers. According to legend, two Rom. brothers, Crispin and Crispinian, settled at Soissons, in Gaul, and were beheaded (287) for preaching the gospel. During their mission they supported themselves as shoemakers. The battle of *Agincourt* was fought on the anniversary of St. Crispin's Day, Oct. 25, 1415.

CRITICISM, the art of expressing an unbiassed judgment, particularly in relation to lit. or the fine arts. Aristotle, by virtue of his *Poetics* and *Rhetoric*, may be regarded as the pioneer of literary c. amongst

the ancients, though Plato and some earlier Gk. writers had produced works somewhat in the nature of c. Longinus, a later Gk. critic, wrote *On the Sublime*, one of the greatest critical books of the world. Quintilian, at a later date, took high rank as a literary critic. Ital. c. began with Dante's *De Vulgari Eloquio*, and was continued by many Ital. writers in XVI. cent. In XVII. cent. France took up neo-classic c., and its influence reached England. In England literary c. began about the middle of the XVI. cent., and much critical work of a very high character was produced during the three cent's following, amongst the leading writers being Dryden, Johnson, Hazlitt, Coleridge, Ruskin, Matthew Arnold, to name but a few. Lessing's critical writings hold an important place in Ger. lit.; and amongst great Fr. critics may be named Malherbe, Boileau, Voltaire, Diderot, Sainte-Beuve, and Taine.

Saintsbury, *History of Criticism* (3 vols., 1905); Spingarn, *Renaissance Criticism* (1899); Gregory Smith, *Elizabethan Critical Essays* (1897).

CRITTENDEN, JOHN JORDAN (1787–1863), Amer. lawyer and statesman; Attorney-General, 1841; gov. of Kentucky, 1848–50; strong upholder of the Union, but advocated concessions to Southerners. His s., GEORGE BIBB (1812–80), was distinguished Confederate general, and another s., THOMAS LEONIDAS (1815–93), was a lawyer and Federal general.

CRIVELLI, CARLO (fl. 1480), Ital. artist.

CROATIA-SLAVONIA (45° N., 18° E.), kingdom forming part of Hungary; bounded by Adriatic on S.W. and separated from Hungary Proper on N.E. by rivers Drave and Danube; total area, c. 16,400 sq. miles; capital, Agram (Zagrab). C.-S. is mountainous, with plains in N.E.; coast districts have mtn. ranges—Velebit Planina and Kapela—and include portion of highlands known as the Karst (famous for deep valleys and subterranean watercourses); farther inland are Eastern Alps. There are extensive marshes. C.-S. is intersected by the river Save. Earthquakes are frequent in Agram district. The Croatian seaboard of 84 miles has few good harbours (Fiume not being included in C.-S.).

History.—The Croats, a Slavonic tribe, invaded C.-S. in VII. cent.; maintained an independent kingdom, X.–XI. cent's; subject to kings of Hungary, XII. to early XVI. cent's; from 1526 partly Turkish, partly Austrian; in XVIII. cent. almost entirely subject to Austria; as 'Illyrian Provinces' partly under Fr. rule, 1809–13; great national movement begun against Hungarian domination, 1840; constitutional struggle of Serbo-Croats against other races of Austria-Hungary still proceeding. C.-S. is represented by 40 members in Hungarian House of Representatives, and 3 delegates to House of Magnates. Purely provincial affairs are controlled by the national Diet of C.-S., which meets annually at Agram and consists of 90 members. C.-S. is administered by a gov., called the 'Ban.'

Soil is fertile; staple crops being wheat, maize, pulse, potatoes, flax, hemp, tobacco, etc. Wine is largely produced, and a peculiar plum brandy. Timber is an important product. Swine are reared in the oak forests of Slavonia; and cattle, sheep, and horses are bred. Agriculture is the main industry. There are no extensive manufactures, but cotton and beautiful silk fabrics are produced.

About 90 per cent. of inhabitants are Croats and Serbs; there are a good many Germans, but few Hungarians. Seventy-five per cent. of people are R.C.; only other church of any standing is Gk. Church. Croatian dialects belong to the Slavonic (*q.v.*) branch of Indo-European languages; the literary tongue (Serbo-Croatian) is the same as in Servia (*q.v.*). Pop. (1900) 2,416,304; (1910) 2,621,954. See HUNGARY, AUSTRIA-HUNGARY.

CROCIDOLITE, fibrous amphibole mineral found in Griqualand West, S. Africa (*Cape asbestos*). When altered by deposition of silica it can be polished, and is known as hawk's-eye (blue) or tiger-eye—variation of quartz cat's-eye—(brown-golden); used for ornamental purposes.

CROCIDURA, see SHREW FAMILY.

CROCKETT, DAVID (1786–1836), Amer. politician and adventurer.

CROCKETT, SAMUEL RUTHERFORD (1860–), Scot. novelist; author of *The Stickit Minister*, *The Raiders*, and other successful stories.

CROCKFORD, WILLIAM (1775–1844), founder of Crockford's gaming club.

CROCODILIA, order of carnivorous freshwater reptiles including crocodiles, alligators, and gavials. The true crocodiles may attain a length of about 20 feet, and occur in Africa, tropical Asia, Central America, and W. Indies. A kind of plover was said by Herodotus to be associated with the Nile c., by getting food from its teeth and warning it of danger. The alligators have shorter and broader heads, and occur in N. and S. America. The huge gavials or gharials have long snouts, and occur in India. Fossil c. are known from ancient Triassic strata onwards.

CROCOITE ($PbCrO_4$), reddish crystallised mineral, occurring in the Urals, Philippines, Tasmania, and Mashonaland. The element chromium was discovered by Vauquelin's assaying of c.

CROCUS, genus, comprising about 70 species, of hardy cormous plants of the order Iridaceæ, belonging to Europe, W. Asia, and N. Africa. Many varieties are cultivated for spring, autumn, and winter flowering.

CRŒSUS, king of Lydia (560–546 B.C.), proverbially wealthy. He subdued the whole of Ionia, but finally his kingdom fell before Cyrus, king of Persia.

CROFT, SIR HERBERT, Bart. (1751–1816), Eng. scholar and miscellaneous writer.

CROFT, SIR JAMES (d. 1590), Eng. statesman; Lord Deputy of Ireland, 1551; employed in Scot. affairs by Queen Elizabeth; twice imprisoned for treason.

CROFT, WILLIAM (1678–1727), Eng. composer; chiefly church music.

CROFTER, a small farmer who rents a small holding or 'croft'; term generally applied in N. and N.W. Scotland. Majority occupy, in separate tenancy, a small plot of arable land and combine to rent pasture on mountains. High rents, insecurity of tenure, etc., led to passing of *Crofters Act*, 1886, for their protection. The Crofters Commission app. under the Act settled fair rents, cancelled certain arrears of debt, and assigned c. 50,000 acres for enlarging crofts.

CROKER, JOHN WILSON (1780–1857), Brit. Conservative statesman and writer; said to have introduced word 'Conservatives'; typical contributor to *Quarterly Review*, penning condemnation of *Endymion* for that magazine; wrote *Stories for Children from the History of England*, model of Scott's *Tales of a Grandfather*.

CROKER, RICHARD (1842–), Amer. politician, and Derby winner (1907).

CROKER, THOMAS CROFTON (1798–1854), Irish antiquary and humorous writer; pub. *Fairy Legends*, *Popular Songs of Ireland*, etc.

CROLL, JAMES (1821–90), Scot. scientist; in spite of poverty and ill-health heroically strove to further science; keeper of Andersonian Museum, Glasgow; app. to Scot. Geological Survey; pub. many philosophical and geological works.

CROLY, GEORGE (1780–1860), Eng. clergyman and miscellaneous author.

CROLY, JANE CUNNINGHAM, JENNIE JUNE (1831–1901), Anglo-Amer. journalist and author; founded New York Women's Press Club, 1889; author of *Jennie Juneiana*, *Talks on Women's Topics* (1864), *For Better or Worse* (1875), etc.

CROMAGNON RACE, type of supposed early Neolithic man; remains found in France.

CROMARTY (57° 41′ N., 4° W.), seaport, Ross and Cromarty, on Cromarty Firth, Scotland; birthplace of Hugh Miller, geologist; fisheries.

CROMARTY, GEORGE MACKENZIE, 1ST EARL OF (1630–1714), prominent Scot. statesman and

writer; cr. Earl of C., 1703; helped to bring about Union of England and Scotland.

CROMARTY FIRTH (57° 41′ N., 4° 10′ W.), inlet of North Sea, connecting with Moray Firth and extending into county of Ross and Cromarty; fine natural harbour, with two 'Sutors of Cromarty' (400–500 ft. high; *c.* 1500 yds. apart) guarding the entrance.

CROMARTYSHIRE, see ROSS AND CROMARTY.

CROME, JOHN (1769–1821), Eng. landscape artist; known as 'old Crome'; leader of 'Norwich school.'

CROMER (52° 56′ N., 1° 16′ E.), watering-place, Norfolk, England. Pop. (1911) 4074.

CROMER, EARLDOM OF, see BARING.

CROMER, EVELYN BARING, 1ST EARL OF (1841–), Brit. statesman and ambassador; commissioner of Egyptian public debt, 1877–79; controller-gen. in Egypt, 1879–80; financial member of Ind. Council, 1880–83; Royal Agent and Consul-General in Egypt and minister plenipotentiary, 1883–1907. Owing to his advice Egypt temporarily surrendered Sudan; but recovered it through Kitchener's means when other states threatened to annex it, 1896–98. He reorganised Egyptian education, finance, irrigation, and general administration, and in 1906 received the Order of Merit. His literary works are *Modern Egypt* (2 vols., 1908), *Ancient and Modern Imperialism* (1910), *The Situation in Egypt* (1910). In politics he is a Unionist Free Trader.

CROMLECH, see STANDING STONES, BARROWS.

CROMORNE, wood wind-instrument, consisting of long straight pipe, the lower end being curved like the handle of a walking-stick; used throughout Europe XIV. to XVII. cent's.

CROMPTON (53° 32′ N., 2° 8′ W.), northern suburb, Oldham, Lancashire, England; cotton mills and collieries. Pop. (1911) 14,758.

CROMPTON, SAMUEL (1753–1827), Eng. cotton spinner; invented spinning-mule for muslin yarns.

CROMWELL, HENRY (1628–74), Eng. administrator; younger s. of Oliver C.; able and reforming ruler in Ireland; made Lord-Deputy, 1657; Lieut.- and Gov.-Gen., 1658–59.

CROMWELL, OLIVER (1599–1658), Eng. statesman; b. at Huntingdon; great-grandson of Richard Williams, who assumed name Cromwell after patron and kinsman Thomas, minister of Henry VIII.; nephew of Sir Oliver C. of Hinchingbrook, and cousin of Hampden and St. John; ed. at Sussex Coll., Cambridge, then a nursery for Puritanism. C. soon showed popular sympathies in public life at Huntingdon and Ely; underwent long period of religious depression, which ended in 'light'; he was member for Cambridge in Short and Long Parliaments (1640), and was already 'much hearkened unto' by anti-Episcopalians. He was foremost in securing military forces of country for Parliament, often acting without previous authorisation of Parliament.

C. commanded under Essex at *Edgehill* (1642); became colonel (1643), and used religious fervour of troops to outrival devotion of royal forces; app. one of four colonels of horse under Manchester, and distinguished himself at *Winceby* (1643); became lieut-gen. and member of Committee of Both Kingdoms; assisted in capture of Lincoln and other towns; commanded left wing at *Marston Moor*, and was generally considered author of victory, winning from Prince Rupert nickname of *Ironsides* for troops (1644).

A dispute now rose between C. and Manchester as to ultimate aim of war; the latter, having no idea of deposing Charles, was supported by Scots and Presbyterians in his army; rest of army, composed of Puritans of various new sects, looked to C. (already called 'the great Independent'), whose views went further. C. persuaded Parliament to appoint committee to bring about union between Presbyterians and Independents, but at end of year charged Manchester before House of Commons with wilfully obstructing military success; Manchester, in reply, accused C. of animosity to aristocratic institutions and showing favour to Independents alone. C., however, secured 'Self-denying Ordinance' (1645) for remodelling army. Sir Thomas Fairfax was appointed gen., and C. (exempted from new law) lieut.-gen. C. commanded right wing and all the cavalry at *Naseby* (1645), routed king's left, completed defeat of centre, and pursued flying army. When the war ended (1646), a quarrel ensued between army and Parliament, and in June 1647 C. joined army, the king having been seized, probably by his orders, in May. A council of war corresponded with Parliament and offered terms to the king. On flight of Charles to Carisbrooke, C. forced Parliament to abandon attempt at compromise; and, exasperated by second Civil War which followed, he denounced 'Charles Stewart, that man of blood.' Dissensions followed in Parliament after king's death; Pride's 'Purge' made Independents supreme, and after suppression of fanatical 'Levellers,' Parliament became C.'s instrument.

Appointed Lord-Lieutenant and Commander-in-Chief for Ireland, C. subdued Drogheda, Wexford, and great part of sea coast (1649); ruthless slaughter or transportation avenged Prot. blood shed by Irish; inland towns were conquered in 1650; laws against Catholicism were enforced. C. was made Commander-in-Chief against party of Charles II. in Scotland (1650); great victories of *Dunbar* (Sep. 3, 1650) and *Worcester* (Sep. 3, 1651) ended Civil War. Long Parliament was denounced and dismissed by C. (1652), and he as Commander-in-Chief became Dictator. He summoned 'Little Parliament,' which introduced anarchical measures, with result that Conservative members insisted on resignation of powers to C., again Dictator, and he was made Protector (Dec. 1653). The Church was reformed; would-be ministers were examined by '*triers*,' Presbyterians, Baptists, and Independents being eligible; oaths and other vices were prohibited. The Court of Chancery was reformed also, and condition of Scotland improved. Peace was made with Holland, which submitted to Navigation Act. C. championed Vaudois, and Blake's successes against Spain led to acquisition of Dunkirk. England acquired a great name in Europe, and a large party besought C. to become king; C. refused the title owing to army's objection. He was buried in Westminster Abbey, but exhumed and hanged at Restoration.

C., it has been said, was greater than his work. A Puritan who suddenly achieved power to establish the Kingdom of God on earth, he was statesman enough to attempt to do so in only small measure. It is not generally held now that he was a hypocrite. About 5 ft. 10 in. in height, with large head, red, puffy face, and harsh voice, he yet deported himself well as head of State, 'without any indecency through the want of custom.'

Oliver Cromwell, Hilda Johnstone (1912); *Life*, by Carlyle, Frederick Harrison (1888), Firth (1900), Morley (new ed., 1910), Rosebery (1910), Roosevelt (1910).

CROMWELL, RICHARD (1626–1712), Protector of England (1658–59), s. of Oliver C., and succ. his father as Protector, but being violently opposed by army was forced to retire; moderately well-gifted, but without capacity for ruling; was unmolested after Restoration, and lived as a country gentleman.

CROMWELL, THOMAS (*c.* 1485–1540), Eng. statesman; s. of Walter Cromwell, blacksmith, fuller, innkeeper, and brewer of Putney; fought in Ital. wars; employed as merchant, money-lender, and solicitor; in Wolsey's service (1520); M.P. (1523); ruthless but efficient agent in carrying out suppression of lesser monasteries (1525); won general applause (1529) by fidelity to fallen Wolsey; supreme in Henry VIII.'s councils (1532–39). His policy was to increase royal power and subordinate the Church; foreign policy was to secure alliance of Prot. princes of Germany against R.C. powers, from whom Eng.

religious settlement was in danger until 1540; Earl of Essex (1540). He fell on failure of Henry's marriage with Anne of Cleves, which he brought about, and was executed.

Merriman, *Life and Letters of Thomas Cromwell* (1904).

CRONJE, PIET ARNOLDUS (1840–1911), Transvaal general; defeated British at *Magersfontein* (1899); captured at *Paardeberg* (1900).

CRONSTADT, see KRONSTADT.

CROOKES, SIR WILLIAM (1832–), Eng. chemist and physicist; discovered the element thallium, invented the radiometer (*q.v.*), and investigated electric discharges in exhausted tubes. He conducted researches on the composition of rare earths, artificial production of diamonds, and the fixation of atmospheric nitrogen; received numerous honours, scientific and public; O.M. (Order of Merit), 1910; pres. of the Chemical Soc. and other societies.

CROOKSTOWN (47° 48′ N., 96° 38′ W.), city, Minnesota, U.S.A.; market for grain and lumber. Pop. (1910) 7559.

CROP, top of plants, therefore meaning harvest; the pouchlike enlargement (ingluvies) of a bird's gullet; equivalent to outcrop (geol.); whole untanned hide; short-stocked whip with leather loop; closely cut hair.

CROPSEY, JASPER FRANCIS (1823–1900), Amer. landscape artist.

CROQUET, game played by two or more players, who, by means of mallets, drive balls, made of wood or a composition material, and distinguished by different colours for the different players, through a series of hoops and against each of two pegs set in a particular pattern on a lawn. The game is a development from the game of *paille-maille*, originated in southern France about the XIII. or XIV. cent's, and popular in England in the time of the Stewarts, the modern game of c. being introduced from France into England about 1852. The All England Croquet Club was formed in 1866. After a decade of great popularity the game declined in favour, lawn-tennis (*q.v.*) taking its place, but revived again about 1897, when the Croquet Association, which controls the game in Britain and holds championship meetings, was founded. The ground marked out for play should be 35 yds. by 28 yds., the hoops six in number, standing 1 ft. high and 4 in. across, and the pegs two in number, standing 1½ ft. high and of 1½ in. diameter (for the arrangement of hoops and pegs, see larger works). The object of the game is for the player to strike his ball through each of the hoops and against each of the pegs in a definite order, his progress being retarded by the balls of his opponents and assisted by those of his partners. If he succeeds in scoring a point, *i.e.* strikes his ball through a hoop or against a peg, he is entitled to another stroke. When he strikes his ball against another ball which is in play he is entitled to two more strokes, and must lift his own ball and place it in contact with that which he struck, strike his own ball so that the other moves, and then proceed to attempt to score the next point. It is by alternating the above strokes that a good player scores a succession of points, or a 'break,' and makes a rapid progress through the hoops.

See *Laws of Croquet*, pub. annually by the Croquet Association; *Modern Croquet Tactics*, Locock.

CRORE, a hundred *lakhs*.

CROSBY, HOWARD (1826–91), Amer. Presbyterian minister, writer, and social reformer; preached total abstinence from alcohol. His s., ERNEST HOWARD (1856–1907), lawyer and social reformer, wrote books of verse against war, etc.

CROSIER, bp.'s crook, or pastoral staff, carried before him at religious ceremonials.

CROSS (Lat. *crux*, cross), in its most usual form the intersection of two straight lines at right angles, † (*crux immissa*); varieties are St. Andrew's C., X (*crux decussata*); Greek C., where the lines intersect equally at right angles, ✚; Egyptian C., shaped like letter ☥; while more elaborate c's are Patriarchal, Lorraine, Tau, and Nowy quadrant. The C. was a constant theme in prehistoric art and an important pagan symbol. Egyptian or *Tau* Cross, shaped like Gk. capital T, is frequently found in Egyptian art; arrangement of lines seen in *svastika* 卐, a Buddhist symbol, is found on Etruscan tombs. The C. is an ancient emblem in many countries, and was adopted as Christian symbol. Crucifixion was the old form of punishment in East, and was early used by Romans. After crucifixion of Christ, C. at once became favourite badge of Christians, and under Constantine, to whom it is said to have appeared in vision, obtained the place of a symbol of Christian Church. It is of great importance in Christian art, and *sign of C.* was early used for exorcism. Helena, mother of Constantine, is said to have discovered Christ's C., and Rom. Church celebrates feast of *Invention of Holy Cross* on May 3, but since 1895 recognition has been made of an earlier claim to its discovery than Helena's. At the feast the relic of the c. kept in the Church of S. Croce in Gerusalemme at Rome is offered to view. Feast of Exaltation of the Holy C., Sep. 14, is said by some to commemorate the erection of churches by Helena on the sites of her discovery and of Holy Sepulchre, by others to commemorate the day of appearance of the C. to Constantine.

Besides the crosses named, there are numerous others of various significations, amongst which are the 'Celtic C.,' in which a circle is included in the upper portion; the 'Runic C.,' used by the Norsemen to define boundaries, and also erected over the tombs of heroes; the twelve varieties of c. employed in heraldry; the 'Red C. of Geneva'; the 'Maltese C.,' in which the ends are broadened; the c. upon coins; the Fr. C. of the Legion of Honour, conferred upon persons of distinguished abilities; the Brit. 'Victoria C.' (V.C.), a bronze decoration, instituted in 1854, and awarded for valour in war; the 'fiery c.' of the Scot. Highlands, consisting of small wooden c., the extremities of which had been charred and dipped in the blood of a goat, and used for the purpose of mustering the clans. In astronomy there are the 'Northern C.,' formed by four stars in Cygnus; and the 'Southern C.,' a brilliant star group, seen in the S. hemisphere, first reckoned a constellation in 1679. Town crosses were originally pulpits, or were memorials of great events. Later they became elaborate structures, *e.g.* Winchester Market C., Edinburgh Mercat C. 'The Cross' in many Scot. towns at the present day is a square at the centre of the town.

Rimmer, *The Ancient Stone Crosses of England* (1875); Ashton and Baring-Gould, *Legendary History of the Cross* (1887).

CROSS RIVER (*c.* 5° 30′ N., 8° E.), river, West Africa; rises in mountains of Kamerun, enters Bight of Biafra through Calabar estuary.

CROSS ROADS, BURIAL AT, custom of disposing of bodies of criminals as nearest approach to consecrated burial.

CROSS SPRINGER, term in arch. for the point from which a vaulted rib starts.

CROSSBILL (*Loxia*), genus of birds belonging to the finch family, living in cone-bearing trees of Europe, Asia, and N. America. The curious bill, in which the mandibles are crossed, is adapted for the extraction of seeds from fir-cones, apples, or other fruits.

CROSS-BREEDING, see BREED.

CROSSEN, KROSSEN (52° 3′ N., 15° 3′ E.), town, on Oder, Prussia, Germany; manufactures woollen goods; brisk shipping trade in wine and fruit. Pop. (1910) 7588.

CROSSING, see BREED.

CROSSING, term in arch. for the point wherein the nave and transept meet.

CROSSKEY, HENRY WILLIAM (1826–93), Eng. clergyman and geologist; authority on Brit. glacial geol.

CROSSOPTERYGII, see under FISHES.

CROSSOPUS, see SHRUB FAMILY.

CROTCH, WILLIAM (1775–1847), Eng. musician and composer.

CROTON OIL, prepared by grinding the seeds of the euphorbiaceous tree, *Croton Tiglium*, is a viscid, brownish-yellow, acid, malodorous fluid; powerful irritant, used in med. as a violent purgative, and, mixed with Cajiput oil and alcohol, as a blister-raising liniment, *e.g.* in acute bronchitis.

CROTONA (39° 8′ N., 17° 8′ E.), ancient Gk. town, E. of Lucania, Italy; founded by Achæans, 710 B.C.; residence of philosopher Pythagoras; modern Cotrone.

CROTONIC ACID ($C_4H_6O_2$) crystallises in needles, M.P. 72°, B.P. *c.* 180°. Isocrotonic acid is an oil (B.P. *c.* 172°), and methacrylic acid crystals (M.P. 16°, B.P. *c.* 160°) are isomeric acids.

CROUP, term formerly applied to conditions in which there is difficulty in breathing, sore throat, hoarseness, and hard coughing, most of such cases being now recognised as of diphtheritic origin (see DIPHTHERIA). A false membrane, resembling that of diphtheria, may also be found on the throat in scarlet fever, measles, etc., but in such cases the so-called c. is merely a complication of the primary disease. The term is properly now applied only in non-infectious acute laryngitis (inflammation of the throat), in which in severe cases the mucous membrane may be very much swollen, the difficulty in breathing intense, and death may occur in a few hours. In the slighter forms, rest in bed, a steam-kettle to assist breathing, eucalyptus inhalations, and a dose of Dover's powder or sometimes ipecacuanha wine at first, as an emetic, usually effect recovery. Such cases must always be under the care of a medical man, as they may go on to the more severe forms, in which ice to suck at times gives some relief, ether is sprayed on the throat, and tracheotomy, making an artificial opening into the windpipe, is often necessary.

CROUSAZ, JEAN PIERRE DE (1663–1750), Swiss writer on philosophy and logic.

CROW FAMILY, CORVIDÆ, moderately sized, large, and strong-billed perching birds, often with black, or black and grey plumage. The 330 known species are spread over the whole world, and many are familiar in Britain. The members of the genus *Corvus* are known by their sharp-edged bill, straight beneath, curved to the tip on the upper profile: such are the large glossy raven (*C. corax*), equally common in the Old World and America; the sooty, majestic rook (*C. frugilegus*); the carrion crow (*C. corone*); the jackdaw (*C. monedula*); and the hooded crow (*C. cornix*). The long-tailed magpies have a single black-and-white representative (*Pica pica*) in Britain; the common jay (*Garrulus glandarius*), common throughout Europe, is easily distinguished by the light-blue bars on its wing feathers.

The species mentioned above, while for the great part vegetarian, also feed upon animal matter, lambs and small mammals, young birds and eggs, and carrion, but the nutcrackers (*Nucifraga*), which have long pointed bills and occur both in America and in Europe and Asia, feed on nuts and fruits.

CROW INDIANS, tribe of N. Amer. Indians inhabiting reservation in Montana; once notorious for raids on whites.

CROWBERRY, CRAKEBERRY (*Empetrum nigrum*), small heath-like shrub with edible black berries; grows in the colder parts of N. hemisphere and on the S. American Andes.

CROWE, EYRE EVANS (1799–1868), Eng. historian and journalist; author of valuable *History of France*.

CROWLAND, CROYLAND (52° 42′ N., 0° 11′ W.), market town, on Welland, Lincolnshire, England; a Benedictine abbey was founded by King Ethelbald in VIII. cent., and portion remaining is now used as parish church.

CROWLEY, ROBERT (*c.* 1518–88), Eng. printer, anti-Romanist writer, and social reformer; supported Protector Somerset, and was pioneer of Puritanism under Elizabeth.

CROWN, gold coin of Henry VIII.'s reign; since Charles II.'s days coined only in silver; value, five shillings.

CROWN, head-dress worn as badge of honour. Alexander the Great wore the first royal crown of Greece, but the crown was never a symbol of rule in republican or imperial Rome; as in Greece, victors in athletic contests received wreaths of leaves or flowers, which also rewarded success in war, and were worn on ceremonial occasions; gold later replaced early simple garland. C. has been a symbol of sovereignty since the beginning of Christian times, replacing earlier diadem. Eng. dukes and marquesses were first invested with crowns in XIV. cent. The royal crown of Britain was made in Charles II.'s reign; made of gold and studded with gems, it is surmounted with a Maltese cross, having on each point a pearl. Queen Mary wears the crown which was specially made for Queen Victoria in 1838; it contains the ruby taken by Henry V. at *Agincourt*, the sapphire from Edward the Confessor's ring, and the sapphire from the crown of Charles II. Queen Alexandra's crown bears in its centre the celebrated Koh-i-noor diamond. The Scot. crown was recovered from a chest in Edinburgh Castle in 1818, and can be seen amidst other Scot. regalia at the Castle.

The coronet, a small crown, is the state head-dress of the nobility; a duke's coronet being a gold circle surmounted by eight strawberry leaves of gold; a marquess's, silver gilt with four gold strawberry leaves; an earl's, silver gilt with eight silver balls on points, with gold strawberry leaves between; a viscount's, silver gilt with sixteen silver balls; while a baron's is silver gilt with six silver balls. Their being worn by earls dates from 1444, when Earl of Warwick received the right to wear a coronet; viscounts acquired the right under James I., and barons in 1661.

Legg, *Eng. Coronation Records* (1901).

CROWN DEBT, amounts due to the Crown, which take precedence of all other debts.

CROWN LAND, estate belonging to head of a country or state.

CROWN POINT (43° 54′ N., 73° 29′ W.), town, New York State, U.S.A.; fort captured from British by Americans, 1775; lumber manufactures.

CROWNE, JOHN (fl. 1685), Eng. dramatist.

CROWTH, CROWD, CRWTH, musical instrument of the lyre kind, used in mediæval times.

CROWTHER, SAMUEL ADJAI (1810–91), African native bp. (1864) of Niger territories.

CROYDON (51° 22′ N., 0° 6′ W.), town, Surrey, England; chiefly residential; has handsome parish church and public buildings; formerly seat of abp's of Canterbury; has excellent railway service; chief manufacture, clocks. Pop. (1911) 169,559.

CROYLAND, see CROWLAND.

CROZAT, PIERRE (1661–1740), Fr. art connoisseur; author of the *Cabinet Crozat*.

CROZET ISLANDS (46° 27′ S., 52° E.), group of uninhabited islands of volcanic origin, in S. Indian Ocean.

CROZIER, WILLIAM (1855–), Amer. military inventor; chief of ordnance, U.S. army, 1901; invented Buffington-Crozier disappearing gun-carriage; wrote text-book, *On the Construction of Ordnance*.

CRUCIFERÆ, large order of plants, widely distributed in temperate zones, whose flowers have four petals arranged like a Maltese cross and six stamens, two opposite stamens being shorter than the others. Insects generally effect the pollination. About 120 genera with 1200 species are known, many of them cultivated for food; they include cabbage, radish, mustard, stock, wallflower, charlock, shepherd's purse, and other well-known garden and field plants.

CRUDEN (57° 24′ N., 1° 52′ W.), village, on Cruden Bay, Aberdeenshire, Scotland; seaside resort.

CRUDEN, ALEXANDER (1701–70), Scot. scholar; author of *Concordance* to the Bible, pub. 1737, and

other works, chiefly religious. As a reformer of public morals he carried a sponge to efface offensive scribbling in streets, and called himself 'Alexander the Corrector'; often confined for intermittent lunacy, and of permanent eccentricity.

CRUELTY TO ANIMALS, see ANIMALS.

CRUIKSHANK, GEORGE (1792–1878), Eng. artist, caricaturist, and book-illustrator; secured immense popularity by his illustrations to Dickens, Ainsworth, Lever, etc.; work held in great estimation by Ruskin and other discerning critics.

CRUNDEN, JOHN (d. 1828), Eng. designer; noted for his *Designs of Ceilings*, etc.

CRUSADES, name for series of expeditions (XI.–XIII. cent's) for the purpose of rescuing the Holy Land from 'infidels' and extending the territory of Christianity. The immediate cause was danger to the Byzantine Empire from Seljukian Turks. Persians had conquered Mesopotamia and northern Syria and invaded Asia Minor (603–10), when the usurper Phocas was Byzantine emperor. Under his successor, Palestine was attacked, Jerusalem with the Holy Sepulchre fell into Persian hands, 614, and a Persian force seized Chalcedon, close to Constantinople. The Church took the lead in fitting out an army, and after a long, brilliant war, which was precedent for C., recovered the Holy Land, 628.

A more important precedent was established in the wars of Muhammadanism: the 'Star and Crescent' was the emblem of Holy War before the Cross. The Arabs had attacked the Byzantine and Persian Empires, and captured Jerusalem, 637. The proselytising zeal of the Arabs, however, soon died away, Christianity on the whole being tolerated and pilgrimages allowed to Holy places. With the rise of the Seljukian Turks not only Christianity but civilisation was threatened. The Turks, who had accepted Muhammadanism, established a great Mongol state in Asia under Seljuk, conquered Persia, and attacked the Eastern Empire at the period of its lowest decline. A decisive victory at *Manzikert* resulted in the capture of Jerusalem from Arabs (1071); Asia Minor was conquered; appeals were made by Emperor Alexius Comnenus to Baldwin of Flanders and Pope Urban II.

Pilgrimages to Jerusalem were naturally regarded as of greater sanctifying benefit than those to ordinary shrines, and were very often made. Under Turk. rule pilgrims were subject to great outrages; and the idea of a Holy War was taken up by Gregory VII., when the Byzantine emperor, Michael VII., begged for aid against the Turk. Envoys of Emperor Alexius appeared at Council of Clermont (1095), and Urban II. made a speech advocating aid to Eastern Empire as incident to a larger attack on the infidel. The great object was the recovery of Holy places, but C's were partly due to other motives, some of them secular. The Church conceived the idea of turning to pious use the warlike character of feudal society; rulers were glad to direct energies of turbulent nobles into distant channels; great nobles entertained visions of rule in the East. A pestilence was then raging in Europe, and dearth and civil strife made men eager to escape and try possibilities of countries reputed to be rich. Urban's speech was received with great enthusiasm; crosses of stuff were distributed among pilgrims to wear as emblem; Peter the Hermit, monk of Amiens, wandered on an ass through France and Italy, preaching a Holy War (there seems to be no authority for legend that he first inspired Urban), and headed a contingent of one of the two great divisions of the **First Crusade.**

Five contingents of 'paupers' formed the first division, of which only two contingents (under Peter the Hermit and Walter the Penniless) arrived at Constantinople. The whole company fell before the Turks on setting foot in Asia Minor (1097). The second division, that of the magnates, was under the general command of Adhemar, bp. of Puy, and papal legate, whose appointment by the pope marked Church origin of war. Chief leaders were: Godfrey de Bouillon, his bro's Baldwin and Eustace, Hugh de Vermandois, bro. of king of France, Stephen, Count of Blois, Robert, Count of Flanders, Raymond, Count of Toulouse, Bohemund, Prince of Otranto, and Tancred, Duke of Apulia; they arrived at Constantinople in 1097; their force, according to tradition, numbered 300,000 men, but probably its strength was only half that number. Alexius carefully took homage of leaders for lands they might conquer from infidels, before allowing the huge army to pass on. The moment was favourable; the population of Asia Minor and Syria, groaning under military occupation of the barbarous Turk, was ready to assist; the Seljukian Empire, extremely decentralised, was a prey to dissensions. Jerusalem changed hands in 1098, and Asia Minor was speedily restored to Byzantine Empire; Antioch was captured and retained by Bohemund, 1098, but disputed by Raymond. Baldwin was made Count of Edessa. Led by Godfrey de Bouillon, the Crusaders, their forces diminished by fever and famine, captured Jerusalem after a month's siege (1099); the papal legate being dead, Godfrey was made ruler as 'advocate of the Holy Sepulchre.' On Godfrey's death (1100) Baldwin was crowned king of Jerusalem, and enmity to Bohemund of Antioch led to support of Latin Kingdom by the Byzantine emperor; other leaders obtained feudal lordships in the midst of the enemies' country, Turks and Arabs not being completely expelled.

Second Crusade (1147–49), Latin Kingdom failed to become permanent; the Franks could not thrive in the climate, morality suffered, Eastern vices were adopted, people were alienated by despotic rule which showed worst evils of feudal system. Edessa was captured by Muhammadans (1144); and Franks appealed to Europe. St. Bernard at request of Eugenius III. preached a C.; Louis VII. of France and Conrad III. of Germany took the Cross, the overlordship of territories gained being reserved to Byzantine emperor. There was disunion from the first: Byzantine emperor could not give aid because of a war with Sicily; the north Ger. force was diverted in a separate C. against the Wends; that of England and Netherlands went to capture Lisbon; Conrad and Louis united in Holy Land with King Baldwin III. in an unsuccessful attack on Damascus and returned. The net result was further weakening of the Latin Kingdom. Damascus conquered by Turks, 1154, and regained, 1174, was taken, 1183, by Saladin, who thus united Muhammadan realms of Egypt and of northern Syria. Jerusalem fell, 1187.

Third Crusade (1189–92).—At the news of the capture of the Holy City papal letters were issued and the kings of Germany, France, and England took the Cross; 'Saladin tithe' was imposed on all who did not go, while, on the other hand, Crusaders' debts were wiped out; the finest force ever seen in the Middle Ages consequently assembled. Acre, the key to Jerusalem, already besieged by king of Jerusalem, Guy de Lusignan, was the first object of attack; Frederick Barbarossa died on the way, and the German force was almost entirely destroyed; Richard *Cœur de Lion* turned aside to conquer Cyprus, thus becoming founder of Latin Kingdom of Cyprus, but joined French, 1191, before Acre, which surrendered shortly afterwards. Philip Augustus and Richard quarrelled, and the former returned to France; Richard, unable to take Jerusalem, made a truce with Saladin, 1192, by which Christians retained only the seaboard from Jaffa to Tyre and received permission to visit the Holy Sepulchre. An important feature of this C. is lay initiative and subordinate religious element.

Fourth Crusade (1202–4).—Henry VI., emperor of Germany, took the Cross in 1195, but died (1197) before he was ready to start; from his plans, however, his real aim was to attack Byzantine Empire. Innocent III. now took up the work and sought to restore to C's the character of a Holy War lost sight of in territorial schemes; France responded, Theobald of Champagne being chief commander, and Baldwin of Flanders and

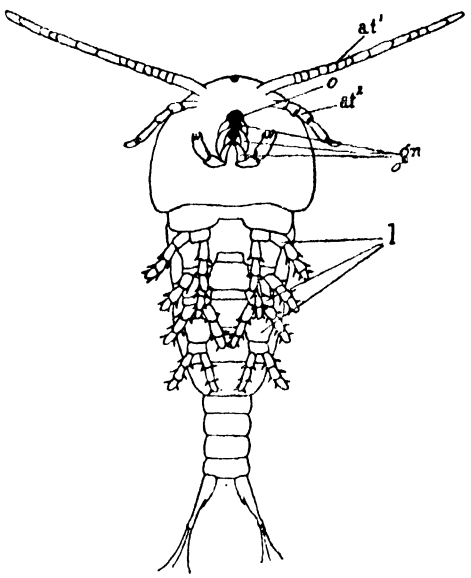
the Count of Blois being leaders. They decided to attack Egypt, chief seat of Turk. rule, as a preliminary to the recapture of Palestine; Venice lent her fleet, but once the Crusaders were embarked the schemes of Innocent III. went for naught. Persuaded by Philip of Swabia and Venetians the flotilla sailed for Constantinople, capturing Zara for Venice on its way; Constantinople was captured (1204); Baldwin of Flanders was made Byzantine emperor and the territory of Venice enlarged at expense of the Empire. Result of C. was fatal diversion of Crusaders. Clergy of north of France and Germany, in despair, imagined the scheme of CRUSADE OF CHILDREN, hoping that success might be obtained if instruments were pure; thousands of children perished or were sold as slaves (1212).

Fifth Crusade (1218–21), due to enthusiasm of Innocent III. for recapture of Holy places, was preached by him at the fourth Lateran Council, 1215; a Truce of God was proclaimed in the W., and trade with the infidel was forbidden. Emperor Frederic II. took the Cross, but delayed joining; large forces from Germany, however, and from Austria and Hungary, again set forth under leadership of John de Brienne, king of Jerusalem, for Egypt, and captured Damietta, 1219; the papal legate refused to accept terms offered by Sultan, but Crusaders were driven from Egypt, gaining nothing but the surrender of the Holy Cross.

Sixth Crusade (1228–29).—C. of territorial expansion based on alliance with infidel and under the interdict of the Church; of great interest as remarkable episode in career of Emperor Frederick II., who became titular king of Jerusalem (1225) by marriage with Isabel de Brienne. Frederick, almost certainly a polytheist or freethinker, started on the C. (1227), but, falling sick, returned to Italy, thus incurring papal excommunication, as Gregory IX. would not credit his excuse. Still under the papal ban, Frederick left Italy (1228) and made a treaty (1229) with Sultan by which, in return for toleration of Muhammadanism, he was allowed to proceed to his kingdom of Jerusalem, and Judea was ceded to the Christians. Frederick was obliged to put the crown on his own head as no priest would do so; he was absolved by the pope (1229). Frederick, however, failed in his attempt to rule Jerusalem, and was compelled to acquiesce in the independence of the Frankish baronage of that kingdom (1243). Jerusalem, laid waste by Mongolian tribes (1244), was captured by Turks in the same year, and never again came into Christian hands.

Seventh Crusade.—On news of the fall of Jerusalem, a new crusading movement started. Papacy was again at war with Emperor, and at Council of Lyons (1245) Innocent IV. preached a C. against both Frederick II. and infidels. Louis IX. (*St. Louis*) of France supplied the religious element, taking the Cross and winning adherents; Damietta fell at his approach (1249), but, as in Fifth C., further progress was impossible; being captured, he was forced to pay a heavy ransom and to restore Damietta; he went on a pilgrimage to Holy Land, and until 1254 did penance and sought to organise the Christian kingdom. Muhammadans, now weakened by pressure of Tartar tribes and Mameluke mercenaries, became supreme in Egypt, but the Latin Kingdom was torn by dissensions. The Mameluke captain, Bibars, became Sultan (1260), and conquered Jaffa and Antioch (1268).

Eighth Crusade.—Remaining towns of Holy Land being threatened by Bibars, Louis IX. again took the Cross (1270), but the crusading movement was dead; only hired soldiers and barons bound by feudal duty followed; an attack on Tunis failed, and Louis died of plague. His companion and heir, Philip the Bold, only secured his retreat by a humiliating truce. Council of Lyons (1274) in vain preached a new C.; Tripoli fell (1289) before the successor of Bibars: Acre surrendered in 1291; Cyprus alone remained under Christian rule. Capture of Rhodes by Hospitallers took place in 1310; an attack in the old crusading spirit was made on Egypt and Syria by Peter I. of Cyprus (1365–69); defensive wars waged by Christians against Turks in XIV. and XV. cent's ended (1453) in capture of Constantinople by Muhammad II.



The importance of the C's in the history of civilisation lies in their opening up the East for trade, and the impetus they gave to the study of war. Systematic taxation commenced during C's; France and the papacy, having taken most important part, gained greatly in prestige. History, poetry, languages, and culture of European states were all influenced.

W. B. Stevenson, *The Crusaders in the East* (1907); T. A. Archer and C. L. Kingsford, *Crusades* (1894); G. W. Cox, *The Crusades* (1910).

CRUSENSTOLPE, MAGNUS JAKOB (1795–1865), Swed. hist. and political writer.

CRUSOE, ROBINSON, see SELKIRK (ALEXANDER), DEFOE (DANIEL).

CRUSTACEA, class of Arthropoda, comprising lobsters, crayfish, prawns, shrimps, crabs, barnacles, water-fleas, wood-lice, sand-hoppers, numerous parasitic and an enormous number of microscopical forms widely distributed in all seas as constituent of the 'plankton' (*q.v.*). It is difficult to characterise a group consisting of such diverse members, but they generally have in

A WATER-FLEA, AS AN EXAMPLE OF CRUSTACEA, VIEWED FROM BELOW. *at*¹, first antennæ; *at*², second antennæ; *gn*, gnathites (jaws); *l*, walking legs; *o*, mouth.

common a chitinous coat impregnated with carbonate of lime, two-branched appendages, the latter occurring on the abdomen as well as the thorax; and, on the whole, they live in water. Their development is usually indirect, several larval stages being passed through before attaining the adult form. The following are the more important Crustacean orders: *Branchiopoda*, including brine-shrimps and the primitive Apus. *Cladocera*, or water-fleas, chiefly freshwater, exhibit an interesting alternation of parthenogenetic and fertilised generations. *Ostracoda*, small, laterally compressed, and with a bivalve shell. *Copepoda* swim about very actively and occur in vast numbers, constituting an important part of the food-supply of fishes. Many are parasitic, *e.g.* the 'fish-lice.' *Thyrostraca*, or Cirripedia, include barnacles and acorn shells, as well as the degenerate parasite Sacculina living in the crab. The *Leptostraca* are of theoretical interest, as they probably link the higher Crustaceans with ancient Palæozoic forms. In *Isopoda* the body is flattened from above downwards, and some, the wood-lice or slaters (Oniscus) and pill-bugs (Armadillo), have a respiratory system adapted

for terrestial life. Others are parasitic, and the gribble (Limnoria) eats into wood. Asellus is a common fresh- or salt-water isopod. *Amphipoda* have a laterally flattened body, the beach-flees (Talitrus) and the aquatic Gammarus are common representatives. Phronima, Hyperia, and others are commensals, with other marine animals. The following orders have stalked eyes: *Schizopoda*, e.g. Mysis, Lophogaster, and Euphausia live in the sea, the latter having luminous organs on the eye-stalks. The *Decapoda*, with ten walking legs, comprise the best-known crustacean forms, lobsters, crabs, crayfish, shrimps, and prawns (*q.v.*) undergoing complete metamorphosis. The *Stomatopoda* are flattened and have a powerful abdomen. The *Cumacea* have unstalked eyes and are marine.

Fossil C. have been discovered from Cambrian strata.

W. T. Calman, *Life of Crustacea* (1911); Stebbing, *History of Crustacea* (1893).

CRUSTUMERIUM, ancient town, Latium, a few miles N.E. of Rome.

CRUVEILHIER, JEAN (1791–1874), Fr. anatomist; one of the foremost pathological anatomists of his country.

CRUZ E SILVA, ANTONIO DINIZ DA (1731–99), Portug. serio-comic poet.

CRYOLITE (Na_3AlF_6), mineral occurring in pearly-grey or white masses in granitic veins in Greenland; quarried for production of aluminium and manufacture of enamels and porcelains.

CRYPT, subterranean chamber in ecclesiastical building; originally a chapel attached to the tomb of saint or martyr. The c. of Canterbury Cathedral is the largest in England.

CRYPTOBRANCHUS, genus of tailed lung-breathing Batrachia of the family Amphiumidæ; three known species, *C. maximus* of Japan and Tibet being the largest living Batrachian (about 4 ft. long).

CRYPTOGAMS, see BOTANY.

CRYPTOGRAPHY, the art of writing in cipher, or secret characters. Amongst the various methods employed may be mentioned transposition of letters, the use of numerals, misplacement of words, vertical and diagonal reading, etc. The art was used by the ancient Spartans, by the Romans—particularly by Julius Cæsar—and, in later times, was largely employed by Charles I. and the Cavaliers. Francis Bacon exhibited a lively interest in the art, and laid down the dictum that a good cryptogram should be easy to write and read, impossible to detect, and should bear on the face of it nothing to suggest its being a secret message.

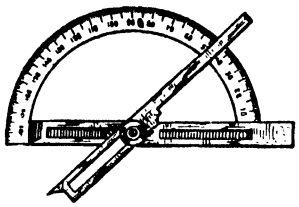
Pesler, *Cryptography* (1901); Admiral Beaufort, *Cryptography* (1910).

CRYPTOMERIA JAPONICA, Jap. cedar, beautiful evergreen tree of China and Japan; cultivated in sheltered parts of Britain; attains a height of 100 ft.

CRYSTAL, body naturally formed by the solidification of a liquid or gas, and bounded by symmetrically arranged plane surfaces, which are the expression of a definite structure. These surfaces meet in constant angles, which are often characteristic of certain substances. Perfect c's are slowly formed from solution (*e.g.* alum, sugar, common salt), while ice is an example of solidification of a liquid, and hoar-frost and iodine of a vapour. Minerals (*e.g.* quartz, calcite, etc.) are the best-known examples of crystallisation. According to the number and disposition of their axes, *i.e.* imaginary lines drawn parallel to certain edges, or from solid angles to the opposite faces, through the centre of the c., crystals are grouped in six systems.

(1) *Cubic system* (Regular, Isometric, Octahedral, or Tesseral)—c's with three equal axes at right angles to each other. (*a*) Cube (*e.g.* salt, galena). (*b*) Octahedron (alum, magnetite). (*c*) Rhombic dodecahedron (garnet). (*d*) Tetrahedron (blende, boracite). (*e*) Pentagonal dodecahedron (pyrites). Other forms occur besides, and frequently two or three are combined. (2) *Tetragonal system* (Pyramidal, Dimetric, or Quadratic)—c's with three axes, but only two of equal length at right angles to each other. (*a*) Ditetragonal bipyramid. (*b*) Tetragonal prism. Combinations occur, *e.g.* apophyllite, rutile. Chalcopyrite, scheelite, urea, and other substances crystallise in different classes of the same system. (3) *Orthorhombic system* (Rhombic, Prismatic, or Trimetric)—c's with three axes of different lengths at right angles; potassium permanganate, Epsom salts, and picric acid are examples of salts crystallising in this system. (*a*) Orthorhombic bipyramids (sulphur). (*b*) Prism (barytes). (*c*) Bisphenoid. (4) *Monoclinic system* (Oblique, Monosymmetric)—c's with three axes of unequal length, two of which form right angles, while the third forms an oblique angle with the others, *e.g.* gypsum, borax, amphiboles, orthoclase naphthalene, cane-sugar, milk-sugar, sodium hypophosphate. (5) *Anorthic system* (Triclinic)—c's with three unequal axes, none at right angles, *e.g.* potassium bichromate, axinite, chalcanthite. (6) *Hexagonal system*—c's with a principal axis and symmetry in three or six directions. (*a*) Rhombohedron (calcite). (*b*) Scalenohedron (calcite). (*c*) Hexagonal prism (tourmaline). (*d*) Hexagonal bipyramid (quartz). For detailed classification, see references.

The growth of c. is not always regular, and two c's may grow together or twin. *Crystallites* (q.v.) are incipient c. arrested in development. That different crystalline forms are expressions of different atomic structures is proved by the examination of the physical and chemical properties of crystal.



When c's are elastic, they may be deformed by pressure or tension (*e.g.* ice and the 'liquid crystals'). Hardness depends on crystalline structure, a well-known example being the two modifications of carbon, diamond and graphite. An important character is that of cleavage, many c's being cleavable in planes parallel to well-developed faces; calcite and mica show perfect cleavage. A method by which the symmetry of c's has been determined has been discovered by corroding c. by suitable solvents which leave characteristic and well-defined 'etched figures' or small pits on the faces. The optical properties of c's, their refraction and absorption of light, and their behaviour in polarised light, are of the utmost importance in determining to what species they belong, *e.g.* gem-stones, and discovering their internal structure. Crystalline symmetry is also illustrated by their electrical properties, different faces of c. acting differently under charges of heat and electricity. As regards the relations between crystalline form and chemical composition, some substances of the same chemical formula, *e.g.* calcite and aragonite, graphite and diamond, have a different form (dimorphism), other absolutely different substances chemically have the same form, *e.g.* marcasite (FeS_2) and celestite ($SrSO_4$) (homœomorphism). Chemically related substances frequently crystallise in a similar way (isomorphism), *e.g.* the mineral carbonates of calcium, cobalt, iron, magnesium, manganese, etc., all form rhombohedral crystals. See MINERAL (MINERALOGY).

W. J. Lewis, *A Treatise on Crystallography* (1899); H. A. Mier, *Mineralogy* (1902); A. E. H. Tutton, *Crystalline Structure and Chemical Constitution* (1910).

Crystallisation, process of forming crystals, usually by cooling out of a substance in state of solution. Fractional c. means the separation of different substances by their successive c.

Crystallography, science of the form, structure, and properties of crystals. Nicolaus Steno (*q.v.*) was the first to record (1669) that, although the faces of different quartz crystals varied in size and shape, the angles as measured by a goniometer, the *Contact* form being used for large crystals) between corresponding faces are constant. This fact was corroborated by Bartholinus and Huygens, who agreed with R. Hooke's suggestion that crystals were built up of spheroids. Cappeller, of Lucerne, published the earliest treatise on c's (1723), but the science was not properly founded till 1783–84, when Romé de l'Isle and Haüy discovered the symmetry of crystals to certain planes, and derived all crystals from six 'primitive

forms.' C. S. Weiss (1809) studied crystalline forms from a geometrical standpoint, and introduced a new system of classification. Lévy, Naumann, and Miller (1839) devised methods of notation which refer the planes of crystals to three axes, corresponding in direction to three edges. In 1830 Hessel proved that 32 types of symmetry are possible in crystals, which are now grouped in 32 corresponding classes, belonging to 6 systems. The importance of the optical properties of crystals was recognised by Sir D. Brewster (*q.v.*), 1828. E. von Fedorow showed (1912) that when the crystals of any substance are correctly set up and measured on the theodolite goniometer they furnish an adequate means of identification without further analysis. The crystals of 10,000 substances have been thus measured and tabulated, and in future an unknown substance (if contained in the list) will be recognised as soon as its crystals are measured. Numerous discoveries in the allied sciences of chem., physics, and mineralogy have done much towards furthering the progress of c.

Contact Goniometer (Steeg and Reuter). The crystal is placed between the two edges terminating in a point, and the edges are made to lie along the faces of the crystal by adjusting until no trace of a white sheet held behind is seen between the edges and the crystal; the angle is then shown by the lower edge of the bar crossing the graduated arc.

Tutton, *Crystallography* (1911).

CRYSTAL PALACE, THE, place of entertainment, Sydenham, London; originally stood in Hyde Park, and is mainly structure erected for Exhibition of 1851; designed by Sir Joseph Paxton.

CRYSTAL GAZING ('Scrying') is the practice of looking into a glass ball or mirror, water, etc., and seeing] pictures either of past events or those happening elsewhere. Andrew Lang concluded that neither fraud nor coincidence would account for many of the remarkable results attained, though there has been much superstition mixed up with the subject.

Lang, *Making of Religion*; Thomas, *Crystal Gazing.*

CRYSTALLITE, minute forms of crystallisation discovered in 'glassy' volcanic rocks. They may be spherical (globulites), or strung together like beads (margarites), or in groups (globospherites), or like small daggers (longulites), or like hairs (trichites). Microliths are very minute crystallic bodies, usually densely crowded together, often forming fibres or tree-like grouping.

CSENGERY, ANTON (1822–80), Hungarian publicist.

CSIKY, GREGOR (1842–91), Hungarian dramatist

CSOKONAI, MIHALY VITEZ (1773–1805), Hungarian poet.

CSOMA DE KÖRÖS (d. 1842), Hungarian philologist.

CTENOPHORA, class of Cœlentera, comprising transparent, free-swimming, generally more or less ellipsoidal, often phosphorescent sea-animals, moving with the aid of eight rows of comb-like ciliated plates arranged on meridians, provided with a well-developed jelly-like layer, 'mesoglœa,' a mouth, and ectodermic gullet, and a sense-organ at the pole opposite to the mouth. They are hermaphrodite and undergo direct development. All species except *Beroe* and its relatives are provided with retractile tentacles bearing adhesive cells, e.g. *Cydippe* and the ribbon-shaped Venus' girdle (*Cestus*). See Embryology.

CTESIAS (V. cent.), Gk. historian.

CTESIPHON (*c.* 33° 10′ N., 44° 40′ E.), ancient ruined village, on Tigris, Mesopotamia; was one of the chief cities of the Parthians.

CUBA (19° 50′ to 23° 11′ N., 74° 10′ to 84° 57′ W.), republic; largest of W. Indian islands at mouth of Gulf of Mexico, 130 miles S. of Florida, and separated from Key West by Florida Strait; area, 44,000 miles; *c.* 750 miles long; breadth, 27 to 150 miles; coast-line, *c.* 2000 miles, exceedingly dangerous for shipping owing to banks and reefs. There are numerous excellent harbours—notably Havana (*q.v.*), the capital, one of finest in W. Indies. In the Sierra de Maestra (province of Santiago) the Pico de Tarquino rises 8400 ft. These mts. are densely wooded, and contain copper, iron, and other minerals. The largest river is the Cauto (250 miles long; about a third being navigable for small craft).

The climate of C. is more temperate than in other W. Indian islands, and healthy in highlands of the interior, but fever and ague prevail on the coast. During coldest months (Dec. and Jan.) the temperature seldom falls below 50°, and during July and Aug. (the hottest months) 83° is about the maximum. There is no snow in the lowlands, and the annual rainfall varies from 40 to 160 inches. Desolating hurricanes are frequent. The agouti or cavy and insectivore are the only indigenous animals, with the exception of the bat. Birds, including migrants from U.S.A., are very numerous.

History.—C. (sometimes called 'Queen of the Antilles') is divided into six provinces, and has been an independent republic since 1902. It was discovered by Columbus on his first voyage in 1492, and in 1511 Spaniards settled at Baracoa. The natives were immediately subjected and, under cruel tyranny, speedily exterminated, and negroes were brought in. In 1519 Havana (*q.v.*) was founded. In 1846 a hurricane swept away 1872 houses and sank 216 vessels. C. progressed favourably and, being open to the world, carried on a flourishing trade; but a War of Independence broke out in 1862, and was carried on fiercely—chiefly in the E.—till 1878. Owing to continued oppression by the Spaniards, a second war broke out in 1895; the U.S.A. intervened, and as a result of the Spanish-American War (*q.v.*) the island was completely freed of Span. sovereignty in 1898, and held by Americans until 1902. In 1906 an insurrection broke out, and a U.S.A. Commission undertook provisional government till 1909, when a new Pres. assumed office.

There is a House of Representatives with 83 members; the National Congress has 24 members—4 from each of the States. There is a Cabinet, consisting of Secs. of State, of Justice, and of the Interior; Ministers of Public Works, Commerce, Agriculture, Labour, Sanitation, and Charity. The navy consists of 13 steam cutters and revenue launches. There is a Rural Guard (5000-6000) and a small regular army.

C. abounds in luxuriant vegetation, the soil being exceedingly fertile. Long tracts of forests (embracing an area of 1,250,000 acres) are rich in mahogony, cedar, ebony, fustic, etc. A considerable portion of land is devoted to cattle-breeding. About half the centre cultivated land consists of sugar plantations, sugar being C.'s most important product. Tobacco, the second largest product, is grown chiefly in the Vuelta Abajo district. The principal cereal is Indian corn; other products are rice, coffee, cotton, maize, and tropical fruits. There are copper, manganese, and iron mines; gold is found in small quantities; also asphalt, which is not worked much.

America carries on a flourishing trade with C., and has coaling-stations in the Bay of Guantanamo and Bahia Honda. The chief towns are Havana, Santiago, Matanzas Cienfuegos, Camaguey, Cardeñas.

About two-thirds of inhabitants are whites (mostly of Span. descent); R.C. religion is predominant. Pop. 2,300,000.

Clark, *Commercial Cuba* (1899); Piron, *L'Ile de Cuba* (Paris, 1898); Roosevelt, *Rough Riders* (London, 1899).

CUBE (geom.), regular solid with six equal square sides; (algebra) the third power, the volume of a cube (a^3) being the product of its side (a) taken as a

factor thrice. See ALGEBRA, EQUATION, CRYSTALLOGRAPHY.

CUBEBS, dried unripe berry of *Piper cubeba*, a tropical Asiatic (Java) climbing shrub; used in medicine, as a stimulant of mucous membranes, expectorant, and the smoke in respiratory complaints.

CUBITT, SIR WILLIAM (1785–1861), Eng. engineer; invented treadmill; designed Oxford and other canals, the Bute Docks at Cardiff, floating landing-stages at Liverpool, and other works; he was frequently consulted by foreign authorities.

CUBITT, THOMAS (1788–1855), Eng. architect, who planned many of fashionable squares of London and assisted in projection of Battersea Park. His s., GEORGE (b. 1828), Conservative politician, was cr. Baron Ashcombe, 1892.

CUCHULIN, hero of cycle of stories in oldest Irish lit.; so called after episode in his career in which he acted as watch-dog for Culann, the smith, the name signifying 'Culann's Hound.'

CUCKOLDS, see TRUNK-FISHES.

CUCKOO (*Cuculus*), bird of solitary habits, feeding on insects and caterpillars; familiar in Old-World folklore; noted for its characteristic two-syllabled call, and for foisting its parental duties of hatching and feeding the young on other birds, such as the hedge-sparrow, water-wagtail, and titlark. The fact that c.'s eggs often closely resemble those of their foster-nurses is a peculiar example of natural selection. The adult c.'s remain in the Brit. Isles between March and July, while the young follow them to warmer climes in Sept. Other genera of the same family (Cuculidæ) show parasitic habits, *e.g.* jay c. and American c. The coucal, channelbill, and anis are more divergent types.

Kirkham, *The Brit. Bird Book* (1910).

CUCKOO-PINT, LORDS AND LADIES, WAKE-ROBIN (*Arum maculatum*), plant of order Aroidaceæ; flowers arranged on a spadix and enclosed by a bract or spathe.

CUCKOO-SPIT, frothy secretion found on plants produced by the froth-fly (or frog-hopper), a small insect. Within the secretion is found the larva.

CUCUMBER (*Cucumis sativa*), widely cultivated, edible, annual creeping plant of the order Cucurbitaceæ (*q.v.*), smaller varieties being termed *gherkins*. The squirting c., *Ecballium elaterium*, yields the extremely powerful purgative elaterium.

CUCURBITACEÆ, order of tendrilled climbing plants containing about 85 genera and 650 species, with succulent, frequently edible, tough-rinded fruits, growing in temperate and warm climates. The briony, cucumbers, gourd, melon, pumpkin, marrow, and chocho are the more important representatives. The fibrous pericarp of *Luffa ægyptiaca* provides the loofah used in the bathroom and in manufacture of hats.

CUDDALORE (11° 42′ N., 79° 48′ E.), town, S. Arcot district, Madras, India; exports sugar, oil-seeds, and indigo; scene of several battles between French and British in XVIII. cent. Pop. (1911) 52,216.

CUDDAPAH (14° 29′ N., 78° 52′ E.), district, Madras, India; partly hilly, partly low-lying plains climate unhealthy; watered by Pennar and tributaries chief town, CUDDAPAH; cotton and indigo are exported. Area, 8723 sq. miles. Pop. 1,291,267.

CUDWORTH, RALPH (1617–88), Eng. divine and philosopher; the greatest of the Cambridge Platonists. His chief works were *The True Intellectual System of the Universe* (1678) and *Treatise Concerning Eternal and Immutable Morality*. Against atheism he endeavoured with enormous learning to show that belief in a single and good God underlay even pagan polytheism, and that the existence of such a God is demonstrable; against sensationalism, that there are truths of reason, *e.g.* the mathematical; and against Hobbes's ethics, that there are moral ideas and rules, independent of private interest or positive law, directly apprehended by reason.

CUENCA (2° 48′ S., 78° 51′ W.), city, Ecuador, S. America; cathedral and univ.; sugar refineries; exports Peruvian bark, hides, cheese. Pop. 30,000.

CUENCA (40° N., 2° 15′ W.), province, Central Spain; chiefly mountains and valleys, clothed with pine forests; stock-raising. Area, 6636 sq. miles. Pop. (1910) 268,458.—CUENCA, the capital, has a Gothic cathedral, and is birthplace of Molina. Pop. 11,000.

CUESTA, Mexican term for 'scarped' ridge of land, when one slope is steep and the other only slightly inclined.

CUEVAS DE VERA (37° 17′ N., 2° W.), town, on Almanzora, Spain; district rich in silver mines. Pop. 20,562.

CUIRASS (O. Fr. *cuirée*, Ital. *curazza*), piece of armour, originally leather, later any close-fitting protection for body against attack; now applied to piece of mail covering upper part of body composed of breast-plate and back-plate buckled together at sides. A *cuirassier* is a horse soldier who wears a c., *e.g.* Household Cavalry; the name cuirassier is not now used in Britain.

CUJAS, JACQUES, CUJACIUS (1520–90), Fr. jurist, famous for collections of MSS. and his own commentaries. He lectured on law at various univ's, but is chiefly associated with Bourges; first edit's of his works rare.

CULDEES, monastic order established in Ireland and Scotland from VIII. to XIV. cent., when they seem to have been incorporated with the Canons Regular. In Ireland they did pastoral work in connection with monasteries; in Scotland they were independent, each house having its religious and lay brethren.

Beveridge, *Makers of the Scot. Church* (1908).

CULEBRA (18° 20′ N., 65° 20′ W.), one of Virgin Islands, E. of Porto Rico, and dependency thereof.

CULLEN (57° 41′ N., 2° 49′ W.), seaport, on Moray Firth, Banffshire, Scotland; industries, fisheries, rope- and sail-making.

CULLEN, PAUL (1803–78), Irish ecclesiastic; Abp. of Armagh, 1849; of Dublin, 1852; cardinal, 1866; opposed extreme nationalists and sided with Brit. Government against Fenians.

CULLEN, WILLIAM (1710–90), Scot. physician; practised at Hamilton. Lecturing on chem., bot., and medical subjects at Glasgow Univ., he soon proved to be a teacher of extraordinary ability; app. to chair of med., founded for him at Glasgow; subsequently elected prof. of Chem. in Edinburgh he at the same time lectured on materia medica. He relinquished the chair of chem. on accepting successively the chairs of institutes of med. and practice of physic; pub. several standard works on medicine.

W. Thomson and D. Craigie, *Cullen's Life, Lectures and Writings* (1859).

CULLERA (39° 10′ N., 0° 15′ W.), seaport, Valencia, Spain; exports grain, fruits. Pop. 12,000.

CULLINAN (25° 35′ S., 28° 40′ E.), town, Transvaal; named after Sir Thos. Cullinan, the chairman of the company owning the diamond mines there. The famous C. diamond (discovered in 1905) was bought by the Transvaal Government for £150,000, and presented to Edward VII. While being cut in Amsterdam, a flaw was discovered, and the diamond was divided into a number of gems (including two largest brilliants in existence, viz. 516 and 309 carats). See DIAMOND.

CULLODEN (57° 30′ N., 4° 5′ W.), moor, 6 miles N.E. of Inverness, Scotland; scene of defeat of Prince Charles Edward by Duke of Cumberland, April 16, 1746 (also called *Drummossie Muir*); fine examples of stone circles on neighbouring plain of Clava.

CULM, shales and limestones in coal measures of Lower Carboniferous system; term first applied to Devonshire strata, then extended to corresponding stages elsewhere, containing the characteristic fossil *Posidonomya*.

E. A. N. Arber, *On the Upper Carboniferous Rocks of W. Devon and N. Cornwall*, Q.J.G.S., lxiii. (1907).

CULMINATION, reaching of highest point; (astron.) points where heavenly body crosses meridian.

CULROSS (56° 4′ N., 3° 38′ W.), town, on Firth of

Forth, Fifeshire, Scotland; remains of Cistercian abbey (1217); formerly extensive coal-field.

CUMACEA, see MALACOSTRACA.

CUMÆ, KYME (40° 50′ N., 15° 5′ E.), earliest Gk. colony in Italy, on W. coast, near Naples; only ruins remain of once flourishing city—Acropolis, Arco Felice (brick arch, 64 ft. high), amphitheatre, etc.; abode of famous Cumæan sibyl (see SIBYLS); probably founded by Chalcidians from Eubœa, *c.* 1050 B.C.; under Rom. rule, *c.* 350 B.C.; destroyed by Neapolitans, 1205; interesting XIX.-cent. excavations.

CUMANÁ (10° 23′ N., 64° 20′ W.), town and port, Gulf of Cariaco, Venezuela; oldest European settlement on S. Amer. continent; almost totally destroyed by earthquake, 1853. Pop. 9000.

CUMBERLAND (54° 45′ N., 3° W.), most n.-westerly county in England, bordered by Scotland and Solway Firth in N. The S.E. of the county is picturesque, with steep and rugged mts. and narrow valleys, lakes, rivers, and waterfalls. The centre is hilly; the W. and N.W. low and flat. C. comprises part of the 'Lake District,' the largest lakes being Ullswater, Derwentwater, Bassenthwaite, Thirlemere, Buttermere, Wastwater, Ennerdale. Chief mts. are Scaw Fell Pike (3210 ft.), Scaw Fell (3162), Helvellyn (3118), Skiddaw (3062), Bow Fell (2960), Cross Fell (2892). The most important rivers are Eden, Esk, and Derwent. The climate is wet and variable specially from July to Oct.; rainfall at Styhead Pass (1077 ft.), 50–244 in. There are numerous small dairies, estates, and farms. Chief towns are Carlisle (great railway centre), Cockermouth (birthplace of Wordsworth), Whitehaven, Workington, Maryport (with coal exports), Wigton, Penrith, and Keswick (a tourist resort, with two fine stone circles in neighbourhood). Cumbria was annexed to England in 1157; for centuries the scene of Anglo-Scottish warfare and Border raids. Area, 1520 sq. miles. Pop. (1911) 265,780.

CUMBERLAND (39° 37′ N., 78° 43′ W.), city, on Potomac, Maryland, U.S.A.; coal; iron and steel industries. Pop. (1910) 21,839.

CUMBERLAND (41° 55′ N., 71° 22′ W.), township, Rhode Island, U.S.A.; granite quarries; coal mines. Pop. (1910) 10,107.

CUMBERLAND, Eng. title (1525 onwards). The family of Clifford were Earls of C., 1525–1643. In 1644 Charles I. created his nephew, Rupert, s. of Frederick Elector Palatine, Duke of C.; the honour has since been given to royal persons, and now belongs to Ernest Augustus, s. and heir of the last king of Hanover, and 3rd Duke of C. of the fifth creation.

CUMBERLAND, RICHARD (1631–1718), Eng. divine and philosopher; ed. at St. Paul's and Cambridge; became bp. of Peterborough. In 1672 he pub. his clumsy but important *De legibus naturæ disquisitio philosophica*, which has been more than once translated. He sought especially to disprove Hobbes's contentions that man is naturally selfish, and that good means to the individual taken by himself simply what he wants, and to the citizen what the sovereign commands. He argues that benevolent impulses (*e.g.* the parental) are as natural as selfish impulses, and further that the natural good of man—i.e. the perfection and happiness of his nature in its highest development—is inseparable from the good of society of which he is an organic member. The good of all, or of as many as possible, is the aim of moral conduct.

CUMBERLAND, RICHARD (1732–1811), Eng. dramatist and novelist; entered diplomatic service and filled numerous government appointments; wrote several novels and epic poems of poor quality, and was a prolific writer for the stage, his plays numbering upwards of fifty. Perhaps the best is a comedy, *The West Indian* (1771). His *Memoirs* constitute a useful commentary on the times.

CUMBERLAND, WILLIAM AUGUSTUS, DUKE OF (1721–65), 3rd s. of George II.; Duke of C., 1726; distinguished general; won great fame at *Fontenoy*, 1745; put down the Jacobite rebellion, 1745–46, winning the battle of *Culloden* and stamping out revolt in the Highlands; fell into disgrace through misfortunes in Seven Years War, but ultimately regained popularity as a politician.

CUMBERLAND MOUNTAINS (36° 50′ N., 83° 10′ W.), chain, forming part of Appalachian system; extends N.E. to S.W. through eastern part of Kentucky into Tennessee; highest altitudes about 2000 ft.; very rocky; fertile valleys; variety of marbles found; numerous caverns.

CUMBERLAND RIVER (36° 50′ N., 88° W.), rises in Cumberland mountains, E. Kentucky; flows S.W. through Kentucky into Tennessee; re-enters Kentucky and joins Ohio near Smithland; course about 650 miles; navigable for steamboats to Nashville (200 miles).

CUMBRAES, THE (55° 45′ N., 4° 55′ W.), two islands, Firth of Clyde, Scotland, between Isle of Bute and Ayrshire; form part of county of Bute. *Great Cumbrae* has circumference of 10½ miles; only town, Millport, summer resort. *Little Cumbrae* has area about one square mile; lighthouse.

CUMIN, CUMMIN (*Cuminum cyminum*), annual herbaceous umbelliferous plant of Mediterranean countries and Asia; seed used for curry powder and therapeutically as carminative.

CUMMING, JOSEPH GEORGE (1812–68), Eng. clergyman and archæologist; author of work on the Isle of Man.

CUMNOCK (55° 28′ N., 4° 16′ W.), town, Ayrshire, Scotland; coal mines in New Cumnock parish.

CUNARD, SIR SAMUEL, Bart. (1787–1865), Anglo-Canadian engineer and shipowner; founder of *Cunard Line*. See STEAMSHIP LINES.

CUNAS, tribe of Panama Indians.

CUNDINAMARCA (*c.* 5° N., 72° W.), department, E. central Colombia, S. America; consists chiefly of plateaux; productive soil; coffee, tobacco, cereals. Area, 8046 sq. miles. Pop. 720,000.

CUNEIFORM, name given to a style of linear and hieroglyphic writing used by the ancients, particularly Babylonians and Assyrians. It consisted to some extent of picture-writing, thus 'foot' and 'star' were represented by drawings resembling those things. This style of writing eventually gave way to the Aramaic form of the Phœnician alphabet, but its use continued almost down to beginning of Christian era.

Booth, *Discovery and Decipherment of the Trilingual Cuneiform Inscriptions* (1902); G. Bertin, *Abridged Grammar of the Languages of the Cuneiform Inscriptions* (1910).

CUNEO (44° 23′ N., 7° 32′ E.), town (and province), Italy; formerly fortified; silk and cotton manufactures. Pop. 27,000.

CUNINA, see HYDROMEDUSÆ.

CUNITZ, MARIA (*c.* 1610–64), Silesian woman astronomer of European reputation.

CUNNINGHAM, ALEXANDER (d. 1730), Scot. scholar.

CUNNINGHAM, ALLAN (1784–1842), Scot. lyric poet and man of letters. Several of his sons were also of a literary turn of mind.

CUNNINGHAM, WILLIAM (1849–), Eng. economist; Archdeacon of Ely, 1907.

CUNNINGHAM, WILLIAM (1805–61), Scot. theologian.

CUPAR, CUPAR FIFE (56° 19′ N., 3° 1′ W.), town, on Eden, Fife, Scotland; contains several fine public buildings; Bell-Baxter school now occupies site of castle of Macduffs, Earls of Fife; agricultural centre; flax-spinning, breweries; native place of Sir David Lyndsay of the Mount. Pop. (1911) 4380.

CUPID (classical myth.), Latin name for Eros, the Gk. god of love; in sculpture and painting a nude boy, blind, winged, and carrying bow and quiver. The beautiful story of the love of C. and Psyche (*q.v.*) is an allegory of the soul's progress to perfection.

CUPOLA, in arch., dome-shaped portion of roof; shallow domed cover for guns, used in fortification.

CUPPING, method employed in surgery to draw blood to relieve a congestion or an inflammation. In dry c. a round glass vessel is heated and immediately applied to the skin, causing the serum to accumulate under it owing to the partial vacuum created. In wet c. small incisions are first made for blood-letting.

CUPRA, name of two ancient Ital. cities in Picenum.—(1) CUPRA MARITIMA (*c.* 43° N., 13° 50′ E.), on Adriatic coast; 48 miles S.S.E. of Ancona. (2) CUPRA MONTANA (*c.* 42° 58′ N., 13° 50′ E.), inland town, 10 miles S.W. of mod. Jesi; mentioned by Pliny and Ptolemy.

CUPRITE (Cu_2O), copper ore, occurring as reddish granular masses or crystals of cubic system, is produced in nature from copper sulphides; found in Cornwall, Arizona, and Urals.

CUPULIFERÆ, botanical group of trees with simple leaves and hard bracts forming cupules. Oak, beech, chestnut are typical representatives.

CURA, CIUDAD DE CURA (10° N., 67° 38′ W.), town, Aragua, Venezuela; commercial centre. Pop. *c.* 13,000.

CURAÇAO, CURAÇOA (12° 10′ N., 69° W.), island, Dutch West Indies, in Caribbean Sea; settled by Spaniards, 1527; taken by Dutch, 1634; chief town, Willemstad, on Bay of St. Anna; salt. Area, 210 sq. miles. Pop. 30,930.

CURAÇAO, liqueur manufactured, chiefly in Holland, from peel of Curaçoa orange.

CURASSOW (*Oracinæ*), large gallinaceous game-birds of S. American forests, one species (*Crax globicera*) in Central America. Females possess white crest and markings.

CURATE (Fr. *curé*), priest having the care or 'cure' of souls; now applied, in Anglican Church, to an assistant clergyman.

CURCI, CARLO MARIA (1810–91), Ital. theologian.

CURCULIONIDÆ, WEEVILS, see under RHYNCHOPHOROUS BEETLES.

CUREL, FRANÇOIS, VICOMTE DE (1854–), Fr. dramatist.

CURÉLY, JEAN NICOLAS (1774–1827), Fr. general; rose from ranks through daring feats under Napoleon; one of greatest leaders of light cavalry.

CURES (*c.* 42° 13′ N., 12° 40′ E.), ancient Sabine town, Italy; birthplace of Tatius and Numa.

CURETES (Gk. *kouretes*).—(1) Priests of Zeus and Rhea in Gk. myth. (2) A tribe which figures in Homer's *Iliad*, and is said by Strabo to have been located in Greece.

CURETON, WILLIAM (1808–64), Eng. ecclesiastic and Orientalist.

CURFEW ('Cover fire'), custom in Middle Ages of tolling a bell at sunset in summer, and 8 p.m. in winter, as a signal for people to extinguish lights and fires; said to have been introduced into England by William I. It was intended as a safeguard against fire.

CURIA, name of the thirty parts into which, according to tradition, Romulus divided Rom. people, there being ten *curiæ* in each of three tribes, ten *gentes* in each curia; members called *curiales*.

CURIA REGIS, name for a Crown Court of Appeal under the Norman kings of England. Ultimately it divided into three courts—Exchequer, Common Pleas, and King's Bench.

CURIA ROMANA, designation of legal and administrative department of papal court (*Corte romana*), the other branches of which are the civil court (*familia*) and court for ecclesiastical ceremonies (*capella*). Decrees emanating from its various subdivisions are known as Acts of Holy See in distinction from Pontifical Acts; its authority, however, emanates from pope who ratifies its acts. It was organised by Sixtus X., 1587; reorganised by Pius X., 1908. Divisions are (1) Tribunals, (2) Offices, (3) Congregations.

(1) There are three TRIBUNALS: the *Penitentiary*, which deals with matters of conscience; the *Rota*, court of ultimate appeal in civil and judicial matters; and *Signatura*, court of cassation. (2) OFFICES are reduced to *Chancery*, which issues papal bulls; *Datary*, which bestows benefices, dispensations, and other 'graces'; the *Camera apostolica*, which administers property of See; the *Palatine secretaries*, including secretariate of state, which administers home and foreign affairs and issues papal briefs, secretary of briefs to princes, and secretary of Latin letters. (3) The CONGREGATIONS are in *personal* subdivisions of Consistory, and of greatest importance. They are: Congregation of Inquisition, which deals with heresy; of the Consistory, which prepares agenda for Consistory, decides on competence of other congregations, erection of dioceses, etc.; of Papal Visitation, of Sacraments, of disciplinary matters, of Council of Trent, of Propaganda, of Index (list of forbidden books), of Liturgy, of Ceremonies, of Indulgences and Relics, of Fabric of St. Peter's, of Loretto, of Education, and of Extraordinary Ecclesiastical Business.

CURIATII, see HORATII.

CURICÓ (34° 37′ S., 71° 23′ W.), province, Chile, S. of Colchagua (area, *c.* 3000 sq. miles); fertile; rich minerals. Pop. (1910) 108,120. Capital, CURICÓ. Pop. 18,000.

CURIE, PIERRE (1859–1906), Fr. physicist; prof. of Physics at Sorbonne; m. MARIE SKLODOWSKA (1867–), with whom he jointly discovered polonium and radium (*q.v.*). In 1903 they received Davy medal of Royal Soc., and shared the Nobel prize for physics with Henri Becquerel. Mme Curie succ. her husband as director of Physics at the Faculty of Sciences in Paris.

CURIO, GAIUS SCRIBONIUS (d. 53 B.C.), Rom. statesman and general of age of Cicero; consul, 76 B.C.; oratory better than his statesmanship. His clever son of same name erected first Rom. amphitheatre.

CURITYBA, CURITIBA (25° 30′ S., 49° 30′ W.), town, Paraná, Brazil; several factories; exports maté. Pop. 50,000.

CURLEW, WHAUP (*Numenius arquatus*), long-billed bird of the family Scolopacidæ, living on northern moors and heaths in summer and sea-shores in winter, known by its peculiar cry. About twenty species are known, *e.g.* whimbrel and titterel. The stone-curlew, or thick-knee (*Œdicnemus*), comes to England in summer.

CURLING, THOMAS BLIGARD (1811–88), Eng. surgeon; pres. Royal Coll. of Surgeons (1873); introduced new surgical treatments and wrote several surgical works.

CURLING, game played on the ice by throwing rounded stones along the surface to a mark; probably of Dutch origin, but has been popular in Scotland at least from the beginning of the XVII. cent., and has latterly spread to England, Canada, Switzerland, and other countries. The stones used are round and somewhat flat, about 9 in. in diameter and from 30 to 50 lb. in weight, fitted with a handle on top; each player in the game has two, the two sides being of a variable number of players, usually four. At each end of the piece of ice, or *rink*, concentric circles are marked on the surface, the centre being termed the *tee*, and the result depends on the nearness of the stones of the respective sides to the tee, the object of the players being to displace the stones of the opposing side in favour of their own. C. is known as 'The Roaring Game'; the players clear a stone's-path with heather-brooms, and shout 'Soop! soop!' (Sweep! sweep!). Tournaments are called 'Bonspiels.'

Rev. John Kerr, *History of Curling* (1890).

CURLL, EDMUND (1675–1747), Eng. publisher; referred to in Pope's *Dunciad*.

CURRAGH (53° 8′ N., 6° 50′ W.), plain, County Kildare, Ireland; famous for its racecourse and military camp; crown property.

CURRAN, JOHN PHILPOT (1750–1817), Irish lawyer and politician; worked for Catholic emancipation and against Union; made famous speeches at Bar; noted for disinterestedness and fearlessness, eloquence and wit; became Master of the Rolls, 1806.

CURRANTS, dried, seedless berries of a dwarf variety of grape-vine cultivated in the Levant, chiefly

in Greece. Garden currants of the white, red, and black variety are fruits of deciduous shrubs of the genus *Ribes*, cultivated in Europe, Siberia, and Canada.

CURRENCY CONFERENCES, international assemblies for establishing uniform *media* of exchange. First met in Paris, 1867, at time of Exhibition; great obstacle to success in Eng. conservatism, but resulted in independent reforms of Germany and U.S.A. Bimetallism was chief subject of subsequent conferences.

CURRIE, SIR DONALD (1825–1909), Scot. shipowner; established 'Castle' Line, 1862, between Liverpool and Calcutta; Castle Line to South Africa was amalgamated with Union Line as 'Union Castle.' See STEAMSHIP LINES.

CURRIE, JAMES (1756–1805), Scot. physician; promoted hydrotherapy and prepared a standard edition of Burns.

CURRY.—(1) Method of dressing leather; (2) to rub down a horse; (3) a pungent Indian condiment of powdered chillies, coriander, etc.; (4) also a dish of meat, fish, or vegetables, etc., in which c. is an ingredient; served with rice.

CURSOR, LUCIUS PAPIRIUS (fl. 325 B.C.), Rom. dictator.

CURSOR MUNDI, Eng. XIII.-cent. religious dialectal poem, dealing with history of the world.

CURTANA, Edward the Confessor's pointless 'Sword of Mercy,' used in Eng. coronations.

CURTEA DE ARGES (45° 40′ N., 24° 40′ E.), town, on Arges, Rumania; one of ancient capitals of Walachia; bp.'s see; cathedral (built XVI. cent.) is finest specimen of Byzantine arch. in Rumania. Pop. 4210.

CURTILAGE, enclosed yard, or piece of land attached to a house; the enclosed courtyards and bailies in baronial mansions.

CURTIN, ANDREW GREGG (1817–94), Amer. statesman and diplomatist; sec. of the Commonwealth, 1854; afterwards gov. of Pennsylvania; did good service to Union in war.

CURTIS, GEORGE TICKNOR (1812–94), Amer. lawyer and writer; incurred popular odium (1852) by remanding fugitive slave to master; best-known work, constitutional history of U.S.A. His bro., BENJAMIN ROBBINS (1809–74), distinguished jurist.

CURTIS, GEORGE WILLIAM (1824–92), Amer. author and reformer.

CURTIUS, ERNST (1814–96), Ger. historian; b. Lübeck; prof. at Berlin Univ.; made excavations in Greece for Ger. Government; wrote numerous archæological works and standard *History of Greece*. His bro., GEORG (1820–85), esteemed philologist.

CURTIUS, MARCUS, Rom. legendary hero. A chasm having opened in the Forum, the soothsayers declared that it could only be filled by throwing into it Rome's best treasure; C., crying that the greatest treasure of Rome was courage, leaped on horseback into the chasm, which immediately closed up.

CURTIUS RUFUS, QUINTUS (date uncertain), Latin author; wrote life of Alexander the Great.

CURULE CHAIR, Rom. chair of state, said to have been used in very early times as an emblem of kingly power.

CURVE.—(1) May be defined as a continuous, singly-infinite system of points. A c. may be regarded as being generated by the motion of a point, which occupies in succession all the different points of the line. We may regard any c. as being defined by a relation or relations existing between the co-ordinates of the moving point, *i.e.* we represent c's by means of equations. Hence we have a means of classifying c's according to the degree of the equations which represent them. This method was due originally to Descartes. Different systems of co-ordinates (as Cartesian, Polar, Trilinear, etc.) may be employed, giving corresponding equations. We shall consider simply Cartesian co-ordinates.

(2) An equation of the first degree in x and y always represents a straight line; thus $ax+by+c=0$ is a straight line, or c. of the first order. An equation of the second degree, as $ax^2+2hxy+by^2+2fx+2gy+c=0$, always represents some conic section. Thus, if h^2 is $< ab$, the equation represents an ellipse; it represents a parabola or a hyperbola if $h^2=$ or is $> ab$, a circle if $a=b$ and $h=0$. It reduces to two straight lines, real or imaginary, if $\Delta=0$. Δ is known as the *discriminant*, and is expressed by the determinant

$$\begin{vmatrix} a, & h, & g \\ h, & b, & f \\ g, & f, & c \end{vmatrix} \equiv abc+2fgh-af^2-bg^2-ch^2.$$

A curve of the third order is called a cubic, one of the fourth order a quadric, and so on. A curve of the mth order has $\frac{1}{2}m(m+3)$ *independent* constants, and can thus be made to satisfy $\frac{1}{2}m(m+3)$ conditions. Thus a curve of order 4 can be made to pass through 14 points.

(3) Any curve of order m is cut by an arbitrary line in m points, for on eliminating y between the two equations we get an equation in x of order m, which has m roots, real or imaginary. To each of these corresponds a value of y, giving m points, real or imaginary. Some of these points may be situated at infinity, and two or more of them may coincide.

(4) The idea of points and lines at infinity plays a very important part in the theory of higher plane curves. Thus, regarding circles as limiting cases of ellipses when the major and minor axes approach equality, and regarding the fact that two ellipses may intersect in four real points, we can show that *all* circles, whether they intersect in two real points or not, pass through two imaginary points at infinity, usually called the circular points at infinity, and denoted by the letters I, J.

(5) The *class* of a curve is, in general, different from the *order* of the curve. A plane curve is of the nth class when from any point in its plane there can be drawn to it n real or imaginary tangents. The relation between the order and the class of a curve is given by one of Plücker's equations, which are relations between the numbers of various singular points, the order m and the class n.

(6) *Singular points.*—These are (i.) the *cusp*, the moving point coming to rest and reversing its motion; (ii.) the *node*, at which the moving point passes through a former position of the point, the two branches of the curve not in general coinciding; (iii.) the *stationary tangent*, the line coming to rest and then reversing the direction of its motion; (iv.) the *double tangent*, a tangent to two points of the curve. If δ is the number of double points or nodes, κ the number of cusps, τ the number of double tangents, i the number of inflections or stationary tangents, Plücker showed that the following relations hold:—

(i.) $n=m(m-1)-2\delta-3\kappa$
(ii.) $i=3m(m-2)-6\delta-8\kappa$
(iii.) $\tau=\frac{1}{2}m(m-2)(m^2-9)-(m^2-m-6)(2\delta+3\kappa)+2\delta(\delta-1)+6\delta\kappa+\frac{3}{2}\kappa(\kappa-1)$
(iv.) $m=n(n-1)-2\tau-3i$
(v.) $\kappa=3n(n-2)-6\tau-8i$
(vi.) $\delta=\frac{1}{2}n(n-2)(n^2-9)-(n^2-n-6)(2\tau+3i)+2\tau(\tau-1)+6\tau i+\frac{3}{2}i(i-1)$.

G. Salmon, *A Treatise on the Higher Plane Curves*.

CURVILINEAR, term in arch. for a kind of decorative tracery.

CURWEN, JOHN (1816–80), Eng. Nonconformist preacher; founded Tonic Sol-Fa musical system.

CURZOLA (42° 55′ N., 16° 55′ E.), island, Adriatic Sea, belonging to Dalmatia, Austria; ancient *Corcyra*; capital, CURZOLA, on E. coast; fortified; has XII.-cent. cathedral; boat-building; fishing. Pop. 17,377.

CURZON OF KEDLESTON, GEORGE NATHANIEL, EARL (1859–), Brit. (Conservative) statesman; Chancellor of Oxford Univ. (1907); app. Under-Sec. for India, 1891; Under-Sec. for Foreign Affairs, 1895; Viceroy of India, 1898. The chief events during his viceroyalty were the Tibet expedition (1904)

and unrest in Bengal (*Swadeshi* Movement and partition of Bengal); promoted education; in 1905 Lord Kitchener opposed him on question of dual control of Indian Army, and C. resigned (1906); cr. earl (1910). He wrote *Russia in Central Asia* (1889); *Persia and the Persian Question* (1892); *Problems of the Far East* (1894); *Principles and Methods of University Reform* (1909).

Lipsett, *Lord Curzon in India* (1903); Lovat Fraser, *India under Curzon* (1911).

CUSA, NICHOLAS OF (1401–64), Ger. ecclesiastic; s. of fisherman; took name from birthplace; maintained superiority of Councils over popes at Council of Basel, but changed his views; made cardinal, 1448; interesting as speculative philosopher and scientist, anticipating neo-Platonism and Copernican theory.

CUSH, son of the Biblical Ham, after whom is named the land of Cush, in Upper Egypt.

CUSHING, CALEB (1800–79), Amer. statesman, jurist, and diplomatist; originally Jeffersonian Republican, but became Whig; did great service in Southern War, codifying laws, etc., but mistrusted by party.

CUSHING, WILLIAM BARKER (1842–74), Amer. naval commander.

CUSHMAN, CHARLOTTE SAUNDERS (1816–76), Amer. Shakespearean actress.

CUSP, in arch., point where tracery intersects.

CUSTARD APPLE, edible fruit of different species of *Anona*, shrubs and trees of tropical America and India.

CUSTER, GEORGE ARMSTRONG (1839–76), Amer. general; distinguished himself in war with Confederate States; led campaigns against Indians, in last of which he and his party, including his bro., Lieut.-Col. Thomas Ward C., were massacred.

CUSTINE, ADAM PHILIPPE, COMTE DE (1740–93), Fr. general; condemned as traitor and guillotined; see remarkable memoirs of his dau.-in-law.

CUSTOMARY FREEHOLD, in law, a kind of copyhold tenure.

CUSTOMS, see TARIFF.

CUSTOS ROTULORUM, leading county justice of peace, and keeper of the records.

CUSTOZZA (45° 22′ N., 10° 47′ E.), village, Verona, Italy; scene of Austrian victories over Piedmontese, 1848, over Italians, 1866.

CÜSTRIN, KÜSTRIN (52° 35′ N., 14° 37′ E.), fortified town, Brandenburg, Prussia, at confluence of Warthe and Oder; has considerable river trade; manufactures machinery, pianos, furniture, etc. Pop. 17,400.

CUTCH, KACH (22° 47′ to 24° 40′ N., 68° 26′ to 71° 45′ E.), principality between Gujarat and Sind, forming a kind of peninsula, on W. coast of Brit. India; area, 7616 sq. miles; frequent earthquakes; governed by native chief under Brit. protection. N. and E. lies the *Runn of Cutch*, which is flooded half the year, and converts C. into an island. When not flooded, the Runn is mostly a desert with a deposit of salt. Pop. (1910) 513,529.

CUTCH, GULF OF (23° N., 70° E.), arm of Indian Ocean, between peninsulas of Cutch and Kathiawar.

CUTHBERT, ST. (d. 687), Scot. Evangelist; b. S.E. Scotland; joined Melrose Abbey, becoming prior; later prior of Lindisfarne, bp. of Hexham, and bp. of Lindisfarne; preferred hermit life; converted Scotland, from Forth to Tweed, to Christianity; biography by Bede; famed during life and after death for sanctity, asceticism, and evangelising power.

A. C. Fryer, *Cuthbert of Lindisfarne* (1880).

CUTLASS, CUTLAS, COUBTELAS, sailors' sword with curved blade; used with cutting, not thrusting, movement.

CUTLER, MANASSEH (1742–1823), Amer. Congregational preacher and educationist.

CUTLERY, general term originally applied to edged or cutting instruments. Modern c., while including forks, does not include certain cutting-tools, *e.g.* carpenter's tools—chisels, saws, etc. Surgical instruments and gardening implements (sickles, pruning-hooks, etc.) come under the term; domestic c. includes table-knives, forks, razors, scissors, pocket-knives, etc. Sheffield has long been the chief centre of the industry in England. In manufacture of knives, etc., the order is—forging, tempering, grinding, polishing, fitting, finishing. Cheap knives are made by machinery. A razor is made from a steel bar the thickness of its back; it is shaped roughly by hammer, ground, tempered, ground again, and finished by lapping and polishing. Scissor blades are made from flat steel bars. Forks are formed by dies; cheap forks are cast.

CUTTACK, KATAK (20° 29′ N., 86° E.), city, Bihar and Orissa, India, 220 miles S.W. of Calcutta; seat of Ravenshaw Coll., and famous for gold and silver filigree work; capital of CUTTACK—a district in Orissa bounded on E. by Bay of Bengal, and embracing delta of Mahanuddy. There is a canal to False Point. Pop. (1911) 51,347.

CUTTLE-BONE, see under CEPHALOPODA.

CUTTLEFISH, see CEPHALOPODA.

CUTTS OF GOWRAN, JOHN, BARON (1661–1707), Eng. writer, general, and diplomatist; distinguished in Irish wars, 1690–91, at siege of Namur, and under Marlborough; subject of Swift's *Ode to a Salamander*.

CUVIER, GEORGES LÉOPOLD CHRÉTIEN FRÉDÉRIC DAGOBERT (1769–1832), Fr. anatomist; assistant, later prof. in the Jardin des Plantes, Paris; made painstaking researches in comparative anatomy and palæontology, especially of molluscs and vertebrates and fossil reptiles and mammals. He engaged in a controversy against evolution theories propounded by Lamarck and Geoffroy Saint-Hilaire. His numerous research papers were embodied in his classical work, *Le règne animal* (1817; 2nd, 1830). He also rendered valuable national services to Public Instruction and the Fr. Prot. Church.

Sarah Lee, *Memoirs of Baron Cuvier* (1833).

CUVILLES, FRANÇOIS DE (fl. 1740), Fr. engraver and architect.

CUXHAVEN, KUXHAVEN (53° 52′ N., 8° 41′ E.), fortified town, at mouth of Elbe, Hamburg State, Germany; fine harbour; free port; sea-fishing. Pop. (1910) 14,888.

CUYABA, CUIABA (15° 30′ S., 55° 38′ W.), town, Brazil; formerly centre of rich goldfields. Pop. 36,000.

CUYAPO (15° 50′ N., 120° 43′ E.), town, Luzon, Philippine Islands; rice. Pop. 17,000.

CUYP, ALBERT (1620–91), Dutch artist; famous for landscapes. His f., JACOB GERRITZ (1575–1649), was also noted as an artist.

CUZA, ALEXANDER JOHN (1820–73), prince of Rumania; abdicated.

CUZCO.—(1) (13° 30′ S., 72° 4′ W.) city, Peru, in valley of Andes; founded by Manco Capac, XI. cent.; ancient capital of the Incas; site of famous Temple of the Sun, now occupied by Dominican convent; remains of gigantic fortress and other Inca arch.; taken by Pizarro, 1533; bp.'s see; cathedral, univ.; chief manufacture, cotton and woollen goods. Pop. 30,000. (2) department, Peru; area, 155,950 sq. miles. Pop. 329,000.

CYAMIDÆ, see MALACOSTRACA.

CYANIC ACID (CNOH), volatile acid liquid, polymerising above 0° to two solids, cyanuric acid, $C_3N_3O_3H_3$, and cyamelide (CNOH). C. a. salts are termed cyanates, ammonium cyanate being of interest, as the first synthesis of an 'organic' compound from 'inorganic' substances was carried out by Wöhler (1828) by heating it with water, thereby forming urea.

CYANIDE, a metallic salt of hydrocyanic (prussic) acid. Potassium cyanide is used in extracting gold. See PRUSSIC ACID, GOLD.

CYANITE (Al_2SiO_5), sky-blue mineral occurring as long flat crystals in gneiss and mica schists.

CYANOGEN (C_2N_2), colourless, poisonous gas,

burning with a purple flame. M.P. −34·4°; B.P. −25°. C. acts like a radicle, *i.e.* like an element in forming compounds.

CYAXARES, king of Media in late VII. and early VI. cent's B.C.; conquered Scythians and Assyrians, destroying Nineveh, 606; founded Median empire.

CYBELE (classical myth.), Phrygian goddess of fruitfulness, and mother of the gods; in Gk. *Rhea*.

CYCLADES (37° N., 25° E.), group of islands in Ægean Sea; of volcanic origin; generally mountainous; mostly fertile; among principal are Andros, Paros, Delos (*q.v.*), Melos (*q.v.*), Tinos, Myconos, Naxos, Thera, Ceos; form separate nome of kingdom of Greece; export emery. Area, 1042 sq. miles. Pop. 130,370.

CYCLAMEN, genus of primulaceous plants of Central and S. Europe; many species cultivated in Britain for their beautiful foliage and numerous winter and spring flowers. Sow-bread (*C. europæum*) grows wild in S.E. England.

CYCLING, the use of a bicycle as a means of locomotion. This pastime has undergone many changes since the early days of the XIX. cent. when the 'dandy-horse,' a two-wheeled structure propelled by [illegible] the ground with each foot in turn, afforded pleasure to the young men of the period. Pedals fixed to cranks connected with the back wheel were introduced about 1840. In the 'boneshaker' (1866) the pedals were arranged to turn the front wheel. The introduction of rubber tyres, some years later, rendered this instrument of torture somewhat less terrible, and with the adoption of one large fore wheel and a small back one, cycling was made moderately pleasant. In 1885 the 'Starley Rover,' with two wheels of equal diameter, and driven by a chain passing over a gear-wheel, revolutionised c. Later improvements have been steel wire tension spokes (1870); ball bearings (1877); Dunlop's pneumatic tyres (1888); 'free-wheel' (1901), rim-brake, changeable gear. The cycle is extensively used by the military; and cyclist corps have the dispatch of mounted infantry. For MOTOR CYCLE, see MOTOR CAR.

Sharp, *Bicycles and Tricycles* (1896); Hillier, *The Art of Ease in Cycling* (1899) and *Cycling* (1895, Badminton Library); Chalmers, *The Law as it affects Cyclists* (1899).

CYCLOID, curve traced by a point on the periphery of circle rolling in a plane along a line. When the tracing point is within the circle the resulting curve is termed a prolate, when without, a curtate c. Both the latter curves are known as trochoids.

T. H. Eagles, *Constructive Geometry of Plane Curves*.

CYCLONE, an eddy or circling current of air formed by the meeting of a polar current of cold air with an equatorial current of warm air. At the centre of the eddy the barometer is lowest. The direction of the wind is from places where the atmosphere pressure is high to places where it is low, but the centre of the c. is comparatively calm, the full force of the wind being felt where the barometric differences are most marked. The term ANTI-CYCLONE is applied to the belt of high pressure surrounding the cyclonic area. As the lowest barometrical readings indicate the centre of the c., so the highest readings mark the locality of the anti-c. Hurricanes, typhoons, and tropical storms are typical forms of c. See METEOROLOGY.

CYCLOPEAN MASONRY, name given to the rude wall-building of the ancient Greeks and Etruscans, in which huge blocks of unshaped rock were used.

CYCLOPES, or **CYCLOPS** (classical myth.), race of giants in which two sets are mentioned. Homer's C. are a wild race led by their one-eyed chief, Polyphemus. The C. of the older tradition are three Titans each with one eye in the centre of his forehead; these three forged Jove's thunderbolts.

CYCLOSTOMATA, MARSIPOBRANCHII, group of primitive eel-shaped fishes with round mouths, adapted for sucking, without jaws, without scales and paired fins, and possessing paired gill-pouches. The skeleton is wholly cartilaginous and the notochord persists throughout adult life. They are semi-parasitic, preying on fishes, and widely distributed, the hag (*Myxine*) and the lamprey (*Petromyzon*) being two divergent representative types, the extinct Ostracoderms and Palæospondylus having doubtful affinities. The lampreys, occurring in fresh water as well as the sea, suck themselves on to other fishes and rasp off the flesh with the teeth on their 'tongue,' while the hags, which are exclusively marine, are still more destructive, devouring all the soft parts and only leaving the skin and skeleton of their prey. See ANIMALS.

CYCLOSTYLE, term used in arch. in reference to building consisting of columns arranged in circular form.

CYGNUS, 'Swan' constellation of N. hemisphere between Pegasus and Lyra—61 Cygni is the nearest star except σ Centauri.

CYLINDER, surface traced by a straight line rotating round a parallel straight line as axis; also the space contained between such a surface and two parallel planes either perpendicular (right c.) or oblique (oblique c.) to the axis.

CYLLENE (37° 56′ N., 22° 24′ E.), mountain, Greece, N.E. of Arcadia; sacred to Hermes; modern Ziria.

CYMA, term in arch. for double-curved moulding.

CYMBALS, musical instruments dating from prehistoric times. The modern c's consist of thin circular metal plates (tin and copper alloy), which are clashed, or rubbed, together.

CYMOSE, see FLOWER.

CYNEGILS (d. 643), king of Wessex; Christianised.

CYNEWULF (d. 785), king of Wessex.

CYNEWULF (fl. 750), Old Eng. poet; nothing known of life; four poems, *Christ*, *Juliana*, *Helene*, and *The Fates of the Apostles*, proved to be his by insertion of his name in Runic letters in text; poetry shows feeling for nature, especially in stormy moods.

CYNICS, THE, a Gk. philosophical school founded by Antisthenes (b. c. 436 B.C.), an acquaintance of Socrates. Diogenes of Sinope (reported to have lived in a tub) is its best-known member. They held that virtue is the only good, vice the only evil, everything else indifferent or even contemptible. Hence they wished to discard all the gains of civilisation, and preached a 'return to nature,' which was often exaggerated into a dirty shamelessness. See ETHICS.

CYNIPIDÆ, see GALL-FLIES.

CYNOCEPHALUS, see under CERCOPITHECIDÆ.

CYNOPITHECUS, see under CERCOPITHECIDÆ.

CYNOSURE (Lat. *cynosura*), ancient name for the 'Little Bear' constellation; hence anything which draws the attention.

CYPERACEÆ, widely distributed order of grass or rush-like herbs, comprising about 70 genera with 3000 species; many are marsh plants. Papyrus, bulrushes, sedges, and cotton-grass are common representatives.

CY-PRÈS, see TRUSTS.

CYPRESS (*Cupressus*), genus of aromatic, dark, evergreen, cone-bearing trees, comprising 15 species of S. Europe, W. Asia, Himalayas, China, Japan, U.S.A., and Mexico. *C. sempervirens* is the characteristic tree of Mediterranean countries, and its wood was prized by the ancients for durability. Several varieties are cultivated in Britain for ornamental purposes. The tree receives its name from Cyparissus, a youth who grieved so much for a stag that the gods changed him into a c. tree; hence the association of the c. with death and mourning.

CYPRIAN, ST. (c. 200–58), bp. of Carthage; converted from paganism to Christianity; made bp. 248–49; after various conflicts between Christians and the State, C. was beheaded by order of the Emperor Valerian; one of most remarkable Fathers of the Church, and writer of treatises important for patristic history.

CYPRINIDÆ, see CARPS.

CYPRINODONTIDÆ, family of ovo-viviparous

Teleostean fishes allied to carps, but provided with teeth. The allied *Amblyopsidæ* comprise remarkable blind species living in N. American caves. See KILLIFISHES.

S. Garman, in *Mem. Mus. Comp. Zool.*, xix. (1895); C. H. Eigenmann, *Archiv für Entwickelungs mechanik*, vii. p. 545 (1899).

CYPRUS (35° N., 33° E.), third largest island in Mediterranean; 60 miles W. of Syria, 40 miles S. of Asia Minor. C. belongs nominally to Turkey, but is occupied and administered by Britain, and governed by a High Commissioner. Its length is 140 miles, including Karpas Peninsula; breadth, 60 miles; area, *c.* 3600 sq. miles. In N. are two ranges of mountains, and one in S., with Mt. Troödos (6400 ft.). In the centre is a low-lying fertile plain. Rivers are generally dry beds; torrents after heavy rains and snow melting.

History.—C. is Chittim of Old Testament; colonised by Phœnicians, *c.* 1000 B.C.; held in turn by Egyptians, Assyrians, Persians, Greeks, and returned to Egypt till 58 B.C., when it became a Rom. province. Then came Saracens and Byzantines. Taken by Richard *Cœur de Lion*, C. was presented in 1192 to Guy de Lusignan; conquered by Genoese, 1373; sold to Venetians, 1489; captured by Turks, 1571. In 1878 C. came into hands of Britain, by treaty with the Porte, and is to remain under Brit. administration until Batum and Kars are restored to Turkey by Russia. The High Commissioner is assisted by a Legislative Council (partly elected). C. is famed for its antiquarian treasures, chiefly brought to light since General di Cesnola began excavations (1866).

Irrigation is effected by wells and a canal. Climate is good, except in hot seasons, when fever is prevalent in low-lying regions. The Cyprus sheep (*moufflon*) has become exceedingly scarce. There are few wild animals, but goats overrun the island to the destruction of trees. Forests formerly yielded much material for shipbuilding, and were of some extent and fame, but have almost entirely vanished; climate and soil have suffered accordingly. Locusts (once a terrible pest) have been nearly exterminated.

C. was famed of old for copper (from which its name is derived), but little is worked now. Salt is mined and procured by evaporation. Most important products are wheat, barley, locust beans, cotton, silk, flax, tobacco, wool, gypsum, fruits, sponges, and large quantities of wine. Splendid mules are bred. Under Brit. administration the island has greatly improved, materially and otherwise.

The principal towns are Nicosia (capital), Larnaca, Limasol, Famagusta. The inhabitants mostly belong to the Gk. Church, but there are many Muhammadans. Pop. (1911) 274,100.

Hutchinson and Cobham, *A Handbook of Cyprus* (1907); Cobham, *Bibliography of Cyprus* (1908).

CYPRUS, CHURCH OF, independent but orthodox-Gk. church, its status being confirmed by general councils and the Byzantine Empire.

CYPSELUS (657–627 B.C.), tyrant of Corinth; famous builder and patron of art.

CYRANO DE BERGERAC, SAVINIEN (1620–55), Fr. soldier, novelist, and dramatist; wrote plays on classical model, and scientific-romantic stories; notorious for reckless bravery, duels, and free-thinking; subject of play by Rostand.

CYRENAICA (*c.* 31° N., 21° E.), district on N. African coast; boundaries ill-defined, but modern C. is considered larger than ancient C. Northern half in ancient history was called Pentapolis, having five considerable towns: Barca and Cyrene, inland; Hesperis (later Berenice), Apollonia, Teucheira (later Arsinoë), on coast. After some 500 years' prosperity, C. declined about 100 B.C.; interesting ruins. As result of Turco-Italian War (*q.v.*), 1911–12, C. or BENGAZI passed to Italy along with Tripoli. Area, *c.* 30,000 sq. miles. Pop. 250,000.

CYRENAICS, THE, a Gk. philosophical school founded by Aristippus of Cyrene (*c.* 435–360 B.C.), an acquaintance of Socrates. They held that the only good is the pleasure of the moment, and all else valuable only in so far as it produces pleasure. Aristippus himself, though thoroughly a 'man of the world,' valued wisdom and culture as liberating a man from external circumstances; his followers often fell either into licentiousness or into disillusioned pessimism. See ETHICS.

CYRENE (32° 46′ N., 21° 53′ E.), original capital of ancient district of Cyrenaica (*q.v.*), N. Africa; situated on crest of Jebel Akhdar, about 10 miles inland; now in complete ruins; built about middle of VII. cent. B.C., and said to have been called after a local nymph; became a great city and passed to Rome in 96 B.C.; mostly ruined before Christian era, and became deserted till Arab conquest (641 A.D.); said to have once had a population of over 100,000.

CYRIL (315–86), bp. of Jerusalem; famed for addresses to catechumens.

CYRIL (*c.* 376–444), bp. of Alexandria. As patriarch of Alexandria expelled Jews, and in zeal against heretics is said to have instigated murder of Hypatia; defeated Nestorius at Council of Ephesus, 431; works valuable in patristic literature.

CYRIL (827–69), Gk. missionary to Slavs; supposed inventor of 'Cyrillic' alphabet. His bro., Methodius, shared his life-work.

CYRILLUS (V. cent.), Gk. jurist.

CYRTO-STYLE, term in arch. for a columned circular portico.

CYRUS, name of two great Persian rulers. CYRUS THE GREAT: modern dispute as to his origin; succ. to throne of Anzan, *c.* 558 B.C.; overthrew his suzerain Astyages, king of the Medes, 550, and became sole ruler of Medes and Persians; defeated Crœsus of Lydia, and annexed Lydia, 546; overran Asia Minor; captured Babylon and annexed its dominions, 539; slain in warfare with savage tribes of eastern frontier, 528.

See *History of Greece*, by Firth, Grote, Norton, Oman.

CYRUS THE YOUNGER, younger s. of Darius II. of Persia; in Peloponnesian War gave important help to Spartans, who assisted him in attempt to overturn government of bro., Artaxerxes, and obtained insight into military weakness of Persia; slain at *Cunaxa*, 401.

CYSTICERCUS, larval TAPEWORM (*q.v.*).

CYSTITIS, see BLADDER.

CYSTOFLAGELLATA, or RHYNCHOFLAGELLATA, group of Protozoa provided with two unequal flagella, the larger forming a kind of tentacle, a pharynx and a pellicle covering the ectoplasm. Reproduction takes place by fission, and, after conjugation, by formation of spores. The apple-shaped *Noctiluca*, the disk-shaped *Leptodiscus*, and jellyfish-like *Craspedotella* occur in great numbers in the sea, manifesting their presence despite their size (0·15–1·5 mm.) by their phosphorescence at night. See PROTOZOA.

CYSTOLITH, concretion of calcium carbonate in cellulose matrix of some plant cells, as in the leaves of the india-rubber plant.

CYTHERA (36° 15′ N., 23° E.), one of Ionian Islands, S. of Laconia, Greece; modern Cerigo; in ancient times had magnificent temple to Aphrodite; surface mostly rocky; capital, Capsali; wine, corn.

CYTISINE ($C_{11}H_{14}N_2O$), alkaloid occurring in seeds of laburnum and furze.

CYTOLOGY, the branch of biology (*q.v.*) treating of the structure, functions, and life-history of cells. The study of cells as component parts of normal tissues is termed histology (*q.v.*). Hooke was the first to observe (1665) with the aid of primitive lenses small cavities in cork and kindred vegetable substances, which he called cells. After Malpighi (1674) and Grew (1682) had extended this knowledge by discovering that plant cells were provided with firm walls and contained a fluid, and Treviranus (1806) had observed the formation of tubes and vessels by the breaking down of the walls of adjoining cells, Schleiden (1838)

laid the foundations of modern c. by recognising the importance of the cell nucleus discovered by R. Brown seven years previously. To Schwann (1839) is due the discovery, already foreshadowed by J. Müller, Henle, and Purkinje, that animals likewise are composed of cells, and that embryonic cells differentiate into muscle, nerve, and other cells. Research was stimulated, and Nägeli, Kölliker, Remak, Leydig, Cohn, de Bary, and others began to realise that the cell-wall was of subordinate importance. Max Schultze finally showed that 'cell' was a misnomer, and that all plants and animals consist of unit masses of protoplasm, or living matter, frequently but not necessarily surrounded by membrane. The growing conviction that all cells originate from pre-existing cells was formulated by Virchow (1858) in his famous aphorism, *Omnis cellula e cellula*. Improvements in optical instruments and laboratory technique have progressed with the science, and names like van Beneden, Boveri, Delage, Driesch, Flemming, Haeckel, O. and R. Hertwig, T. H. Morgan, Strasburger, Weismann, and E. B. Wilson are only a few of the well-known students of modern cytology. See CELL.

CYTOPLASM, see CELL.

CYZICUS (40° 25′ N., 27° 50′ E.), ancient Gk. town, on peninsula of Mysia, Sea of Marmora, Asia Minor; besieged by Mithridates, 75 B.C.; ruined by earthquake, A.D. 1063.

CZARNIECKI, STEPHAN (1599–1665), Polish military commander; prevented conquest of Poland by Sweden, obstinately defending Cracow and repairing disaster of *Warsaw*; defeated Russia.

CZARTORYSKI, ADAM GEORG, PRINCE (1770–1861), Polish statesman; family estates confiscated at third partition of Poland; made Russ. Adjunct of Foreign Affairs (1804), and proposed erection of Polish kingdom under protection of Russia; on establishment of kingdom, largely through his means, held high office for long, but ultimately disapproved of preponderance of revolutionary party.

CZARTORYSKI, FRYDERYK MICHAL, PRINCE (1696–1775), Polish statesman; formed alliance with Russia, Austria, and England against Prussia and France, and left great name as patriot and reformer.

CZECHS, Slavic people, to number of 8,000,000, living in Bohemia (Czechy) and parts of Moravia, Silesia, and Hungary, who employ a written language different from that in general use in Bohemia.

Bourlier, *Les Tchèques* (1897); W. R. Morfill, *Grammar of the Bohemian or Czech Language* (1899), *Slavonic Literature* (1910).

CZENSTOCHOWA, CHENSTOKHOV (50° 49′ N., 19° 3′ E.), town, on Wartha, Russ. Poland; place of pilgrimage; cotton and woollen goods. Pop. (1910) 69,900.

CZERNÓWITZ (48° 17′ N., 25° 57′ E.), town, capital of Bukovina, Austria, on Pruth; seat of Gk. abp.; has cathedral and univ.; active trade in agricultural produce. Pop. (1910) 87,128.

CZERNY, KARL (1791–1857), Austrian composer and pianist; pupil of Beethoven; teacher of Liszt.

D, 4th letter of alphabet; Semitic *daleth* meant 'a door,' as did the Gk. derivative *delta*; *d* may be voiceless (e.g. *rapped*), assimilated (e.g. *gospel* = God's spell, *accept* = ad ceptum).

DA COSTA, ISAAK (1798–1860), Dutch theologian and poet.

DA GAMA, VASCO (*c.* 1460–1524), Portug. navigator; b. Sines in Alem-Tejo; first to reach India by Cape route, 1498; founded Portug. colonies on E. African coast; second voyage to Calicut, 1502; app. Viceroy of India, 1524, but d. soon after; celebrated in Camoens' *Lusiads*; gave Portugal vast power and riches, and opened door to East.

Stanley, *Three Voyages of Vasco da Gama*; Jayne, *Vasco da Gama*; Colvin, *The Cape of Adventure*.

DACCA (23° 45′ N., 90° 23′ E.), town, Bengal, India, on Burigunga River; Government headquarters for part of year (July–Sept.); capital of Eastern Bengal and Assam, 1905–12; formerly celebrated for magnificence; seat of projected teaching univ.; has a coll. and ruins of many Muhammadan public buildings; manufactures cotton cloth, gold and silver work, shell-work, and pottery; a jute-trade centre. Pop. (1911) 108,551. DACCA DIVISION has area of 15,937 sq. miles. Pop. *c.* 13,000,000. DACCA DISTRICT, area, 2782 sq. miles. Pop. *c.* 3,000,000.

DACE, DARE or **DART** (*Leuciscus vulgaris*), European cyprinoid fish living in clear, still streams. In N. America the name is applied to Minnilus, Semotilus, and other fishes of the same family.

DACH, SIMON (1605–59), Ger. poet and hymnologist.

DACIA (46° N., 24° E.), ancient land of the DACI; district of Central Europe, including E. part of Hungary Proper, Transylvania, and Rumania; bounded by Carpathians and Danube. Inhabitants were Thracians; fairly civilised when first known by Romans, who conquered them after long struggle (*c.* 100 B.C.).

DACIER, ANDRÉ (1651–1722), Fr. classical scholar.

DACIER, ANNE LEFÈVRE (1654–1720), Fr. scholar; wife of above; trans. Homer.

DACITE, volcanic rocks, allied to andesite, consisting of quartz, plagioclase, felspar, hornblende, biotite, and pyroxene; found chiefly in Hungary, Scotland, Greece, and N. America.

DACOIT, member of armed gang of Ind. robbers.

DÆDALUS (classical myth.), constructor for Minos of the Cretan labyrinth; made wings for himself and his s., Icarus.

DAFFODIL (*Narcissus pseudo-narcissus*), bulbous plant of the order Amaryllidaceæ; wild in Europe, numerous varieties cultivated as garden flowers.

Bourne, *Book of the Daffodil* (1903); Jacob, *Daffodils* (Present-Day Gardening).

DAFYDD AB GWILYM (1340–1400), see CELTS (WELSH LIT.). Lewis Jones, *Life* (1911).

DAGGER, a short, pointed, and edged weapon for stabbing; formerly part of civil costume of persons with right to bear arms; still worn in East, and by Highland officers and Brit. midshipmen.

DAGHESTAN (42° 23′ N., 46° 30′ E.), province, Russia, in Transcaucasia, extending along W. coast of Caspian Sea; area, 11,471 sq. miles; mostly mountainous; thickly wooded; well-watered; fertile valleys; dry climate; minerals found; inhabitants chiefly Lesghians; leading industry, sheep and cattle breeding; products—grain, cotton, silk, fruit; capital, Temirkhan-shura. Pop. (1910) 675,800.

DAGO, slang term for Span., Portug., and Ital. sailors and others belonging to the Mediterranean littoral.

DAGOBERT I. (d. 639), greatest of Merovingian kings; succ. his f. as king of the Franks, 629, curbed disorder of nobles and Church, encouraged art, sent out Christian missionaries, made equal alliance with Byzantine empire.

DAGON, Philistine fish-deity, worshipped at Gaza and Ashdod.

DAGUERRE, LOUIS JACQUES MANDÉ (1789–1851), Fr. painter of panoramic views; invented the diorama, and after prolonged experiments with J. N. Niepce, later alone, the *daguerrotype*, the forerunner of modern photography. The discovery was made public by Arago in 1839. See PHOTOGRAPHY.

DAGUPAN (16° 2′ N., 120° 40′ E.), town, in Gulf of Lingayen, Luzon, Philippine Islands; commercial centre; exports sugar, indigo, rice, and salt. Pop. 20,000.

DAHABEAH, Arab. name for Nile passenger boat.

DAHL, JOHANN CHRISTIAN (1778–1857), Nor. landscape artist.

DAHL, MICHAEL (1656–1743), Swed. artist; portraits at Hampton Court.

DAHL, VLADIMIR IVANOVICH (1802–72), Russ. novelist and philologist.

DAHLBERG, ERIK JOHANSEN, COUNT (1625–1703), Swed. military engineer.

DAHLGREN, JOHN ADOLF (1809–70), Amer. naval commander.

DAHLGREN, KARL FREDRIK (1791–1844), Swed. poet.

DAHLIA, genus of tuberous-rooted herbs with composite flowers indigenous in Mexico and Central America. Many varieties are popular garden plants.

Gordon, *Dahlias* (Present-Day Gardening).

DAHLMANN, FRIEDRICH CHRISTOPH (1785–1860), Ger. author and politician; app. prof. at Kiel, 1812, and stirred up patriotic feeling in Schleswig-Holstein against Denmark; obtained chair at Göttingen, 1829; banished after protest of Göttingen prof's, 1837, against dictate of king of Hanover; wrote valuable hist. works and took important part in bringing about union of Germany, 1849.

DAHLSTJERNA, GUNNO (1661–1709), Swed. poet.

DAHN, JULIUS SOPHUS FELIX (1834), Ger. poet, prof., historian, and jurisconsult; rector of Breslau Univ., 1895.

DAHOMEY (7° 25′ N., 1° 30′ E.), division of W. Africa, belonging to France; situated on coast and stretching inland; bounded by Ger. Togoland on W.; Lagos and Yoruba on E.; and by Gulf of Guinea on S.; capital, Porto Novo; area, *c.* 60,000 sq. miles. Coast (extending *c.* 80 miles) consists largely of islands and swamps, separated by lagoons and channels, and protected from the ocean by long barrier of sand, which affords good navigation. The interior is fairly level, with gentle slope and plain stretching from Great Swamp in direction of Kong Mts.; several mt. ranges; many springs and small rivers which flow into Avon and Denham lagoons; magnificent forests—baobob—palms and fruit trees. Among wild animals are the lion, elephant, leopard, hippopotamus, and monkey. Oil-palms grow generally in neighbourhood of towns, and large quantities of palm-oil are made. Important settlements are Abomey (former capital), Allada, and Sayi. People are good agriculturists and potters; many well-cultivated farms to be seen on coast.

D. state dates back to XVIII. cent.; formerly ruled by absolute monarchs who were deified; last ruler deposed by French in 1900, the kingdom having been

entirely won over by 1894. Fetish-worship formerly prevailed and serpent worship on the coast with savage and murderous rites; once notorious for slave-trading ('Slave Coast'). Pop. 749,000.

Toutée, *Dahomé, etc.* (1897), and *Du Dahomé au Sahara* (1899); *Le Dahomey* (official publication, 1909).

DAILLE, JEAN (1594–1670), Fr. Prot. preacher and controversialist.

DAIRYING is the department of farming concerned with milk and its products. Milk (*q.v.*), the most complete, and one of the most important forms of human nourishment, has, according to local circumstances, been obtained from goats, ewes, asses, mares, camels, reindeer, and other animals, but the milch-cow is the universal and best provider. Shorthorn, Polled Angus, Dutch, Jersey, and Guernsey, and numerous other cattle (*q.v.*) are specially bred for dairy purposes. According to breed and environment, cows have been known to produce more than 1000 gallons of milk in a year, but 600 gallons is a fair annual average. The milk-producing value of different foods has increasingly become the subject of scientific inquiry and application, and their manure value is also a matter of great importance in the economy of the farm. Besides grass, the natural food of the cow, cotton-seed, or other cakes, cabbages, mangels, turnips, and succulent fodder are given, and a plentiful supply of clean, cold water is essential for the production of good milk. For summer dairying calving takes place from March to May, while in the case of winter dairying cows are made to calve at all times of the year to ensure a steady milk supply. Byres for dairy cattle must be kept clean, be well ventilated, drained, and lighted, and the cows should be clean and periodically examined by a veterinarian to guard against tuberculosis and other diseases. It is a matter of course that the most scrupulous cleanliness should be observed in milking and dairying, as few substances are so easily contaminated as milk, and regularity is not only essential for economical reasons, but for the health of the cows. Even the best milking machines have failed to supersede milking by hand.

The milk is immediately removed from the cow-house to a clean, dry room where it is strained through a metal gauze and flannel or cotton cloth, and cooled to about 15° for ordinary purposes, or to 7° for shipment. The cream is either skimmed from the milk with a skimmer, or by a centrifugal separator in which the separated milk and cream are forced out at two different tubes. The separated milk by the latter method contains considerably less fat than the ordinary skim-milk, and is, therefore, of small value for feeding pigs, etc. The cream is then kept in a crock till churning-time. For infants' food the entire milk may be *pasteurised, i.e.* all germs are destroyed by heating it under exclusion of air for about fifteen minutes at a temperature below boiling point, generally 60°. It is sold in hermetically sealed bottles. *Condensed milk* is prepared by evaporating milk with cane-sugar in a vacuum to about ¼ of its original volume, and is used where fresh milk is not procurable, as at sea.

Since the new-milk trade has been increasing at an enormous rate to meet the urban demand, butter- and cheese-making has become a less important adjunct to the farm. Dairy factories, especially in America, have attained a high standard of development by manufacturing butter and cheese of a uniform quality otherwise unobtainable, besides being better able to cope with the fluctuating demand for milk. The cream is churned in an over-end or other churn till granules of *butter* appear, the *butter-milk* drawn off, and the butter when formed washed in the churn till the water used remains clear. The surplus water is squeezed out by a butter-worker and the butter made into pats. *Cheese-making* essentially consists in coagulating milk by heating it to about 30° and adding rennet; the curd is settled by cutting it with special knives. After a process of heating and stirring, the pale yellow fluid called *whey* is drawn off, the curds being cut into slabs and allowed to 'ripen.' In this process the presence of certain bacteria is essential, and in scientific dairying pure cultures are now being used. The curd is salted and pressed, and the cheese formed requires skilful attention till it is ready for the market. Dairy products such as koumiss, kephyr, and humanised milk are now prepared for invalids and children according to the latest results of bacteriological and chemical research.

The principal countries in which dairying is carried on on a large scale are U.S.A., Canada, the U.K., Denmark, Holland, France, Germany, Switzerland, Sweden, and Australasia. The importance of dairying in national economy may be estimated from the fact that in the U.S.A. 2090 million gallons of milk, 1430 million lb. of butter, and 300 million lb. of cheese from more than 17 million cows were produced in 1899. See MILK, BUTTER, CHEESE.

Up-to
Oliver's
Modern Dairy F
Industry.

DAIS, raised floor in mediæval dining-hall, where high table stood.

DAISY, GOWAN (*Bellis perennis*), common composite plant occurring in Europe, Asia Minor, and N. America. The Michaelmas and Christmas daisies are asters.

DAKAR (14° 39′ N., 17° 24′ W.), fortified town, capital of Fr. W. Africa, on Gulf of Goree, Cape Verde; magnificent harbour; chief Fr. port on W. coast. Pop. 18,447.

DAKOTA, NORTH (47° 30′ N., 100° W.), N. central state of U.S.A., bounded on N. by Canadian provinces of Saskatchewan and Manitoba, E. by Minnesota, S. by South Dakota, W. by Montana; area, *c.* 70,800 sq. miles; surface consists mainly of plateaus, undulating plains, and grassy prairies; there are no trees unless along river banks, round shores of lakes, and in sheltered spots; state in some parts well watered, chief rivers being Red River of the N., which forms E. boundary, and its affluents, Mouse (or Souris), Cheyenne, Goose, Park, and Pembina; Missouri, with tributaries Little Missouri, Big Knife, and Cannon Ball; in N.E. is sheet of salt water, Devil's Lake, or Minnewaukon. High plateau called Coteau du Missouri extends from N.W. to S.E., and divides state in two; N. D. contains no great elevations, highest ground to be found in S. of Bowman county.

First successful settlements were made at Pembina; N. D. included in country ceded to U.S.A. from France by Louisiana Purchase, 1803; territories of N. and S. Dakotas organised in 1861, and proclaimed separate states in 1889.

Governor is elected every 2 years; state has 2 representatives in each House of Federal Congress; Senate of 49, House of Representatives of 100 members.

Especially in valley of Red River soil is rich, fertile, and highly cultivated; state famous wheat-growing country; agriculture chief industry; there are extensive farms; principal crops besides wheat are barley, rye, flax, hay, potatoes, and Indian corn; in W. ranching is successfully carried on; chief minerals produced are lignite, sandstone, and clays. Manufactures include flour, paper, and dairy produce, but are of no great importance. Principal towns are Bismarck (capital), Fargo, Grand Forks, and Minot. The climate is healthy, summer is short and winter severe but dry. Pop. (1910) 577,056, including 617 negroes.

DAKOTA, SOUTH (42° 30′ to 45° 57′ N., 96° 27′ to 104° 2′ W.), N. central state, U.S.A.; bounded N. by North Dakota, W. by Montana, Wyoming, S. by Nebraska, E. by Iowa, Minnesota; area, 77,615 sq. miles. Surface generally is undulating prairie land; drained by Missouri, and its tributaries—the Grand, Cheyenne, Bad, White, and other rivers. Principal mts. are the Black Hills in S.W. Climate has great extremes of heat and cold.

S. D. was formerly included in the territory of Dakota, and was organised as a state in 1889. Ad-

ministration is carried out by a gov. and various officers of state; there are 2 representatives in each branch of Federal Congress, and the state has an elected Senate (45) and House of Representatives (104).

The chief towns are Pierre (cap.), Sioux Falls, Lead, and Aberdeen. Principal industry is agriculture; cattle, sheep, horses, mules, and pigs are extensively raised, and wheat, corn, oats, barley, rye, and flax are grown; dairy-farming is carried on, and fruits and vegetables are cultivated. Minerals include gold, silver, tin, and nickel, which occur in the Black Hills district. Manufactures include flour-milling, butter- and cheese-making. Lumbering is carried on in the forest districts of the Black Hills. Education is free and obligatory; Vermilion is seat of State Univ., and there is a Wesleyan Univ. at Mitchell. Religions in order of numerical importance are R.C., Lutheran, Methodist, Congregational, and Prot. Episcopal. The inhabitants include whites, Indians, negroes (817). Pop. (1910) 583,888.

Robinson, *Brief History of South Dakota.*

DALAGUETE (*c.* 10° N., 124° E.), town, at mouth of Tapon, E. coast of Cebú, Philippine Islands. Pop. 22,000.

DALBEATTIE (54° 57′ N., 3° 48′ W.), town, Kirkcudbrightshire, Scotland; important granite quarries in district. Pop. (1911) 3357.

DALBERG, name of Ger. noble family taken from their property of D. They received (1494) right of precedence in obtaining knighthood at coronation of emperor. Prominent members were JOHANN (1445–1503), noted patron of letters, KARL THEODOR ANTON MARIA (1744–1817), important statesman of Empire. The dau. of the last duke was mother of Lord Acton, the Eng. historian.

DALE, ROBERT WILLIAM (1829–95), Eng. Congregational minister, and important exponent of Nonconformist opinion; wrote *History of Congregationalism,* pub. 1907 by his s., SIR ALFRED W. W. DALE (1855–), principal of Liverpool Univ.

DALE, SIR THOMAS (fl. *c.* 1588–1619), Deputy-Gov. of Virginia.

DALECARLIA (61° N., 14° 30′ E.), former province, Sweden, now forming county of Kopparberg.

DALGAIRNS, JOHN DOBREE (1818–76), Eng. R.C. priest and author; formerly member of Church of England.

DALGARNO, GEORGE (d. 1687), Scot. educationist.

DALHOUSIE, FOX MAULE RAMSAY, 11TH EARL OF (1801–74), Brit. administrator.

DALHOUSIE, EARL OF, JAMES ANDREW BROUN-RAMSAY (1812–60), Brit. administrator; b. at Dalhousie Castle, in Midlothian; succ. Gladstone as Pres. of Board of Trade, 1845–46; gov.-gen. of India, 1847–56, during which time British conquered or annexed large dominions, and railways, canals, telegraphs, etc. revolutionised India; cr. marquess, 1849. After war of 1848–49 D. on his own authority annexed Punjab, organised expedition which resulted in annexation of kingdom of Pegu, 1853; introduced policy of considering native states escheats to crown on failure of heirs-male, and thus made pretext for annexation of Nagpore (1853); introduced numerous civilising measures and reformed organisation; allowed large amount of independence to greater native states. Annexation of Oude, 1856, prescribed by home government, 'well-nigh brought our Empire in the east to a setting in gloom and blood'; urged by D. as misrule of king made native rising inevitable; considered, later, crown of D.'s career.

Lee-Warner, *Life of Dalhousie* (1904); Trotter, *Lord Dalhousie*; Sir W. Hunter, *Marquis of Dalhousie* ('Rulers of India').

DALIN, OLAF VON (1708–63), Swed. poet.

DALKEITH (55° 54′ N., 3° 4′ W.), market town, Midlothian, Scotland. Dalkeith Palace is seat of Duke of Buccleuch; D. is important agricultural centre; has weekly grain-markets; carpet-making, iron- and brass-founding are chief industries. Pop. (1911) 7019.

DALKEY (53° 17′ N., 6° 7′ W.), watering-place, on Irish Sea, County Dublin, Ireland.

DALLAS (32° 46′ N., 96° 31′ W.), city, **Texas,** U.S.A., on Trinity; contains univ. and several colls.; flour and woollen mills, foundries; important centre for saddlery and leather goods. Pop. (1910) 92,100.

DALLAS, ALEXANDER JAMES (1759–1817), Scoto-Amer. statesman, lawyer, and writer; famous for success in founding Amer. bank (1817) and financial administration. His bro., ROBERT CHARLES (1754–1824), wrote *Recollections of Lord Byron.*

DALLAS, GEORGE MIFFLIN (1792–1864), Amer. lawyer, diplomatist, and statesman; leader of Conservative Democrats of North; Vice-Pres. of U.S.A., 1845–49; minister to England, 1856–61.

DALL' ONGARO, FRANCESCO (1808–73), Ital. poet and dramatist.

DALLES, THE (45° 33′ N., 121° 1′ W.), city, Oregon, U.S.A.; near T.O., name of rapids in Columbia river and hills. Pop. (1910) 4880.

DALLMEYER, JOHN HENRY (1830–83), Anglo-Ger. optician; manufactured telescopes; authority on photographic lenses; on the council of Royal Photographic and Royal Astronomical Societies. His son, THOMAS RUDOLPH (1859–1906), wrote a well-known book on *Telephotography* (1899).

DALMATIA (44° N., 16° E.), crownland, Austria; a narrow, mountainous country with numerous islands on N.E. coast of Adriatic Sea; bounded by Croatia on N., Bosnia and Herzegovina E. and N.E., Montenegro S.E.; area, 4940 sq. miles; breadth, 2–40 miles; mountain ranges include Velebit and Dinaric Alps (Dinara, *c.* 6000 ft.) and Cattaro Mts. (Orien, 6100 ft.). Coast is mountainous and indented with numerous harbours and bays, the most important being Cattaro, Ragusa, Spalato, Sebenico; many islands, including Pago, Brazza, Lesina, and Curzola. Principal rivers are Narenta in S.; Zermagna, Kerka, and Cettina. Country is mostly pasture-land and woods, and produces timber, wine, oil; shipbuilding is carried on in some islands. Iron, lignite, asphalt, and salt are found; gold formerly. Climate is warmer than rest of Austria-Hungary; sirocco felt in spring; mean annual temp., 59° on coast. Inhabitants are mostly Serbo-Croats and Italians, R.C. and Gk. in religion.

D. was conquered by Romans (*c.* 400 B.C.); occupied by Slavs in VII. cent.; passed to Venice in Middle Ages; became independent republic, then fell into Austria's possession; taken by Napoleon (1805); became united to Italy, then to Illyria, and returned to Austria in 1814. Chief towns are Zera (capital), Spalato, Ragusa; principal agricultural products, Indian corn, rye, barley, and fruits; famed for Maraschino liqueur; large quantities of fruit; few cattle reared, and little manufacturing done. A Provincial Diet with forty-three members is elected for six years and summoned annually; D. sends eleven members to Austrian Reichsrath. Pop. (1910) 645,664.

Maud Holbach, *Dalmatia* (1907).

DALMATIC, a vestment which took its name from a species of Rom. tunic worn in the first centuries of Christian era; adopted by pope and deacons, and later used by deacons and subdeacons of the R.C. Church; has wide, straight sleeves, skirt split at sides, and two vertical joined by two horizontal stripes.

DALMELLINGTON (55° 20′ N., 4° 23′ W.), village, Ayrshire, Scotland; collieries and ironworks.

DALOU, JULES (1838–1902), Fr. sculptor.

DALRADIAN, complicated series of metamorphic rocks, consisting chiefly of schists and limestones, of the Highlands of Scotland and N.W. Ireland.

DALRIADA.—(1) ancient name for a district now forming northern part of County Antrim, Ireland. (2) ancient name for part of Argyllshire, Scotland; founded by Dalriads from Ireland *c.* 500 A.D.; united with the northern kingdom of the Picts under King Kenneth, in 843.

DALRY (55° 43′ N., 4° 43′ W.), town, on Garnock, Ayrshire, Scotland; worsted-spinning and machine knitting, box- and cabinet-making. Pop. (1911) 4812.

DALTON (33° 43′ N., 83° 18′ W.), city, Georgia, U.S.A.; fruit and vegetable canneries. Pop. (1910) 5324.

DALTON, JOHN (1766–1844), Eng. chemist and physicist; b. of a Quaker family in Cumberland; became a teacher in Manchester in 1793, and there continued meteorological observations which he entered until the day before his death. D. communicated a paper to the Manchester Literary and Philosophical Soc. on colour-blindness (*Daltonism*), with which he was afflicted, and from 1801 onwards published numerous papers on the properties of gases. His most important work, however, is his enunciation of the atomic theory. He delivered courses of lectures (1803–10) at the Royal Institution, London, in Glasgow, and in Edinburgh; elected F.R.S., 1822. See Atoms.

A. Smith, *Memoir of John Dalton and History of the Atomic Theory* (1856); Roscoe and Harden, *A New View of the Origin of Dalton's Atomic Theory* (1896) *John Dalton and the Rise of Modern Chemistry* (1895).

DALTON-IN-FURNESS (54° 9′ N., 3° 12′ W.), market town, Lancashire, England; with extensive ironworks; ruins of Furness Abbey in vicinity. Pop. (1911) 10,765.

DALY, JOHN AUGUSTIN (1838–99), Amer. dramatist and theatre manager; built Daly's Theatre in London (1893).

DALYELL, THOMAS, Dalzell (*c.* 1599–85), Scot. Royalist commander; defeated Covenanters at *Rullion Green*; notorious for cruelty to Covenanters taken as prisoners.

DAM, see Reservoir.

DAMAGES, compensation claimed by persons for breach of contract, loss sustained, infringement of copyright, slander, libel, breach of promise, etc. As regards breach of contract, Baron Parke expressed the opinion that 'the rule of the common law is, that where a party sustains a loss by reason of a breach of contract, he is, so far as money can do it, to be placed in the same situation with respect to damages, as if the contract had been performed.' D. cannot be recovered if they are too remote. Nor can they be based on the intention of punishing the party who has committed the breach. But in assessing the d. respect may be paid to prospective loss arising from the refusal of the defendant to perform his contract. In regard to loss or depreciation of goods sustained by land or sea, the consignee is the proper person to claim d., unless the goods are sent on approval, when the consignor must make the claim. D. for infringement of copyright are treated under Copyright (*q.v.*).

Mayne, *On Damages* (new ed., 1909).

DAMAN, Damão (20° 23′ N., 72° 32′ E.), seaport town belonging to Portuguese, on Gulf of Cambay, Bombay, India; teak forests; cotton-weaving, fisheries; Portug. settlement since 1558. Area, 150 sq. miles. Pop. *c.* 60,000.

DAMANHÛR (31° N., 30° 30′ E.), town, Behera, Egypt; occupies site of ancient *Hermopolis*; manufactures cotton goods; important station on Cairo-Alexandria railway. Pop. *c.* 39,000.

DAMARALAND (*c.* 21° S., 15° E.), region in middle of Ger. S.W. Africa; partly mountainous; district rich in copper; cattle-rearing carried on. See German South-West Africa.

DAMASCENING, Oriental, now particularly Persian, art of ornamenting weapons and armour, by deep incision of the pattern into which gold or silver threads are hammered, the article then being filed and polished. The term is also applied to the production of a peculiar blade steel with a watered pattern, by twisting welding strips of different steel together, or by corrosion.

Hendley, *Damascening on Steel and Iron, as practised in India* (1892).

DAMASCUS (33° 30′ N., 36° 18′ E.), city, capital of Syria, beautifully situated on plain surrounded by orchards at base of Anti-Lebanon Mts., is enclosed by ruined walls with towers, and has a palace, citadel, handsome baths, mosques, and bazaars. Great mosque (VIII. cent.) was partly destroyed by fire in 1893. Most of streets are narrow, and houses ruinous. D. is great caravan centre, and manufactures embroidered goods, inlaid and metal work, jewellery. Damascus-Mecca railway was completed as far as Medina in 1908. The city is now lit by electricity and has an electric-car system. D. is sacred city to Muhammadans, and dates back to beginning of history; flourished under Jewish and Rom. rulers, but was supplanted by Bagdad in VIII. cent. Pop. 350,000.

Porter, *Damascus, Palmyra, and Lebanon* (1910); Smith, *Hist. Geography of Holy Land* (new ed., 1900).

DAMASK, figured silk, used for upholstery and hangings, originally made at Damascus; linen, or cotton, figured fabrics, generally used as table napery; adjective for 'red,' as 'damask rose.'

DAMASUS I., pope, 366–84; maintained his position with great difficulty. His forgeries of inscriptions to martyrs are archæologically important, and he encouraged the learned labours of St. Jerome.—Damasus II., pope for less than a month in 1048.

DAMAUN, see Daman.

DAME'S VIOLET, Rocket (*Hesperis matronalis*), herbaceous cruciferous plant, allied to stock and wallflower; native of temperate Asia and Europe; cultivated in gardens.

DAMGHAN (36° 10′ N., 54° 20′ E.), decayed town, Persia; large export trade in almonds. D. was destroyed by Afghans in 1723.

DAMIANI, PIETRO (*c.* 1007–72), Ital. ecclesiastic; reformed monastic life; denounced simony and marriage of priests; became cardinal (1058), and was adviser to the pope.

DAMIEN, 'FATHER' JOSEPH (1841–89), Belg. missionary to lepers of Hawaii; d. of leprosy; eulogised by R. L. Stevenson.

Clifford, *Father Damien* (1889).

DAMIENS, ROBERT (1715–57), Fr. religious fanatic; tried to murder Louis XV., and was executed after revolting torture.

DAMIETTA (31° 23′ N., 31° 48′ E.), town, Lower Egypt, on chief eastern branch of Nile; formerly important; several times taken and lost by Crusaders (XIII. cent.); exports grain and fish. Pop. *c.* 29,250.

DAMIRI (1344–1405), Arab. author; wrote *Life of Animals.*

DAMJANICH, JÁNOS (1804–49), Hungarian military commander.

DAMMAR, resins obtained from different coniferous trees of New Zealand, Australia, and E. Indies; used for manufacture of varnishes.

DAMMARTIN (49° 4′ N., 2° 35′ E.), small town, Seine-et-Marne, France.

DAMME (51° 15′ N., 3° 17′ E.), village, W. Flanders, Belgium; formerly important seaport; here, in 1213, the Fr. fleet was destroyed by an Eng. fleet; cattle-raising.

DAMOCLES (IV. cent. B.C.), flatterer at court of Dionysius, who, at a banquet, suspended a sword above Damocles' head by a single hair to show how close death is to earthly felicity.

DAMOH (23° 50′ N., 79° 29′ E.), town and district, Central Provinces, India; large cattle market. Pop. 13,555.

DAMON (*c.* 400 B.C.), Pythagorean philosopher; famed for devotion to friend and fellow-philosopher Pythias, in whose place he was ready to be executed.

DAMOPHON, famous Gk. sculptor.

DAMPIER, WILLIAM (1652–1715), Eng. navigator and author; buccaneer on Span. Main; app. commander of Eng. voyage of discovery to Australia, 1699, exploring district round Shark's Bay; surveyed east coast of New Guinea; commanded venture to South Seas in which Alexander Selkirk sailed; his accounts of voyages are admirable.

Clark-Russell, *Life of Dampier.*

DAN, Israelitish tribe, named after a s. of Jacob and Bilhah, originally settled in northern Palestine.

DAN (*c.* 33° N., 35° E.), ancient frontier city, Palestine; destroyed by Benhadad I. (*1 Kings* 15[20]).

DANA, CHARLES ANDERSON (1819–97), Amer. journalist and miscellaneous writer.

Wilson, *Life of C. A. Dana* (1907).

DANA, FRANCIS (1743–1811), Amer. lawyer and diplomatist; advocated secession from Britain and became leader of 'Sons of Liberty' in Massachusetts; assisted in organising army, and urged refusal of Brit. offers; representative to Russia, 1780–83; chief justice of Massachusetts supreme court, 1791–1806; member of Massachusetts Convention, which ratified U.S. constitution.

DANA, JAMES DWIGHT (1813–95), Amer. geologist; mathematical teacher, U.S. navy; geologist to U.S. exploring expedition to southern seas under Wilkes (1838). In 1850 he succ. Prof. Silliman, whose dau. he had married, as prof. of Natural History and Geol. at Yale Coll., and collaborated with him as edit. of the Amer. Journal of Science. Of his numerous works his *Manual of Geology* is perhaps the most widely known.

D. C. Gilman, *Life of J. D. Dana* (1899).

DANA, RICHARD HENRY (1787–1879), Amer. poet and critic.

DANA, RICHARD HENRY (1815–82), Amer. author; s. of above; wrote *Two Years before the Mast*; was an authority on maritime law.

Adams, *Richard Henry Dana* (1890).

DANAË (classical myth.), daughter of Acrisius, king of Argos, who shut her up in a tower; mother of Perseus by Zeus, who visited her in a shower of gold.

DANAÏDES, see DANAUS.

DANAO (10° 30′ N., 124° 3′ E.), town, E. coast of Cebú, Philippine Islands; centre of rich agricultural district. Pop. *c.* 16,000.

DANAUS, legendary s. of Belus, Egyptian king; f. of the fifty *Danaïdes* who married the fifty sons of Ægyptus and, at their f.'s command, murdered their husbands (with one exception) on their wedding night.

DANBURITE ($CaB_2(SiO_4)_2$), rare mineral, transparent orthorhombic crystals, found in Connecticut and other parts of U.S.A., in Grisons (Switzerland) and Japan.

DANBURY (41° 23′ N., 73° 30′ W.), city, Connecticut, U.S.A.; extensive hat factories. Pop. 20,234.

DANBY, FRANCIS (1793–1861), Eng. artist.

DANCE, the performance of a succession of rhythmic movements with the body, usually to a musical accompaniment. It is a custom which dates back to antiquity, and though amongst civilised nations it has been raised to a fine art, it constitutes an important part in the lives of most primitive and savage races (*e.g.* the war-dances of N. Amer. Indians and Zulus). Modern dancing dates back to the XV. cent., and, though often of Ital. or Span. origin, was generally refined, developed, and popularised in France. Catherine de' Medici (1519–89) introduced a number of Ital. d's at the Valois court. Amongst the most popular d's of this period were the *gaillarde*, *volta*, *branle*, the stately and beautiful *pavane*, and the *sarabande*. In some of these d's kissing played a part, and the *pavane* was usually accompanied by a *chanson*. Another famous old d. was the *courante*, from which was derived the *minuet*, the latter being brought to a high state of perfection in France. The *gavotte*, originally a peasants' d., became popular in the XVIII. cent., as also did the *cotillon*. The *lancers*, *polka*, *schottische*, *quadrille*, and *waltz* belong to the XIX. cent., though some of them, under slightly different forms, had been in use earlier. The *fandango* (XVIII. cent.) was danced by two persons, with castanets and finger-snapping. Most countries have their peasant d's, and the charming Eng. Morris d's date back to the reign of Edward III. Eng. country-d's under the Tudors were mostly kissing d's. *Sir Roger de Coverley* was popular before the close of the XVII. cent. The golden age of dancing in England was under the *régime* of Beau Nash (XVIII. cent.). Scot. national d's are the *reel* and *strathspey*; the Irish national d. is the *jig*. Within recent years d's with no pretensions to grace have been introduced, mostly from America — the *cake-walk*, *two-step*, *one-step*, *Turkey trot*, and *Ragtime*. Miss Isadora Duncan's Grecian dancing popularised classical dancing in Britain, and many artists, notably Miss Maud Allan, give rhythmical interpretations of the music of Chopin and other classical composers. Russian dancers (*e.g.* Pavlova) have brought ballet-dancing to perfection.

Vuillier, *History of Dancing* (Eng. trans., 1898); Mrs. Grove, *Dancing* (Badminton Library).

DANCE, CHARLES (1794–1863), Eng. burlesque writer; one of first to use that medium; several of his ancestors were distinguished artists and architects.

DANCOURT, FLORENT CARTON (1661–1725), Fr. dramatist and comedian.

DANDELION (*Leontodon taraxacum* or *Taraxacum officinale*), perennial composite herbaceous plant of temperate zones. In France the leaves are used for salad, and roasted roots as a substitute for coffee. An extract of the roots is used medicinally as a bile stimulant.

DANDOLO, name of noble Venetian family. ENRICO, doge, 1193–1205, succeeded in turning aside Fourth Crusade from attack on Egypt to capture of Constantinople; rewarded for aid with Crete and other possessions of Gk. Empire. Three other members of the family were doges; ANDREA (doge, 1343–54), a famous administrator, was eulogised by Petrarch.

DANDOLO, VINCENZO, COUNT (1758–1819), Ital. agriculturist; took part in the political troubles of Venice during the Napoleonic times; app. gov. of Dalmatia (1805), he improved the sanitary, agricultural, and educational conditions of the people.

DANEGELD, land tax imposed in England to provide means for resisting the Danes (X. cent.), but afterwards employed by Ethelred the Unready to buy them off; abolished in reign of Henry II.

DANELAGH, name given to district of England N. of Thames, E. of Lea, and N.E. of Watling St., ceded to Danes by Treaties of Wedmore and Chippenham, 878; N. boundary unknown, but probably D. did not extend beyond Deira; abolished by Dan. conquest of England. A large infusion of Dan. speech took place at time of D.

DANEWERK, ancient Dan. rampart in Jutland, raised as protection against Germans.

DANGERFIELD, THOMAS (d. 1685), Eng. criminal; professed discoverer of 'Meal-tub Plot.'

DANIEL, chief character of Bible Book of *Daniel*, shown by modern criticism to have been written during persecution of Antiochus Epiphanes (175–64 B.C.), not, as it purports to be, during Babylonian captivity. Partly concerned with prophecy, partly with life of D., it has been included in hagiographical, not prophetic, books of Bible. Some of it is written in Hebrew, the rest in Aramaic, and it has been suggested that it is a compilation from an uncompleted Aramaic trans. and a Hebrew original. It repeats Jeremiah's prophecy of the establishment of the Messiah's kingdom, and seems intended to comfort Jews suffering under persecution of the Seleucid king. The influence of Persia is strongly shown, *e.g.* in doctrine of resurrection, expressed for first time in *Old Testament*, and in system of angels among whom archangels Michael and Gabriel receive names. Identity of prophet is obscure; a Daniel mentioned in Book of *Ezekiel* was of great importance in the early history of the Jews, but cannot be made to agree in date; his deeds, it has been suggested, may have been confused by a writer of the time of Antiochus Epiphanes (whose narrative is full of hist. errors) with those of a hero of the time of Babylonian captivity; Josephus, pseudo-Epiphanius and Epiphanius invented accounts of the prophet; certain rabbis accepted the tradition of his return to Jerusalem and assistance in founding the Great Synagogue, others believed he died in captivity and his tomb was shown at Susa in XII. cent.

Wright, *Daniel and his Prophecies* (1905); R. H. Charles, *Daniel* (The Century Bible, 1911).

DANIEL (OF KIEV) (c. 1106), Russ. traveller and writer.

DANIEL, GABRIEL (1649–1728), Fr. historian.

DANIEL, SAMUEL (1562–1619), Eng. poet; author of the *Complaynt of Rosamund*, *Delia* (sonnets), a verse history of the Wars of Roses; he championed poetry in *A Defence of Rhyme*, and wrote court masques.

DANIELL, JOHN FREDERIC (1790–1845), Eng. physicist; inventor of *Daniell cell*, a pyrometer and hygrometer, and of a process to prepare illuminating gas from turpentine; first prof. of Chem., King's Coll., London; foreign sec. of the Royal Soc. from 1839.

DANIELL, THOMAS (1749–1840), Eng. landscape artist; R.A. (1799); Oriental scenes.

DANNAT, WILLIAM T. (1853–), Amer. figure-artist.

DANNECKER, JOHANN HEINRICH VON (1758–1841), Ger. sculptor; his *Ariadne on the Panther* (at Frankfurt) is a masterpiece.

D'ANNUNZIO, GABRIELE (1864–), Ital. writer; has achieved remarkable distinction as poet, novelist, and dramatist. His work generally is noteworthy for great beauty of style, vivid description, and keen psychological insight, but much of it is marked by a pronounced sensuousness of tone. His poems include *Primavera*, *In Memoriam*, *Canto Nova*, and *La Canzone di Garibaldi*; his novels, *Il Piacere* (The Child of Pleasure), *L'Innocente* (The Intruder), and *Giovanni Episcopo*; and his dramas, *Città Morta*, *La Gioconda*, *La Gloria*, and *Francesca da Rimini*. There are Eng. trans. of many of his works.

DANSVILLE (42° 34′ N., 77° 41′ W.), town, Livingston Co., New York, U.S.A., on Canaseraga Creek; flour and paper mills. Pop. 4000.

DANTE ALIGHIERI (1265–1321), Ital. poet; b. Florence; s. of Alighieri, a notary of good family; D. is an abbreviation of *Durante*. Little is known of his early life, except that his first meeting with Beatrice occurred at the age of nine (1274), when she was of the same age, and that both his parents were dead by the time he was eighteen. Beatrice is believed to have been the dau. of Folco Portinari; she married Simone dei Bardi, and died in 1290. At the age of eighteen the poet began to write the noble lyrics inspired by his love for Beatrice, which he collected after her death and included in the *Vita Nuova* (New Life). The death of Beatrice was followed by a period of bitter depression, which was succeeded by one of moral decline, and D. appears to have plunged into dissipation and found consolation in the gratification of an earthly passion. His delinquencies, however, were bitterly repented of, and followed by a noble atonement. A period of military service ensued. Somewhere about 1298 the poet married Gemma, dau. of Manetto Donati, by whom he had four children.

The government of Florence at this period was in the hands of the wealthy trade guilds. D. became a member of the Guild of Physicians, but the party to which he belonged was overthrown by the nobles in 1301, and, in the following year, sentence of banishment was pronounced against him. During the period of his first exile (1302–10) D. wandered over Italy, spending much time at Verona, and commenced to write his *Convivio* (Banquet) and *De Vulgari Eloquentia*. Subsequently there seemed a prospect of the poet returning to his native Florence, but the terms offered were so humiliating that they were rejected, and a fresh sentence of banishment was pronounced. D.'s closing years were happily spent under the patronage of Can Grande della Scala at Verona, and that of Guido Novella (relative of Francesca of Rimini) at Ravenna. During this period his *Divina Commedia* was written, and other works continued. His death took place at Ravenna, the result of a fever, caused by a journey to Venice, and he was buried in the Franciscan convent there. In person D. was of middle height, dark-complexioned, long-faced, aquiline-nosed, with a protruding under-lip, and black, curly hair.

As the greatest poet which Italy has produced he was supreme as an epic poet, but also distinguished as a lyric writer, as is shown in his *Canzoniere* and the lyrical portions of the *Vita Nuova*, while his minor writings, letters, etc., stamp him as one of the greatest intellectual forces the world has yet known. D., by selecting the cream of the Ital. dialects, the Tuscan dialect especially, formed a great literary language; in his opinion literary words are those used by the best society. It is, however, by virtue of his epic masterpiece that Dante chiefly lives. In this, the *Divina Commedia*, man's life after death is portrayed, the poet describing his visions of hell, purgatory, and the heavens, under the guidance first of Virgil and then of Beatrice.

Complete Eng. trans. of Dante's works in 'Temple Classics'; also trans. of the *Divine Comedy*, by Cary, Longfellow, and Plumptre; Howell's *Dante* in Jack's 'People's Books.'

DANTON, GEORGES JACQUES (1759–94), Fr. revolutionary leader who did most to bring about Reign of Terror under which he fell; became prominent as pres. of *Cordeliers* Club (*q.v.*), extreme anti-monarchical and anti-aristocratic body; probably led march of people to Tuileries; app. Minister of Justice, and afterwards became member of *Mountain* in Convention; condemned by Girondists for allowing massacre in prisons; member of Committee of Public Safety and voted execution of king; fanned rage of populace against Girondists; made Committee of Public Safety supreme and army efficient. 'Terror' now passed out of D.'s control. At first D. was protected by Robespierre, but he was subsequently abandoned, and guillotined with other 'moderates.'

Beesly, *Life*; C. F. Warwick, *Danton and the Fr. Revolution* (1909); Hilaire Belloc, *Life* (new ed., 1911).

DANTSIC, see DANZIG.

DANUBE, DONAU, second largest river of Europe, draining about 315,000 sq. miles; total length, 1740 miles. D. begins at Donaueschingen, Black Forest, at junction of Brega and Brigach (elevation, 2264 ft.); course generally eastwards; N.E. and S.E. through Germany, S.E. through Austria, S.E. and S. through Hungary, E. as boundary between Hungary and Servia and between Rumania and Bulgaria; N. through Rumania and E. as Russo-Rumanian frontier; flows into Black Sea through vast delta, chief mouths being Kilia, St. George, and Sulina. D. has innumerable tributaries, including Iller, Lech, Altmühl, Wörnitz, Regen, Isar, Inn, Enns, Wien, Marsh, Leitha, Raab, Waag, Gran, Drave, Theiss, Save, Morava, Schyl, Aluta, Isker, Sereth, Pruth. Chief towns on banks are Vienna, Budapest, Belgrade; also Ulm, Ratisbon, Passau, Linz, Pressburg, Waitzen, Orsova, Vidin, Nikopoli, Silistria, Braila. D. is navigable from Ulm to Black Sea, and is open to all nations; shipping enters at Sulina mouth (greatly improved by European Commission of the Danube—instituted 1856); famous Iron Gates rapids long hindered navigation. D. is connected with Rhine by Ludwigs canal (1844), with Elbe by Moldau and Mühl canals. D. has played a prominent rôle in history, commerce, and lit.; has served as great national frontier since days of Rom. Empire; scenery in Upper and Lower Austria is especially fine, with many historic and romantic buildings, fine mediæval and modern castles, churches, etc.

Jerrold, *The Danube* (1911); F. D. Millet, *Danube from Black Forest to Black Sea* (1892).

DANUBIAN PRINCIPALITIES, Moldavia and Walachia, see RUMANIA.

DANVERS (42° 29′ N., 71° 1′ W.), town, Massachusetts, U.S.A.; boots and shoes. Pop. (1910) 9407.

DANVILLE (40° 6′ N., 87° 38′ W.), town, Illinois, U.S.A.; extensive coal-fields. Pop. (1910) 27,871.

DANVILLE (37° 27′ N., 84° 49′ W.), town, Ken-

tucky, U.S.A.; important seat of educational institutions; produces cotton and tobacco. Pop. (1910) 5420.

DANVILLE (40° 54′ N., 76° 33′ W.), town, Pennsylvania, U.S.A.; extensive ironworks. Pop. (1910) 7517.

DANVILLE (36° 36′ N., 79° 17′ W.), city, Virginia, U.S.A.; tobacco factories and cotton mills. Pop. (1910) 19,020.

DANZIG, Dantsic (54° 22′ N., 18° 39′ E.), fortified seaport town and naval station, Germany; capital of province of W. Prussia; one of principal ports and chief commercial centres; notable edifices are—Church of St. Mary (built in XIV. and XV. cent's), Gothic townhall, and Franciscan monastery (now museum of antiquities). D. was taken from Teutonic Knights by Poles (1454); unsuccessfully besieged by Swedes (1627–29); retaken by Prussia (1793); captured by French (1807) and ceded to Prussia (1814); has large transit trade in grain, timber, and sugar; has important gun factories and shipbuilding yards. Pop. (1910) 170,347.

Simson, *Geschichte der Stadt Danzig* (1903).

DAPHNÆ (*c.* 30° 54′ N., 32° 18′ E.), ancient town, on E. arm of Nile, Egypt; modern Defenneh.

DAPHNE (classical myth.), nymph beloved by Apollo; changed by her mother into a laurel tree.

DAPHNE, genus of European and temperate Asiatic shrubs of order Thymelæaceæ, mostly evergreen with fragrant flowers and, frequently, poisonous berries; cultivated in gardens.

DAPHNEPHORIA, festival celebrated at Thebes, every ninth year, in honour of Apollo.

DAPHNIS (classical myth.), Sicilian shepherd, punished with blindness for infidelity; reputed inventor of bucolic poetry.

DARAB (28° 42′ N., 54° 25′ E.), town, Farsistan, Persia; produces dates; antiquarian remains. Pop. 5000.

DARBHANGA (26° 10′ N., 86° E.), district, Bihar and Orissa, India; consists of alluvial plain; exports rice and indigo; area, 3348 sq. miles. Pop. 2,912,611. Chief town is Darbhanga, on Little Bághmati. Pop. 65,990.

D'ARBLAY, MADAME, see Burney, Fanny.

DARBOY, GEORGES (1813–71), Fr. ecclesiastic; upheld independence of Gallican Church; made abp. of Paris (1863); killed at siege of Paris.

DARCY, THOMAS (1467–1538), Lord D. of Templehurst, Yorks; Tudor warden of marches; summoned to Parliament as baron, 1509–38; executed for part in Pilgrimage of Grace.

DARDANELLES (40° 4′ N., 26° 14′ E.), fortified town, on Dardanelles Strait, Asia Minor. Pop. 15,000.

DARDANELLES, Hellespont (40° 15′ N., 26° 30′ E.), narrow strait between Europe and Asia; connects Ægean Sea with Sea of Marmora; length, *c.* 45 miles; breadth, 1 to 5 miles; historically famous for Xerxes' crossing by a bridge of boats to enter Greece with an army of 5,000,000 (480 B.C.), which was stopped by 400 Spartans under Leonidas at *Thermopylæ*; and for Alexander the Great's crossing in 334 B.C. when invading Asia Minor. The legendary Leander swam the Hellespont near Abydos (*q.v.*) nightly to visit Hero, and was drowned at last. It is strongly fortified. By treaty (1841) no warship can pass through the D. without Turkey's consent. Yet in 1878 Britain sent a fleet through to protect Constantinople from Russia. In 1904, during the Russo-Jap. War, Russia sent the cruisers *Peterburg* and *Smolensk* through, under a commercial flag. In the Turco-Ital. Tripoli War, the D. were bombarded by Ital. warships.

DARDANUS (classical myth.), s. of Zeus and Electra; reputed founder of Trojan royal family.

DARDISTAN (36° 10′ N., 74° E.), the 'County of the Dards'; mountainous tract of country; N.W. borders of Kashmir; inhabited by race of Aryan origin.

DARES PHRYGIUS, reputed writer of a description of Trojan War, who lived before Homer.

DAR-ES-SALAAM (6° 50′ S., 39° 18′ E.), seaport and capital of Ger. E. Africa, on Ind. Ocean; fine harbour; commercial centre; exports ivory, rubber; railway being built from D. to Tanganyika. Pop. 20,000.

DARFUR (13° N., 25° E.), country in E. Central Africa, lying between Kordofan and Wadai; division of Sudan. Its limits are ill-defined; capital is El-Fasher. D. is hilly (Marra, *c.* 6000 ft.), with oasis; N. level is sandy, almost waterless; during rainy season (June to Sep.) vegetation is good; heat excessive. Chief crops are millet, rice, maize, fruits; home-grown tobacco much used by natives; inhabitants mostly Furs, Arabs, and negroes. Commerce (mostly with Egypt) is effected by caravans. From *c.* 1450 to 1874 D. was ruled by absolute sovereigns; it has been under Anglo-Egyptian rule since 1899, although its hereditary Sultan directs the management of internal affairs; formerly notorious for slave-trading. Pop. 4,000,000.

DARGAI (34° 30′ N., 71° 52′ E.), hill station, N.W. Frontier Provinces, India; scene of stirring incident in Tirah campaign.

DARGOMIJSKY, ALEXANDER SERGEIVICH (1813–69), Russ. composer.

DARIAL (42° 43′ N., 44° 41′ E.), gorge, in Caucasus, E. of Mt. Kazbek, on Georgian military road; the chief pass across Caucasus.

DARIEN, see Panama.

DARIEN SCHEME (1695), a plan to colonise the Isthmus of Darien with Scotsmen. It was formed by William Paterson (founder of the Bank of England). William III. opposed it. 1200 colonists landed at Darien; they were withstood by Spaniards and were short of provisions. Disease broke out, and only a small remnant returned to Scotland.

J. S. Barbour, *William Paterson and the Darien Company* (1907).

DARIUS, name of three Persian rulers. Darius I., *the Great* (d. 485 B.C.), seized throne, 521 B.C.; extended territories to Caucasus; great lawgiver and organiser; led immense expeditions to Greece in revenge for interference in Asia Minor; famous defeat of his general at *Marathon*, 490 B.C.—Darius II. (*Ochus*) ruled 423–404 B.C.; made alliance with Sparta against Athens.—Darius III. (*Codomannus*), beaten at *Issus* and *Arbela* (331) by Alexander the Great.

DARJEELING, Darjiling (27° 3′ N., 88° 18′ E.), district, Bengal, India, on Himalayas; partly mountain and valley; well cultivated; magnificent scenery; area, 1164 sq. miles. Pop. 249,117. Capital is Darjeeling, elevation over 7000 ft., chief health station in Bengal; tea-planting. Pop. 13,000.

DARLEY, GEORGE (1795–1846), Irish poet and critic.

DARLING (34° 30′ S., 142° E.), river, Australia; rises in Queensland; flows through N. S. Wales; joins the Murray.

DARLING, GRACE HORSLEY (1815–42), Eng. heroine; dau. of William D., keeper of Longstone lighthouse (Farne Islands); famous for share in rescue of shipwrecked crew of *Forfarshire* (1838); d. of consumption.

Grace Darling: Her True Story (1880).

DARLINGTON (54° 32′ N., 1° 34′ W.), market town, Durham, England, on Skerne, near junction with Tees; has ancient Gothic church (1160), Edward Pease Library (1885), technical coll., grammar school; woollen manufactures, iron and steel works; Stockton and Darlington Railway (opened Sep. 27, 1825) was the first passenger line on which locomotives were used. Stephenson's Locomotive No. 1 is preserved at Bank Top Station. Pop. (1911) 55,633.

DARLINGTONIA CALIFORNICA, pitcher plant of the order Sarraceniaceæ, native on Sierra Nevadas, California. The bright-coloured leaves are twisted to form an insect trap (pitcher), the prey being digested and absorbed by the leaf.

DARLY, MATTHIAS (*c.* 1741–80), Eng. caricaturist and engraver.

DARMESTETER, JAMES (1849–94), Fr. antiquary. His bro., **Arsène** (1846–88), Fr. philologist.

DARMSTADT (49° 52′ N., 8° 38′ E.), town, on Darm, Hesse, Germany; residence of grand-duke and seat of government of duchy of Hesse-Darmstadt; has several fine squares and churches; chief edifice —ducal palace (containing large library and works of art); chemicals, machinery. Pop. (1910) 87,085.

DARNLEY, HENRY STEWART, LORD (1545–67), Scot. noble; great-grandson of Henry VII.; s. of Earl of Lennox; Earl of Ross and Duke of Albany (1565); m. Mary, Queen of Scots, in 1565, being proclaimed king on previous day; father of James VI. of Scotland, I. of England; assisted in murder of Rizzio. D. was murdered at Kirk o' Field, a house on the site where Edin Univ. now stands; Bothwell was tried for the murder, but was not convicted. See MARY, QUEEN OF SCOTS.

DARRANG (26° 30′ N., 92° E.), district, Assam, India; mostly level; watered by Brahmaputra and tributaries; tea and rice. Area, 3418 sq. miles. Pop. 337,313.

DARTFORD (51° 27′ N., 0° 12′ E.), market town, Kent, England; Wat Tyler's rebellion commenced here, 1381; paper-mills. Pop. (1911) 23,609.

DARTMOOR (50° 35′ N., 4° W.), granitic plateau, S.W. Devonshire, England; mean elevation, 1500 ft.; rich in minerals and antiquities; seat of convict prison.

Baring-Gould, *Dartmoor* (1900); Cresswell, *Dartmoor and its Surroundings* (new ed., 1910).

DARTMOUTH (50° 22′ N., 3° 34′ W.), seaport, market town, Devonshire, England, near mouth of Dart; has spacious harbour; Royal Naval College; number of quaint houses of Elizabethan architecture, and remains of ancient castle; is yachting centre and coaling-station; boat-building. D. was burnt by the French in reigns of Richard I. and Henry IV.; besieged and captured by Prince Maurice in the Civil War (1643), retaken by Fairfax (1646).

DARTMOUTH (44° 40′ N., 63° 34′ W.), town, Nova Scotia, Canada; iron foundries. Pop. 5000.

DARTMOUTH COLLEGE, Amer. educational institution at Hanover, New Hampstead; developed from 'Moor's Indian Charity School,' founded 1755 by Eleazar Wheelock; named after 2nd Earl of D., its great benefactor.

DARTMOUTH, EARLDOM OF, Eng. family. Earldom was granted (1711) to WILLIAM LEGGE (1672–1750). WILLIAM (1731–1801), 2nd earl, was Sec. for Colonies at Amer. secession; being very religious, he was called 'Psalm-singer.' The family has estates in Yorks, Staffordshire, Bucks, Salop, Sussex, Kent, and Middlesex. Chief seat is Patshull House, Wolverhampton.

DARU, PIERRE ANTOINE NOEL BRUNO, COUNT (1767–1829), Fr. soldier, author, and statesman; able commissary to Napoleon's armies; Sec. of State, 1811; Minister of War, 1813; praised by Napoleon as 'enlightened, firm, and vigilant administrator.'

DARWEN (53° 45′ N., 2° 28′ W.), manufacturing town, Lancashire, England; cotton-mills. Pop. (1911) 40,344.

DARWIN, CHARLES ROBERT (1809–82), Eng. naturalist; s. of Dr. Robert Waring D., and grandson of Dr. Erasmus D. (*q.v.*). His mother was the dau. of Josiah Wedgwood (*q.v.*). After schooldays in his native town, Shrewsbury, he went to Edinburgh in 1825 to study medicine. This proved to be uncongenial, so he entered Christ's Coll., Cambridge, in 1828, with the intention of becoming a clergyman, and graduated three years later. However, his scientific proclivities, which had already been apparent in Edinburgh, received much encouragement from Prof. J. H. Henslow, botanist, and Prof. Adam Sedgwick, geologist, and through the former he received the position of naturalist for the surveying expedition of H.M.S. *Beagle*, under Capt. Fitzroy. On this celebrated voyage, visiting Cape Verde and other Atlantic islands, S. America, Pacific islands, Australia, Tasmania, and various islands in the Indian Ocean and S. Africa, D. made observations and collected material which laid the foundations for his subsequent work. On his return to England he was for several years occupied in preparing reports of the scientific results of the voyage, of which the most noted are: *Journal of a Naturalist* (1839), *Structure and Distribution of Coral Reefs* (1842), *Geological Observations* (1844 and 1846).

After marrying his cousin, Miss Wedgwood, he settled permanently in a country house at Down, in Kent, where, owing to his favourable pecuniary circumstances, he was enabled, in spite of persistent ill-health, to pursue indefatigably the researches which led to the enunciation of one of the most far-reaching theories in human history. He became more and more convinced, especially after reading Malthus *On Population*, that species were not immutable. After discussing the problem with Asa Gray (*q.v.*) and his friends Lyell and Hooker (*qq.v.*), he prepared the essay, *On the Tendency of Species to form Varieties, etc.*, which, together with an essay by A. R. Wallace, who had, independently, arrived at the same conclusions, was read at a memorable meeting of the Linnæan Society in 1858. This communication, followed by the publication, in the following year, of *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*, aroused wild enthusiasm, and at the same time bitter opposition, and has inspired research in every branch of science, including that of human conduct. *The Variation of Animals and Plants under Domestication* (1868) and *The Descent of Man, and Selection in Relation to Sex* (1871), were other proofs of the vast amount of material D. had collected. He published various works on the fertilisation of plants and their movement, subjects which fascinated him greatly, and on *The Formation of Vegetable Mould through the Action of Worms* (1881). D. was always a reverent searcher after truth, and never hesitated to abandon a favourite theory when it proved to be erroneous.

His sons attained eminence in the scientific world: SIR GEORGE HOWARD (1845–1912), F.R.S., prof. of Experimental Philosophy and Astron., Cambridge. Sir FRANCIS (1848–), F.R.S., botanist, and his f.'s assistant; pres., Brit. Assoc., 1908. LEONARD (1850–), major, late R.E.; pres., Roy. Geogr. Soc., 1896; pres., Eugenics Education Soc., 1911. HORACE (1851–), F.R.S., civil engineer. See EVOLUTION.

Francis Darwin, *The Life and Letters of Charles Darwin, including an Autobiographical Chapter* (3 vols., London, 1887); Dr. A. R. Wallace, *Darwinism*; J. Arthur Thomson, *Darwinism and Human Life*; Guenther, *Darwinism and the Problems of Life*; Kellogg, *Darwinism To-day* (1910).

DARWIN, ERASMUS (1731–1802), Eng. physician and poet; practised med. at Lichfield and Derby. By his first marriage he was grandfather of Charles Darwin, by his second, of Francis Galton. He was an original thinker, an advocate of temperance, and possessed a faculty for detecting analogies in nature. He anticipated in part the theory of evolution propounded by Lamarck, and by his grandson. His chief works were: *Zoonomia* (1794–96), *Phytologia* (1799), and his poem, *The Botanic Garden* (1789).

Charles Darwin, *Life of Erasmus Darwin, an Introduction to an Essay on his Works by Ernst Krause* (1879).

DASENT, SIR GEORGE WEBBE (1817–96), Eng. journalist and translator from Scandinavian.

DASHKOV, CATHERINA ROMANOVNA VORONTSOV (1744–1810), Russ. princess, dramatist, and educationist; helped to place Catherine II. on Russ. throne; friend of Garrick, Diderot, Voltaire; founder (1783) and director (1784–96) of Russ. Academy of Sciences. There is an Eng. trans. of her memoirs.

DASS, PETTER (1647–1708), Nor. poet; author of *The Trumpet of Nordland.*

DASYURES, marsupial family of the sub-order Polyprotodontia, carnivorous, generally nocturnal animals of Australia, Tasmania, and New Guinea; among best known is Tasmanian devil.

DATE-PALM (*Phœnix dactylifera*), tree growing

wild and cultivated for its nourishing fruit from the Canary Islands to Arabia and India, and also in China and California. Besides the fruit, which is a main article of food in Turkey, W. Asia, N. Africa, and Arabia, the palm supplies timber and fuel, the leaves are used as thatch, and the fibre for making ropes.

DATIA (25° 40′ N., 78° 30′ E.), native state, Central India. Area, 912 sq. miles. Pop. 173,759. Chief town, DATIA, is walled and has several palaces. Pop. 25,000.

DATOLITE ($Ca(BOH)SiO_4$), mineral occurring in colourless or greenish white monoclinic crystals in cavities of basic igneous rocks.

DAUB, KARL (1765–1836), Ger. theologian.

DAUBENTON, LOUIS JEAN MARIE (1716–99), Fr. naturalist; assisted Buffon by writing the anatomical part of the *Histoire naturelle*; prof. of Mineralogy at the Jardin du Roi; prof. of Nat. History at the Coll. of Med.; author of numerous research papers.

DAUBENY, CHARLES GILES BRIDLE (1795–1867), Eng. scientist; travelled in S. and E. Europe to study volcanic phenomena; prof. of Chem. (1822) and of Bot. (1834) at Oxford; investigated thermal waters in U.S.A.; pub. numerous works; pres. Brit. Association, 1856.

DAUBIGNY, CHARLES FRANÇOIS (1817–78), Fr. landscape artist of Barbizon school (*q.v.*).

DAUBRÉE, GABRIEL AUGUSTE (1814–96), Fr. geologist; prof. of Mineralogy and Geol. at Strassburg, subsequently prof. and director at the École des Mines; known for his experiments in the artificial production of rocks.

DAUDET, ALPHONSE (1840–97), Fr. novelist; b. at Nimes; served as usher (vide *Le Petit Chose*); took to journalism, and experienced hard struggles; achieved fame with *Fromont Jeune et Risler Aîné*, *Jack*, *Numa Roumestan*, *Sapho*, the brilliant, humorous *Tartarin* stories, and *Les Lettres de Mon Moulin*; noted as a stylist; his play, *L'Arlésienne*, with Bizet's music, is still a favourite.

L. A. Daudet, *Alphonse Daudet* (1898).

DAULATABAD (19° 57′ N., 75° 15′ E.), decayed city,—the ancient *Deogiri*,—Hyderabad state, India; on isolated rock 600 ft. high; celebrated fortress; taken by Muhammadans, 1294.

DAUMIER, HONORÉ (1808–79), Fr. artist and caricaturist.

DAUN, LEOPOLD JOSEF, COUNT VON (1705–66), Austrian general; inflicted first defeat suffered by Frederick the Great, at *Kolin*, 1757, and was principal deterrent to Prussia during Seven Years War; prince of Thiano.

DAUNOU, PIERRE CLAUDE FRANÇOIS (1761–1840), Fr. scholar, writer, and revolutionary statesman; Girondist and member of Directory; archivist under empire and monarchy, and pioneer in study of hist. sources.

DAUPHIN.—Title of lords of Vienne who were called 'Dalphinus' (Dolphinus) in XII. and XIII. cent's. When Dauphiné came to Fr. crown (1349), title of Dauphin was bestowed on king's eldest son; crest contained a dolphin (*dauphin*).

DAUPHINÉ (44° 50′ N., 6° E.), ancient province, S.E. France; capital, Grenoble; formed part of kingdom of Burgundy; now comprised in departments of Drôme, Isère, and Hautes-Alpes. See DAUPHIN.

Guide Joanne, *Dauphiné* (Paris, 1905).

DAURAT, JEAN (1508–88), Fr. poet and scholar.

DAVENANT, CHARLES (1656–1714), Eng. economist.

DAVENANT, SIR WILLIAM (1606–68), Eng. poet and dramatist; b. and ed. Oxford; served as court page; wrote for the stage; fought on royal side in Civil War; suffered imprisonment, and is said to have been released through Milton's influence; wrote *Gondibert*, an epic poem; numerous plays, including *Siege of Rhodes*, a precursor of opera; and adaptations, e.g. *The Tempest* (with Dryden).

DAVENPORT (41° 29′ N., 90° 42′ W.), city, on Mississippi, Iowa, U.S.A.; R.C. and Prot. episcopal see; shipping port for grain and coal; extensive manufactures; iron foundries. Pop. (1910) 43,028.

DAVENPORT, EDWARD LOOMIS (1816–77), Amer. actor; his dau., FANNY D. (1850–98), popular actress.

DAVENPORT, ROBERT (fl. about 1624), Eng. dramatist; wrote *Henry I.*, *Henry II.*, and some comedies.

DAVENTRY (52° 16′ N., 1° 10′ W.), market town, Northamptonshire, England; boots and shoes. Pop. (1911) 3517.

DAVEY OF FERNHURST, HORACE DAVEY, BARON (1833–1907), Eng. judge.

DAVID (Hebrew, 'Beloved'), Hebrew king whose career is recounted in Books of *Samuel*, *Kings*, and *Chronicles*. Books of *Samuel* are earliest in date, but are themselves evidently compiled from earlier and often incompatible histories; *Chronicles*, much later, remodels story to suit in accordance with the changed ideals of a later age. D. was son of Jesse of Bethlehem in Judah; kept his f.'s sheep and practised music until called to cure the madness of King Saul by means of his harp; became a royal favourite and formed the classical friendship with king's s., Jonathan. Modern criticism accepts the evidence of *2 Samuel* 21^{19}, against his being the hero who slew Goliath, and recognises discrepancy as to the point in his career at which he was anointed king over Israel. The growing jealousy of Saul resulted in D.'s exile, and his final refuge in the cave of Adullam with kinsmen and partisans; here he was visited by Jonathan. From Adullam D. led attacks on Philistines; on Saul's being slain by an Amalekite, D. persuaded the inhabitants of Judah to accept him as king. Jerusalem, captured from Jebusites, was fortified as 'City of D.,' and received 'Ark of the Covenant,' for the shelter of which a tent was pitched, the building of temple being reserved by command of prophet Nathan for Solomon; census of people was taken, an act punished by plague; D.'s defeat of Ammonites and Moabites secured his country from external warfare. Retribution to house of Saul for slaughter of Gideonites was carried out by Jehovah's command. Further events of D.'s reign were his sin in the abduction of Bathsheba, wife of Uriah the Hittite; murder of his s. Amnon by his half-bro., D.'s s. Absalom; revolt of Absalom and Ahithophel, which drove D. from Jerusalem (he was reinstated by Gileadites). Modern critics disallow his claim to be compiler of Book of *Psalms*; many of psalms were written by him but some later than his epoch. His reign marks culmination of Jewish national prosperity; most famous king of Israel, unifier of nation and founder of capital; prophets foretold birth of Messiah from D.'s line. Bible account is of great hist. and literary importance.

Dieulafoy, *David the King* (Eng. trans., 1902); Robertson Smith, *Old Testament in Jewish Church*.

DAVID I. (1084–1153), king of Scots; s. of Malcolm Canmore and 'St.' Margaret; introduced Norman feudalism into Scotland, which he greatly consolidated and civilised; his ecclesiastical reforms earned for him the title, 'Ane sair sanct for the crown.'

DAVID II. (1324–71), king of Scotland, 1329; s. of Robert Bruce; taken prisoner by England at *Neville's Cross*, 1346.

DAVID I. OF WALES (d. 1203), lord of district round Snowdon; called by one chronicler 'king.'—DAVID II. (c. 1208–46), prince of N. Wales; forced to do homage to Henry III.—DAVID III. (d. 1283), patriot, executed by Edward I.

DAVID, ST., DEWI (c. VI. cent.), Welsh patron saint; canonised XII. cent.; festival, March 1.

DAVID, FÉLICIEN (1810–76), Fr. composer; achieved fame with *Le Désert*, a symphonic ode (1844), and later composed comic operas and oratorios.

DAVID, GERHARD, (d. 1523), Dutch artist; religious subjects.

DAVID, JACQUES LOUIS (1748–1825), Fr. artist;

painted chiefly classical subjects (e.g. *Rape of Sabine Women*) and portraits (e.g. *Madame Récamier*); an ardent revolutionist; later Napoleon's artist; d. in exile.

DAVID, PIERRE JEAN, David d'Angers (1789–1856), Fr. sculptor; b. Angers; executed pediment of Panthéon, Paris.

DAVIDSON, ANDREW BRUCE (1831–1902), Scot. linguist and pioneer of Bible criticism; pub. part of commentary on *Job* (1862); prof. of Oriental Lan- Edinburgh, and member of Old Testament Revision Committee.

DAVIDSON, JOHN (1857–1909), Scot. poet, dramatist, and novelist; won distinction with *Fleet Street Eclogues* (1893), and other vols. of verse; trans. Coppée's *Pour la couronne*, and wrote several original plays; committed suicide.

DAVIDSON, RANDALL THOMAS (1848–), abp. of Canterbury since 1903; previously bp. of Rochester and of Winchester.

DAVIDSON, SAMUEL (1806–99), Irish Biblical scholar.

DAVIDSON, THOMAS (1817–85), Scot. palæontologist; great authority on Brachiopoda.

DAVIES, DAVID CHARLES (1826–91), Welsh theologian and preacher.

DAVIES, JOHN (1679–1732), Eng. scholar.

DAVIES, SIR JOHN (1569–1626), Eng. poet; author of *Orchestra*, poem in praise of dancing, *Nosce Teipsum*, philosophical poem, *Hymns to Astræa*, etc.

DAVIES, SIR LOUIS HENRY (1845–), Canadian jurist and politician.

DAVIES, RICHARD (d. 1581), Welsh ecclesiastic; was bp. of St. Asaph, later of St. David's.

DAVILA, ENRICO CATERINO (1576–1631), Ital. soldier and historian; served crown in Fr. civil wars; wrote valuable *Istoria delle guerre civili di Francia*.

DAVIS, CUSHMAN KELLOGG (1838–1900), Amer. lawyer and politician.

DAVIS, HENRY WILLIAM BANKS (1833–), Eng. landscape artist; A.R.A. (1873), R.A. (1877).

DAVIS, HENRY WINTER (1817–65), Amer. statesman and lawyer; did much to keep Baltimore faithful to Union; urged Maryland to emancipate slaves and advocated votes for negroes.

DAVIS, JEFFERSON (1808–89), Amer. statesman; commanded Mississippi regiment in Mexican war, 1845; senator of U.S. senate, 1847; made pres. of Southern Confederacy, 1861. D. sought to prevent war by compromise, but organised efficient army under every disadvantage; offered to abolish slavery in return for recognition of Confederacy by England and France. His military tactics were not always wise, however, and he laid himself open to charge of autocracy; proposal to supersede him shortly before end of war, but General Lee refused to become dictator; taken prisoner, 1865; severity of his confinement (he lay in chains) roused general sympathy; amnesty of 1868 probably only anticipated order for release.

Life of Davis, by Alfriend (1868), Pollard (1869), Varina Davis, his widow (1891), W. E. Dodd (1907).

DAVIS, JOHN (*c.* 1550–1605), Eng. discoverer; sought north-west passage to East, passing through straits since called *Davis*, 1587; invented quadrant long used, and wrote books on navigation.

DAVIS, RICHARD HARDING (1864–), Amer. novelist and dramatist; novels include *The Princess Aline* (1896), *The Bar Sinister* (1904); and plays: *The Taming of Helen* (1903), *Galloper* (1905).

DAVIS STRAIT (67° N., 58° W.), W. of Greenland; connects Baffin Bay with Atlantic Ocean.

DAVIS, THOMAS OSBORNE (1814–45), Irish poet and journalist; a leader of 'Young Ireland' party.

DAVISON, WILLIAM (*c.* 1541–1608), Scot. statesman; app. sec. to Walsingham, 1586; accused by Elizabeth of passing on warrant for execution of Queen of Scots against her orders.

DAVITT, MICHAEL (1846–1906), Irish nationalist; became Fenian, 1865; associated with Parnell, 1879–90; several times imprisoned for sedition.

DAV-KINA, see Babylonia (Religion).

DAVOS (46° 44′ N., 9° 45′ E.), small valley, Alps, Swiss canton of Grisons; contains two villages, Platz and Dörfli; winter health-resort. Pop. 7500.

DAVOUT, LOUIS NICOLAS (1770–1823), Marshal of France, Duke of Auerstädt, and Prince of Eckmühl; distinguished in Napoleonic wars; his corps won battle of *Auerstädt* against whole Prussian army; famous disciplinarian.

DAVY, SIR HUMPHRY, Bart. (1778–1829), Eng. chemist. Apprenticed to a surgeon at Penzance, he educated himself in natural philosophy and chem., and became superintendent of Dr. Beddoes' medical 'Pneumatic Institution' at Bristol, where he investigated the physiological properties of nitrous oxide (laughing gas), after having somewhat hastily published an untenable theory of heat and light. App. lecturer in chem., later (1802) prof., at the Royal Institution in London, D. first devoted himself to agricultural chemistry. However, his main researches were in electro-chem., which won him the medal of the Fr. Institute and other scientific honours. He investigated the alkalies and alkaline earths, and isolated potassium and sodium, also boron and other elements. Spending several years on the Continent, he proved in Florence that diamond is pure carbon, and at Genoa made inquiries into the nature of the electricity of the torpedo fish. After his return to England (1816) he invented the miner's safety-lamp bearing his name; Pres. of the Royal Society, 1820–27.

Collected Works, with memoir by Dr. John Davy (1839); T. E. Thorpe, *Humphry Davy, Poet and Philosopher* (1896; new ed., 1901).

Davy Lamp, invented by Sir Humphry Davy, an oil lamp having the flame protected by a wire gauze. Air passes through the gauze, but the flame cannot pass outward, and the lamp can be carried with safety in mines where combustible gases obtain. A draught will drive the flame through the gauze, and the latest 'safety' lamps are protected by draught-shields. Electricity is superseding the D. lamp in mines.

DAWARI, tribe of Pathans in N.W. India.

DAWES, HENRY LAURENS (1816–1903), Amer. lawyer.

DAWES, RICHARD (1708–66), Eng. scholar.

DAWISON, BOGUMIL (1818–72), Ger. Shakespearean actor.

DAWKINS, WILLIAM BOYD (1838–), Eng. geologist; on Geological Survey of Great Britain (1861–69); curator of Manchester Museum, 1870; prof. of Geol. in Owens Coll. from 1872–1909; consulting geologist on questions of civil engineering; travelled in N. America and Australia; author of *Early Man in Britain*, 1880, and other works and research memoirs.

DAWLISH (50° 36′ N., 3° 28′ W.), watering-place, S. coast Devonshire, England. Pop. (1911) 4099.

DAWN, the morning twilight, from the time when the sun is 18° below the horizon to sunrise.

DAWSON (64° 37′ N., 139° 10′ W.), city, on Yukon, Klondyke, Canada; goldfields (discovered 1896). Pop. 3000.

DAWSON, GEORGE (1821–76), Eng. Nonconformist preacher and lecturer.

DAWSON, GEORGE MERCER (1849–1901), Canadian geologist; s. of Sir J. W. D.; geologist and naturalist to N. Amer. Boundary Commission; assistant director, afterwards director, Geological Survey of Canada; in charge of Yukon expedition, 1887; Dawson City owes its name to him; on Bering Sea Arbitration Board; pres. Royal Society of Canada, 1893.

DAWSON, SIR JOHN WILLIAM (1820–99), Canadian geologist; made geological researches with Sir Charles Lyell in Nova Scotia, where he was app. superintendent of education (1850); prof. of Geol. and principal, M'Gill Univ., Montreal; first pres. of the Royal Soc. of Canada; pres. of Brit. Association, Birmingham, 1866; F.R.S. His *Eozoon canadense*, in Laurentian rocks, was afterwards proved to be of mineral origin. D. was an opponent of Darwinism.

DAX (43° 42′ N., 1° 3′ W.), town, on Ardour, Landes, France; ancient *Aquæ*; hot sulphur springs; wood; rock-salt. Pop. 10,000.

DAY.—The *sidereal d.* is the time taken by earth to make one rotation in the interval between two consecutive appearances of a fixed star on the meridian; the *solar d.* is about four minutes longer, and is measured between two consecutive appearances of the sun on a meridian. The *solar d.* varies in length because of variation of earth's motion in its orbit and because equator is inclined to plane of sun's path. The average of the variations is termed the *mean solar d.*

DAYS OF WEEK.—Names are of Teutonic origin. Sunday and Monday are called after the sun and moon; Tuesday is the day of the god of Tiw (Jupiter), Wednesday of Woden, god of war, Thursday of Thor, god of thunder, Friday of Frigu, goddess of love, Saturday of Saturn, Rom. god of harvests. See CALENDAR.

DAY, JOHN (c. 1574), Eng. dramatist; collaborated with Dekker and others; chief work is *Parliament of Bees* (1641). *Works* edit. by A. H. Bullen (1881).

DAY, THOMAS (1748–89), Eng. author, eccentric, and philanthropist; wrote *Sandford and Merton.*

DAY-FLIES, see MAY-FLIES.

DAYLESFORD (37° 20′ S., 144° 13′ E.), town, Victoria, Australia; gold mines. Pop. 3500.

DAYTON (39° 5′ N., 84° 27′ W.), city, Kentucky, U.S.A.; whisky distilleries. Pop. (1910) 6979.

DAYTON (39° 41′ N., 84° 34′ W.), city, Ohio, U.S.A.; on Great Miami and on Miami canal; manufacturing centre; carriages, machinery. Pop. (1910) 116,577.

DE BARY, HEINRICH ANTON (1831–88), Ger. botanist; privat-docent, Tübingen; prof. of Bot., Freiburg, 1855; Halle, 1857; Strassburg, 1872, where he was the first rector of the new univ.; eminent authority on fungi and plant diseases; discovered that lichens represent a symbiosis of algæ and fungi.

DE COSTA, BENJAMIN FRANKLIN (1831–1904), Amer. preacher and writer on hist. subjects.

DE COSTER, CHARLES THÉODORE (1827–79), Belg. man of letters.

D'ERLON, JEAN BAPTISTE DROUET, COUNT (1765–1844), marshal of France; fought in Revolutionary campaigns, at *Jena*, *Waterloo*, and in Algeria, 1834.

DE GEER, LOUIS GERHARD, BARON (1818–96), Swed. statesman and author.

DE HAAS, MAURITZ (1832–95), Amer. artist; seascapes.

DE KALB (41° 56′ N., 88° 52′ W.), city (and county), Illinois, U.S.A.; woven and barbed wire, agricultural implements, etc. Pop. (1910) 8102.

DE KEYSER, THOMAS (1597–1667), Dutch artist.

DE LA BECHE, SIR HENRY THOMAS (1796–1855), Eng. geologist; of rare insight, induced government to establish the Geological Survey of Great Britain (director, 1835), the Museum of Practical Geol., and Royal School of Mines; Pres. of the Geological Soc., 1847; author of *The Geological Observer* (2nd edit., 1853) and numerous research memoirs.

DE LA RIVE, AUGUSTE ARTHUR (1801–73), Swiss physicist; app. prof. of Physics at Geneva, at age of twenty-two; investigated various electrical phenomena, and invented method of galvanising. When France annexed Nice and Savoy (1860) he was sent to England on a special embassy, and received guarantees for the independence of Geneva.

DE LA RUE, WARREN (1815–89), Brit. chemist and astronomer; undertook researches on solar physics and astronomical photography; invented photoheliograph; founder of a well-known firm of stationers; pres. of the Royal Astronomical and (twice) of the Chemical Soc.

DE LA WARR (La Warr), Eng. barony. ROGER DE LA W. of Isfield was summoned to Parliament as baron (1399); descendants fought in Fr. wars of Edward III. and Henry V. Barony went by marriage (1426) to family of West, who have ever since held it, with (since 1761) earldom.

DE LAND (29° 1′ N., 81° 17′ W.), town, health-resort, Florida, U.S.A.; univ.; sulphur springs.

DE LONG, GEORGE WASHINGTON (1844–81), Amer. explorer.

DE L'ORME, PHILIBERT (d. 1570), Fr. architect; one of architects of the Tuileries; largely employed by Valois kings.

DE MORGAN, AUGUSTUS (1806–71), Eng. mathematician and logician; b. Madura, S. India; s. of army officer under East India Co.; ed. Cambridge, where he studied math's under Sir G. B. Airy; fourth wrangler, 1827; unable to take his degree, because of conscientious objections to Univ.'s theological tests; on establishment of London Univ. (1828), became prof. of Math's there, and, with exception of short break, served the Univ. for over 30 years. He was a great and clear teacher—Todhunter and Routh were amongst his pupils; also did much for the development of Formal Logic and for introduction of *metric system*; chief works: *Formal Logic*; Elements of: *Arithmetic*, *Algebra*, *Trigonometry*; Treatises on *Differential and Integral Calculus.* See *Life*, by his wife (1882).—**William Frend** (1839–), s. of above, an artist in stained glass and ceramics till *Joseph Vance* (1906), and *Alice-for-Short* (1907) won him fame as novelist.

DE PERE (44° 26′ N., 88° 4′ W.), city, Wisconsin, U.S.A.; flour- and paper-mills. Pop. (1910) 4477.

DE QUINCEY, THOMAS (1785–1859), Eng. essayist; b. Manchester, and ed. at Grammar School there and at Oxford. His early life was marked by many irregularities, and while at Oxford he became a victim to the opium habit, which had disastrous effects upon his future career. About 1807 he made the acquaintance of Wordsworth, Coleridge, Lamb, and others, settled at Grasmere, edited a local paper, and contributed to *Blackwood.* He married a farmer's dau. in 1816; removed to Edinburgh in 1828, where, and at Lasswade, he spent the remainder of his life. His *Confessions of an English Opium-Eater* appeared in the *London Magazine* in 1821, and was followed by critical writings and biographical studies in *Blackwood*, *Tait's Magazine*, and other journals. His reading was very extensive, and he had great intellectual endowments. He was one of England's greatest stylists, and excelled in impassioned ornate prose, but his work is marred by digression. Masson, *Life*; H. S. Salt, *De Quincey.*

DE RUYTER, MICHAEL ADRIANZOON (1607–76), Dutch admiral; served with Van Tromp in first Dutch War with England (1653); assisted Danes against Swedes (1659); in Second Dutch War defeated Eng. fleet at N. Foreland (1665); sailed up the Thames and burned shipping (1667); in Third Dutch War he defeated combined Fr. and Eng. fleets at *Sole Bay* (1672); assisting Spain against France was wounded near Messina, and a week later d. at Syracuse.

DE TABLEY, JOHN BYRNE LEICESTER WARREN, 3RD BARON (1835–95), Eng. poet, botanist, and numismatist.

DE VERE, AUBREY THOMAS (1814–1902), Irish poet; author of *Legends of St. Patrick*, etc. His f., SIR AUBREY DE V. (1788–1846), was a distinguished sonneteer.

DE WET, CHRISTIAN (1854–), Orange Free State general and politician; famed for guerilla tactics during South African War (1899–1902).

DE WETTE, WILHELM MARTIN LEBERECHT (1780–1849), Ger. theologian; prof. at Weimar, Berlin, and Basel; pioneer of critical study of Bible, specially Old Testament.

DE WINT, PETER (1784–1849), Eng. landscape artist; of Dutch descent; noted water-colourist.

DE WINTER, JAN WILLEM (1750–1812), Dutch admiral; defeated by Admiral Duncan (1797).

DE WITT, JAN (1625–72), Dutch statesman; pensionary of Dort; grand pensionary of Holland, 1653–72. Like his f., JACOB (burgomaster of Dort),

he resolutely opposed the house of Orange; led the Republican Anti-Stadtholder party; did much for Holland in commercial struggle with England; secured Triple Alliance with England and Sweden against France, 1668; with his bro., CORNELIUS (1623–72), torn to pieces by mob on defeat of Holland by Louis XIV.

Geddes, *Administration of De Witt* (1879); Lefèvre-Pontalis, *Life of De Witt* (1885).

DEACON (Gk. *diakonos*, servant), member of lowest of three Holy Orders of Christian Church, *i.e.* bishops, priests, deacons. First indisputable mention is *Epistle to the Philippians* 1¹. In Church of England d's have all powers of priest but absolution and the consecration of bread and wine of Eucharist. In Scottish Presbyterian churches a d. is a layman elected to manage financial affairs of a church.

DEACONESS (Gk. *diakonissa*, servant), name of woman officer in the Early Christian Church; mentioned in III. cent., and continued to exist till V. They assisted in the general services of the church in the same way as deacons, except that they had no priestly powers. The office was revived in XIX. cent. in Prot. churches, hence the establishment of d. institutions by Kirk of Scotland in Edinburgh, by Church of England in London.

DEAD NETTLE (*Lamium*), genus of Labiatæ; two species—*L. album* and *L. purpureum*; square stems.

DEAD SEA (31° 30′ N., 35° 30′ E.), salt lake in S. Palestine, some 25 miles E. of Jerusalem; length, 45 miles; greatest breadth, 9 miles; depth varies from 3 ft. in S. to 1300 in N.; lies almost 1300 ft. below level of Mediterranean; receives Jordan and other streams with fertile banks; otherwise surrounded by bleak deserts and stony salt hills; precipitous mts. on E. and W. shores; no apparent outlet. Its waters evaporate in great heat, are intensely salt (25 % of salts, as compared with ordinary sea water, *c.* 5 %), and contain no animal life; Sodom (*q.v.*) and Gomorrah were near it; called in Bible Salt Sea, Sea of Plain, East Sea; also known as 'Sea of Asphalt,' 'Sea of Lot.' See PALESTINE.

Blanckenhorn, *Das Tote Meer* (1898).

DEADLY NIGHTSHADE, see BELLADONNA.

DEAD-MEN'S-FINGERS, see ANTHOZOA.

DEADWOOD (44° 27′ N., 103° 40′ W.), city, Dakota, U.S.A.; gold mines. Pop. (1910) 3653.

DEAF AND DUMB, term applied to persons who by a defect of hearing from birth, or soon after, have not acquired the power of speech, although the organs of speech are usually normal, so that the term is incorrect in denoting that two organs are affected. The defect is more common than was formerly supposed. When schools for the education of deaf-mutes were first proposed the main objection to them almost everywhere was that there would be insufficient pupils, but once established it was found that there were great numbers of applicants for admission. In 1901 there were estimated to be 15,246 deaf and dumb persons in England and Wales, 2638 in Scotland, 3971 in Ireland, and somewhat over 50,000 in the U.S.A., the proportion to the population being highest in England and Wales. Switzerland is the country with the highest proportion of deaf-mutes, there being computed to be 1 to every 408 of the population, while England and Wales have 1 to every 2132, and Holland 1 in every 2985. The proportion of deaf and dumb persons in the population is, however, diminishing yearly.

Deafness in those who are born deaf is believed to be due not to any great extent to malformation of the organs of hearing, but from exhaustive investigation it has been found that intermarriage between near blood relations has a very considerable effect on the number of children born deaf. These children are much more commonly found in communities where such intermarriage is usual than where it is not usual. In persons who become deaf later in life, various diseases are the main cause, scarlet fever being by far the most important, while various forms of meningitis of the brain and spinal cord, of brain congestion and inflammation, and typhoid fever, measles, etc., also are the causes of a great number of cases.

The education of the deaf and dumb dates from about the XVII. cent., although there are one or two instances of deaf-mutes being educated before that time. Hippocrates understood that deaf-mutes were dumb only because they did not know how to speak, and in this he was much in advance of his contemporaries, for in ancient times deaf-mute children were killed along with other defectives. The Venerable Bede tells of a deaf-mute being taught to speak by St. John of Beverley (d. 721 A.D.), but little attention was given to the subject from then till the XVI. cent., when Jerome Cardan discovered the principle that 'written characters and ideas may be connected together without the intervention of sounds,' and therefore considered the education of the deaf and dumb to be a possibility. Pedro Ponce de Leon (1520–84), a Span. Benedictine monk, actually taught deaf-mutes to speak, and in 1620 Juan Paulo Bonet wrote a work on the subject, in addition to teaching by signs and writing as well as by the mouth. In 1648 John Bulwer issued the first treatise in English on the instruction of deaf-mutes, and after him Holder, Wallis, Dalgarno (who invented a manual alphabet), and others wrote valuable contributions on the subject, and carried on the work of teaching. In 1760 Thomas Braidwood started in Edinburgh the first school in Britain for the education of the deaf and dumb (which was visited by many men of note, including Dr. Johnson on his northern journey), removing it later to the vicinity of London; while in 1765 the Abbé de l'Epée established a school in Paris and devoted his life and his fortune to the education of deaf-mutes. The first school for the deaf and dumb in America was founded in 1816 in Connecticut by Thomas Gallaudet. Charitable persons in different parts of the world organised the education of the deaf and dumb, and established schools, until in 1900, there were 450 schools with 25,800 pupils in the different countries of Europe, including 95 schools with 4222 pupils in Britain; in the U.S.A. at the same date there were 126 schools with 10,946 pupils, while other schools had been instituted in India, China, Japan, Mexico, the different countries of South America, Algeria, Egypt, and the various Brit. Colonies, in all of which a total of almost 40,000 deaf and dumb pupils were being educated, in over 600 different schools. A training college for teachers of deaf-mutes was established near London in 1885, and church services for the deaf and dumb, in which the manual alphabet is used, have also been instituted in several towns. In 1891 and 1893 Acts of Parliament were passed in Britain, making the education of deaf-mutes in Great Britain compulsory between the ages of seven and sixteen, school authorities being given the power to maintain deaf-mute children whose parents were unable to maintain them, and money grants are given by the government to help schools for the deaf and dumb, which are under the inspection of government officials.

There are two main methods of instructing the deaf and dumb—the *manual*, in which the sign language, manual alphabets, writing, and pictures are employed, and the *oral*, including lip-reading, writing, and pictures, but excluding altogether signs and manual alphabets. The *combined system* is a combination of the two, using all methods of instruction. In regard to the manual method there are two alphabets in use, the two-handed alphabet of signs being used in Britain and most of the Brit. colonies, while a one-handed alphabet is mainly used in America and the continent of Europe, and also to a small extent in England and Ireland. A speed of 120 or 130 words a minute can be obtained by the manual method. In the oral method children are first taught to pronounce the elementary sounds of the language, to recognise the form of the lips in pronouncing them,

and to associate objects and ideas with the words. The combination of sounds in longer words and the articulation of them is a matter of greater difficulty, and a course of eight or ten years is necessary for a knowledge of the language not greater than that of the average normal child of seven years or so. The combined method is valuable in that a child who finds much difficulty in the oral method will take to the manual method, and *vice versa*, the oral method being generally found the more difficult, although, of course, the great advantage is that when he has acquired speech by this method the deaf-mute can communicate with any person speaking the language of his country and is not limited to those who know the manual alphabet.

There are a number of instances of the successful education of blind deaf-mutes, instruction generally beginning by the pupil feeling the larynx and lips of the teacher, by finger-spelling into the hand, and by reading by the Braille method for the blind. Laura Bridgman and Helen Keller (*qq.v.*) are notable examples.

Report of the Royal Commission (1885); Love and Addison, *Deaf-Mutism*; Mygind, *Deaf-Mutism*; Boultbee, *Practical Lip-reading for the Use of the Deaf*.

DEÁK, FERENCZ (1803–76), Hungarian statesman; became representative to Diet, 1832; led Liberal opposition and brought about reconciliation with Austria; Minister of Justice, 1848, but opposed to Kossuth's party and retired; Hungary received constitution, 1860. Deák returned to power, 1861, and opposed extremists under Count Téléki; drew up address to emperor demanding constitution of 1848, return of exiles, etc.; repeated demand, 1866, when Austria was forced to concede it.

DEAKIN, HON. ALFRED (1856–), Australian statesman; Prime Minister of Commonwealth, 1903–4, 1905–8, 1909–10; leader of Federal Opposition, 1910–13; prominent at Colonial Conference, 1907.

DEAL (51° 13′ N., 1° 24′ E.), seaport, watering-place, on E. coast of Kent, England; one of old Cinque Ports; supposed landing-place of Julius Cæsar, 55 B.C.; has two castles built by Henry VIII. Boatmen have reputation for skill and hardihood. Chief industries are provisioning ships, boat-building. Pop. (1911) 11,297.

DEAN (Lat. *decanus*, one set over ten).—(1) Used until XV. cent. to denote leader of military force of ten men. (2) Chief of ten monks in mediæval monastery. (3) Head of chapter of collegiate or cathedral church, title being derived from monastic official. (4) Head (rural d.) of division of archdeaconry. (5) Deans of Peculiars, of the Arches, etc., whose spheres are exempt from bp.'s jurisdiction. (6) Fellows of colleges of Oxford and Cambridge, whose functions are akin to those of monastic deans. (7) President of faculty of Scot. and Ger. Univ's., *e.g.* 'Dean of Faculty of Arts' in Edinburgh Univ. (8) Pres. of Scot. Faculty of Advocates.

DEAN, FOREST OF (51° 45′ N., 2° 32′ W.), hilly district between Severn and Wye, W. Gloucestershire, England; ancient royal forest; coal and iron mines; stone quarries.

DEAN OF GUILD, in Scotland was the head of a Merchant Guild. In Edinburgh the D. of G. Court consists of the D. of G., five town councillors, and five citizens, of whom three must be builders, civil engineers, architects or surveyors. The court superintends all building, ventilation, and sanitary operations in the city. The D. of G.'s duty is to see that all buildings are erected according to law, and that dangerous structures are demolished.

DEANE, RICHARD (1610–53), Eng. regicide; naval commander; member of 'New Model'; commanded at *Naseby*, *Preston*, etc.; supported Cromwell in subjugation of Parliament; general-at-sea with Blake and Popham.

DEANE, SILAS (1737–89), Amer. diplomatist; obtained Fr. aid for revolt of colonies; long under suspicion of treachery.

DEATH, permanent cessation of vitality in the whole of the tissues of the body of an animal or plant. The immediate cause of d. may be (1) *syncope*, sudden heart failure, due to disease of the heart or circulatory system, or to shock reacting on the heart by the nervous system; (2) *asthenia*, gradual heart failure from weakening of the whole system by wasting disease or toxins in fevers, etc.; (3) *asphyxia*, when air is prevented from entering the lungs, as in drowning, suffocation, etc.; (4) *coma*, unconsciousness due to a brain lesion or poisoning of the brain through its blood supply, by, *e.g.*, opium or alcohol. D. may, of course, be due to a combination of two or more of the above four modes. The signs of d. include cessation of circulation and respiration, lowering of the body temperature; if a cut is made, the edges of the wound collapse instead of gaping as in life; rigidity of the muscles, or *rigor mortis*, comes on some time after death, and lasts for 24 or 36 hours, commencing at the face and neck; livid colours appear in the parts of the body which are lowest, depending on its position, and, later, a greenish colour appears on the abdomen.

Deaths must be *registered* within five days of occurrence by the nearest relative of the deceased, a form being filled up giving the name, age, sex, occupation, cause of death, etc., or within a fortnight if notice of d. and a medical certificate be first given to the registrar immediately after the occurrence. After a fortnight the registrar ought to call upon the person who should have registered the d. to appear before him to give the necessary particulars, and after twelve months have elapsed permission of the Registrar-General is necessary for registration.

DEATH DUTIES, taxes paid out of property left at death. By Brit. Finance Act (1894) property exceeding £100 pays 1 %; £500, 2 %; £1000, 3 %; £5000, 4 %; £10,000, 5 %; £20,000, 6 %; £40,000, 7 %; £70,000, 8 %; £100,000, 9 %; £150,000, 10 %; £200,000, 11 %; £400,000, 12 %; £600,000, 13 %; £800,000, 14 %; £1,000,000, 15 %. Charitable gifts made within a year, and other gifts within 3 years of death, are taxed.

DEATH VALLEY, desert valley, formerly bed of salt lake, in Inyo County, E. Cal., U.S.A.; depth, *c.* 430 ft.

DEATH-WATCH, see BOOK-LICE.

DEBENTURES AND DEBENTURE STOCK.—A *debenture* is a writing promising to repay a specified sum at a given date, with interest in the meantime half-yearly. It usually gives a 'floating charge' on the assets of the company as security for the loan. A floating charge means that the whole of the company's property, present and future, is security for the loan, but that the company, until the charge becomes a fixed charge or the debenture-holders enforce their rights, has power to deal with any specific part of its assets in the ordinary course of its business. *Debenture Stock* is related to debentures in much the same way as stock is to shares.

DEBORAH, a character in the *Book of Judges*, represented as encouraging Israelites against Canaanites. 'Song of Deborah' at victory of former is assigned by Higher Criticism to earliest period of Jewish literature. There are hist. difficulties in narrative.

DEBRECZEN (47° 33′ N., 21° 38′ E.), town, Hungary; centre of Hungarian Protestants; active trade; cattle markets. Pop. (1910) 92,729.

DEBT, sum of money due from one person to another. If a creditor accepts a smaller sum in discharge he can sue for the balance unless an article not money has been thrown in. Imprisonment for d. was abolished by the *Debtors Act* (1869), but default of payment in a judgment d. renders defaulter liable to six weeks' imprisonment. Actions to recover simple contract d's must be brought within six years from the time they become due or from the last acknowledgment of the d. in writing. Any person who has obtained an order for the payment of money may get the court to serve a 'Garnishee' order, attaching any d's due to the judgment debtor or any money standing to his credit at a bank.

DEBUSSY, CLAUDE ACHILLE (1862–), Fr.

composer; b. St. Germain-en-Laye; studied at Paris Conservatoire; won *Grand Prix de Rome* (1884) with cantata *L'Enfant prodigue*; influenced by Russ. music; masterpiece, *Pelléas et Mélisande*, produced, Paris, 1902; *La Mer*, *Petite Suite*, songs, pianoforte pieces, etc. Mrs. Franz Liebich, *Debussy* (1910).

DECAEN, CHARLES MATHIEU ISIDORE, COUNT (1769–1832), Fr. soldier.

DECALOGUE ('The ten words'), Ten Commandments. Term originated in Gk. Church, and was first used in English by Wycliffe. Ten Commandments are stated in *Exodus* to have been written by God on two tables of stone, broken by Moses, and afterwards inscribed on two new tables according to revelation of Jehovah to Moses on Mount Sinai. Accounts in *Exodus* and *Deuteronomy* disagree as to second tables. The division of the Commandments is uncertain; system adopted in Orthodox Eastern, Anglican, and most Calvinistic Churches is known as Philonic, from work of Gk. father, Philo; while Rom. Church, followed by Lutherans, adopted views of St. Augustine. Date of D. is agreed by Higher Criticism to be later than age of Moses, not earlier indeed than middle of VIII. cent. Meissner, *Der Dekalog* (1893).

DECAMPS, ALEXANDRE GABRIEL (1803–60), Fr. artist.

DECAPODA, a sub-order of Cephalopoda (*q.v.*).

DECAPOLIS (32° 37′ N., 35° 50′ E.), league of 10 cities E. and W. of Jordan, Palestine; enumerated by Pliny—Damascus, Philadelphia, Raphana, Scythopolis, Garada, Hippos, Dion, Pella, Gerasa, Kanatha; only Scythopolis (the capital) lay west of Jordan. Population, mainly non-Jewish, enjoyed liberal civic rights and the privilege of coinage.

DECASTYLE, temple with ten-columned portico.

DECATUR (39° 51′ N., 88° 55′ W.), city, Illinois, U.S.A.; iron and woollen manufactures. Pop. (1910) 31,140.

DECATUR, STEPHEN (1779–1820), Amer. naval commander.

DECAZES, ÉLIE (1780–1860), Fr. politician; duc (1820); prime minister (1819); faithful to monarchy, but passed reforms and excited fear of ultra-royalists; accused of murder of Duc de Berry and resigned (1820). His s., LOUIS CHARLES ÉLIE (1819–86), Duc de Glucksberg, was Orleanist member of Assembly, 1871–77.

DECAZEVILLE (44° 34′ N., 2° 14′ E.), town, Aveyron, France; coal-fields; iron manufactures. Pop. 9180.

DECCAN (*c.* 16° N., 76° 30′ E.), name applied to whole peninsula of India, S. of Vindyha mountains, between Bay of Bengal on E. and Arabian Sea on W.; sometimes limited to that portion of tableland between Nerbudda and Kistna.

DECEMBER (Lat. *decem*, ten), the tenth month in ancient Rom. calendar.

DECEMVIRS (Lat. *decemviri*, ten men), colleges or commissions of ten Rom. magistrates; drew up famous Twelve Tables of Rom. law; administered religious matters, decided as to civil rights, and allotted public land.

DECHEN, ERNST HEINRICH KARL VON (1800–89), Ger. geologist; director of the Prussian Mining Department in Bonn. His survey and geological maps of Rhenish Prussia and Westphalia greatly furthered the development of Ger. mining and metallurgical industries.

DECIDUOUS, term applied in bot. and zool. to the seasonal shedding of, *e.g.*, leaves, or hairs, antlers, etc. Milk teeth are called deciduous.

DECIMAL COINAGE, currency in which the coins are multiples of ten with regard to a standard unit. With the exception of Great Britain and India all leading countries have adopted d. c., the U.S.A. being the first (1792). See MONEY.

DECIUS, CAIUS MESSIUS QUINTUS TRAJANUS (201–51), Rom. emperor of Illyrian extraction; did much to retard advance of Goths; great persecutor of Christians.

DECIZE (46° 51′ N., 3° 29′ E.), town, Nièvre, France, on island in Loire; glass-works; ancient *Decetia*. Pop. 5000.

DECKER, SIR MATTHEW (1679–1749), Eng. writer on commerce.

DECKER, PIERRE DE (1812–91), Belg. author and statesman.

DECLARATION OF PARIS (1856).—Following agreements concluded by most of Great Powers: (1) abolishment of privateering; (2) neutral flag covers enemy's goods, except contraband of war; (3) neutral goods under enemy's flag not liable to capture; (4) blockades to be binding must be effective. Spain, America, Venezuela, and Mexico refused to agree, but when Span.-Amer. War broke out (1898), Spain and America bound themselves to respect the declaration. Bowles, *Declaration of Paris* (1901).

DECLINATION (magnetism), the angle between a magnetic needle and the geographical meridian; (astron.) angular distance between the celestial equator and a heavenly body. See MAGNETISM (TERRESTRIAL).

DECLINATION, see ASCENSION, RIGHT.

DECOLORISING, in chem. and sugar industry, the elimination of coloured impurities, usually by means of powdered charcoal, also by permanganates or sulphurous acid.

DECORATED STYLE, in arch., the second Pointed or Gothic style (XIV. cent.); seen in cathedrals of Lincoln, York, Carlisle, Ely, and in Melrose Abbey. See ARCHITECTURE.

DECREE, judgment by one in authority; in Eng. law the judgment of a court. In divorce petitions a *decree nisi* is a conditional dissolution of marriage, which may be made *absolute* six months later.

DECRETALS (med. Lat. *decretales*, i.e. *epistolæ decretales*), letters of popes issuing decrees; they form important part of canon law. 'False Decretals' include some genuine d's, but many spurious documents (*e.g.* famous 'Donation of Constantine') drawn up in IX. cent. by writer under name of Isidore Mercator, now known as pseudo-Isidore. Collection was accepted by Pope Nicholas, and became incorporated in ecclesiastical law, strengthening papacy in claims to territory and power. Authenticity was questioned in XV. cent. by Cardinal Nicholas of Cusa and Juan Torquemada; rejected by Erasmus and other great scholars of XVI. cent.; used by Protestants in XVI. and XVII. cent's for attack on papacy. Critics have since agreed as to spuriousness, or reverse of all documents of collection.

DECURION (Lat. *decurio*), Rom. title for head of *decuria*, the 10th part of *curia* (q.v.), and senators of Rom. towns and colonies.

DÉDÉ AGACH (40° 48′ N., 25° 47′ E.), seaport, on Ægean Sea, in vilayet Adrianople; timber.

DEDHAM (42° 15′ N., 71° 10′ W.), town, Massachusetts, U.S.A.; woollen goods. Pop. (1910) 9300.

DEDICATION (Lat. *dedicatio*), setting apart in honour of Deity or for sacred purpose; originates in Jewish custom, consecration of tabernacle being mentioned in *Exodus*; temple of Solomon dedicated, and Feast of D. established to commemorate reconsecration, 165 B.C., after desecration by Seleucid king. Christ recognised the Feast (*John* 10^{22-3}), and custom of d. was probably adopted by first Christians, although no mention of it is found till 314 A.D. From accounts of early historians it appears that Mass and simple service only accompanied consecration of churches. Councils of 506 and 517 provided for separate d. of altars. Annual feast early held at anniversary of d., and day of feast is now often guide to name of patron saint of church.

DEDUCTION, form of reasoning which proceeds from universal to particular, or from the more to the less general. See SYLLOGISM.

DEE.—(1) (53° 17′ N., 3° 8′ W.) River, England, rises in Lake Bala, Merionethshire; flows generally N., enters Irish Sea, N.W. of Chester. (2) (57° 5′ N., 2° 15′ W.) River, Kincardineshire and Aberdeenshire, Scotland; rises in Cairngorm Mts.; flows into North Sea at

Aberdeen. (3) (54° 55′ N., 4° W.) River, Kirkcudbrightshire, Scotland; flows from Loch Dee to Solway Firth.

DEE, JOHN (1527–1608), Eng. astrologer and alchemist; imprisoned for sorcery; afterwards patronised by Queen Elizabeth; had an adventurous life; wrote mathematical and spiritualistic works.

DEEMS, CHARLES (ALEXANDER) FORCE (1820–93), Amer. preacher, author, and social reformer; pastor, 1868–93, of Church of the Strangers, New York, founded by himself.

DEER FAMILY (*Cervidæ*), family of ruminant even-toed Ungulates with 120 species found frequenting bush and forest tracts throughout world—except Africa, S. of Sudan, and West Indies; male generally provided with antlers—branched, bony structures covered during growth with a skin or 'velvet,' without fleshy covering during breeding season, and shed yearly. Young deer are known as fawns.

Most familiar in highland woods of Britain is small graceful ROE DEER (*Capreolus*), closely related structurally, though the antlers differ much, to the REINDEER (*Rangifer*) of N. Europe and Asia. The Amer. CARIBOU and ELK or MOOSE (*Alces*), with fork-like or spiked antlers, are the true AMERICAN DEER (*Cariacus*), and the 28 species range from Patagonia to Canada. The Scot. RED DEER (*Cervus elaphus*), famous for handsome antlers, occurs also throughout Europe, N. Africa, and Asia Minor, and is closely related to the N. Amer. WAPITI (*C. canadensis*), and less closely to the FALLOW DEER (*C. dama*) of Eng. parks, a native of the Mediterranean basin; the SPOTTED or AXIS DEER (*C. axis*) and SWAMP DEER (*C. duvaucelli*), both of India, and the small MUNTJAC (*Cervulus muntjac*) of India, Burma, Malay and neighbouring islands.

Very distinct from these is the E. and Central Asian antler-less MUSK DEER (*Moschus*), with tusk-like upper canine teeth, and scent gland containing the valuable perfume musk.

DEERFIELD (42° 29′ N., 72° 36′ W.), township, Massachusetts, U.S.A.; destroyed and inhabitants massacred by French and Indians, 1704. Pop. 2200.

DEFAMATION, see LIBEL.

DEFAULT, neglect to perform an act required by law, or to appear in court in answer to legal summons.

DEFEASANCE, instrument annexed to legal document, which, being performed, annuls the deed.

DEFENCE, in Eng. law, answer to a charge; claim of justification for act committed. In regard to physical d. a person has full right to use any necessary force to protect himself from attack.

DEFENDER OF THE FAITH, *Fidei Defensor*, title borne by all Eng. sovereigns since, and including, Henry VIII., on whom it was bestowed by the Pope for writing against Luther (1521).

DEFFAND, MARIE ANNE DE VICHY-CHAMROND, MARQUISE DU (*c.* 1697–1780), Fr. authoress; presided over famous salon; considered by Sainte-Beuve best writer of time.

DEFIANCE (41° 17′ N., 84° 23′ W.), city (and county), Ohio, U.S.A.; agricultural implements. Pop. (1910) 7327.

DEFINITION, explicit statement of just those attributes, no more and no less, which are implied by a name. See LOGIC.

DEFOE, DANIEL (1661–1731), Eng. author and pamphleteer; s. of James Foe, a London butcher; acted as hosier's agent; took part in Monmouth's rebellion; afterwards found trading occupation abroad; subsequently returned to London, changed his name to Defoe; took to journalism; became bankrupt (1692), but eventually paid his creditors in full; published *The Shortest Way with the Dissenters* (1702), and for this he was convicted of seditious libel, fined, pilloried, and imprisoned by Anne's Tory Government. Harley sent him to Scotland (1706) to promote the Union of the Parliaments. Between 1704 and 1713 D. carried on his famous *Review*, written entirely by himself. Later he wrote for the *Mercator*, and was secretly paid by the Whigs for his treachery to the Jacobites. In 1719 he achieved success with *Robinson Crusoe*, which has since been acclaimed throughout the world as one of the masterpieces of Eng. prose literature. It was founded on Dampier's *Voyage round the World* (1697) and Alexander Selkirk's story of his adventures told to D. at Bristol. Other works of high literary quality are *Captain Singleton*, *Moll Flanders*, *Colonel Jack*, *Roxana*, and *Journal of the Plague Year*—the latter perhaps his masterpiece—and *Memoirs of a Cavalier*. D's style is direct and lucid, and unapproachable in realism, which is helped in a considerable degree by his frequent use of the first person. He was a great journalist; he excelled in graphic description and in forcible polemics.

Life, by Hazlitt, Minto, Masefield.

DEGAS, HILAIRE GERMAIN (1834–), Fr. artist.

DEGGENDORF, DECKENDORF (48° 51′ N., 12° 56′ E.), town, on Danube, Bavaria; church of Holy Sepulchre, visited annually by thousands of pilgrims; depôt for timber trade of Bavarian forest. Pop. 7211.

DEHRA (30° 20′ N., 78° 6′ E.), chief town, Dehra Dun district, United Provinces, India; military cantonment. Pop. 28,000.

DEHRA DUN (30° 30′ N., 78° E.), district, Meerut division, United Provinces, India, at foot of Mussourie Mountains (Himalayas); consists for most part of fertile valley (Dun) of Dehra; tea-gardens. Area, 1209 sq. miles. Pop. 178,195.

DEIOCES (*c.* 699–47 B.C.), first Median king.

DEIOTARUS (I. cent. B.C.), tetrarch of Galatia; Rom. ally against Mithradates; cause pleaded by Cicero when accused of design against Cæsar.

DEIR, DEIR-EL-ZOR (35° 20′ N., 40° 11′ E.), town, on Euphrates, Asiatic Turkey. Pop. *c.* 7000.

DEIRA, ancient Anglian kingdom; between Humber and Tees; date of foundation unknown; united with Bernicia to form kingdom of Northumbria in VII. cent.

DEISM (Lat. *deus*, god), system of 'natural' religion evolvable by reason without aid from revelation. Term *deist* was invented to distinguish a certain class of self-thinkers of XVII. and XVIII. cent's from *atheists*; etymologically it is equivalent of theist, and was considered synonymous till end of XVII. cent., but later *theists* accept certain kinds of revelation. Deism as form of rationalism is important in history of European thought, being early result of extension of outlook through scientific discoveries, Renaissance, etc. Its upholders varied in attitude towards questions of immortality, determinism, etc., but agreed in accepting God, rejecting Bible. First deists asserted pagan and eastern origin of their system, naming Confucius, the Stoics, Marcus Aurelius, Seneca, etc. The term first occurs in Bayle's *Dictionnaire* (1695–97), the work of a Fr. deist who exercised enormous influence on contemporary thought, but movement dates from writings of Montaigne. Voltaire and later Fr. deists drew ideas from Eng. philosophers. Lord Herbert of Cherbury (1538–1648) was called 'father of D.' in England, although his famous contemporaries, Bacon and Hobbes (especially the latter, whose name became synonymous with atheism), exercised even greater influence in this direction. Lord Herbert's religious beliefs were confined to God, virtue, immortality, future rewards, and punishments. The deist, Charles Blount (1654–93), adopted many of Hobbes' views, attacking Pentateuch on same lines; his name is associated with application of hist. criticism to New Testament. The influence of Shaftesbury and Bolingbroke did much to popularise D., but it went out of fashion at end of XVIII. cent. with return to 'ages of faith' of Romanticism.

Leslie Stephen, *History of Eng. Thought* in *XVIII. Cent.*; Benn, *Hist. of Eng. Rationalism in XIX. Cent.*; Robertson, *Short Hist. of Free Thought*.

DEISTER (52° 15′ N., 9° 30′ E.), chain of hills, Hanover, Germany; coal mines, sandstone quarries.

DÉJAZET, PAULINE VIRGINIE (1798–1875), Fr. actress.

DEKKER, JEREMIAS DE (1610–66), Dutch satirical poet.

DEKKER, THOMAS (*c.* 1570–1641), Eng. dramatist; wrote *Old Fortunatus*, *The Honest Whore*, *Shoemakers' Holiday*, and other plays with Webster, Massinger, Chettle, Ford, and Middleton. He attacked Jonson in *Satiromastix*. D. was one of the most prolific writers of Elizabethan period, and his work is often of high poetical quality.

Rhys, *The Best Plays of Dekker* (Mermaid Series).

'DEL CREDERE' AGENT, person who is employed to sell goods for his principal, and who gets an extra commission for guaranteeing the solvency of the buyer: *i.e.* he guarantees that no bad debts shall occur.

DELABORDE, HENRI FRANÇOIS, COUNT (1764–1833), Fr. general.

DELACROIX, FERDINAND VICTOR EUGÈNE (1799–1863), Fr. artist; leader of Fr. Romantic School; famed for classical and hist. subjects.

Paul G. Konody, *Delacroix* (T. C. & E. C. Jack).

DELAGOA BAY (26° S., 33° E.), inlet of Ind. Ocean, Portug. E. Africa, extending N. to S., over 70 miles; partly enclosed by peninsula and island of Inyack; fine natural harbour, accessible to large vessels; port of Lourenço Marques is on N.W. shore. The Delagoa Bay Railway to Transvaal (opened 1890) carries a large percentage of the Rand traffic.

DELAMBRE, JEAN BAPTISTE JOSEPH (1749–1822), Fr. astronomer; assistant in the measurement of the meridianal arc between Dunkirk and Barcelona; pub. Tables of Uranus; prof. of Astron. at the Collège de France.

DELAMER OF DUNHAM MASSEY, SIR GEORGE BOOTH, 1ST BARON (1622–84), Eng. Royalist; commanded forces of Cheshire, Lancashire, and North Wales for king; imprisoned.

DELAND, MARGARETTA WADE (1857–), Amer. novelist; author of *John Ward, Preacher* (1888), *The Awakening of Helena Richie* (1906), etc.

DELANE, JOHN THADEUS (1817–79), Eng. journalist; editor of *The Times* (1841–77).

DELANY, MARY GRANVILLE (1700–88), Eng. writer; wrote chatty *Autobiography*, but chiefly known for friendship with Swift, Burke, and Fanny Burney.

DELAREY, JACOBUS HENDRIK (1848–), Transvaal general in South African War (1899–1902).

DELAROCHE, PAUL (1797–1856), Fr. artist of *Eclectic school*; among his Eng. and Fr. hist. subjects are *Cromwell at the Coffin of Charles I.*, *The Princes in the Tower*, *Execution of Lady Jane Grey*.

DELARUE, GERVAIS (1751–1835), Fr. hist. writer.

DELATOR (Lat.), accuser or informer who reported sums due to treasury or infraction of law in ancient Rome; richly rewarded under Republic; developed into extensive spy system under Empire.

DELAUNAY, ÉLIE (1828–91), Fr. artist.

DELAUNAY, LOUIS ARSÈNE (1826–1903), Fr. actor.

DELAVIGNE, JEAN FRANÇOIS CASIMIR (1793–1843), Fr. dramatist and poet, author of *Les Vêpres Siciliennes* (1818), *Les Enfants d'Édouard* (1833), *Louis XI.* (1832).

DELAWARE (40° 15′ N., 83° 2′ W.), city (and county), Ohio, U.S.A.; seat of Ohio Wesleyan univ.; railway workshops; iron foundries. Pop. (1910) 9076.

DELAWARE (38°28′ to 39° 50′ N., 75° to 75° 46′ W.), state, U.S.A.; bounded N. by Pennsylvania, W. and S. by Maryland, E. by Delaware river, bay, and Atlantic; smallest state except Rhode Island; capital, Dover. D. is situated on plain on peninsula formed by Chesapeake Bay and Delaware River; surface mostly flat and level; shores sandy and marshy, with many creeks and bays; some parts reclaimed from sea by dykes. D. has three counties: N.—Newcastle, centre—Kent, S.—Sussex. N. is beautiful fertile district, with rolling hills and deep valleys. Long ridge running N. and S. forms watershed of state. S. is almost flat, and in some parts swampy. Rivers, small but navigable, include Brandywine, Christiana, Duck, and Murderkill; canal connects Delaware River with Chesapeake Bay.

Hudson (*q.v.*) explored D. (*c.* 1609) for the Dutch; visited (1610) by Lord de la Warr, Gov. of Virginia; Dutch colony destroyed by Indians; next settlers Swedes; again acquired by Dutch, then by English (1664); received separate legislature (1704) and executive (1710) from Pennsylvania; declared independent state (1776). Gov. holds office for four years; Senate has 15, House of Representatives 35 members. D. Coll. is in Newark; also agricultural coll. in Dover for coloured people.

Principal harbours are Wilmington, Newcastle, and Lewes. Other towns are Smyrna, Delaware City, Milford, Laurel, Seaford, and Georgetown; Wilmington also a rising manufacturing town and railway centre. Granite clays and kaolin are to be found in N., but state is chiefly agricultural. Principal productions are fruits (especially peaches, strawberries, and other small fruits) and grain; market-gardening, dairy-farming, stock-raising, and oyster-fishing carried on; forests supply fine timber. Various manufactures, including iron and steel products, ships, leather goods, cottons, flour, and paper. Area, 1965 sq. miles. Pop. (1910) 202,322.—Scharf, *History of State of Delaware*.

DELAWARE INDIANS, a once-powerful N. Amer. tribe, now inhabiting part of Oklahoma.

DELAWARE RIVER (40° 30′ N., 75° 10′ W.), Amer. river; rises in Catskill Mts., Delaware County, New York; separates Pennsylvania on W. from New York and New Jersey on E., expands into Delaware Bay; navigable up to Philadelphia; length, 400 miles.

DELAWARE WATER-GAP (40° 58′ N., 75° 8′ W.), town, summer resort, Pennsylvania, U.S.A.

DELBRÜCK, HANS (1848–), Ger. historian.

DELBRÜCK, MARTIN FRIEDRICH RUDOLF VON (1817–1903), Prussian statesman.

DELCASSÉ, THÉOPHILE (1852–), Fr. statesman; did much to develop Fr. navy and colonies; responsible for occupation of Fashoda; made colonial agreements with Britain (1904); prominent in Morocco disputes; ambassador at St. Petersburg (1913–).

DELESCLUZE, LOUIS CHARLES (1809–71), Fr. journalist and Commune leader; killed at Barricades.

DELESSE, ACHILLE ERNEST OSCAR JOSEPH (1817–81), Fr. geologist; prof. of Geol. and Mineralogy at Besançon (1845); at the Sorbonne (1850); prof. of Agriculture at the École des Mines (1864); inspector-general of mines (1874).

DELFT (52° 1′ N., 4° 22′ E.), town, S. Holland; noteworthy buildings, Prinsenhof (now museum; former residence of Counts of Orange and scene of assassination of William the Silent, 1584); town hall; Old Church (XI. cent.); New Church (1381); birthplace of Grotius (1583); in XVII. and XVIII. cent's D. was famous for pottery—'Delft Ware,' and the industry is now revived, the modern product being termed 'New Delft.' Pop. (1910) 34,388.

DELHI (28° 44′ N., 77° E.), capital of India; industrial and commercial centre of Punjab. D. was made capital of India, 1912, being selected on geographical, historical, and political grounds; it forms an imperial enclave under a Chief Commissioner; area, 557 sq. miles. The planning and laying out of the new Government buildings has been entrusted to experts; the site is to be south-west of the old city; estimated cost, £4,000,000, will certainly be exceeded; the style of arch. has been a matter of controversy. The Viceroy's first entry into the new capital (Dec. 26, 1912) was the occasion of an anarchist outrage, in which Lord Hardinge was seriously wounded by a bomb.

D. is situated on right bank of Jumna (with fine railway bridge), on high ground. Principal street (Silver Street) is busy thoroughfare with many handsome buildings. Famous palace of Shah Jehan (*q.v.*) magnificent Moslem architecture) is about a mile in circumference and has beautiful interior. Jama Masjid (Great Mosque), also work of Shah Jehan, is 'one of India's glories'; Kala Masjid (Black Mosque);

tombs of Imperial family (in suburbs); Kutab-Minar, wonderfully built tower, surrounded by miles of ruins. D. has fine public gardens; bazaars famous for shawls, precious stones, gold and silver ware; centre of wheat trade.

D. became capital of great Muhammadan Indian Empire at beginning of XIII. cent.; taken by Baber—founder of Mogul Dynasty—in 1525; captured by Lord Lake and under Brit. rule since 1803; scene of awful massacre of Europeans (May 11), and stormed and taken by small Brit. and native force after famous siege in 1857; scene of Durbars in 1877, 1903, and Oct. 1911, when George V. visited D. in person and proclaimed it capital. Pop. *c.* 400,000; D. city (1911), 232,837.

Fanshawe, *Delhi, Past and Present* (1902).

DELIA, festival and games in honour of Apollo, held in Delos, every four years.

DELIAN CONFEDERACY.—(1) Alliance of Ionian states of *Magna Græcia* against Persia, 478 B.C.; named after meeting-place of executive council at Delos; almost unique effort of autonomous Gk. states at federation. Necessity of union against Persia was perceived by Athens alone, who incurred Persian invasion by aiding Gk. cities of Asia Minor; result was great Persian defeat at *Marathon* (490), and gratitude of Ionians, which enabled Athens to establish and control confederacy. Nominally Athens was merely president of representative synod, but as Athens was brilliant naval power, and unwarlike Ionians gradually commuted services for money payments, they sank into position of tributary states. Athens divided Ægean into taxation districts of Hellespont, Thrace, Ionia, Caria, and islands. With removal of treasury from Delos to Athens pretence of confederacy came to end. Purpose was also completed; Persians had been driven from Lycia and Caria by Cimon, who finally won decisive battle at river *Eurymedon*, and Athens simply used funds of league to keep up her own position; result, successful revolt of constituent states; no charges against Athenian hegemony except acts of despotism, such as insisting on allies having democratic constitutions, and making war on seceding states; failure of her empire was due to Gk. love of autonomy.

(2) Athenian League of 378 B.C. against Sparta. Severer rule of Sparta enabled Athens to form new alliance to which Persians were not admitted, but which was joined by several barbarian states and recognised by Macedonia. Second Delian Confederacy was more of free league than first. It marked brief and final period of Athenian pre-eminence.

J. H. Marshall, *The Second Athenian Confederacy* (1905); see also general histories of Greece.

DELIBES, CLÉMENT PHILIBERT LÉO (1836–91), Fr. composer; best opera, *Lakmé*; ballets include *Sylvia* and *Coppélia.*

DELILAH, Philistine woman who betrayed Samson to his enemies (*Judges* 16).

DELILLE, JACQUES (1738–1813), Fr. poet and translator.

DELIRIUM, a temporary derangement of the brain, usually a complication of some disease, *e.g.* brain injury, fevers, poisoning by alcohol or opium; is commonly considered as of three forms: *maniacal d.*, in which there is much violence; *muttering d.*, in which the individual lies quietly, muttering incoherently in a high fever; and *d. tremens*, in which there is great restlessness and trembling, with hallucinations both of hearing and of sight. Ice to the head, sponging with cold water, with bromide of potassium or morphia internally, is the usual treatment for the first type; stimulants, and quinine for the fever, in the second; and nutritive broths and other fluids to keep up the strength, with bromide of potassium and chloral, for the third.

DELISLE, JOSEPH NICOLAS (1688–1768), Fr. astronomer; founded the observatory in St. Petersburg; app. naval astronomer in Paris; discovered a method for calculating the transit of Mercury and Venus; pub. numerous research papers.

DELISLE, LÉOPOLD VICTOR (1826–1910), Fr. historian.

DELITZSCH (51° 33′ N., 12° 20′ E.), town, on Lober, Saxony, Germany; tobacco, woollens. Pop. 10,940.

DELITZSCH, FRANZ (1813–90), Ger.-Hebrew divine of Lutheran persuasion; author of many theological works, and regarded as one of founders of Higher Criticism. His son, FRIEDRICH (b. 1850), is well-known Oriental scholar.

DELIUS, NIKOLAUS (1813–88), Ger. Shakespearean scholar and philologist.

DELLA BELLA, STEFANO (1610–64), Ital. engraver.

DELLA CASA, GIOVANNI (1503–56), Ital. poet and archbishop.

DELLA COLLE, RAFFAELLINO (fl. *c.* 1530), Ital. artist.

DELLA GHERARDESCA UGOLINO, see UGOLINO, DELLA GHERARDESCA.

DELLA QUERCIA, JACOPO (1374–1438), Ital. sculptor.

DELLA ROBBIA, LUCA (1399–1482), Ital. sculptor; after being trained as a goldsmith, turned to sculpture and executed much fine work in marble, bronze, and terra-cotta reliefs; much of it done for cathedral at Florence; held very high position in Florentine art, and his relief work gave name to a style known as 'Della Robbia ware.' His nephew, ANDREA DELLA R. (1435–1525), continued his work, and, with several other members of same family, achieved remarkable distinction.

Cavallucci and Molinier, *Les Della Robbia* (1884); Burlamacchi, *Della Robbia* (2nd ed., 1910); Illustrated Biographies of The Great Artists, *Della Robbia and Cellini.*

DELMEDIGO, Jewish family, of which most famous members were ELIJAH (XV. cent.) and JOSEPH SOLOMON (XVI. cent.).

DELMENHORST (53° 3′ N., 8° 38′ E.), town, grand-duchy of Oldenburg, Germany; woollen factories. Pop. (1910) 22,516.

DELOLME, JEAN LOUIS (1740–1806), Swiss jurist and author.

DELONEY, THOMAS, Eng. ballad-writer and silk-weaver, who, during Elizabeth's reign, wrote numerous popular broadsides on the Armada, and other national subjects.

DELORME, MARION (1613–50), Fr. courtesan; famed for wit and beauty; life dealt with by Hugo, de Vigny, and G. P. R. James.

DELOS, LITTLE DELOS (37° 24′ N., 25° 17′ E.), island, smallest of Cyclades group, in Ægean Sea; birthplace and seat of worship of Apollo ('Delios') and Artemis ('Delia'); believed to have been inhabited by Ionians; later in possession of Athens. After fall of Corinth (146 B.C.) D. became centre of commerce, and had large slave-trade; noted for art, especially bronze works. City of Delos was situated on W. of island; contained temple of Leto, besides Great Temple and oracle of Apollo. D. was protected by sanctity; there was no need of fortifications; continued to flourish till destroyed (87 B.C.) during Mithridatic war. Here was kept the treasury of the *Delian Confederacy* (q.v.); interesting Fr. excavations since 1876.

Lebègue, *Recherches sur Délos* (1876); Homolle, *Délos* (1887).

DELPHI (38° 29′ N., 22° 30′ E.), small town (originally called *Pytho*; modern *Castri*), in Phocis, Greece; famous for oracle of Apollo, in charge of Pythian priestess; situated on steep slope on S. side of Mt. Parnassus; shut in on N. by mts. Name is derived, either from eponymous hero, Delphus, or from *Adelphos* (brother), referring to twin-peaks near by, between which issued Castalian spring. D. was governed by several aristocratic families of Doric origin, from which were chosen magistrates, priests, etc. (see AMPHIC-

TYONY); principal place of worship for Apollo, whose temple stood in N.W. of town; first built of stone; burnt in 548 B.C., and rebuilt with marble front. Its marvellous store of wealth tempted Xerxes, whose attempt at possession, however, was repelled; plundered (350 B.C.) by Phocians to carry on war against Thebes; robbed later by Sulla, Nero, and others; important excavations by Fr. archæologists.—*Fouilles de Delphes.*

DELPHINIA, Athenian festival in honour of Apollo, held yearly in April.

DELPHINUS, constellation of N. hemisphere, known to the ancients.

DELSARTE, FRANÇOIS ALEXANDRE NICOLAS CHERI (1811–71), French-Amer. first operatic tenor, and then teacher of system of dramatic expression.

'DELTA,' *nom de plume* of D. Macbeth Moir (*q.v.*).

DELTA (from shape of Gk. letter Δ), any tract of land enclosed by branches of a river's mouth (*e.g.* Ganges, Nile, Mississippi, Danube); the triangular tract of land is formed by deposits of fine silt brought down by the river. The d. of the river Po advances by about 100 yards annually towards the sea.

DELUC, JEAN ANDRÉ (1727–1817), Swiss geologist and natural philosopher; emigrated to England; F.R.S., 1773; app. reader to Queen Charlotte; travelled on the Continent and was awarded the title of honorary prof. of Geol. at Göttingen; pub. memoirs on atmospheric moisture, geol., and on philosophy.

DELUGE, THE, name given to the flood which overwhelmed the world, because of the wickedness therein, as related in *Genesis* (vi.–ix.). This Biblical story, which is supposed to be founded on the Babylonian tradition, contains several inconsistencies, and is admittedly of a composite character. Indeed, flood stories are to be found in all primitive religions and traditions—notable instances being that set forth in Ind. epic, *Mahābhārata*, and the story of Deucalion (Ovid's *Metamorphoses*). While there seems to be some foundation in fact regarding a great cataclysm which overtook the world, it is almost impossible to disentangle truth from tradition. The Eng. Bible dates the D. at 2348 B.C.

Elwood Worcester, *Genesis in the Light of Modern Knowledge* (1901); Suess, *Face of the Earth* (1904); Gordon, *The Early Traditions of Genesis* (1910).

DELYANNI, THEODOROS (1826–1905), Gk. diplomatist and prime minister; great opponent of Tricoupi; equipped army against Turkey, 1885; fell, 1897, after failure of anti-Turk. ministry.

DEMADES (d. 318 B.C.), famous Athenian orator; opponent of Demosthenes; put to death.

DEMANTOID, a species of green garnet, or 'Uralian emerald.'

DEMARATUS (*c.* 520 B.C.), king of Sparta.

DEMERARA (6° 15′ N., 58° 27′ W.), county of Brit. Guiana, between Essequibo and Demerara Rivers. Pop. 171,000.

DEMETER (classical myth.), dau. of Cronus and Rhea; eventually assumed her mother's attributes and functions, and became recognised as goddess of the earth's fruitfulness. Her favour was besought for the blessing of plentiful harvests, and drought and blight were supposed to be the result of her anger. She is generally represented as a woman of majestic appearance, with flowing yellow hair, emblematical of ripened corn. She was tenderly attached to her dau., Persephone, whom Aïdes carried off to the nether world. D. was known to the Latins as Ceres.—**Demetria,** Gk. seed-time festival in honour of Demeter.

DEMETRIUS (IV. cent. B.C.), Gk. sculptor, famed for realism.

DEMETRIUS (*c.* 206 B.C.), king of Bactria.

DEMETRIUS, name of two Macedonian kings.—**Demetrius I.** (337–283 B.C.), the 'besieger,' established supremacy over Greece and Macedonia, seizing throne, 294; d. a prisoner during attempted conquest of Asia.—Rule of **Demetrius II.** (239–29), marked by first Rom. interference.

DEMETRIUS, name of 3 Syrian kings.—**Demetrius I.,** SOTER (fl. 162–50 B.C.); **Demetrius II.,** NICATOR (fl. 147–25 B.C.); **Demetrius III.** (d. 88 B.C.).

DEMETRIUS DONSKOI, Grand-Duke of Moscow (1350–89), Russ. statesman and general.

DEMETRIUS PHALEREUS (345–283 B.C.), Gk. philosopher and statesman.

DEMETRIUS, PSEUDO.—Name given to three Pretenders who claimed to be Demetrius, the heir to the Russ. empire, murdered in 1591. The first defeated army of reigning Tsar, was crowned at Moscow, 1605, but murdered, 1606; the second won great successes, failed in attack on capital, and was murdered, 1610; the third was captured and executed, 1612.

DEMIDOV, NIKITA (fl. *c.* 1720), famous Russ. armourer, favoured by Peter the Great; several descendants were distinguished in arts and sciences.

DEMISE, term commonly used for death, but the correct meaning is transfer of estate. *D. of the Crown* is its transfer to a successor without any interregnum ('The king is dead: long live the king'). Formerly anarchy theoretically obtained between the death of the sovereign and the proclamation of his successor.

DEMIURGE (Gk. *dēmos,* 'people,' and *ergon,* 'work'), among the Gnostics the creator of the world of sense, as distinguished from the higher God, the creator of the divine soul, identified with the Jehovah of the Old Testament. See GNOSTICISM.

DEMMIN (53° 54′ N., 13° 1′ E.), town, Prussia, Germany; iron foundries; trade in grain, wool, coal, and timber. Pop. 12,541.

DEMOCHARES (d. 275 B.C.), Athenian statesman; nephew of Demosthenes.

DEMOCRACY, government by the people, is opposed to autocracy or oligarchy. With Aristotle d. was *bad* government by the people. Gk. d., which excluded slaves, had no representative government: the citizens met, spoke, and voted. In Gk. and Rom. cities there were continual struggles between lower and upper classes. Ancient d. was local; modern d. governs countries. The so-called 'Failure of d.' means that the votes of a nation's citizens do not effect legislation wanted by the nation; reforms are suggested by political parties, and the people by voting endorse or negative proposals.

DEMOCRATIC PARTY, one of the great political parties in U.S.A.; originally opposed to the elements of aristocracy of wealth or position which still existed even after Declaration of Independence. The South is now nearly all Democratic, and the inhabitants of large cities largely belong to the Party. Democratic Presidents have been Jackson, 1829–37; Van Buren, 1837–41; Polk, 1845–49; Pierce, 1853–57; Buchanan, 1857–61; Cleveland, 1885–89, 1893–97; Woodrow Wilson, 1913. From 1895 to 1911 the party was in a minority in Congress. In 1911 Elections Democrats secured majority in House of Representatives and demanded eight-hours' day for Government employees, reduction of tariffs, publication of election expenses, but these were vetoed by Pres. Taft. The D. P. advocates low tariff for revenue purposes only, while antagonistic *Republican Party* supports high protective tariffs.

Woodburn, *Political Parties and Party Problems in the United States* (1903).

DEMOCRITUS (b. *c.* 460 B.C.), one of the greatest Gk. philosophers; anticipated atomic theory of matter (see ATOMS), *i.e.* matter is composed of atoms which are always in motion; held that all atoms were alike, only by arrangement and position could they form different objects, hence objects did not vary, but their varied appearances were due to our sensations.

Burnet, *Early Gk. Philosophy* (1892); Beare, *Gk. Theories of Elementary Cognition* (1906).

DEMODEX, see under MITES AND TICKS.

DEMOGEOT, JACQUES CLAUDE (1808–94), Fr. literary historian.

DEMONOLOGY, the belief in demons and study connected therewith. In many religions there have been not only good gods whose favour it was desirable to obtain, but bad gods or spirits to be mollified. The

Jews inherited from ancient Semitic religion a belief in demons to which we find occasional reference in the Bible, but during the Exile they came into contact with Persian religion in which angels and demons played a prominent part. The phenomenon (whether or supposed) of possession by an evil spirit is familiar to every reader of the New Testament, and persons at any rate believed themselves possessed. The Early Christians did not deny the existence of pagan gods, but transformed them into devils. Demons were not prominent in either Gk. or Rom. religions, but in Oriental religions devil-worship takes uncouth and sometimes cruel forms. Modern occultism has led to revival of belief in demons.

Tylor, *Primitive Culture* (4th ed., 1904); J. C. Wall, *Devils* (1904).

DEMOSPONGIÆ, see under SPONGES.

DEMOSTHENES (*c.* 384–22 B.C.), Gk. statesman and orator. Early left an orphan, D. had a small fortune from his f., but his guardians made away with most of it. He studied law, and devoted all his energies to becoming a good public speaker, at first being very bad and meeting with derision. He entered political life in 355, and henceforward devoted himself to his life's work of trying to revive the best spirit and traditions of Gk. life. D. believed that Athens was the rightful leader of Greece, and it was her mission to play this part not merely in her own interest, but in that of Greece as a whole. Philip, king of Macedon, in opposition to whom D. tried to stir up his fellow-citizens, was for him a type of what was not Gk. but barbarian. D. delivered his *First Philippic* and the three *Olynthiac Orations*, while Philip was still a foreign foe, outside Greece, his *Second* and *Third Philippic* when Philip was a power in Greece itself. This last speech has been spoken of as D.'s 'crowning effort.' From 338 to 322 D. worked loyally for Athens in her internal affairs. His speech *On the Crown* is the greatest of this period. In the political troubles after the death of Alexander the Great, D. was condemned to death. He fled to Ægina and then to Calauria, and committed suicide by taking poison.

The work of D. as a statesman and as an orator is really one; he spared no trouble in setting forth the principles he held dear. His fame as an orator and a stylist has been almost unquestioned in ancient and modern times. His style is dignified and simple, elegant and refined, and as Homer is reckoned supreme among Gk. poets, so is D. among Gk. orators. Dionysius, one of the ablest critics of antiquity, praised D. unreservedly as setting the standard for Attic prose. Of the 61 speeches attributed to D., 27 are genuine, the rest certainly spurious. There are over 170 MSS. of his works, of which one of the X. cent. is far superior to the rest.

S. H. Butcher, *Introduction to the Study of Demosthenes*; many separate editions of speeches; complete in Oxford Classical Texts. Complete Eng. trans. by Kennedy.

DEMOTICA (41° 22′ N., 26° 30′ E.), town, Rumelia; important in Middle Ages as chief market of Thrace; linen, pottery, silk, and grain exported. Pop. *c.* 9000.

DEMPSTER, THOMAS (1579–1625), Scot. historian and scholar; prof. of Classics at Bologna; author of *Historia Ecclesiastica Gentis Scotorum*.

DEMURRAGE, payment made by shipper of goods to shipowner as compensation for delay in loading or unloading a vessel; a charge made by railway companies for delay in removing goods from their wagons.

DEMURRER, in law, preliminary protest made by defendant to the effect that plaintiff had no proper cause for action; abolished in civil cases (1875), but still obtaining in criminal cases.

DENAIN (50° 20′ N., 3° 25′ E.), town, Nord, France; coal mines and ironworks; scene of Villars' victory over Prince Eugène (1712). Pop. 25,000.

DENBIGH (53° 12′ N., 3° 25′ W.), county town, Denbighshire, N. Wales; ruined XIII.-cent. castle; timber, shoes. Pop. (1911) 6892.

DENBIGH, WILLIAM FIELDING, 1ST EARL OF (*c.* 1582–1643), Eng. Royalist; of family wrongly supposed to be descended from Hapsburgs; cr. Earl of D., 1622.

DENBIGHSHIRE (53° 10′ N., 3° 30′ W.), maritime county, Wales, having Irish Sea on N., the Conway forming W., and Dee part of E. boundary; surface partly mountainous, divided into several fertile valleys; greater part of lower ground produces oats, barley, turnips; uplands form pasturage; dairy produce; rich in coal, lead, slate, limestone, and freestone; collieries and extensive ironworks; woollen manufactures. County town is Denbigh; other towns, Wrexham, Ruthin. Area, 665 sq. miles. Pop. (1911) 144,796.

DENDERA (26° 13′ N., 32° 40′ E.), village, on Nile, Upper Egypt; has celebrated temple of Hathor (dating from period of later Ptolemies), one of most magnificent and best-preserved remains of antiquity in Egypt; D. is the ancient *Tentyra*.

DENDROCOMETES, see under INFUSORIA.

DENE-HOLES, excavations in form of narrow shafts, extending frequently to considerable depth and terminating in enlarged chambers or caves; of very ancient origin; in England chiefly confined to those parts of Essex and Kent, along lower banks of Thames, and popularly attributed to the Danes or other early invaders.

DENGUE, infectious fever usually occurring in India, Africa, and tropical America; the onset is sudden, and the fever is characterised by an eruption resembling that of scarlatina, and severe pains in the joints.

DENHAM, DIXON (1786–1828), Eng. African traveller; gov. of Sierra Leone.

DENHAM, SIR JOHN (1615–68), Eng. poet; author of *Cooper's Hill* (1642) and a fine elegy on Cowley; D., Cowley, and Waller are called 'the reformers of our numbers,' but D. is the least poet of the three. Johnson, *Life*.

DÉNIA (38° 53′ N., 0° 5′ E.), seaport, on Mediterranean, Alicante, Spain; interesting Moorish relics; exports grapes, raisins, onions. Pop. 12,431.

DENIKER, JOSEPH (1852–), Fr. anthropologist; author of *Les six Races de l'Europe* (1904), *The Races of Man* (1900).

DENILIQUIN (35° 33′ S., 145° 6′ E.), town, N. S. Wales, Australia; pastoral district.

DENINA, CARLO GIOVANNI MARIA (1731–1813), Ital. historian.

DENIS, JOHANN MICHAEL (1729–1800), Austrian poet.

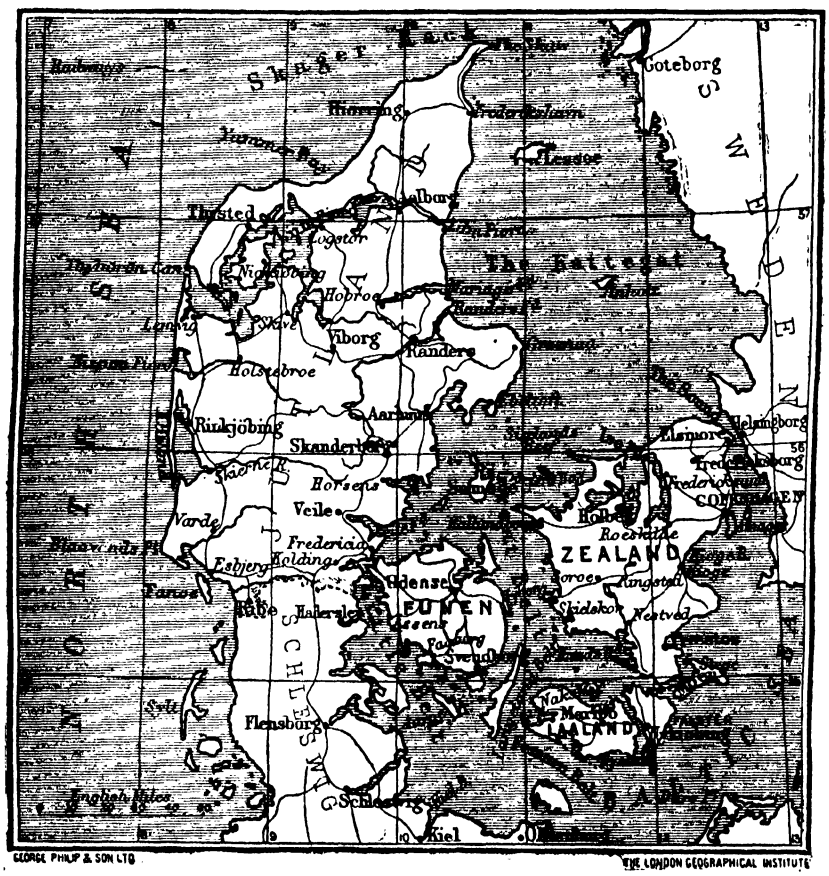
DENIS, ST. (III. cent.), short for Dionysius, believed to have been martyred in Decian persecution; patron saint of France; first bp. of Paris; evangelised Gauls.

DENISON (33° 45′ N., 96° 43′ W.), city, Texas, U.S.A.; cotton manufactures; important railway and trade centre for fruit and farm produce of district. Pop. (1910) 13,362.

DENISON, GEORGE ANTHONY (1805–96), Anglican theologian; ritualist and keen High Church controversialist.

DENISON, GEORGE TAYLOR (1839–), Canadian publicist and colonel; has seen much active service; wrote *History of Cavalry* (1877), *Soldiering in Canada* (1900), *The Struggle for Imperial Unity* (1909).

DENIZEN, a foreigner enjoying certain rights by letters patent; in Britain he cannot be a member of Parliament or of Privy Council, nor can he hold any military office.



DENIZLI (37° 49′ N., 29° 2′ E.), town, Asia Minor, near ruins of Laodicea; cotton fabrics.

DENMAN, THOMAS, 1ST BARON (1779–1854), judge and politician; defended Queen Caroline (1820).

DENMARK (55° to 58° N., 8° to 15° E.), kingdom, Northern Europe; 15,360 miles in area, including the

Faroes; is partly mainland, partly archipelago. The mainland part, Jutland, is the N. part of the long peninsula extending N.W. of Germany, between the N. Sea and the Baltic, the S. part being occupied by Schleswig and Holstein. It is divided from Norway by the Skager Rack, from Sweden by the Cattegat and the Sound. The larger islands are Zealand and Fünen, the smaller Langeland, Laaland, Falstor, Moen, and, 90 miles to the E., Bornholm. The surface is generally low, and in places is protected by dykes. The climate is temperate and damp; about half of the country is in pasture, most of the remaining available land being arable; 800 miles are under wood, the beech flourishing better here than anywhere else in Europe.

History.—The mainland peninsula was known to the Romans as the Cimbrian Chersonese, it and the islands being inhabited by Cimbri and Teutones.

The first mention found of the Danes is in the VI. cent. Little information has been extracted from the Scandinavian sagas or from the early part of the *Gesta Danorum* of Saxo Grammaticus (*q.v.*), but Alfred the Great stated in the IX. cent. that the Danes inhabited Jutland, Scania, and the islands; for a cent. they had been the most prominent among the 'Northmen,' who in their Viking ships were sailing up the streams of the kingdoms of Franks and Angles, plundering and burning. In early IX. cent. the semi-mythical Norwegian dynasty of the Ynglinger was ruling over D., and one of its members, King Harold Klak, was baptized with many of his nobles at Ingelheim in 826. The pagan, Gorm the Old (d. 936), expelled this dynasty, but his s., King Harold Bluetooth, accepted Christianity in 960. The River Eider, between Schleswig and Holstein, was already established as the natural boundary of D., and Harold extended Dan. rule farther south than this point.

Harold's son, Swegen I., conquered England in 1013; Swegen's son, Cnut or Canute the Great (1014–35), ruled over England, Norway, and Denmark, and was the most powerful monarch of his time. Harold and Harthacnut, sons of Cnut, disputed over England until the death of the former (1040); D. finally lost England at the death of the latter (1042). In D. Cnut's sister's son, Svend Estridsen (1047–76), succeeded in founding the dynasty of the Estridsen, who ruled over D. for many cent's. Waldemar I. (1157–82) and Cnut VI. (1182–1202) defeated the Wends, acquired Rügen, and again reduced Norway. Waldemar II. (1202–41) ruled over the N. almost as Cnut the Great had done. The competition between Denmark and Ger. princes had already become strong, and the latter combined with Waldemar's vassals and inflicted a great defeat upon him. After his death (1241) D. was torn by strife for a cent. Waldemar IV. (1340–75) again established firm rule, increased the royal demesnes, and codified the laws. His famous daughter Margaret (1375–1412), widow of Haakon VI. of Norway, ruled over D. and Norway, and by the Union of Calmar (1397) persuaded Sweden to agree to the hegemony of D. She was beginning to suffer from the hostility of the Hanseatic League and the attacks of Holstein when her death brought the feeble Eric VII. (deposed in 1440) to the throne. After the disasters of his reign and that of his nephew, Christopher of Bavaria (1440–48), the Rigsrad elected a descendant of Waldemar II., Christian of Oldenburg (1448–81). Norway and Sweden chose other rulers and the Union came to an end.

The OLDENBURG DYNASTY ruled over D. until 1863. Christian II. (1513–23) was elected ruler of Norway and forced his rule upon Sweden; there was much craft in his methods, but he failed in justifying them by success; he sought to crush the nobles as the Tudors in England were doing, tried to make the Church while still R.C., Danish and national. The result, unfortunately, was the triumph of the nobles. Christian was deposed in favour of his uncle, Frederick I. (1523–33), the long *Adelsvælde* (rule of the nobles) was established; Norway remained to D.; but Sweden was finally separated. Christian III. (1536–59) ended the revolt of the Counts by capturing Copenhagen, 1536, and made Lutheranism the State religion. Christian IV. (1588–1648) was a gifted monarch, and saved D. in the Thirty Years War from the aggression of Sweden, until, hampered in every way by the factious

nobles, he was forced to surrender islands and provinces and open the Sound to Swed. trade (1645). This marked the end of Dan. supremacy in the N. The *Adelsvælde* was, however, drawing to a close.

In 1658 D. was forced to make further humiliating concessions to Sweden at Röskilde, only partially redeemed at Copenhagen (1660). The latter treaty was largely due to the king, and in alliance with clergy and burgesses, in opposition to the nobles, the Crown was able to establish in 1660 an hereditary, absolute monarchy. The privileges of the various orders of society were abolished. The serfs, ground down for cent's, were now protected by the Crown, and gradually became emancipated; despite frequent wars with Sweden D. prospered until the coalition of the N. powers against Britain in the Napoleonic Wars. The Brit. fleet bombarded Copenhagen in 1801 and in 1807, and confiscated the Dan. fleet until the end of the war, when D., having been driven to support Napoleon, was compelled to cede Norway to Sweden. The chief fact of the XIX. cent. in D. was the loss of Schleswig and Holstein through the deep-laid schemes of Prussia, and the growing Ger. discontent in Holstein.

On the death of Frederick VII. in 1863 the house of Oldenburg came to an end, and under the Treaty of London, Prince Christian of Schleswig-Holstein-Glücksborg, nominee of the Powers, became Christian IX. The new Duke of Augustenborg, however, whose father had agreed to the treaty, refused to acquiesce in his own disherison and assumed the title of Frederick VIII. The second episode of the Schleswig-Holstein question followed, resulting in the final loss of the duchies. The succeeding years have seen the decay of the old alliance, no longer needed, of people and Crown, and a new league of Crown and *Landsthing* against the advances of socialism. Frederick VIII. (1843–1912), bro. of Queen Alexandra of Britain, succeeded his f. (1906) and was followed by his son, Christian X. (1912–).

Literature.—Danish is a Scandinavian tongue akin to that of Sweden. An early writer of note was Saxo Grammaticus (1140–1206), whose Lat. history, *Gesta Danorum*, although not critical, is invaluable as lit. D. has also a fine collection of vernacular ballads and romances, collected in the XVI. cent., but composed at the height of the Middle Ages. As in other countries vernacular prose (except for isolated legal documents, etc.) and drama commence in the XVI. cent.; poetry after the Renaissance manner is represented by the great Anders Kristensen Arrebo (1587–1637). In the XVII. cent. Thomas Kingo (1634–1703) wrote religious verse of distinction. Ludvig Holberg (1684–1754), author of witty, polished comedies in the Fr. manner, has been called the Plautus of D.

D. felt the Romantic Movement very early. Johannes Ewald (1743–81) and Herman Wessel (1742–85), by tragedy and comedy respectively, slew the Classical School. The movement was organised by Schack von Staffeldt (1769–1826) and Ohlenschläger (1779–1850), who learned in Germany to turn back to the Middle Ages for inspiration. Blicher (1782–1848) wrote poems and stories at the height of the new manner. The mediæval revival was the great influence on Ingemann (1789–1862), the 'return to nature' the motif of Winther (1796–1876). Among the greatest of the poets was Frederick Paludan-Müller (1809–76). The chief prose writer of the movement was Hans Christian Andersen (1805–75), whose *Fairy Tales* were pub. 1835. Like other countries D. came to an end of her Romantic Movement; Schandorph (1836–1901), Drachmann (1846–1908), and Jacobsen (1847–85) illustrate the revival of classical feeling with style infinitely enriched by the experiments and achievements of the preceding school. Side by side with these pure stylists ran the realistic movement under Georg Brandes, a critic of European renown; one of its chief exponents is Pontoppidan (b. 1857). Among the many archæologists of D. are Worm, Gram, Langebek, Rask, Worsaae, Wimmer; among the few philosophers Kierkegaard.

Government is a limited monarchy; the parliament (*Rigsdag*) consists of the 'House of Aristocrats' (*Landsthing*) and Lower House (*Folkething*); 12 of the 66 members of the former are nominated for life by the Crown, the rest elected indirectly for 8 years; the members of the Lower House, who are paid, are elected under a system of male suffrage, with qualifications of age and character.

D. has a citizen army with few exemptions; the field army numbers about 50,000. A considerable amount is spent on the small fleet for coast defence.

The total exports amount to about £27,000,000 annually; the principal are butter, eggs, pork, bacon, besides sheep, hides, wool, fish, oil, machinery, paper; the U.K. receives over £15,000,000 worth. The enormous amount of dairy-produce is obtained largely by the co-operative butter factories and excellent methods of preservation.

Despite the Anglo-Scandinavian Import and Export Association, Harnegade, Copenhagen, D. receives from Germany twice the amount of imports received from Britain. The W. coast being useless owing to the shallow sea, the ports are on the E. There are 4213 miles of main road, 22,012 miles of local roads, and 2150 miles of railway (largely owned by the State) connected by steamboats or in winter by iceboats, etc.

Lutheranism became the State religion in 1536, but there is religious toleration. The archiepiscopal see is at Röskilde. Copenhagen Univ. dates from 1479; elementary education became compulsory in 1814; the country is strongly democratic.

The Faeroes are considered an integral part of D. Dan. dependencies are Iceland, Greenland, and the islands of St. Croix, St. Thomas, and St. John in the Dan. West Indies.

Chief centres of population are the capital, Copenhagen, Röskilde and Elsinore in Zealand, Aalborg and Aarhus, chief towns of Jutland, and Odense, the chief town of Fünen. Pop. (1911) 2,757,056.

R. N. Bain, *Scandinavia* (1904); Weitemeyer, *D.: its History, etc.* (1891); Brochner, *Dan. Life in Town and Country* (1903); Stefansson, *Sweden and D.* (1912).

DENNERY, ADOLPHE (1811–99), Fr. dramatist; wrote libretto of Gounod's *Faust* (1856).

DENNEWITZ (51° 58′ N., 12° 56′ E.), village, Brandenburg, Prussia, Germany; scene of defeat of French by Prussians, 1813.

DENNIS, JOHN (1657–1734), Eng. critic; ed. Cambridge; unsuccessful as playwright, he turned to literary criticism, and became involved in quarrels with Pope, Addison, and Swift; immortalised in the *Dunciad*.

DENON, DOMINIQUE VIVANT, BARON DE (1747–1825), Fr. archæologist and artist; director-general of Fr. museums.

DENOTATION, term used in logic (*q.v.*) for sum-total of objects having a given qualification.

DENS, PETER (1690–1775), Roman Catholic ecclesiastic, taught many years at Malines.

DENSITY of a substance is the mass of unit volume. It may be expressed as the mass of a cubic centimetre in grammes or of a foot in lbs. It is generally obtained by determining the ratio of the density of the substance to that of some standard substance, in which case the densities are relative and are often called *specific gravities* (q.v.). Gases are referred to hydrogen, the density of which at 0° C. and one atmosphere is taken as unity. The d. of liquids is referred to that of water at the required temperature. One cubic centimetre at 4° C. is assumed to weigh exactly one gramme, although careful experiment has ascertained it to be ·99996 gr. The d. of a liquid is obtained (1) by weighing an empty small glass bottle, called a pyknometer, subtracting this weight from its weights filled with water and with the required fluid; this gives the weights of equal volumes of the liquid and water, and the ratio, weight of liquid over

weight of water, gives the required density. (2) By weighing a solid first in water, then in the liquid, and so determining its loss of weight in each; the ratio of the loss of weights of each is equal to the ratio of the weights of equal volumes of the liquid and of water.

DENSU, CHO (1352–1431), Jap. artist, one of most famous of his country; his portrait of the priest, Shoichi Kokushi, is regarded as one of the world's greatest portraits.

DENTATUS (d. 270 B.C.), Rom. general and consul; conqueror of Pyrrhus, and of Samnites.

DENTIL, in architecture, tooth-like projecting block employed in cornices.

DENTISTRY, the science and art of the treatment of disease in the teeth, and of the replacement of them when lost, was practised by the ancient Egyptians and Greeks; and by succeeding teachers and surgeons the modern science, which reaches its most advanced stage in the U.S.A., has been evolved.

In 1878 an Act was passed in Britain forbidding those who have not undergone a course of study and taken a recognised licence or degree from assuming the title of dentist or any other title signifying registration as such.

In the treatment of disease in a tooth, a dentist either takes measures to stop the decay and repair the damage, or removes the tooth, and, in this latter case, frequently puts an artificial one in its place.

In the first case, the tooth may be subjected to *scaling*, or removing such a substance as *tartar*; to *filling* or *stopping*, in which the decayed material is entirely removed, and plugs of various materials, *e.g.* gold, porcelain, or metallic amalgams, inserted in its place; or to *capping* or *crowning*, in which part of the tooth, with the pulp, is removed, and a metallic cap or a crown, which encircles the tooth as far as the end of the root, applied.

In extraction of teeth a local anæsthetic, usually *cocaine* or its preparations, or a general anæsthetic, such as nitrous oxide or ethyl chloride, is now almost invariably used, while modern instruments have rendered the operation much more exact than formerly.

Artificial teeth are considered as partial or as complete sets, according as any natural teeth remain or not. The artificial teeth (or even a single tooth when only one tooth is required) are fastened to a *plate* or *base*, which is accurately fitted either to the natural teeth remaining or to the palate and gum. The plate is made most frequently from vulcanite or from platinum.

Dental appliances used in the various departments of D. are innumerable, and are often of intricate and beautiful design, while their manufacture is now an important industry.

Griffiths, *Dental Metallurgy* (1910); Tomes, *Dental Surgery* (5th ed., 1906); Burchard and Inglis, *Dental Pathology* (3rd ed., 1908); Johnson, *Operative Dentistry* (new ed., 1910).

DENTON (53° 27′ N., 2° 7′ W.), town, Lancashire, England; felt hats. Pop. (1911) 16,880.

DENVER (39° 48′ N., 104° 5′ W.), capital of Colorado, U.S.A., on S. Platte River; great commercial and railway centre; fine buildings, including univ., public library, museum, State Capitol, mining exchange, chamber of commerce. D. is the centre of a mining, agriculture, and stock-raising district; manufactures steel, iron, glass, shoes, paper, cotton. Pop. (1910) 213,381.

DEODAND, term (now abolished) formerly used in Eng. law for the object which had caused a person's death, and was forfeit to the king for good uses, or 'given to God.'

DÉOLS (46° 50′ N., 1° 40′ E.), town, Indre, France; X.-cent. abbey.

DEPEW, CHAUNCEY MITCHELL (1834–), Amer. orator and politician.

DEPILATORY, anything that will remove hair, by chemical or other means; electrolysis is the only satisfactory method.

DEPRETIS, AGOSTINO (1813–87), Ital. politician; follower of Mazzini; in cabinet, 1862; premier, 1881–87; carried through some reforms, but extravagant financier.

DEPTFORD (51° 29′ N., 0° 2′ E.), S.E. metropolitan borough, London, on S. bank of Thames; site of dockyards (closed 1869), now occupied by cattle markets. Pop. (1911) 109,498.

DERA GHAZI KHAN (30° 5′ N., 70° 52′ E.), town, on Indus, Derajat division, Punjab, India. Pop. 23,731.

DERA ISMAIL KHAN (31° 49′ N., 70° 52′ E.), town, near W. bank of Indus, N.W. Frontier Province, India. Pop. 31,737.

DERBENT, DERBEND (42° 2′ N., 48° 15′ E.), town Daghestan, Russia, on W. coast of Caspian; silk and cotton fabrics; fruit and madder. Pop. 14,821.

DERBY (41° 19′ N., 73° 5′ W.), city, Connecticut, U.S.A.; at junction of Housatonic and Naugatuck; iron manufactures; pianos. Pop. (1910) 8991.

DERBY (52° 55′ N., 1° 28′ W.), town, capital of Derbyshire, England, on Derwent; royal borough in XI. cent.; has Free School dating back to Henry II.; interesting churches, town hall, free library, art gallery, museum; headquarters of Midland Railway Co.; manufactures silk, lace, iron, porcelain; near supposed site of Rom. station *Derventiœ*. Pop. (1911) 123,433.

DERBY, EARLDOM OF.—Title has been held by several families: (1) **Ferrars.** ROBERT FERRARS was cr. Earl of D., 1138; d. 1139. His descendant, ROBERT, 6TH EARL, served on barons' side in wars against Henry III.; disinherited, 1266.—(2) **Plantagenet.** HENRY PLANTAGENET, s. of Edmund, s. of Henry III., was cr. Earl of D., 1337; also Earl of Lincoln and Duke of Lancaster. His dau., Blanche, m. John of Gaunt, Duke of Lancaster, s. of Edward III. Their s., HENRY, was Earl of D. before acceding to throne as Henry IV.—(3) **Stanley.** THOMAS STANLEY, who deserted Richard III. at *Bosworth*, was cr. by Henry VII. Earl of D., 1485; title held by his descendants ever since. He was also Lord of Man—a title which passed to Dukes of Athole, 1736.

Among more famous of subsequent earls have been: JAMES STANLEY, 7TH EARL (1607–51), the *Great Earl*, fought for Charles I. in Civil War; executed at Bolton; a man of fine character. EDWARD GEOFFREY SMITH STANLEY, 14TH EARL (1799–1869), strong advocate of Great Reform Bill; Chief Sec. for Ireland, 1830; from 1834 Conservative; succ. to earldom, 1851; Sec. of State for Colonies, 1833–34; Prime Minister, 1852, 1858, and 1866; vigorous opponent of disestablishment of Irish Church; good classical scholar; pub. translation of *Iliad*; fine orator. His s., EDWARD HENRY, 15TH EARL (1826–93), Sec. for Colonies, 1858, 1882–85; Sec. of State for India, 1858–59; Foreign Affairs, 1866–68, 1874–78. FREDERICK ARTHUR, 16TH EARL (1841–1908), bro., Sec. of State for Colonies, 1885–86; Pres. of Board of Trade, 1886–88; Gov.-Gen. of Canada, 1888–93; Chancellor of Univ. of Oxford. EDWARD GEORGE VILLIERS STANLEY, 17TH EARL (1865–), present earl, succ. his f.; fought in S. Africa; Postmaster-Gen., 1903–5.

DERBYSHIRE (53° 9′ N., 1° 35′ W.), county, England; bounded to N. by Yorkshire, E. by Nottinghamshire, S. by Leicestershire and Staffordshire, W. by Staffordshire and Cheshire; area, 1008 sq. miles. Surface varies greatly. In N. is grand and rugged scenery of the Peak District, where Pennine Range terminates; chief summits are Kinder Scout and Axe Edge. Owing to elevated position, soil is too poor here for cultivation, but sheep-farming is practised. Bordering on Cheshire are wide moorlands. In E. surface is gently undulating, and in S. mostly flat; here there are good crops of wheat and barley and large dairy-farms. D. abounds in picturesque scenery; valleys of Derwent and Wye being especially beautiful. Other rivers are Trent, Dove, and Dane. Chief towns are Derby (capital), Chesterfield, Glossop, Ilkeston, Ashbourne. Matlock,

Buxton, and Bakewell are popular health-resorts on account of their mineral springs. D. supplies limestone, lead, zinc, and chiefly in E. has important collieries. Manufactures include silk, cotton, elastic web, porcelain, and lace. D. has some fine old churches; ruined abbeys of Dale and Beauchief; remains of Bolsover, Duffield, and Codnor Castles; famous mansion of Haddon Hall, and Arbelow, interesting stone-circle. Pop. (1911) 560,129.

Derbyshire (Victoria County Histories); J. B. Firth, *Highways and Byways in Derbyshire* (1905).

DERBYSHIRE NECK, see GOITRE.

DERELICT, vessel abandoned by crew. See WRECKS.

DERENBOURG, JOSEPH (1811–95), Fr. Orientalist.

DERG, LOUGH (54° 40′ N., 7° 56′ W.), lough, County Donegal, Ireland; legendary scene of St. Patrick's purgatory.

DERG, LOUGH (53° N., 8° 15′ W.), lough, Counties Tipperary, Galway, and Clare, Ireland; expansion of the Shannon.

DERHAM, WILLIAM (1657–1735), Eng. theologian and scientist; elected F.R.S., 1702.

DERMOT MAC MURROUGH (d. 1171), king of Leinster; brought the English over into Ireland.

DERNA (32° 46′ N., 22° 38′ E.), small seaport, Barca, Tripoli, N. coast of Africa; ancient *Darnis*.

DÉROULÈDE, PAUL (1846–), Fr. poet, dramatist, and politician; banished for conspiracy, 1899.

DERRICK, tackle, or crane, used for hoisting purposes; derived from name of a hangman.

DERVISH, Persian for 'beggar,' applied to members of Muhammadan religious orders, and especially to members of mendicant orders. Trance and hypnotic suggestion play a considerable part among the Dervishes, who are thrown into frantic ecstasies in which they handle red-hot iron and eat reptiles with impunity; some are Antinomian, *i.e.* claim exemption from moral law.

DERWENT.—(1) (54° 12′ N., 0° 35′ W.) river, England; rises in Yorkshire Wolds, enters Ouse near Barnby. (2) (53° 10′ N., 1° 37′ W.) river, Derbyshire, England; joins Trent 7 miles S.E. of Derby. (3) (54° 38′ N., 3° 34′ W.) river, Cumberland, England; flows N. through Lakes Derwentwater and Bassenthwaite; enters Irish Sea at Workington. (4) (54° 54′ N., 1° 50′ W.) river, Northumberland and Durham, England; joins Tyne near Newcastle. (5) river, Tasmania; flows from Lake St. Clair to Storm Bay; navigable to New Norfolk.

DERWENTWATER (54° 35′ N., 3° 9′ W.), beautiful lake, Cumberland, England, S. of Keswick; an expansion of river Derwent; studded with islands.

DERWENTWATER, EARLDOM OF.—SIR FRANCIS RADCLYFFE (1625–97), cr. Earl of D., 1688.—EDWARD (1655–1705), 2nd earl, s., m. Mary, natural dau. of Charles II.—JAMES (1689–1716), s., 3rd earl, executed for complicity in rebellion of 1715; title forfeited.

DES ADRETS, FRANÇOIS DE BEAUMONT, BARON (1512–87), Huguenot soldier; became Rom. Catholic.

DES BARREAUX, JACQUES VALLÉE, SIEUR (1602–73), Fr. poet.

DES CLOIZEAUX, ALFRED LOUIS OLIVIER LEGRAND (1817–97), Fr. mineralogist; prof. of Mineralogy in Natural History Museum, Paris; carried out profound researches in crystallography.

DES MOINES (41° 34′ N., 93° 39′ W.), city, capital of Iowa, U.S.A., at confluence of Racoon and Des Moines; numerous public parks and fine public buildings, including State Capitol; others are city hall, state library, Drake Univ. (1881); Des Moines Coll. (1865); Highland Park Coll. (1890); centre of extensive manufactures; iron foundries. Pop. (1910) 86,368.

DES PÉRIERS, BONAVENTURE (d. 1544), Fr. author; sec. to Marguerite de Navarre; perhaps assisted in composition of the *Heptaméron*.

DES PRÈS, JOSQUIN (d. 1521), Fr. composer.

DESAIX DE VEYGOUX, LOUIS CHARLES ANTOINE (1768–1800), Fr. general; of noble family, but on popular side in Revolution; fought in Egypt and elsewhere; killed at *Marengo*.

DÉSAUGIERS, MARC ANTOINE MADELEINE (1772–1827), Fr. song-writer and dramatist.

DESAULT, PIERRE JOSEPH (1744–95), Fr. surgeon; his clinical teaching at the Hôtel Dieu, Paris, attracted an enormous number of pupils; pub. works on surgery.

DESBOROUGH, JOHN (1608–80), Eng. soldier; fought in Civil War on Parliamentary side; held several offices under Commonwealth; imprisoned, but set free under Charles II.

DESCARTES, RENÉ, RENATUS CARTESIUS (1596–1650), Fr. philosopher and mathematician; founder of modern rationalistic philosophy; b. of noble Touraine family; ed. at the Jesuits' school of La Flèche, where he was thoroughly trained in math's and scholastic philosophy. When twenty-three, in winter quarters at Neuberg, he first thought of the principle of method which guided all his philosophy, and discovered, also, the possibility of employing algebra to solve geometrical problems. His chief works were the *Discourse on Method* (1637); *Meditations* (1641); *Principia* (1644). His writings involved him in much theological disputation, and to avoid religious persecution he accepted invitation to become tutor to Queen Christina, and withdrew to Stockholm, where he d. a few months later.

D. anticipated several later discoveries in science, accepted a modified Copernican theory, worked on the properties of curves, and was a pioneer of the calculus; above all else, he was a mathematician, seeking to apply the geometrical method to metaphysics. The famous CARTESIAN METHOD is set out in the *Discourse on Method*, and in the *Règles*. To reach knowledge, we must first clear our minds of vague and doubtful opinion, which may be the product of tradition and authority, or vitiated by imagination and prejudice. We must follow the path of reason; starting from the simplest truths, *i.e.* 'intuitions,' which we can 'clearly' comprehend, and proceeding by 'deduction' from these to more complex cognitions, the truth of which follows since they become as clearly evident as the first intuitions. Hence the rules: (1) To accept as true only what is clearly evident to consciousness; (2) to divide each question up into as many separate questions as possible, applying the test of clearness to each part; (3) to proceed in order from the examination of the simplest objects, to that of the most complex; (4) to make exact calculations, to avoid the omission of anything essential.

In the *Meditations*, these rules are applied to the building up of his metaphysical system. He determines to doubt everything—*Dubitandum est de omnibus*—in the hope of through doubt finding certainty; whence his divergence from the Schoolmen, who believed in order to understand, and the Sceptics, who made doubt an end in itself, and not a means to surety. In this way, excluding everything due to authority and tradition, distrusting the senses as the source of illusions, thinking away all the attributes of body and mind, he reaches one certainty, indicated also by his very doubting:—I think, therefore I am—the famous *Cogito, ergo sum*. In thinking, I exist; I am a thing that thinks.

Is there, besides self, any other certainty? D. proceeds to examine his ideas, making use of another principle, Causality,—that everything must have a cause, which cause must contain as much or more reality than the effect. Now one of our ideas is that of God, as an infinite and perfect Being. But my finite thought cannot be the cause of such an effect, whence it must come from God Himself; hence God exists. Elsewhere, D. introduces another and *à priori* proof of God's existence, as given necessarily in the idea of God.

Hence we may assure ourselves of the existence of

the material world, since through God alone is the reality of our ideas guaranteed. The existence of bodies cannot be proved from the fact of our imagining them, for imagination is not pure thought, but a mode of our subjective life determined by the relation of mind to body; neither from any sensations, *e.g.* sensations may be referred to an arm that has been amputated. Yet our sensations (as above) must have a cause. This cause is not myself, since they proceed neither from my will nor my thought; it must then be either God or bodies; and of these, bodies, since otherwise, I am perpetually deceived by God.

Hence we have three realities,—God, infinite substance on which everything depends, but which itself depends on nothing; the *ego* or soul, the thinking substance; body, extended substance, these being the characteristics of soul and body which cannot be thought away. By substance, we are to understand a thing so existing as to require no other thing for its existence. But from this definition, it follows that God is the only substance, since finite mind and body depend on God. Hence these latter are not substances in the strictest sense, but relatively, requiring for their existence only God. These 'substances' are known through their essences or 'attributes,'—thought (of mind) and extension (of body); and the attributes yield further modifications, 'modes,' on the ground of which we refer to the 'qualities' of bodies, *e.g.* figure, a mode of extension, imagination, feeling, etc., modes of thought.

Mind and body are entirely opposed to each other; mind, active, free, unextended, immaterial; body, soulless, the negation of mind. In man, soul and body are present, yet not united; the soul leads an independent life and survives the destruction of the body; there is no interaction between soul and body, and a real union is impossible. Yet, in his anthropology, Descartes seems to assume a direct and real interaction. Thus he speaks of the soul as united to all parts of the body, and interaction occurring by means of the pineal gland and the 'vital' or 'animal spirits.' Animals are merely complicated material things, automata, having something inside them which sets them going, yet no self-consciousness, and therefore no soul or mind.

The philosophy of D. stands out as almost unique in reach and all-comprehensiveness; it advances in logical sequence from the methodology to the most detailed applications of its general principles; and marks a striking advance on Scholasticism, putting forward the sceptical, subjective point of view as against the formality, authority, and tradition of the latter system. Hence the decided success which it met with. Though denounced as atheism by the Fr. Jesuits and Dutch Calvinists, and attacked in other directions by Hobbes, Bp. Huet, and others, yet CARTESIANISM attracted men of the calibre of Clerselier, Arnauld, Malebranche, Geulincx, and many others. None are theological thinkers in the same sense as the Scholastics; all were Theistic thinkers, starting with the human reason, and aiming at rational explanation through the rational idea of the Deity; though from Theism the whole philosophy tends to Pantheism.

The problem of Cartesianism is a double dualism: (1) an opposition of God and the world; (2) of Mind, as thinking substance, and Body, extended substance. Descartes strove to maintain that the world existed *per se*, and that mind had a substantial existence; yet, as above, the term substance cannot in the same sense be applied both to God and to mind and body. Also, as regards mind and body, in sense and imagination are found difficulties in the conception of complete independence. In view of all these difficulties, two courses were open to Cartesians: (1) to maintain the dualistic principles as strictly as possible, and to explain away the difficulties, abandoning, if necessary, philosophical explanation; (2) to give a philosophical explanation, resigning, if necessary, the dualism.

The first course leads to the theory of Occasionalism. Mind and body retain their substantiality, and pursue their separate courses without causal connection. Mind can act on itself, but can *know* nothing and *do* nothing in relation to that which is outside it. Body can also act on body. How then is to be explained the action of mind on body and *vice versa*? Geulincx replies that such interaction is only apparent, and is to be explained by the intervention of God on the occasion of change in either mind or body; thus our volitions are the occasional causes, but God is the efficient cause of our perceptions. Also, according to Malebranche, mind knows body through God; it is not we who know, but God who knows through us. It follows from this that sorcery, spiritism, magic, etc., are but ridiculous superstitions.

The alternative course is to abandon the substantiality of mind and body, to retain them in an opposition of attributes, not of substances. God (or Nature) is the only substance, and Thought and Extension are His attributes; individual minds and bodies are passing modes. This is Spinozism and Pantheism. See SPINOZA.

Mahaffy, *Descartes*; E. S. Haldane, *Descartes, his Life and Times* (1905).

DESCHAMPS, ÉMILE (1791–1871), Fr. poet of Romantic School.

DESCHAMPS, EUSTACHE (1346–1406), Fr. lyric and patriotic poet; wrote anti-English ballads, etc.

DESCHANEL, PAUL EUGÈNE LOUIS (1856–), Fr. statesman.

DESERT, arid or barren tract either wholly or almost devoid of vegetation. Sahara is the most familiar instance in tropical regions. The condition may arise from either of two causes—excessively high temperature and consequent lack of moisture, or excessively low temperature, but the name is more frequently associated with the former.

DESERTION, act of abandonment, such as the d. of wife or children; or d. from the army or navy. The latter offence was formerly punishable by death; now by imprisonment.

DESFONTAINES, RENÉ LOUICHE (1750–1833), Fr. botanist, prof. of Bot. in Jardin des Plantes (1786); investigated the flora of N. Africa.

DESFORGES, PIERRE JEAN (1746–1806), Fr. dramatist.

DESHAYES, GÉRARD PAUL (1795–1875), Fr. geologist; prof. of Natural History in Natural History Museum, Paris; pub. works on geol., particularly on fossil molluscs.

DESHOULIÈRES, ANTOINETTE (1638–94), Fr. poet.

DESICCATION, the abstraction of water from a substance by gentle heat or by strong sulphuric acid in an air-tight chamber.

DESIDERIUS (fl. 756–774), king of Lombardy; conquered by Charlemagne.

DESLONGCHAMPS, JACQUES AMAND EUDES- (1794–1867), Fr. physician, geologist, and zoologist; prof. of Zool. at Caen (1825); pub. various scientific papers.

DESLONGCHAMPS, EUGÈNE EUDES- (1830–89), s. of above; Fr. zoologist and palæontologist; prof. of Zool. (1856) and Geol. (1861) at Caen.

DESMAISEAUX, PIERRE (1673–1745), Fr. biographer.

DESMAREST, NICOLAS (1725–1815), Fr. geologist; made numerous valuable observations and discoveries in geol., of which science he was one of the founders.

DESMARETS, JEAN (1595–1676), Fr. dramatist and poet.

DESMARETS, NICOLAS, SIEUR DE MAILLEBOIS (1648–1721), Fr. statesman; intendant of finances, 1678; from 1703 had supreme control of finances; dismissed, 1715.

DESMODUS, see VAMPIRE BATS.

DESMOND, ancient district of Ireland, including

E. part of County Kerry and W. part County Cork.

DESMOND, GERALD FITZGERALD, 15TH EARL OF (d. 1583), succ. his f., 1558; imprisoned in Tower for demeanour before Privy Council, 1562; returned to Ireland, 1564, and went to war with Sir Maurice Fitzgerald; sent to England; again in Ireland, 1573; spent rest of his life plotting, and in rebellion.

DESMOSCOLICIDÆ, minute marine worms; body ringed with distinct ridges furnished with rare pairs of bristles, by which they creep; related to the Nematode Worms.

DESMOULINS, LUCIE SIMPLICE CAMILLE BENOÎT (1760–94), Fr. journalist. On outbreak of Revolution D. supported it, stirring populace by fiery speeches and pamphlets; wrote articles urging abolition of monarchy; pub. weekly *Les Révolutions de France et de Brabant*, 1789–91; became a member of Cordeliers Club and a follower of Danton; elected to National Convention, 1793; first friend of Robespierre, but later incurred his enmity; guillotined on same day with Danton and others (April 5). His wife, who tried to save him, shared his fate.

Claretie, *Desmoulins and his Wife* (Eng. trans., 1876).

DESPARD, EDWARD MARCUS (1751–1803), Irish conspirator; naval captain; plotted (1802) to kill George III. and establish republic; hanged.

DESPENSER, HUGH LE, Eng. chief justiciar; killed at *Evesham* (1265).

DESPENSER, HUGH LE (1262–1326), Eng. courtier; s. of above; summoned to Parliament, 1295; he became favourite of Edward II. after Gaveston's death; Earl of Winchester, 1322; m. Eleanor, sister and co-heir of Gilbert de Clare, Earl of Gloucester; incurred enmity of baronage; hanged.

DESPORTES, PHILIPPE (1546–1606), Fr. poet; enjoyed Court favour.

DESPRÉAUX, see BOILEAU.

DESRUES, ANTOINE FRANÇOIS (1744–77), Fr. criminal; poisoner of Madame de la Mothe and her son.

DESSAIX, JOSEPH MARIE, COUNT (1764–1834), Fr. general.

DESSAU (51° 50′ N., 12° 13′ E.), town, on Mulde, capital of duchy Anhalt, Germany; several art collections; sugar, machinery, carpets. Pop. (1910) 56,606.

DESSEWFFY, AUREL, COUNT (1808–42), Hungarian politician and journalist.

DESSOIR, LUDWIG (1810–74), Ger. Shakespearean actor.

DESTOUCHES, PHILIPPE (1680–1754), Fr. comic dramatist; masterpiece, *Le Glorieux*.

DETAILLE, JEAN BAPTISTE (1848–1913), Fr. artist; military subjects.

DETERMINANT (in math's) is an expression written in a particular form. $\begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix}$ is a d., and is but another form of writing $a_1b_2 - a_2b_1$. It consists of two rows and two columns, and is therefore said to be of the *second order*. A d. of the *third order* contains three rows and three columns, and so on for higher orders; it can be written in the form of three second order d's. Thus

$$\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} \text{ is equal to } a_1 \times \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} - a_2 \times \begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix} + a_3 \times \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix}$$

D's give a useful method whereby the solution of simultaneous equations of several unknowns, and also the eliminant (*i.e.* the relation that must exist between the coefficients of the variables in order that the equations containing those variables may be simultaneously true), may be at once written down.

Muir, *Theory of Determinants* (new ed., 1906); Hanus, *Determinants* (1910).

DETERMINISM, ethical theory, opposite of doctrine of Free Will. D. may be more or less thorough. Some determinists admit an element of freedom, but others entirely deny freedom and moral responsibility.

DETMOLD (51° 55′ N., 8° 52′ E.), town, capital of Lippe principality, Germany; linen-weaving, tanning, brewing. Pop. (1910) 14,295.

DETROIT (42° 21′ N., 83° 5′ W.), city, Michigan, U.S.A., on Detroit River, opposite Windsor; built on flat surface, with wide, beautiful avenues and streets; one of best-kept cities in America; streets shaded by trees and intersected by small parks; Woodward and Jefferson's, principal avenues. Almost encircling city is Grand Boulevard, 150 to 200 ft. wide; many fine parks, including Belle Isle, Palmer, and Clark parks. Among public buildings are: city hall, county court-house, federal buildings, municipal museum of art, public library, St. John's Episcopal, St. Anne's, and First Congregational churches, Detroit Coll., also coll's of med., surgery, and law. Owing to central position D. has enormous shipping trade; largest cargoes, grain, lumber, and iron ore; one of chief cities in manufacture of automobiles. Other extensive industries include shipbuilding and meat-packing; manufactures brass goods, stoves, pharmaceutical preparations, alkaline products, furniture, etc. D. was founded by French in XVII. cent.; almost completely destroyed by fire, 1805. Pop. (1910) 465,766.

Powell, *Historic Towns of the Western States* (1901).

DETTINGEN (50° 2′ N., 9° 1′ E.), village, on Main, Bavaria, Germany; scene of defeat of French in 1743 by Anglo-German army. George II. was present—the last occasion on which a Brit. sovereign has commanded in person on the field of battle.

DEUCALION (classical myth.), Thessalian prince, who, when Zeus sent a deluge to destroy the earth, escaped with his wife, Pyrrha, in ark; after the flood the pair were ordered to cast stones behind them, which turned into men and women.

DEUCE (Fr. *deux*, two), two in cards; a term used in tennis; as exclamation, meaning 'the devil!' probably derived from a losing throw at dice.

DEUS, JOÃO DE (1830–96), Portug. poet; one of the greatest since Camoens.

DEUTERONOMY, BOOK OF, last of the Pentateuch, or Mosaic books—though not now, any more than the others, viewed as the actual work of Moses—consists largely of laws, specially chapters 12–26, 5–11 being introductory and 27, 28 supplementary. The laws in *Exodus* 20–23 are the foundation of D., which is parallel to *Leviticus* 17–26. The spirit of D. is not merely legal, but profoundly moral and spiritual. D. was almost certainly combined with earlier portions of Pentateuch before formulation of 'Priestly Code,' which implies a more advanced community. Date before 621. D. has peculiar words and phrases and has influenced other Old Testament books.

Driver, *Deuteronomy* in Internat. Crit. Comm; Robinson, *Deuteronomy* in Century Bible.

DEUTSCH, IMMANUEL OSCAR MENAHEM (1829–73), Ger. Orientalist.

DEUTSCH-KRONE (53° 16′ N., 16° 27′ E.), town, W. Prussia, Germany; machinery. Pop. 8000.

DEUTZ (50° 56′ N., 7° E.), town, on Rhine, Prussia, Germany; ancient *Divitia*; incorporated with Cologne, 1888.

DEUX-PONTS, see ZWEIBRÜCKEN.

DEUX-SÈVRES (46° 30′ N., 0° 20′ W.), department, W. France; formed of parts of old province of Poitou; named from two rivers by which it is traversed, Sèvre-Niortaise and Sèvre-Nantaise; textiles; agricultural and mineral products, coal, marble, granite; capital, Niort. Area, 2337 sq. miles. Pop. (1911) 337,627.

DEVA, Rom. fortress; site of modern Chester.

DEVA, beneficent spirits of the Buddhist and Hindu mythology.

DEVADATTA, s. of Suklodana, uncle of the

Buddha; joined the brotherhood; later started order of his own, extant till IV. cent. A.D.

DEVAPRAYAG, Deoprayag (30° 9′ N., 78° 39′ E.), village, Garwhal, United Provinces, India; Hindu place of pilgrimage.

DEVENTER (52° 15′ N., 6° 9′ E.), town, on Yssel, Netherlands; flourished in Middle Ages; many antique buildings; ironworks, carpet factories. Pop. (1910) 28,005.

DEVICE, contrivance, or plan; heraldic figure on shield.

DEVIL, Satan.—The latter name means in Hebrew 'enemy,' and consequently in Christian theol. the arch-enemy of God and man, represented in the Bible as having the form of a serpent, the most subtle of beasts. In Milton he appears as an outcast of heaven, the lord of hell and the apostate angels. In mediæval times he came to be represented as a goat-like figure, since the goat is the type of uncleanness. That he was supposed to be black in colour is shown in many references in lit., as in 'the little black de'il' of Burns. Other names for the d. are Apollyon, Lucifer, Beelzebub, besides various Scot. equivalents (see Burns, *Address to the De'il*). The mediæval conception of the d. is more particularly identified with Mephistopheles of the Faust legend, the incarnation of the spirit of universal scepticism and mockery.—Robert, the 'Devil,' first Duke of Normandy, was notorious for his crimes and cruelty. The 'Devil's Own' (88th Foot) were so called by Picton for their reckless bravery in the Peninsular War. What is called the 'devil's tattoo' is restless tapping on table or floor with hand or foot. In general, the term d. is applied to an assistant barrister, printer's boy, literary hack-writer.

Harnack, *History of Dogma* (1893); J. C. Wall, *Devils* (1904).

DEVIZES (51° 22′ N., 1° 59′ W.), market town, on Kennet and Avon Canal, Wiltshire, England; ruins of XII.-cent. castle; has two ancient churches; corn exchange; formerly important woollen cloth centre; grain, agricultural implements. Pop. (1911) 6741.

DEVOLUTION, WAR OF (1667–68), Louis XIV. claimed (1667) that succession to Spanish Netherlands 'devolved' upon his wife, Maria Theresa, on death of her f., Philip IV. of Spain; war speedily made good the claim, and Flanders was ceded to France by Treaty of Aix-la-Chapelle (1668). See France (History).

DEVON, EARLDOM OF, title held by Courtenay (*q.v.*) family.

DEVONIAN SYSTEM, in 1829 Sir R. Murchison and A. Sedgwick applied the name 'Devonian System' to rocks of Cornwall, Devon, and Somerset, previously known as *Old Red Sandstone*. These rocks fall between the Silurian and Carboniferous periods, and consist of different-coloured sandstones, grits, limestones, and calcareous slates; three groups, the Lower, Middle, and Upper, all containing fossil remains, including corals, crinoids, crustaceans, cephalopods, and mollusca. Middle group has richest deposit, the fossils being more abundant than in the arenaceous rocks of Scotland, Wales, and Herts, with which they are supposed to be contemporaneous.

D. rocks are found in other parts of the globe besides Devon and Cornwall, *e.g.* U.S.A., E. Canada, Nova Scotia, and Central Europe. They extend from the Ardennes into S. Belgium. Another group is cut through by the Rhine at Bingen, and yet another by the Moselle at Trèves.

A characteristic feature of the D. rocks are fossils of the broad-winged spirifers, and of trilobites, of which there are ten or twelve genera. From the vast numbers of remains of a piscatorial nature, the D. period has been called 'the age of fishes.' A remarkable group of creatures, remains of which have also been found in these rocks, are the ostracoderms. They probably belonged to a separate class of organisms between vertebrates and arthropods, although they closely resemble fishes.

In the D. rocks are found the first traces of plant life, and the remains are so prolific in some localities as actually to form thin seams of coal. They show that the plants were of such a nature as to grow, in their original state, upon the shores of lakes or lagoons. See Geology.

DEVONPORT (50° 23′ N., 4° 11′ W.), fortified seaport on E. shore of Tamar estuary, Devonshire, England; important naval and military station; has extensive dockyards; gun wharf, barracks, hospitals, naval engineering coll., technical schools; owes importance to royal dockyard (founded by William III., 1689) formerly known as *Plymouth Dock*. Pop. (1911) 81,694.

DEVONPORT (41° 9′ S., 146° 22′ E.), town, port, near mouth of Mersey, Tasmania.

DEVONSHIRE (50° 50′ N., 3° 50′ W.), county, S.W. England; bounded N. by Bristol Channel, W. by Cornwall, S. by Eng. Channel, E. by Dorset and Somerset; area, 2598 sq. miles. Coast (especially N.), is bold and rugged, with fine rock scenery. Inland surface is hilly and uneven. Special feature is wide elevated moorland of Dartmoor in S.; less elevated parts are fertile and well cultivated; South Hams especially rich in orchards; river valleys are particularly beautiful and well-wooded. D. is one of chief cattle- and sheep-raising counties, and hardy ponies graze in Dartmoor and Exmoor. D. is deservedly famous for cider and clotted cream. Chief rivers (Exe, Dart, Tamar, Teign, Taw, Torridge, and Plym) rise mostly in Dartmoor and abound in trout. Torquay, Sidmouth, and Teignmouth are health-resorts, on account of mild climate in S. Other towns are Exeter (capital), Plymouth (fine harbour), Devonport, Tiverton, Barnstable, Dartmouth, and Tavistock. Though chiefly agricultural, D. produces copper, tin, manganese, granite, slate, marble, and potters' clay. It has important prehistoric monuments in Dartmoor; several interesting castles, abbeys, and churches; finest specimens of architecture at Exeter Cathedral. D. was birthplace of Raleigh, Drake, Hawkins, Grenville, Reynolds, Coleridge, Kingsley, and other famous men. Pop. (1911) 457,343.

Devonshire (Victoria County Histories, 1906).

DEVONSHIRE, EARLDOM AND DUKEDOM OF.—The title was first given to Charles, Baron Mountjoy, 1603, who d. 1606, when it became extinct. In 1618 William Cavendish, Baron Cavendish, was cr. Earl of D. Since then the title has been held by this family. His great-grandson, William, 4th earl (1640–1707), was cr. Duke of D., 1694; supporter of William and Mary. Spencer Compton, 8th duke (1833–1908), one of the most prominent statesmen of the Victorian era; a Liberal, but split with Gladstone over Home Rule, 1886, and with Unionist leaders in 1903, adhering to Free Trade. Few Englishmen were more respected than he.

Holland, *Life of the* [8th] *Duke of Devonshire*.

DEVRIENT, LUDWIG (1784–1832), Ger. actor; famous in Shakespearean parts; three of his younger relatives also achieved distinction on the stage.

DEW, small drops of water deposited during the night on substances which possess good radiating powers and which consequently cool quickly below the temperature of the surrounding air. As a result, the air which is in direct contact with such a substance becomes cooled until the *dew point* is reached (that temperature at which the water vapour already in the atmosphere is the maximum quantity the air can hold). Any further cooling must be accompanied by condensation of water vapour. For a copious deposition of dew the sky must be clear, the atmosphere calm, and the substance near the ground.

DEWAR, SIR JAMES (1842–), Scot. chemist and physicist; first Brit. subject to receive the Lavoisier Medal (1904) of the Fr. Academy of Sciences; pres. of Brit. Association in 1902; invented cordite with Sir F. Abel. He liquefied and solidified the 'permanent' gases, oxygen, hydrogen, etc.

DEWAS (22° 58′ N., 76° 6′ E.), native state, Malwa, Central India; consists of two united states with two chiefs; capital, DEWAS. Area, 886 sq. miles. Pop. 117,216.

DEWEY, DAVIS RICH (1858–), Amer. statistician and economist.

DEWEY, GEORGE (1837–), Amer. naval officer; fought in Civil War (1861–65) and Span.-Amer. War (1898), defeating enemy in *Manila Bay*.

DEWEY, MELVIL (1851–), Amer. librarian; inventor of the 'Dewey system' of cataloguing.

DEWSBURY (53° 42′ N., 1° 38′ W.), market town, on Calder, Yorkshire, England; woollens; iron foundries, coal. Pop. (1911) 53,358.

DEXIPPUS, PUBLIUS HERENNIUS (*c.* 212–73), Gk. historian.

DEXTER, HENRY MARTYN (1821–90), Congregationalist divine in U.S.A.; wrote works on Congregationalism.

DEXTER, TIMOTHY (1747–1806), eccentric Amer. merchant.

DEY, title borne by Gov. of Tunis; also leader of Turk. Janissaries.

DHAMMAPALA, a follower of Buddha whose name is often taken by Buddhist disciples.

DHANIS, FRANCIS, BARON (1861–1909), Belg. Congo administrator.

DHAR (22° 36′ N., 75° 20′ E.), native state, Malwa, Brit. India; chief town, DHAR; rice, oil-seeds. Area, 1739 sq. miles. Pop. 142,715.

DHARAMPUR, DHURUMPUR (20° 34′ N., 73° 14′ E.), native Rajput state, E. of Surat, Bombay, India. Area, 704 sq. miles. Pop. 100,430.

DHARMSALA (32° 22′ N., 76° 15′ E.), hill station and sanatorium, Kangra district, Punjab, India; destroyed by earthquake, 1905.

DHARWAR, (15° 27′ N., 75° 3′ E.), town and district, Bombay, India; cotton and cotton manufactures. Pop. (town) 31,279.

DHOLPUR (26° 42′ N., 77° 56′ E.), native state, Rajputana, India, on N. bank of Chambal; chief town, DHOLPUR. Area, 1155 sq. miles. Pop. (1911) 263,576.

DHOW, lateen-rigged vessel used in Ind. Ocean, commonly associated with the slave trade.

DHRANGADRA (22° 59′ N., 71° 31′ E.), native state, Gujerat, Bombay, India; chief town, DHRANGADRA; copper and brass ware. Area, 1156 sq. miles. Pop. 70,880.

DHULEEP SINGH (1837–93), maharaja of Lahore; succ. 1843; deposed 1849, and pensioned by Brit. Government; became popular in Eng. society.

DHULIA (20° 54′ N., 74° 46′ E.), town, on Panjhra, Bombay, India; good trade in cotton and oil-seeds. Pop. 24,726.

DIABASE, tough, durable stone, a form of dolerite, with fine-grained crystalline structure; composed of same elements, viz. olivine, augite, and felspar; known also under names of whinstone, greenstone, toadstone, and trap; found in almost all parts of the world, among older rocks; much in demand for roadstone, owing to good wearing qualities.

DIABETES, disease characterised by a greatly increased discharge of urine. There are two forms of it: *Diabetes Mellitus*, in which there is always a quantity of sugar in the excessive amount of urine; and *Diabetes Insipidus*, in which no sugar or other abnormal constituent is found in the excessive quantity of pale, watery urine.

The cause of the former is obscure, and is supposed to be related to some condition of the pancreas. The prognosis is bad, the disease usually ending fatally, often after a prolonged course. Coma frequently comes on some time before death, and diabetic patients are very liable to pneumonia and other lung conditions. The treatment is to avoid all starchy food, *e.g.* bread and potatoes, and various suitable diets have been suggested. *Codeine* is of benefit.

The second form is supposed to be due to some disturbance of the brain centre controlling the nerves of the blood vessels, and it is sometimes produced after severe mental shock. General hygienic treatment is best, and *valerian* and the valerianates are the favourite drugs.

Kleen, *Diabetes Mellitus and Glycosuria*; Poole, *Cookery for the Diabetic*.

DIABOLO, game in which a spool-shaped top is spun and tossed on a string attached to two sticks; originated in China; popular in England at beginning of XIX. and of XX. cent's.

DIACONICON, a place in apse of a Gk. church for ecclesiastical vessels.

DIADOCHI, Macedonian leaders who defended the empire of Alexander the Great after his death.

DIAGORAS OF MELOS (V. cent. B.C.), poet, denounced for his disbelief in the Gk. divinities.

DIAGRAM (in geom.), a figure consisting of points, lines, and curves drawn for the purpose of helping a reader to follow the argument used in demonstrating a geometrical proposition. A good d. will not contain anything irrelevant, but only such points and lines as form the subject of the proposition, or are essential to the development of the argument. Points are named by letters of the alphabet (A, B, etc.). In the text, a line is referred to by the two letters naming the points which it joins (line AB, etc.), and an angle by three letters, the middle one of which is always the name of the point of junction of the two lines forming the angle (angle ABC, or CBA—sometimes written ∠ABC). As a rule the d. is carefully described in words so that the reader can therefrom construct it for himself. See GEOMETRY.

DIALECT, a local form of a standard speech, erroneously considered a corruption. It changes less than written speech. Originally hills, marshes, etc., divided a race or tribe into groups, and each group tended to develop the original language in its own way. D's have become standard literary language; East Midland d. gave English, Tuscan d. gave Italian, High German d. gave German.

DIALECTICS, logical term for the art of discussing or reasoning.

DIALLAGE, important silico magnesian rock-forming mineral belonging to the pyroxene group; characterised by its distinctly foliated structure; closely allied to augite (*q.v.*), and composed of same elements; colours: generally green or dark green, but also known grey and brown; shows bronze metallic lustre when freshly broken, and is sometimes cut and polished for ornamental purposes. Sub-species: green d., hypersthene, and bronzite; occurs in igneous rocks in Is. of Skye, Lombardy, and many other districts.

DIALOGUE, a conversation. As a literary form it was used by Plato for a didactic purpose, and Dryden in his *Essay on Dramatic Poesy* follows the same method. Landor in *Imaginary Conversations* uses d. with great success. Dramatic d. includes soliloquy, but in modern plays soliloquy is seldom used. Oscar Wilde in his comedies used brilliantly witty d., and the plays of Bernard Shaw depend almost entirely upon the sparkle of their dialogue.

DIAMANTE, JUAN BAUTISTA (*c.* 1084), Span. dramatist.

DIAMANTINA (18° 18′ S., 43° 20′ W.), city, Brazil; diamond mines. Pop. c. 14,000.

DIAMOND.—A mineral, one of the most valuable of precious stones, and the hardest substance known. Rom. writers speak of the finding of *adamas* in the sands of certain Indian rivers, and the word 'adamas' is the origin of the word diamond, to which it has been corrupted (cf. adamant and diamant).

The d. consists of pure crystallised carbon, and unlike most minerals is found in single crystals. As a rule they are of octahedron form, but have also been found in rhombic-dodecahedron and hexakis-octahedron. The colour of d's varies, the rarest being clear like glass, and sometimes this variety is tinted with

delicate hues of yellow, grey, blue, green, or red. Black d's are not unknown.

D's were probably first found in India; Golconda, near Hyderabad, is a specially noted locality. Pliny (100 A.D.) speaks of the d. as 'the most valuable of gems known only to kings,' and the collections of the Ind. princes for a long time contained the finest known specimens. About 1850 the stones were found in South America, and twenty years later in S. Africa. They have also been obtained from Algeria, Australia, Borneo, Brazil, Malacca, North Carolina, and Georgia (U.S.A.), whilst in 1829 they were found in the Ural Mountains. As a rule they are found either below the alluvial soils of rivers, as in India, or embedded in quartzy sandstone as at Minas Geraes, Brazil. D. mines are shafts sunk into the ground where 'pipes' are known to exist. These pipes are conical deposits of diamoniforous soil, which is dug out and sorted on the surface. In their virgin state the stones have a rough, dull, and uneven surface, and in fact workers in the Brazilian gold mines regarded them as nothing more than worthless pebbles until the XVIII. cent. when their true value was accidentally discovered. In 1910 the d. mines of South Africa had an output valued at almost £8,500,000. At Kimberley mines (S. Africa) the soil (blue ground) is sorted by huge machines, which take the place of manual labour. The débris is passed over a greased surface which, it has been found, will retain d's while allowing other material to slip past. The vast majority of diamonds now come from Kimberley, and by regulating the output their high price is maintained.

The d. is so hard that it is impossible to scratch it except with another d. Impure crystals and fragments, which are of no use for decorative purposes, are called bort, and in 1476 L. von Berguen of Bruges found that this might be used for engraving and polishing perfect stones. Bort is used also for polishing and faceting other precious stones, whilst small d's are used for cutting glass, drilling porcelain, and as bearings for watches. *Diamond-cutting*, a highly specialised art, is carried on chiefly at Amsterdam and Antwerp. Some famous d's are the *Koh-i-noor*, presented to Queen Victoria by E. India Company, the *Regent* or *Pitt*, one of the Fr. crown jewels, the *Star of the South*, found in Brazil, the *Cullinan* (q.v.), largest d. of good quality yet discovered, and the *Blue Hope* d. (supposed to bring ill-luck).

Experiments have been made (notably by Sir. Wm. Crookes, Mr. MacTear, and M. Moissan) to manufacture artificial d's in crucibles, and very small stones have resulted.

Streeter, *The Great Diamonds of the World*; Bauer, *Precious Stones* (1902); Williams, *Diamond Mines of S. Africa* (new ed., 1906); Sir Wm. Crookes, *Diamonds* (1909). See CARBON.

Diamond Necklace Affair, see ROHAN.

DIANA (classical myth.), Rom. goddess of war, the chase, and the moon; derived from the Gk. Artemis (*q.v.*).

DIANA MONKEY, see under CERCOPITHECIDÆ.

DIANE DE FRANCE (1538–1619), Duchess of Montmorency; natural dau. of Henry II.; m. Francis, s. of the Constable de Montmorency.

DIANE DE POITIERS (1499–1566), Duchess Valentinois; mistress of Henry II. of France, over whom she exercised great influence.

DIAPASON, Gk. term for an octave. In French it denotes musical pitch. In England name applies to certain organ stops extending throughout the whole compass of the keyboard.

DIAPER, cotton or linen cloth with woven pattern; also term in arch. for a running decoration.

DIAPHORETICS, any substances or other means in med. used to promote sweating, *e.g.* hot packs, vapour and similar baths, hot drinks; the drug *pilocarpine* is a powerful d.

DIAPHRAGM, MIDRIFF, the dome-shaped partition, partly muscular and partly tendinous, in the body between the abdominal cavity and the thoracic cavity, attached chiefly to the lumbar vertebræ and the ribs.

DIARBEKR (37° 55′ N., 40° 9′ E.), fortified town, Asiatic Turkey, on Tigris, at head of navigation; formerly a flourishing city; unhealthy climate; seat of Gk. bp.; numerous mosques, churches, bazaars; active commerce; was Rom. colony (*Amida*), 230 A.D.; captured by Turks, 1515; silk and cotton industries, and gold and silver filigree work. Pop. *c.* 38,000.

DIARBEKR (37° 55′ N., 40° 9′ E.), vilayet, Asiatic Turkey; partly mountainous; fertile; copper found; chief products, grain, cotton, tobacco. Area, 14,480 sq. miles. Pop. *c.* 471,500.

DIARRHŒA, condition in which the contents of the bowel are being almost continuously ejected, due to some intestinal irritation, or sometimes to specific disease, *e.g.* cholera, typhoid fever. Treatment in ordinary d. is to give castor oil to clear away the irritating substance; opium and astringents may be necessary if it continues.

DIARY, personal daily record of thoughts, experiences, or engagements. The early diarists apparently wrote merely for their own pleasure, and without reserve, having no thought of publication. The most famous diary is that of Samuel Pepys (1633–1703), written in cypher, and covering the period from 1660 to 1669; first pub. 1825. Other noted diaries are those of John Evelyn, Swift, Dr. Byrom, John Wesley, George Fox, and Madame D'Arblay.

DIATOMACEÆ are unicellular plants which [illegible] impregnated with siliceous matter. This is really of a double nature, and is termed a *frustule*. The two parts, or valves, overlap like a box and its lid, and show characteristic markings or striæ, due to presence of small chambers partially interrupted by minute septa. The plants are brown in colour, owing to the presence in the chromatophores of a pigment termed '*diatomin*.' They occur in vast numbers both in fresh and salt water, many living on larger aquatics, whilst others form a large proportion of both marine and lacustrine plankton. Owing to their indestructible character the frustules are found both as ocean deposits (*diatomaceous ooze*) and as diatomaceous earth (*e.g. Kieselgühr*).

DIAVOLO, FRA, MICHELE PEZZA (1771–1806), Ital. brigand; committed many atrocities in kingdom of Naples; after various adventures captured and shot.

DIAZ, NARCISSE VIRGILIO (1808–76), Fr. artist; pupil of Théodore Rousseau; woodland scenes and storms.

DIAZ, PORFIRIO (1830–), ex-pres. of Mexican republic; of humble birth; practised law; fought in War of Reform, 1854 onwards; fought against French; took Mexico city, 1862; pres., 1872–80; carried through various reforms, specially financial; pres. again, 1884; deposed, 1911. See MEXICO.

DIAZ DE NOVAES, BARTOLOMEU (fl. 1481–1500), Portug. explorer; sailed to Gold Coast, 1481; first to round Cape of Good Hope, 1487, which he named 'Cape of Storms' (*Cabo Tormentoso*); name changed to 'Cape of Good Hope' by King John of Portugal; sailed as far as Great Fish River; went to Brazil, 1500; was lost in storm. See CAPE OF GOOD HOPE.

DIAZO-COMPOUNDS are peculiar to the aromatic series, and may be regarded as salts of diazo-benzene ($C_6H_5N_2OH$). They are prepared by treating an amine of the benzene series with nitrous acid at low temperatures; they are highly explosive and very unstable substances. Owing to the number of reactions they take part in they are much used in synthetic work, especially in the investigation of the substitution products of the benzene series. They are of great value in the preparation of dyes, and they form a link in the formation of the mother-substance of the rosaniline group from paratoluidine. With alcohols they yield hydrocarbons; warmed in aqueous solution nitrogen is evolved and phenols formed; warmed with

concentrated halogen acids they give halogen derivatives.

Caius, *Diazo-Compounds* (1908).

DIBDIN, CHARLES (1745–1814), Eng. poet, composer, and dramatist; wrote about sixty plays and one hundred sea-songs, including *Poor Jack* and *Tom Bowling*.

DIBDIN, THOMAS FROGNALL (1774–1847), Eng. bibliographer.

DIBDIN, THOMAS JOHN (1771–1841), Eng. song-writer and dramatist; s. of Charles D.

DIBRA (41° 30′ N., 20° 38′ E.), fortified town, Albania. Pop. 12,000.

DIBRANCHIA, a sub-order of Cephalopoda (*q.v.*).

DIBRUGARH (27° 28′ N., 94° 57′ E.), town, near junction of Dibru and Brahmaputra, Assam, India; terminus of steam communication on Brahmaputra; coal and tea exported. Pop. 11,227.

DICÆARCHUS (fl. *c.* 320 B.C.), Gk. writer and philosopher; fragments of works survive.

DICE, small cubes having a number on each face; sum of numbers on opposite faces is 7; used in gaming; of great antiquity; Greeks' and Romans' highest throw was the 'Venus'; Greeks' worst throw was the 'wine-throw,' Romans' the 'dog.'

DICETO, RALPH DE (d. *c.* 1202), Eng. chronicler; dean of St. Paul's; works (edit. with introduction by Stubbs) specially valuable for period 1172–1202.

DICEY, EDWARD (1832–), Eng. journalist and author; editor of *Observer* (1870–89); also war-correspondent.

DICHOTOMY, in botany, a system of branching in which the main axis divides again and again into two branches.

DICKENS, CHARLES (1812–70), Eng. novelist; b. Portsea; s. of poor parents, the originals of Mr. Micawber and Mrs. Nickleby. His childhood was spent at Chatham, and later on he worked some time in a London blacking factory, passing Sunday with his father in the debtors' prison. D. was entirely self-educated. As a youth he became a lawyer's clerk, but this position he relinquished for journalism. He soon made a position for himself, first as parliamentary reporter, later as a writer of sketches (collected and pub. under the title of *Sketches by Boz*, 1836). In the same year he began the production of *The Pickwick Papers* in periodical numbers. This work was followed by *Oliver Twist* (1837), *Nicholas Nickleby* (1838), *Old Curiosity Shop* and *Barnaby Rudge* (1840), *Martin Chuzzlewit* and *The Christmas Carol* (1843), *Dombey and Son* (1846), *David Copperfield* (1849), *Bleak House* (1852), *Tale of Two Cities* (1859), *Great Expectations* (1860), *Our Mutual Friend* (1864), *Edwin Drood* (1870)—the latter unfinished—and several other works. Besides novel-writing, D. edited the magazines *Household Words* and *All the Year Round*, and gave readings from his works, which realised large sums, especially in America. The heavy strain caused by these readings, in addition to his other work, eventually caused his health to give way, and he died suddenly at Gadshill. His work must undoubtedly be classed amongst the greatest in Eng. fiction by reason of its humour, sympathy, descriptive power, keen insight into human nature, and inexhaustible store of characters, although sometimes D.'s character-drawing degenerates into caricature.

Life, by John Forster; also studies by George Gissing, Dr. A. W. Ward, and G. K. Chesterton.

DICKINSON, ANNA ELIZABETH (1842–), Amer. author and lecturer on reform.

DICKINSON, JOHN (1732–1808), Amer. politician; studied law in England; held office in Delaware and Pennsylvania; adverse to Declaration of Independence.

DICKSON, SIR ALEXANDER (1777–1840), Eng. general; principal artillery officer at *Quatre Bras* and *Waterloo*.

DICKSON, SIR JAMES ROBERT (1832–1901), Australian politician; one of chief promoters of the Commonwealth.

DICOTYLEDONS, flowering plants characterised by occurrence of two seed leaves (*cotyledons*) in the embryo, and by the secondary growth of the stem.

DICTATOR, in ancient Rome, one who was invested with special powers in an emergency when authority of consuls was not thought sufficient; like a temporary absolute monarch; Sulla and Julius Cæsar were d's.

DICTIONARY, primarily the name given to a book containing the words of a language, with their meanings, arranged in alphabetical order. But it is also now generally applied to works, arranged on similar lines, dealing with biography, dates, geography, theology, science, and numerous other subjects. An etymological d. is one in which the history and derivation of words is made the principal object. A *Glossary* differs from a d. in that the former is a list of dialectal, obsolete, foreign, or unusual words. An *Encyclopædia*, which is supposed to cover the entire circle of human knowledge, often fills the function of a d. also. Apparently the earliest d. of which there is any trace was the Homeric Lexicon (*Lexeis Homerikai*) compiled by Apollonius, a grammarian of the age of Augustus. Latin lexicography was inaugurated by Robert Stephens's *Thesaurus Linguæ Latinæ* (Paris, 1531). Another famous early d. was Bayle's *Dictionnaire Historique et Critique* (1697). Other noted works of the kind are the Ital. *Vocabulario della Crusca* (1612); that pub. by the Fr. Academy (1694); the Madrid Academy (1726–39); and the great Ger. work of the Grimm brothers, commenced in 1854. The first Eng. d. worthy of the name was that compiled by Nathan Bailey (1721–27), which formed the basis of the better-known work of Dr. Samuel Johnson (pub. in 1755). Webster's *Dictionary* was first issued in 1806, and from then to the present time, 1913, when Sir James Murray's *New English Dictionary* is still in course of publication, the output of d's has been enormous, and the need of every kind of inquirer seems to have been supplied.

DICTYS OF CRETE, supposed author of a contemporary description of the Trojan War, now existing in Latin version.

DIDACHÉ, THE, name given to an early Christian moral treatise, also called *The Teaching of the Twelve Apostles*, the MS. of which was discovered at Constantinople (1873). See APOCRYPHA.

DIDACTIC POETRY, see POETRY.

DIDEROT, DENIS (1713–84), Fr. author and encyclopædist; refused to adopt either the law or med. as profession; made a foolish marriage, and, being thrown on his own resources, became a bookseller's hack. After producing much work of a varied but ephemeral character, he was app. to the editorship of a projected Encyclopædia, the first vol. of which was pub. in 1751, and the last in 1772. During some portion of this long period he was assisted by D'Alembert and a host of other writers, but a great part of it was written by himself. Its speculative spirit was feared by the ecclesiastical party, and by their means it was suppressed in 1759, but it was afterwards continued. D. also wrote plays, novels, philosophical works, and art criticisms; he shone as a letter-writer; he was one of the greatest thinkers, writers, and conversationalists of the XVIII. cent.

Lord Morley, *Diderot* (1878); Reinach, *Diderot*.

DIDIUS SALVIUS JULIANUS, MARCUS, Rom. emperor for brief period during year 193 A.D.; supplanted by Septimius Severus.

DIDO, ELISSA, queen and reputed founder of city of Carthage. Æneas visited the city and fell in love with D.; on his departure she slew herself.

DIDON, HENRI (1840–1900), Fr. Dominican; preacher and educationist.

DIDOT, FRANÇOIS (1689–1757), Fr. publisher and printer; founder of family distinguished in same occupation down to recent times.

DIDYMI, DIDYMA, temple of Apollo, near Miletus, Asia Minor; its priests were the *Branchidæ*, tradi-

tional descendants of Branchus; destroyed by Xerxes, 481 B.C.; restored later; collapsed about XV. cent., owing to earthquake. Explorations have revealed the finest temple ruin in Asia Minor.

Pontremoli and Haussoullier, *Didymes* (1904).

DIDYMUS CHALCENTERUS, Gk. grammarian [illegible] Augustus.

DIE (44° 45′ N., 5° 23′ E.), town, Drôme, France; Rom. relics; wine, silk. Pop. 3638.

DIEBITSCH, HANS KARL FRIEDRICH ANTON, COUNT DIEBICH-ZABALKANSKY (1785–1831), Russ. field-marshal; wounded at *Austerlitz*; distinguished himself in Russo-Turk. War, 1828–29; d. in Polish campaign.

DIEDENHOFEN (49° 21′ N., 6° 9′ E.), fortified town, on Moselle, Alsace-Lorraine, Germany; railway junction; vines and fruit. Pop. 11,930.

DIEKIRCH (49° 52′ N., 6° 9′ E.), small town, on Sûre; one of the three administrative centres of Luxemburg; tourist centre. Pop. 3900.

DIELMANN, FREDERICK (1847–), Amer. artist; pres., National Acad. of Design (1899).

DIEMEN, ANTHONY VAN (1593–1645), Dutch admiral and administrator; Tasmania was originally named after him, *Van Diemen's Land*, as he was instrumental in sending out Tasman's expedition.

DIEPENBECK, ABRAHAM VAN (1599–1675), Flem. artist; pupil of Rubens; noted for window-paintings and portraits, etc.

DIEPPE (49° 56′ N., 1° 5′ E.), seaport, Seine-Inférieure, France, on Eng. Channel, at mouth of Arques; fashionable watering-place; an important port for passenger traffic with England; contains castle (now barracks); Church of St. Jacques (XIII. cent.). There is a fine commodious harbour, enlarged 1911; active foreign trade; important fisheries; shipbuilding; ivory work. D. was bombarded by Eng. and Dutch, 1694. Pop. 22,839.

Merk, *History of Dieppe* (1909).

DIERX, LÉON (1838–), Fr. poet; his collected poems (1872) were crowned by Fr. Academy.

DIES, CHRISTOPH ALBERT (1755–1822), Ger. artist, imitator of Claude Lorraine.

DIEST (50° 58′ N., 5° 3′ E.), fortified town, Brabant, Belgium; breweries. Pop. 8337.

DIESTERWEG, FRIEDRICH ADOLF (1790–1866), Ger. educationist; followed methods of Pestalozzi, and advocated unsectarian education.

DIET, word used in English to describe certain continental assemblies, *e.g.* the *Reichstag* of the Holy Rom. Empire. Its origin is to be found in the Teut. *folk-moot*, and then in the assemblies of the Franks. It was, however, a select number of princes rather than the whole body of men that became important, hence the mediæval d. included generally only nobles. The *Bundestag* of the Germanic Confederation and the *Reichstag* of the present Ger. Empire are spoken of as d's.

DIETETICS is the science of food and feeding of man in health and disease. Food is required for building up and repairing tissues, and also as a fuel to provide heat and energy, and different substances contained in food fulfil these different functions. Food is composed both of organic and of inorganic matter, the former including *proteins* (albuminous substances, *e.g.* the flesh of meat, white of egg), *carbohydrates* (sugars and starchy substances), and *fats* (animal or vegetable fats and oils), while the latter include *mineral salts* (sodium chloride or common salt, phosphates, etc.) and *water*. The substances which build and repair tissue are the proteins, the mineral salts, and water, while those which provide heat and energy are the fats, the carbohydrates, and the proteins.

The value of any food as nutrition to the body depends on several facts: the proportion of proteins, carbohydrates, and other substances present; the amount of heat it is able to produce; and the proportion of actually nutritive substances it contains, and the ease with which these are absorbed by the tissues.

The amount of food required naturally varies with different individuals under different conditions, but exhaustive investigations show the minimum dietary required by a normal adult man under moderate conditions of muscular work. Such a man excretes 16–20 grammes of nitrogen and about 320 grammes of carbon every day, and the daily amount of nutritive substances required for such a loss is 125 grammes of protein, 500 grammes of carbohydrate, 50 grammes of fat, the sum of which on analysis will be found to contain 20 grammes of nitrogen and 300 grammes of carbon, while the calorimeter shows that it will produce just over 3000 calories or units of heat. To provide the proper quantities of the above substances a mixed diet is necessary, as no single food has the correct proportion, and a suitable daily diet has been shown to be 1 lb. of bread, ½ lb. of meat, ½ lb. of fat, 1 lb. of potatoes, ½ pint of milk, ½ lb. (or 2) eggs, ½ lb. cheese. A man doing severe muscular work requires a greater amount of food than the above, enough to produce 4500–5000 calories of heat instead of just over 3000 calories.

Bryce, *Dietetics* (1912).

DIETRICH, CHRISTIAN WILHELM ERNST (1712–74), Ger. artist.

DIETRICH OF BERN, poetic name applied to Theodoric the Great (*q.v.*) (455–526); founder of the Ostragothic monarchy.

DIEZ (50° 23′ N., 8° 2′ E.), town, on Lahn, Pruss. province of Hesse-Nassau, Germany; ironworks. Pop. 4362.

DIEZ, FRIEDRICH CHRISTIAN (1794–1876), Ger. scholar, founder of Romance philology.

DIFFERENTIAL EQUATION. — Any relation such as

$$\phi(x, y, a)=0 \quad . \quad . \quad . \quad \text{(i.)}$$

where ϕ denotes some function, represents a certain family of curves, for each member of which the constant a has a particular value. The differential coefficient of y with respect to x is given by

$$\frac{\partial\phi}{\partial x}+\frac{\partial\phi}{\partial y}\cdot\frac{dy}{dx}=0 \quad . \quad . \quad . \quad \text{(ii.)}$$

in which $\frac{\partial}{\partial x}$ and $\frac{\partial}{\partial y}$ denote partial differential operators. Eliminating a between (i.) and (ii.) we get a result of the form

$$f\left(x, y, \frac{dy}{dx}\right)=0 \quad . \quad . \quad . \quad \text{(iii.)}$$

where f is a definite function depending on ϕ. The equation (iii.) is known as the *differential equation* for the family of curves. Similarly, if we start with

$$\phi(x, y, a, b)=0 \quad . \quad . \quad . \quad \text{(iv.)}$$

we reach, by a similar process, the differential equation of the second order

$$f\left(x, y, \frac{dy}{dx}, \frac{d^2y}{dx^2}\right)=0 \quad . \quad . \quad \text{(v.)}$$

The *order of a differential equation* is the order of the highest differential coefficient occurring in it. The reverse process, of passing from equations such as (iii.) and (v.) to (i.) or (iv.), is not always easy, for the steps of an elimination cannot be retraced. Hence various methods have to be adopted for the solution of differential equations, the methods depending on the type of equation dealt with.

I. DIFFERENTIAL EQUATIONS OF THE FIRST ORDER. —(i.) The equation $M dy=N dx$ can always be solved when the variables can be separated; for in this case we can change to the form $Y dy=X dx$; where Y is a function of y alone and X of x alone. Hence $\int Y dy=\int X dx+A$; A being an arbitrary constant.

(ii.) *Linear form.*—This may be written

$$\frac{dy}{dx}+Py=Q$$

where P and Q are functions of x and are explicitly independent of y.

Multiplying each side by $e^{\int P dx}$, we easily obtain

$$ye^{\int P dx} = \int Qe^{\int P dx} . dx + C$$

i.e. $$y = e^{-\int P dx} . \int Qe^{\int P dx} . dx + Ce^{-\int P dx}$$

C being an arbitrary constant.

(iii.) *Homogeneous equations* of the first order are of the form

$$M\frac{dy}{dx} = N$$

where M and N are homogeneous functions of x of the same degree.

Substituting $y = vx$, and regarding M and N as being $x^r\phi(y/x)$ and $x^r\psi(y/x)$ respectively, we get

$$\frac{dx}{x} + \frac{\phi(v)dv}{v\phi(v) - \psi(v)} = 0$$

and so

$$\log x + \int \frac{\phi(v)dv}{v\phi(v) - \psi(v)} = \text{a constant A (say).}$$

(iv.) If one of the variables does not explicitly occur, we have either

$$\phi\left(y, \frac{dy}{dx}\right) = 0 \quad . \quad . \quad . \quad (a), \text{ or } \psi\left(x, \frac{dy}{dx}\right) = 0 \quad . \quad . \quad . \quad (b).$$

In case (*a*) we solve for y or $\frac{dy}{dx}$, as may be most convenient. In the first case we have

$$y = f\left(\frac{dy}{dx}\right) \equiv f(p).$$

Differentiate with respect to x, and we get

$$p = f(p)\frac{dp}{dx}$$

which comes under the form treated in (i.). In the second case we have

$$\frac{dy}{dx} = f_1(y)$$

which again comes under (i.). Similar methods apply to case (*b*).

(v.) An important form is

$$y = px + f(p) \quad . \quad . \quad \text{(i.) (Clairaut's form)}$$

where $p = \frac{dy}{dx}$.

Differentiate with respect to x; we have

$$p = p + [x + f'(p)]\frac{dp}{dx}$$

Thus either $\frac{dp}{dx} = 0$, or $x + f'(p) = 0$.

In the first case $p = c$, a constant, and so $y = cx + f(c)$. In the second case, eliminating p between this and (i.), we get a relation between x and y containing no arbitrary constant. Hence it is not a *general* solution of the equation, but it may be a solution. $y = cx + f(c)$ represents a family of straight lines. If these lines have an envelope, the second solution, known as a *singular solution*, represents this envelope.

II. Linear Equation with Constant Coefficients.—This is of the form

$$D^n y + A_1 D^{n-1} y + \ldots + A_{n-1} D y + A_n y = V$$

where D is written for $\frac{d}{dx}$, and A_1, A_2, etc., are constants, V being a function of x. The solution of such equations consists of two parts: one, known as the *complementary function*, is the primitive of

$$f(D)y = 0 \quad . \quad . \quad . \quad . \quad . \quad (1).$$

$f(D)y$ denoting $(D^n + A_1 D^{n-1} + \ldots + A_n)y$.

The other part, known as the *particular integral*, is any solution whatever (the simpler the better) of the original equation.

The complete solution is the sum of the complementary function and the particular integral.

For discussion of this and information on *second order equations, partial differential equations*, etc., see *Treatise on Differential Equations*, by A. R. Forsyth.

DIFFRACTION OF LIGHT, see Light.

DIFFUSION (Physics).—If water be very slowly poured on top of a solution of a salt (*e.g.* copper sulphate), so as to cause no mixing, and the liquids be then left alone, it will be found that the heavier salt solution will slowly rise and the lighter liquid sink, until the strength of solution is the same throughout. This process, called *diffusion*, takes place with gases of different densities as well as with liquids, but the d. of the former is very rapid as compared with that of the latter, which is extremely slow ($\frac{1}{2}$ grm. of common salt will diffuse across a sq. cm. in a day). Graham, in 1851, was the first to experiment on the subject. He determined the rates of d. of various salts, and found great differences among them — hydrochloric acid diffuses more than 100 times as fast as caramel. He therefore classified substances like the former (chiefly salts of mineral acids) as *Crystalloids*, and substances like gum, albumen, caramel, etc., as *Colloids*.

D. also takes place if the liquids or gases are separated by a porous pot or skin (of parchment, paper, etc.), the rate having been found by Graham to be faster for the lighter substance—actually the velocities are inversely proportional to the sq. roots of the densities. A skin covered with a thin colloid film and used as a partition will stop the d. of colloids but not of crystalloids; by such means a mixture of a colloid and crystalloid in solution can be separated into its components. There is a great similarity between *diffusion* and *conduction* of heat, and similar mathematical methods are employed in both cases.

The study of d. naturally leads on to that of *osmosis*, and hence plays an important part in medical prescriptions of solutions that are applied to the skin; it further accounts for such natural phenomena as the equal distribution of salts in the sea, and that of oxygen and nitrogen at all heights in exactly similar proportions, though oxygen is the heavier gas.

Meyer, *Kinetic Theory of Gases* (1899).

DIGAMMA, obsolete Gk. letter, called 'vau,' shaped like an English *F* and pronounced as *v-w*; disappeared from alphabet *c.* 550 B.C., in some places as early as VII. cent. B.C.; was used in Homeric poems.

DIGBY, SIR EVERARD (1578–1606), Eng. conspirator; became a Roman Catholic c. 1599; joined in Gunpowder Plot, and was executed.

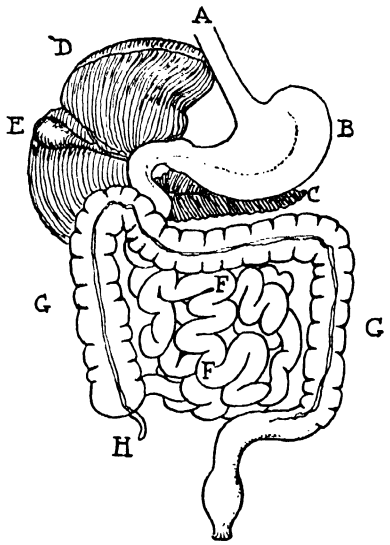
DIGBY, SIR KENELM (1603–65), Eng. soldier and author; s. of Sir Everard D. (*q.v.*), privateer; imprisoned for Royalist intrigues (1612); helped to found Royal Society.

Longueville, *Life of Digby* (1896).

DIGBY, KENELM HENRY (1800–80), Eng. author and archæologist; author of *The Broadstone of Honour*.

DIGENEA, a group of Trematode Worms (*q.v.*).

DIGENIS AKRITAS, BASILIUS, X.-cent. Byzantine hero.



DIGEST, legal term for matter arranged under headings; an alphabetical index to cases, with succinct rules for each case.

DIGESTION, the series of changes which food undergoes in the interior of an animal so that it can be absorbed and thus nourish the body. In the *amœba*, the elementary type of animal, food is simply drawn into the interior at any part of the surface and then digested; but in higher types the digestive system has evolved into a complicated tube, the food entering at one end, nutriment being absorbed during its gradual progress under the influence of various digestive fluids, and undigested débris being ejected.

The mouth is provided with teeth — incisors and canines for biting and cutting the food in pieces, and pre-molars and molars for grinding it down so that it can be more easily swallowed. Six salivary glands, arranged in three sets of pairs, the sublingual

under the tongue, the submaxillary under the angle of the lower jaw, and the parotid in front of the ear pour their secretion into the mouth.

The cavity of the throat or *pharynx*, separated from the mouth by the soft palate above and somewhat in front, the so-called pillars of the fauces on each side, and the tonsils behind the pillars. Like the mouth, the pharynx is lined with smooth mucous membrane. Above, it is in connection with the nasal cavity, which is shut off, during swallowing, by the soft palate, while below it is continued as the œsophagus or gullet, the trachea or windpipe passing in

DIGESTIVE SYSTEM. *A*, œsophagus; *B*, stomach; *C*, pancreas; *D*, liver; *E*, gall bladder; *F*, small intestine; *G*, large intestine; *H*, appendix.

front of the œsophagus and communicating with the pharynx by the larynx, the cavity containing the voice organ; the opening is protected by the epiglottis, a little lid, projecting backwards into the pharynx, which closes down over the entrance of the larynx during the act of swallowing.

The œsophagus or GULLET, a tube about 10 inches long in the normal adult, connects the pharynx with the stomach. It has strong muscular walls and is lined with mucous membrane which secretes viscid mucus, and is thrown into longitudinal folds.

The **Stomach** is the most dilated part of the digestive system, and is the receptacle for the food after it has been masticated and swallowed. Its shape naturally alters with the degree of its distension, but when moderately distended it is pear-shaped, curved upon itself. It is situated on the left side, at the back of the upper part of the abdomen, just below the diaphragm, which is between it and the heart and left lung. It has a muscular coat, the fibres of which are arranged longitudinally, circularly, and obliquely, and is lined with mucous membrane thrown into numerous folds and containing a great number of glands which secrete the digestive juices. The submucous tissue between the muscular coat and the mucous membrane has a great number of little blood-vessels to supply the stomach generally and especially its numerous glands with nourishment. The farther, or pyloric, end of the stomach is furnished with a valve, and leads into the small intestine.

The **Small Intestine** is divided into three parts—the upper (the *duodenum*), the middle (the *jejunum*), and the lower (the *ileum*). The mucous membrane which lines the small intestine is thrown into permanent folds in the form of crescents or complete rings going transversely round the interior, diminishing in number and in prominence in the lower part. These are called the *valvulæ conniventes*, and they increase the absorbing and secreting surface area of the mucous membrane. Over the whole of the interior surface, on the valvulæ and between them, are little projections called *villi*, present in enormous numbers, but less in size and number lower down in the intestine, their function being to absorb the digested food. Scattered over the surface, also, are minute follicles, formed of lymphoid tissue, called solitary glands, which, however, are not glandular at all, their functions being probably connected with the blood. These solitary glands are here and there aggregated together, forming patches of lymphoid tissue called *Peyer's patches*; both the solitary glands and the Peyer's patches are found in greater abundance in the lower part of the intestine.

The mucous membrane also contains secreting glands in great numbers, one type branching and another simple and unbranched, which secrete the digestive fluid of the intestine.

Besides the secretion of these smaller glands there are poured into the upper part of the small intestine the secretion of the *liver* (q.v.) or bile, and the secretion of the pancreas (*q.v.*) or pancreatic juice. The bile is conveyed from the liver by two ducts, and a great part of it passes through another duct termed the cystic duct, to the gall-bladder, where it is stored.

From the gall-bladder it passes to the duodenum by way of the common bile-duct, which is joined just as it enters the intestine by the duct conveying the pancreatic juice from the pancreas.

After passing through the small intestine, the food, mixed as it is with digestive juices, passes into the **Large Intestine** through a valve termed the ileo-cæcal valve, which prevents its going back. The large intestine is short compared with the small intestine, but its diameter is very much greater. The internal surface is smooth and lined with mucous membrane, with the openings of numerous Liebe'kuhn's glands on its surface, and the so-called solitary glands are present in considerable numbers, while villi are absent. The large intestine is best considered under several divisions: the cæcum, the saccular dilatation of the intestine beyond the ileo-cæcal valve, into which opens the narrow blind tube called the vermiform appendix; the ascending colon, going up on the right side as far as the liver; the transverse colon, extending right across the front of the upper part of the abdominal cavity; the descending colon, going vertically downwards on the left side; the iliac colon, a short portion curving into the pelvis; the pelvic colon, a long loop of intestine in the pelvis; and, lastly, the rectum, which is a dilated part just above the opening of the intestine on the surface. The anus, which is the part actually opening on the surface, is usually kept tightly closed by strong circular muscles which surround it.

Digestive Processes.—The food cannot be absorbed so as to nourish the body tissues in the condition in which it enters the mouth, and the various digestive juices break it down into simpler and more soluble substances, which are able to pass into the blood and lymphatic vessels. The substances in the digestive juices which cause this transformation are called ferments or enzymes.

When the food is taken into the mouth it is broken into small pieces by the process of mastication, and at the same time mixed with the saliva, which is alkaline, from the salivary glands. The saliva serves to moisten the food and make it more easily swallowed, and also, by virtue of an enzyme, *ptyalin*, which it contains, it transforms a small part of the starch in the food into dextrin or maltose.

After being thoroughly masticated, the food is gathered on the surface of the tongue, which pushes it backwards to be seized by the muscular walls of the pharynx, and then it is quickly propelled through the pharynx and the œsophagus down to the stomach.

The upper and more dilated part of the stomach,

or the fundus, acts as a reservoir for the food, which is gradually passed along to the pyloric end. Digestion by the saliva goes on for some time in the stomach, but eventually the gastric juice, which has been produced from the gastric glands by the stimulus of the presence of food and of alkaline saliva, is sufficient to neutralise and render acid the stomach contents, thus stopping the action of ptyalin. The gastric juice converts most of the protein in the food into syntonin, albumoses, or peptones, while the fat becomes free. *Pepsin* is the enzyme in the gastric juice which causes the conversion of the protein, and free hydrochloric acid, which is necessary for the action of pepsin, and in addition prevents decomposition of the stomach contents, is also produced in the stomach. Absorption of the food takes place to a small extent in the stomach. The pyloric part of the stomach undergoes violent and rhythmic contractions so as to mix the food thoroughly with the digestive juices, and also to send it gradually through the pyloric valve to the small intestine.

As the *chyme*, i.e. the partly digested food in the stomach, comes into the duodenum it is in contact with the mucous membrane and converts the *pro-secretin* in its cells into *secretin*. This is absorbed by the blood capillaries and conveyed to the pancreas and the liver, exciting a flow of pancreatic juice and of bile. The alkaline pancreatic juice neutralises the acid chyme, and as soon as the neutralisation is complete more chyme comes from the stomach through the pyloric valve. The pancreatic juice also excites a flow of the intestinal digestive juice (*succus entericus*), which contains several enzymes in small quantity acting on the derivatives of protein and the carbohydrates in the food, and converting them into still simpler substances. The pancreatic juice contains an enzyme, trypsin, which causes a still further breaking down of the proteins, and also other enzymes which act on the carbohydrates and fats.

Bile is a solvent of the fats and fatty acids in the food. It is in the small intestine that the food is mainly absorbed, the villi being the absorbent agents; fats (which are absorbed in the form of fatty acids and glycerine) are conveyed away by the lacteal vessels of the villi, while proteins (absorbed in the form of amino-acids or, in some cases, simply as albumoses and peptones) and carbohydrates (absorbed as simple sugars) are conveyed away by the blood capillaries of the villi.

In the large intestine, to which the food next passes, digestion and absorption of food both go on to a slight extent, the digestion being probably caused by enzymes which have been carried down in the food from the small intestine. Absorption of water, however, takes place to a very considerable extent in the large intestine, and the undigested material which passes down to the rectum becomes gradually more and more solid in consistence.

In addition to the undigested débris excreted by the intestine, waste products are excreted by the kidneys, the skin, and the lungs; the urine and the perspiration contain waste products from proteins, while the carbonic acid gas excreted through the lungs is a waste product of the carbohydrates and fats, and water is excreted in the urine, in the perspiration, and also by the lungs.

Disorders.—The different parts and organs of the alimentary system are so intimately connected with one another in the process of digestion that a lesion or disease in one must have a considerable effect on the others; while the mucous membrane, lining the whole digestive tract, is in such intimate contact with the food substances which come from without that any noxious or infective constituent of the food is extremely likely to affect it, and therefore the whole digestive system, to a very considerable extent.

Stomatitis, inflammation of the mouth, and tonsillitis, inflammation of the tonsils, are treated with mild antiseptics and astringents locally and by treating the general condition. Parotitis, or mumps (*q.v.*), is an inflammation, probably a bacterial infection, of the parotid salivary gland. Catarrh frequently affects the fauces, œsophagus, stomach, and bowel, and is usually treated by dietetic measures and sometimes internal antiseptics. Tuberculosis (*q.v.*) and syphilis (*q.v.*) may affect the digestive system. The cæcum and appendix are often subject to inflammation, and medical treatment of the disease may have to yield to surgical interference. Typhoid fever (*q.v.*), dysentery (*q.v.*), and cholera (*q.v.*) are specific infectious diseases with characteristic manifestations in different parts of the intestine. Malignant growths are found in the œsophagus, stomach, pancreas, liver, and the different parts of the intestine, and surgical measures are necessary for their treatment. Animal parasites of man are most commonly found in the alimentary tract, and are treated by quassia, filix-mas, and other anthelmintics in different cases. Colic (*q.v.*), dyspepsia (*q.v.*), ulcer and other diseases of the stomach (*q.v.*), disease of the liver and gall-bladder (*q.v.*), and diseases of the pancreas (*q.v.*) are considered elsewhere. See also DIETETICS.

DIGGING WASPS, see WASPS.

DIGITALIS, in med., the leaves of the foxglove (*q.v.*), used as a drug for stimulating the heart and contracting the arteries, and as a diuretic; the action being due to three of the glucosides in the leaves, *digitoxin*, *digitalin*, and *digitalein*.

DIGNE (44° 5′ N., 6° 14′ E.), town, Basses-Alpes, France; the ancient *Dinia*; bp.'s see; cathedral; preserved fruits and confections. Pop. 7250.

DIGOIN (46° 28′ N., 4° 2′ E.), town, on Loire, Saône-et-Loire, France; pottery and porcelain. Pop. 7000.

DIJON (47° 21′ N., 5° 2′ E.), fortified town, Côte d'Or, France; has Gothic cathedral and several fine churches; Hôtel-de-ville (formerly ducal palace); Palais-de-Justice (XV. cent.); univ., schools of art and music. D. came under Dukes of Burgundy (*q.v.*), XI. cent., and for cent's was their capital; bombarded and occupied by Prussians, 1870. D. is important railway junction, lies on Canal de Bourgogne; centre of Burgundy wine industry; liqueur, beer, mustard, candles, wool, market produce. Pop. (1911) 75,640.

DILAPIDATION, in general, state of decay; in particular, it refers to an incumbent's neglect, or impairing of, ecclesiastical property.

DILEMMA, logical term indicating two suppositions, either of which leads to an unacceptable result; the suppositions are called 'horns of the d.'

DILIGENCE, in Scots law, warrants to enforce attendance of witnesses or production of documents; process of law by which persons, lands, or effects are attached as security for a debt.

DILKE, SIR CHARLES WENTWORTH, Bart. (1810–69), Eng. politician; helped to organise Great Exhibition of 1851; M.P. for Wallingford (1865); with Prof. Lindley founded the *Gardeners' Chronicle* (1841).

DILKE, SIR CHARLES WENTWORTH, Bart. (1843–1911), Eng. Liberal politician, s. of preceding; M.P. for Chelsea (1868–86); Under-Sec. for Foreign Affairs (1880–82); Pres.; Local Government Board 1882–85); appeared as co-respondent in divorce case (1885), thereby ruining a political career of highest promise; re-entered Parliament, 1892, as member for Forest of Dean. D. was proprietor of the *Athenæum* and *Notes and Queries*, and author of *Greater Britain* (1868), *Problems of Greater Britain* (1890), and, with Mr. Spenser Wilkinson, *Imperial Defence* (1897), and *The British Empire* (1899).—LADY DILKE (1840–1904), the widow of Mark Pattison (*q.v.*), m. Sir Charles D. in 1885; wrote numerous books on art, especially Fr. art.

DILLENBURG (50° 44′ N., 8° 14′ E.), town, on Dille, Pruss. province of Hesse-Nassau, Germany; birthplace of William of Orange. Pop. 5039.

DILLENS, JULIEN (1849–1904), Belg. sculptor.

DILLINGEN (48° 34′ N., 10° 30′ E.), town, on Danube, Bavaria, Germany; from XVI.–XVIII. cent., seat of Jesuit university. Pop. 6162.

DILLMANN, CHRISTIAN FRIEDRICH (1823–94), Ger. Orientalist.

DILLON, ARTHUR RICHARD, Catholic prelate of Irish descent; bp. of Evreux, 1753; abp. of Toulouse, 1758, of Narbonne, 1763; emigrated, 1790.

DILLON, JOHN (1851–), Irish naturalist; M.P. for Tipperary, 1880; since 1885 for East Mayo; several times imprisoned for violent speeches.

DIME, tenth part of Amer. dollar; approximately five pence.

DIMITY, cotton cloth, used for curtains and hangings, either white or figured.

DINAJPUR (25° 38′ N., 88° 41′ E.), town and district, Rajshahi division, Bengal, India. Pop. 13,430. District: area, 3946 sq. miles. Pop. 1,567,080.

DINAN (48° 27′ N., 2° 2′ W.), health-resort, Côtes-du-Nord, France; chief buildings, churches of St. Malo and St. Sauveur; leather and canvas manufactured; trade in grain, cider, and agricultural produce. Pop. 10,534.

DINANT (50° 16′ N., 4° 55′ E.), summer resort, on Meuse, Namur, Belgium; formerly fortified; chief edifice is Gothic church of Notre Dame (XIII. cent.); tanneries; 'Dinant' cakes; sacked by Charles the Bold, 1466. Pop. 7552.

DINAPUR (25° 38′ N., 85° 5′ E.), town, on Ganges, Patna district, Bihar and Orissa, India; military cantonment. Pop. 33,699.

DINARCHUS (d. 290 B.C.), celebrated Attic orator.

DINARD (48° 38′ N., 2° 2′ W.), seaport and watering-place, Brittany, France. Pop. 4800.

DINDIGAL (10° 21′ N., 78° E.), town, Madura district, Madras, India; fortress formerly of strategical importance; tobacco exported. Pop. 25,182.

DINDORF, KARL WILHELM (1802–83), Ger. classical scholar.

D'INDY, PAUL-MARIE-THÉODORE-VINCENT (1851–), Fr. composer; disciple of César Franck.

DINEIR (38° 8′ N., 30° 5′ E.), small town, Asia Minor; occupies site of ancient *Celænæ*.

DINGELSTEDT, FRANZ VON (1814–81), Ger. dramatist and poet.

DINGHY, rowing boat used by yachtsmen and in Navy; term originally signified small flat-bottomed craft, square at one end, now used loosely of any boat up to 14 ft. in length.

DINGLE (52° 8′ N., 10° 15′ W.), seaport, on Dingle Bay, County Kerry, Ireland; fisheries.

DINGO, see DOG FAMILY.

DINGWALL (57° 36′ N., 4° 27′ W.), chief town of Ross and Cromarty, Scotland; remains of ancient castle; monument to Sir Hector MacDonald.

DINIZULU, see CETEWAYO.

DINKA, negro tribes occupying districts in neighbourhood of White Nile; chiefly herdsmen.

DINKELSBÜHL (49° 4′ N., 10° 18′ E.), walled town, on Wörmitz, Bavaria, Germany; trade in cattle and corn; manufactures pencils and leather. Pop. 4655.

DINOCRATES, Gk. architect, patronised by Alexander the Great; designed city of Alexandria.

DINOFLAGELLATA, family of marine infusorians sometimes grouped botanically as Peridiniales; furnished with anterior and transverse flagella; occasionally have covering of cellulose.

DINOSAUR, see REPTILES.

DINOTHERIUM, see ELEPHANT.

DINWIDDIE, ROBERT (1693–1770), lieut.-gov. of Virginia, 1751–58; precipitated Fr. and Ind. War.

DIOCESE, district presided over by a bp.; used in ecclesiastical sense since IX. cent.; word originally used for one of twelve civil divisions of Empire under Diocletian; bp's take titles from cathedral sees, not d's.

DIOCLETIAN, GAIUS AURELIUS VALERIUS DIOCLETIANUS (245–313 A.D.), Rom. emperor, 284–305; reorganised Empire under two *Augusti* and two *Cæsars*; conducted the last great persecution of Christians; abdicated. His era is called *Era of* ——.—**Edict of D.,** issued 301 A.D. to regulate price of food and wages; preserved in Gk. and Latin fragments in various places.

Mason, *Diocletian* (1876).

DIODATI, GIOVANNI (1576–1649), Swiss Prot. theologian; prof. of Hebrew at Geneva, 1795; strong Calvinist; translated Bible into Italian and French.

DIODONTIDÆ, see PORCUPINE FISHES.

DIODORUS CRONUS (IV. cent. B.C.), Gk. philosopher of Megarian school (*q.v.*).

DIODORUS SICULUS, Gk. historian; fl. in times of Julius Cæsar and Augustus; wrote history of world from Creation to Cæsar's Gallic wars.

DIODOTUS, Bactrian satrap who rebelled against Antiochus II.

DIOGENES (*c.* 412–323 B.C.), Gk. 'cynic' philosopher; said to have lived in a tub; believed in enduring pain and doing without pleasure.

DIOGENES APOLLONIATES (*c.* 460 B.C.), Gk. philosopher of Ionic school; fragments of writings preserved.

DIOGENES LAËRTIUS (II. cent. A.D.), Gk. historian, and biographer of Gk. philosophers.

DIOGENIANUS, Gk. grammarian of Hadrian's reign.

DIOGNETUS, EPISTLE TO, anonymous document of II. cent., describing the ideal life of the early Church.

DIOMEDES, king of Argos; fought against Troy; figures in *Iliad*.

DIOMEDES (IV. cent. A.D.), Rom. grammarian.

DION (*c.* 408–353 B.C.), follower of Plato; banished from Syracuse by Dionysius the younger, he returned and captured the city; assassinated.

DION CASSIUS (b. 155 A.D.), Rom. historian; wrote the *History of Rome* to the period of Agrippa's death (10 A.D.).

DION CHRYSOSTOMUS (50–117 A.D.), Gk. rhetorician; called the 'Golden-mouthed'; his orations, written in Attic Greek, were distinguished by a clear and eloquent style.

DIONE (classical myth.), d. of Uranus and Ge in some accounts, of Oceanus and Tethys in others; wife of Zeus, and mother of Aphrodite.

DIONYSIUS (d. 367 B.C.), tyrant of Syracuse; cruel despot.

DIONYSIUS, 'THE YOUNGER,' tyrant of Syracuse; s. of above; succ. his f. (367); in turn supplanted by Dion (*q.v.*).

DIONYSIUS AREOPAGITICUS (*Acts* 17[34]), an Athenian converted by St. Paul; name later attached to certain writings of which there are traces *c.* 500 A.D.; they are: *Concerning the Celestial Hierarchy, Concerning Divine Names, Concerning Mystic Theology.* They are valuable in themselves, being influenced by *Neo-Platonic* mysticism, and treating of angels and sacraments. They were trans. into Latin by Erigena, and exercised considerable influence on the thought of the West.

DIONYSIUS EXIGUUS, VI.-cent. Scythian chronologist.

DIONYSIUS OF HALICARNASSUS, Gk. rhetorician and historian of the age of Augustus; one of the greatest of Gk. literary critics.

Sandys, *Hist. of Class. Scholarship* (1906).

DIONYSIUS PERIEGETES, author of time of Hadrian; wrote a geographical treatise in hexameters.

DIONYSIUS, ST. (d. 268), pope, 259, after see had remained vacant for a year owing to persecution; condemned heretical doctrines of Sabellius; ransomed Cappadocian Christians enslaved by Goths.

DIONYSIUS TELMAHARENSIS, patriarch of Syrian Jacobite Church (818–48); first a monk; made patriarch unwillingly, but a zealous prelate; wrote *Annals* (now lost) and a *Chronicle*.

DIONYSIUS THRAX (*c.* 90 B.C.), Gk. grammarian and rhetorician.

DIONYSUS (classical myth.), called by the Latins *Bacchus*, was the god of wine and revelry; s. of Zeus

and Semele; was cared for in his youth by an aged satyr, Silenus, with whom his name is often coupled. The *Dionysia*, festivals in his honour, were held throughout Greece.

DIOPHANTUS, Gk. algebraist of Alexandria; lived (probably) during III. cent.; supposed to be inventor of algebra, but this is doubtful; his analysis of theory of indeterminate problems is named after him; six books of his *Arithmetica* and work on polygonal numbers survive.

DIORITE, family of rocks resembling granite and composed of hornblende and felspar; named D. by Haüg, a well-known geologist; tough composition, in colour white, sometimes speckled with dark green or black.

DIPHILIS (342–291 B.C.), writer of Attic comedy.

DIPHTHERIA, a contagious disease, characterised by fever and a membranous exudation on the mucous surface usually of the back of the throat and the tonsils. An attack generally comes on gradually, with a sore throat, on examination found to be reddened and, sooner or later, with white patches, often accompanied by shivering and vomiting and swelling of the glands of the neck. Diagnosis of D. chiefly depends on the bacteriological examination of a swab taken from the back of the neck. The person is markedly depressed, and may go on sinking to a fatal end, or the symptoms may improve, the membrane become detached, and the throat heal, but recovery is usually slow.

The treatment is now to give the *antitoxin* in practically every case, and as early as possible; it neutralises the poisons produced in the disease, and causes in the individual a change for the better in a few hours. Disinfectants may also be sprayed on the throat. Since the introduction of the antitoxin treatment the mortality has fallen from 30–50 % to about 10 %.

The cause of the disease is a bacillus called the Klebs-Löffler bacillus after its two discoverers.

The disease is endemic in Europe and America, becoming epidemic from time to time, and it is believed to be on the increase, occurring chiefly in children, specially those under ten years of age. It may be spread through the sputum from a diphtheritic person being ejected into the air; while milk, domestic animals (*e.g.* cats), and the crowding together of children through compulsory school attendance are all frequent causes of the spreading of the disease.

Parker, *Diphtheria*; Ker, *Infectious Diseases*.

DIPHYLLA, see VAMPIRE BATS.

DIPLODOCUS, fossil REPTILE (*q.v.*).

DIPLOMACY.—The practice and theory of international negotiation has only been recognised as a distinct art or science since the end of the XVIII. cent. European d. has only been on its present footing since the Congress of Vienna, 1815. In the XVIII. cent. states were viewed pretty much as the private property of their rulers, hence there was little or nothing of that consultation of public opinion which plays so large a part in international relations now. Again, there was little desire for universal peace or real recognition of the duties of nations to one another, even as a far-off ideal. Also, communication, of course, was far slower and diplomatic etiquette elaborate. D., as we know it, could hardly exist in a feudal state, and much of European negotiation between states can be traced back in principle to those Ital. states which at the time of the Renaissance offered a contrast to the centralised monarchies around them. Venice, whose traditions were derived from Constantinople, developed this branch of statecraft greatly, and the reports of Venetian ambassadors to their home government are as remarkable for political sagacity as they are valuable to the hist. student.

Embassies were at first only temporary; Spain was the first to appoint a permanent ambassador to England—in 1487. Machiavelli in *Il Principe* had outlined his political theories with frank unscrupulousness, and Francis I. of France set to work to apply them. So lacking seemed d. in moral principle that some of the best thinkers, *e.g.* Grotius, thought it either useless or mischievous. There was no idea of the possibilities to which it might lead among a number of democratic states. An ambassador was obliged to keep up much ceremony; this and the elaborate etiquette which hedged him in made it more convenient for many states only to send agents. Members of a *Corps diplomatique* have various privileges, *e.g.* they are personally inviolable—even after war has been declared.

E. C. Grenville-Murray, *Embassies to Foreign Courts*, a history of diplomacy.

DIPLOMATICS, that branch of study which concerns itself with the diplomatic sources of history. A *diploma* in Rom. times was a licence or passport, but the term has come to be used loosely of mediæval documents as a whole. They fall into two classes: (1) public deeds, of which an enormous number of all sorts and ages, many in long continued series, are preserved in the Record Office, and (2) private deeds, which include not only those relating to individuals, but municipal deeds and charters of corporations. The documents in the Record Office are now being calendered, as it is not possible to print them all *in extenso*; the private ones are more scattered and difficult to deal with. Of foreign collections the most important is that of the Papal Chancery. Dating from very early times, it was set on a fresh footing by Pope Julius I. (337–52). Very few original documents prior to the XI. cent. have survived; the earlier ones till then are all on papyrus, after that on vellum. From then distinct and different formulæ came to be used; in the XIII. cent. the term *bull* (from *bulla*, a leaden seal) was used for all sorts of documents. Gradually more exact customs and formulæ were followed. *Briefs* (from *brevia*) are first found in the XIII. cent., when they were granted largely for indulgences. The Chancery of the Merovingian kings of France has documents going back to 625, and the earlier ones are on vellum. They consist of precepts, granting gifts, privileges, etc., and judgments. Those of the early Karlings are similar; they took a definite form in the IX. cent., become confused in the X., and are again regulated in the XI. Eng. kings of Anglo-Saxon times followed Frankish precedents in their royal charters. Some genuine ones have survived. Edward the Confessor was the first to use a great seal. William the Conqueror brought in the methods the Normans had learnt from the Capetian kings of France. Until John the kings call themselves *Rex Anglorum* (king of the English), then *Rex Anglicæ* (king of England). John called himself *Lord of Ireland*, Henry VIII., *king of Ireland*, Edward III., *king of France* (a title retained by Eng. kings till 1801).

G. F. Warner and H. J. Ellies, *Facsimiles of Royal and Other Charters in the British Museum*; various publications of the *Record Office*.

DIPLOPODA, millipedes. See MYRIAPODA.

DIPNOI, see under FISHES.

DIPODOMYS, kangaroo rat. See POCKET GOPHERS.

DIPPEL, JOHANN KONRAD (1673–1734), Lutheran theologian and scientist; invented Prussian blue.

DIPPERS, WATER-OUZELS (*Cinclidæ*), a family of 26 thrush-like perching birds, found in the neighbourhood of mountainous streams in both Old and New Worlds.

DIPSOMANIA, an insatiable craving for drink, particularly alcoholic, often occurring periodically.

DIPTERA, FLIES, insects possessing two membranous, usually transparent, wings; the major portion of the head is occupied by the large eyes, and bears the suctorial mouth parts. It is united to the thorax by a delicate neck, ensuring remarkable mobility. The larvæ are termed maggots or grubs,

and are marvellously rapid in development, this only taking a few days. Owing to their scavenging habits, flies are a great source of danger to health, some blood-sucking forms such as the mosquito (*q.v.*) and tsetse (*q.v.*) being of special interest as they are thought to transmit various tropical diseases.

Curtis, *Diptera*.

DIPTYCH, originally a tablet made to shut, containing letters, etc.; then in Christian Church names were recorded on it, and calendars and martyrologies developed.

DIR (35° 15′ N., 71° 50′ E.), independent state, N.W. Frontier Province, India; chief town, DIR.

DIRCE (classical myth.), wife of King Lycus; Antiope's sons tied her to the horns of a wild bull, which dragged her about until she perished.

DIRECTORS, persons managing a public company or trading concern for the benefit of themselves and all shareholders. A share qualification for d's is common, but not essential. If a d. parts with his qualification shares he is disqualified. If the Articles provide for remuneration, the d's may sue for it, whether the company is making profits or not. The fact that d's give their services gratuitously does not lessen their liabilities.

DIRECTORY (1795–99), committee of five which during Fr. Revolution formed executive government of France from end of Reign of Terror and death of Robespierre to Consulate of Napoleon. The extravagant pseudo-classical designs of ladies' dresses at that period were revived (1910) as 'Directoire gowns.'

DIRECTRIX, see CONIC SECTION.

DIRK, dagger, ornamented with cairngorms, worn with full Highland dress; also sword, 18 in. long, worn by Brit. midshipmen.

DIRSCHAU (54° 6′ N., 18° 45′ E.), town, on Vistula, W. Prussia, Germany; sugar factories. Pop. 41,190.

DISCIPLES OF CHRIST, Amer. Prot. Church, founded by Stone and Thomas and Alexander Campbell in 1804; offshoot from [illegible] by [illegible]rians; as regards baptism they advocate [illegible] and observe Lord's Supper; orthodox in Christology, but without elaborate doctrinal formulæ; have now over a million communicants in U.S.

DISCLAIMER, legal term signifying denial or renouncement of claim or right; statement made by patentee when he has claimed more than his due, showing what idea he does not claim under his patent.

DISCOPHORA, see LEECHES.

DISCOVERY, see POLAR REGIONS, AFRICA, and AUSTRALIA and AMERICA.

DISCUS, stone or metal disk, used for throwing in ancient Gk. athletics. At the Olympic games held in Athens (1896) d. throwing was revived as a sport.

DISESTABLISHMENT.—The idea of revolt from the State Church and desire for religious freedom were features of the Protestant reformation; feeling became acute in England during reign of Charles I.; toleration under succeeding monarchs eased the tension, but in 1869 Gladstone's ministry disestablished the Church of Ireland. Agitation for the d. of the Church of Wales led to the Welsh D. Bill, 1912, which was passed by small majority in Commons, but rejected by Lords, 1913.

DISINFECTANTS, substances which destroy bacteria and so prevent the spread of infectious disease, *e.g.* potassium permanganate, carbolic acid, sulphurous acid fumes, formaldehyde.

DISORDERLY HOUSE, BROTHEL, house where women prostitute themselves for money; is treated under English Law as a nuisance, and investigation may be made on the request of two ratepayers; search may also be made if it is suspected that a woman is being detained against her will. Many brothels in Britain are kept by foreigners, but the Criminal Law Amendment Act, 1912, which imposes heavy penalties, including flogging, on procurers, may possibly check the growth of d. h's.

DISPENSATION, remission of a law, generally used in relation to an act of the Pope such as that of granting Henry VIII. permission to marry Catherine of Aragon, his late bro.'s wife. The only act of d. now in the power of Brit. sovereigns is that of granting pardon to criminals.

DISPERSION (in optics), a term used to denote the effect produced when a beam of white light is passed through a glass prism. The resulting beam is spread out into a broad band composed of the seven primary colours. The original light is 'dispersed' owing to the different amounts by which rays of different colours are bent, when passed through a prism (see LENS). On passing the light through substances which absorb certain colours, the d. produced is abnormal. This phenomenon, termed *anomalous d.*, is the cause of the use of ruled gratings instead of glass prisms, in the study of spectra. D. is also used to signify the scattering of light at a reflecting surface.

DISRAELI, BENJAMIN, see BEACONSFIELD.

DISRAELI, ISAAC (1766–1848), Eng. author; belonged to a family of Span. Jews; f. of Earl of Beaconsfield; author of *Curiosities of Literature*, *Calamities of Authors*, etc.

DISS (52° 23′ N., 1° 7′ E.), market town, on Waveney, Norfolk, England. Pop. (1911) 3769.

DISSENTERS, 'Nonconformists,' those who dissent from the teaching of the Church of England; call themselves 'Free Churchmen.'

DISSOLUTION, the breaking up of parliament in accordance with the Parliament Act, 1911 (which limits duration of Parliaments to five years, instead of seven as previously fixed by Septennial Act, 1716), or by royal prerogative. The king dissolves parliament on the advice of the premier and cabinet.

DISTAFF, stick upon which unspun flax or wool is placed preparatory to spinning it into thread on wheel.

DISTILLATION, the conversion of substances into vapours, afterwards condensed into liquid form, is employed to separate and purify liquids, especially organic liquids. Heat converts liquids into vapour; cold converts vapours into liquid. These two processes constitute d. Solid particles, being inconvertible into vapour, are left behind. Liquids have distinct boiling-points at which they pass into vapour, so liquid impurities of lower boiling-point can be condensed and collected first, while those of higher boiling-point than the required liquid are left behind. The necessary apparatus consists of a distilling flask and a condenser. The d. *flask* has a long neck and a long, narrow side-tube. In the neck is a cork fitted with a thermometer, the bulb of which comes just below the side-tube and records the temperature of the vapour. The *condenser* is a glass tube with a glass or metal jacket with entrance and exit tubes through which cold water runs continuously. A cork bearing the side-tube from the d. flask fits into one end, while the other end dips into a collecting flask. The d. flask is heated, and when the thermometer records that the vapour is passing through the side-tube into the condenser at the boiling-point of the required liquid, a fresh collecting flask is connected. FRACTIONAL DISTILLATION.—Liquids can be separated by collecting the distillate in portions at intervals of 5° or 10°, and redistilling each portion. DISTILLATION IN STEAM.—Certain liquids decompose on boiling, but if steam is passed through them they volatilise and pass over unchanged with the steam.

Young, *Fractional Distillation* (1903); E. J. Mills, *Destructive Distillation* (1910).

DISTOMUM, the liver-fluke. See TREMATODE WORMS.

DISTRESS, in law, the act of distraining (seizing) goods by a landlord under a d. warrant for the recovery of rent.

DITHMARSCHEN, DITMARSH (54° 5′ N., 9° 10′ E.),

district, Germany, forming part of ancient duchy of Holstein, between Eider, Elbe, and North Sea; colonised from Friesland and Saxony; annexed to Prussia, 1866. Pop. 87,477.

DITHYRAMBIC POETRY, irregular form of Gk. lyric poetry, originally used in worship of Dionysus (Bacchus). A modern example is Dryden's *Alexander's Feast*.

DITTERSBACH (50° 45′ N., 16° 22′ E.), town, Prussian province of Silesia, Germany; coal mines. Pop. 11,463.

DITTERSDORF, KARL DITTERS VON (1739–99), Austrian composer and violinist; b. Vienna; ed. at Prince Joseph von Hildburghausen's expense; cr. '*von* D.,' 1773; best works: *Esther Isaac, Job* (oratorios), *Doktor und Apotheker, Betrug durch Aberglauben* (comic operas), besides orchestral and chamber music.

DIURETICS, substances which cause increase in the flow of urine, by acting on the kidneys, the blood, or blood-vessels, or the nervous system; *e.g.* caffeine, digitalis.

DIVAN, Diwan, Persian word meaning Oriental council; chamber where such meetings are held; collected works of Arabic poet.

DIVANIEH (32° N., 45° W.), small town, on Euphrates, Asiatic Turkey.

DIVERS (*Colymbidæ*), a family containing 5 species of handsome, long-necked swimming birds, found in the northern parts of the Old and New Worlds. They obtain their food by diving, and have coloured bars on the throat. Three species occur in Britain.

DIVERS AND DIVING.—The employment of naked divers for searching the sea-bottom for pearls, sponges, etc., apparently dates back to very early times, and this primitive method is still used to some extent in the East. Divers are referred to in Homer's *Iliad*; they were employed by Alexander the Great; and numerous references to them are found in the classic writers. The *diving-bell*, the earliest means of assisting the diver, is stated to have been the invention of Roger Bacon (1250). This must have been a very rude contrivance, of which no description is extant. The modern diving-bell dates from 1788 (when it was used by Smeaton at Ramsgate), and consists of a cast-iron chamber, weighing about 5 tons, supplied with air by means of a force-pump. The modern *diving-dress* consists of a suit of sheet india-rubber, covered with twill, with close-fitting vulcanised cuffs and collar; weighted boots, averaging 20 lb. each; weights on back and chest of 40 lb. each; metal helmet and breastplate (40 lb.); and strong sheathed knife at belt. The helmet is provided with glass lights at the front and sides; and air is supplied by means of a rubber tube attached to the back of the helmet. A 'life-line,' or signalling line, of Manila rope is attached to the diver's waist. A naked diver cannot remain below water longer than three minutes at the outside; a diver in patent dress can remain under water from two to four hours. The greatest depth yet reached by a diver is 204 ft. All modern warships of considerable size carry one or more trained divers and complete apparatus.

Boycott, *Compressed Air Work and Diving*.

DIVES-SUR-MER (49° 18′ N., 0° 7′ W.), watering-place, at mouth of Dives, Calvados, France; here William the Conqueror embarked for England, 1066. Pop. 3500.

DIVIDEND, income derived from profit of capital invested in stock or company; 'preference' d. paid before ordinary d.; term also used of money divided between creditors, etc.

DIVINATION, the process of seeking knowledge of unknown or future things by means of astrology, trance, crystal-gazing, and various other methods. The professed art dates back to early times, and is more or less common to civilised and uncivilised peoples, and, mixed with much charlatanism, still finds many believers.

DIVINING ROD, forked branch, usually of hazel, which is carried by the diviner, and is said to dip where water (or some mineral) is concealed in the earth. Some of the phenomena are too well authenticated to be wholly ascribed to charlatanism, and are referred to animal magnetism.

Beaven, *Tales of the Divining Rod* (1899).

DIVISION, process by which a term taken as *genus* is split up into its *species*; must be exhaustive, step by step, and avoid cross-division. See Logic.

DIVISIONAL TRAIN, see Transport and Supply.

DIVORCE, the sentence by which the marriage-tie is dissolved. In England, before the Matrimonial Causes Act (1857), d's were of two kinds: (1) a *judicial separation*, granted by the Ecclesiastical Courts; (2) a *dissolution of marriage*, which could only be obtained by the tedious and costly method of an Act of Parliament. The consequence was that only rich persons could obtain an absolute d., and so the Act was passed to place the trial of matrimonial causes within the reach of all. The husband may obtain d. if his wife commits adultery. To obtain d. the wife must prove her husband guilty of (1) incestuous adultery, *i.e.* adultery with a woman he could not marry because of consanguinity if his wife were dead; or (2) bigamy with adultery; (3) certain criminal offences; (4) adultery with cruelty, or desertion for two years. On the pronouncement of a *decree absolute* the parties are at liberty to marry again; but a clergyman of the Church of England and Ireland cannot be compelled to solemnise the marriage of any person whose former marriage may have been dissolved on the ground of his or her adultery. Divorced wives may keep their married names if they choose. When the petitioner has proved his case, the Court, in the first place, grants a *decree nisi*—that is, a dissolution of the marriage provisional upon his or her good conduct for a period, usually six months, and also that no person in the meantime shows that the decree was obtained by collusion, or the withholding of any material fact. At any time during the cause, or before the *decree absolute*, the marriage is not actually dissolved, and any adultery by the parties is matter for the cognizance of the Court. On good cause being shown, the *decree nisi* may be reversed, or further inquiry may be required. Otherwise, at the end of six months, or other period fixed by the Court, the decree is made *absolute*. Neither party is entitled to marry until the *decree absolute* has been obtained, and if either does so, the decree will be rescinded and the person doing so is guilty of bigamy.

It remains to be said that the following acts constitute bars to divorce: (1) *adultery not proved*; (2) *connivance*, which means that the petitioner actually knew that adultery was going on and took no means to prevent it; (3) *condonation*, meaning that the adultery has been condoned and cohabitation has been resumed; and (4) *collusion*, by which the petitioner and respondent, or co-respondent, arrange between themselves that no obstacles shall be placed in the way of petitioner's suit, so that the entire facts are not placed before the Court, or where a money payment is received to ensure silence, or where adultery, or the appearance of same, is arranged to present a false case.

In Scotland adultery and desertion by either husband or wife for four years form ground for d., but the divorced spouse is forbidden to marry the co-respondent with whom adultery has been committed.

In America each State has its own d. laws, except S. Carolina, which has no d. laws. In the main, the grounds for d. are similar to those obtaining in England, but in some Amer. States d. is granted on the ground of incompatibility of temperament and of habitual drunkenness.

The R.C. Church considers marriage indissoluble.

In 1909 a Royal Commission was app. to inquire into the existing Eng. d. laws, and its Majority Report (Nov. 1912) recommended, *inter alia*, equality of sexes; new grounds for d. (desertion for three years, cruelty, insanity, chronic drunkenness, penal servitude for murder); cheapening of procedure in d. court. The

Minority Report recommends that grounds for d. should not be extended, but on other points agrees with Majority Report.

G. L. Hardy, *The Law and Practice of Divorce* (1910); Lichtenberger, *Divorce: a Study in Social Causation.*

DIWAN, term used in India for native head official of a state.

DIWANIEH (31° 59′ N., 44° 58′ E.), town, built on either bank of Euphrates, Turkey in Asia; seat of government of Affech district transferred from Hillah to D., 1893; of strategic importance.

DIX, DOROTHEA LYNDE (1802–87), Amer. philanthropist; devoted herself to improving condition of paupers, criminals, and insane; continued her work in Europe.

DIX, JOHN ADAMS (1798–1879), Amer. soldier, statesman, and superintendent of schools; sec. of treasury of U.S.A., 1860; served in Civil War, 1861–65; minister to France, 1866–69; Governor of New York, 1873–75.

DIXON (41° 50′ N., 89° 29′ W.), city, on Rock, Illinois, U.S.A.; agricultural implements; shoes. Pop. (1910) 7216.

DIXON, GEORGE (d. 1800), Eng. navigator; pub. *A Voyage round the World* (1799).

DIXON, HENRY HALL (1822–70), Eng. author; under name *The Druid* wrote on sporting life.

DIXON, RICHARD WATSON (1833–1900), Eng. poet; hon. canon of Carlisle; author of *Mano, Odes,* etc.; also valuable work on Church history.

DIXON, WILLIAM HEPWORTH (1821–79), Eng. author and traveller; editor of *Athenæum* (1853–69).

DIZFUL, Diz-Pul (32° 30′ N., 48° 35′ E.), town, on Diz, Khuzistan, Persia; active trade; near ruins of Susa. Pop. 25,000.

DJAKOVO, Djakovar (45° 17′ N., 18° 20′ E.), town, Croatia-Slavonia, Hungary. Pop. *c.* 21,000.

DLUGOSZ, JAN (1415–80), Polish statesman; in service of Cardinal Olesnicki, then of King Casimir IV., abp. of Lemberg, 1478; wrote *Historica Polonica,* first great work on Polish history.

DMITRIEV, IVAN IVANOVICH (1760–1837), Russ. poet and statesman.

DNIEPER (46° 40′ N., 33° E.), river, Russia; ancient *Borysthenes*; rises in N. of Smolensk province, flows generally southward into Black Sea; principal affluents, Desna, Soj, from E.; Pripet, Beresina, from W.; length, *c.* 1300 miles. D. is navigable in sections; cataracts interrupt traffic, but engineering works have overcome these to large extent.

DNIESTER (46° 30′ N., 29° 55′ E.), navigable river, Austria and Russia; ancient *Tyras*; rises in Carpathian Mts., Galicia, flows *c.* 800 miles S.S.E., and enters Black Sea.

DOAB, Duab, Ind. name for a tract of country between two rivers; particularly land between Ganges and Jumna.

DOANE, GEORGE WASHINGTON (1799–1859), Amer. Episcopalian ecclesiastic; bp. of New Jersey, 1832; prominent in educational work.

DOBB'S FERRY (41° 2′ N., 73° 52′ W.), town, on Hudson River, New York State, U.S.A. Pop. 3445.

DOBELL, SYDNEY (1824–74), Eng. poet; belonged to the 'Spasmodic school'; his works include *The Roman, Balder,* and *England in Time of War.*

DÖBELN (51° 7′ N., 13° 7′ E.), town, Saxony, Germany; on island formed by Mulde; iron foundries. Pop. (1910) 19,627.

DOBERAN, Dobberan (54° 7′ N., 11° 53′ E.), summer resort, Mecklenburg-Schwerin, Germany; mineral springs. Pop. 5202.

DOBREE, PETER PAUL (1782–1825), Eng. scholar and critic.

DOBRITCH (43° 22′ N., 27° 47′ E.), town, Bulgaria; annual fair. Pop. (1910) 17,146.

DOBRIZHOFFER, MARTIN (1717–91), Austrian Jesuit missionary in S. America.

DOBRUDJA (44° 20′ N., 28° 30′ E.), region between lower Danube and Black Sea, Rumania; mostly marshes and steppes; assigned to Rumania, 1878. Pop. *c.* 273,000.

DOBSINA (48° 50′ N., 20° 24′ E.), small town, Hungary; iron mines. Pop. 5115.

DOBSON, HENRY AUSTIN (1840–), Eng. poet and critic; *Collected Poems* (1897). His poetry, dealing largely with XVIII.-cent. life, is marked by daintiness of form and expression; and his prose works on the same period are masterly in their kind.

DOBSON, WILLIAM (1610–46), Eng. artist; portraits of Charles I., Prince Rupert, and others.

DOCETÆ, sect of early Church, who denied the real humanity of Christ; some said what appeared as His body was a mere phantom.

DOCK, an artificial basin to receive ships for the purpose of taking or discharging cargo, or undergoing repairs. To facilitate the handling of cargo where the tidal range is large, d's are furnished with gates to retain water at a certain level. The walls are of concrete or masonry, reinforced by steel or iron; the gates, designed on the same principle as a masonry arch, of steel, iron, or wood, are built in two leaves, the meeting surface and the hinges being fitted watertight. The power used for driving the machinery in connection with the d. cranes, gates, etc., is either hydraulic or electric. The lighting is electric. The main points of good d. design demand the convenient maximum of quay length in comparison with water area, and ample space for the discharge of cargo. Sidings are provided so that passengers or cargo may be disposed of as quickly as possible. Depth of d. varies with the draught of vessel and the range of the tides. London d's, with a water area of 650 acres, are the largest in the world. A sum of 14 millions is to be spent on their further enlargement.

Tidal Docks.—Where the range of the tide is small, gates are not necessary. Such d's are called 'tidal.' A d. of this type at Immingham on the Humber, with an area of 50½ acres, was opened in 1912.

Dry Docks or *Graving Docks.*—These are for the reception of vessels to undergo repairs. A vessel having entered the d., the gates are shut and the water is pumped out, the vessel being then received on keel blocks. Repairs on the hull can then be carried out.

Floating Docks.—These are iron and steel structures for the reception of vessels for repairs. Fitted with contrivances for lifting a vessel out of the water, they are used where there is no site for a dry d. In its simplest form there is a pontoon or hollow iron box, carrying two side walls, the whole being U-shaped. Water having been admitted so as to sink the d. sufficiently to receive a vessel, the water is pumped out and the craft supported on keel blocks. The largest floating d., building at Hamburg (1913), will be capable of lifting 40,000 tons, and is 656 ft. long and 141 ft. wide over all; submergible depth, 35¼ ft.

DOCK WARRANT, certificate issued by a dock company entitling a person, named by the owner of goods in the custody of the company, to take possession of these goods.

DOCKET, summary of a document; a label; an endorsement on back of papers.

DOCKYARDS.—A dockyard is properly an establishment in which ships are constructed, repaired, and equipped. Many ships of war are now constructed by private firms, and finished in government d's. D's in England were really started by Henry VIII., first at Woolwich. At present there are d's at Portsmouth, Chatham, Devonport, Pembroke, Sheerness, Gibraltar, and Malta, and at other places in the Brit. Isles and colonies. A great naval d. is being constructed at Rosyth, on the Forth, Scotland. The coming of the 'Dreadnought' battleships has necessitated the building of floating d's. Over each d. is a superintendent who is under the general supervision of the controller of the navy. Orders are issued by the Admiralty, but the carrying out of these rests with officials, the chief of whom is the director of d's. In

U.S.A. *Navy Yards* correspond to our d's. Ger. d's have recently been considerably extended.

DOCTOR, originally a courtesy title applied to a learned person; now a univ. degree in law, divinity, medicine, science, music, letters, philosophy, etc.

DOCTORS' COMMONS, college of ecclesiastical lawyers established near St. Paul's Churchyard, London; abolished 1857.

DOCTRINAIRES, moderate royalists who supported restored monarchy in France, 1815–30; generally, theorists maintaining abstract doctrines, regardless of practical considerations.

DODD, WILLIAM (1729–77), Eng. clergyman, wrote several works; royal chaplain, 1763; executed for forgery.

DODDER (*Cuscuta*), genus of parasitic plants, order Convolvulaceæ; leafless twining stem; small flowers grow in clusters.

DODDRIDGE, PHILIP (1702–51), Eng. Nonconformist minister; pastor at Northampton, 1729; wrote *On the Rise and Progress of Religion in the Soul.*

DODDS, ALFRED AMÉDÉE (1842–), Fr. general; conquered Dahomey, 1894.

DODECASTYLE, in arch., temple with twelve-columned portico.

DÖDERLEIN, JOHANN LUDWIG (1791–1863), Ger. philologist.

DODGE, THEODORE AYRAULT (1843–1909), Amer. soldier; voluminous writer on military subjects.

DODGSON, CHARLES LUTWIDGE, LEWIS CARROLL (1832–98), Eng. humorist and mathematician; writer of *Alice's Adventures in Wonderland, Through the Looking-Glass*, etc.

DODO (*Didus ineptus*) was a flightless and extremely ungainly bird rather larger than turkey; plumage of a dark ash colour, except breast and tail, which were white, and small aborted wings, possessing yellowish white feathers with black-tipped coverts; beak large, stout, and black, tipped with pronounced horny hook; legs feathered above, yellow; heavy and short, adding to stupid appearance. As in existing flightless birds, breast-bone showed aborted keel; and coracoid and shoulder-blade met at an obtuse angle (cf. ostrich). D. was first mentioned by Dutch, XVI. cent.; in existence till latter half of XVII. cent.; ruthlessly exterminated owing to helplessness; inhabited forests; built flat open nest of grass; laid one large egg; said to have eaten pebbles; habitat, Mauritius; nearest ally, *Didus borbonicus*, formerly occurring in Réunion, also extinct; family *Dididæ*, related to *Columbidæ*, pigeons (*q.v.*).

Strickland and Melville, *The Dodo and its Kindred* (1848).

DODONA, ancient sanctuary in Epirus, N.W. Greece; temple founded by Pelasgians and dedicated to Zeus; oak tree supposed to be seat of deity; responses of oracle given by leaves rustling; consulted mainly by Ætolians, Acarnanians, and Epirots; temple and sacred oaks destroyed in 219 B.C. by Ætolians.

DODS, MARCUS (1834–1909), Scot. Presbyterian theologian and Biblical scholar; charged with unorthodoxy before Free Kirk Gen. Assembly, 1878, and acquitted; prof. at Edinburgh, 1889.

DODSLEY, ROBERT (1703–64), Eng. author and publisher; author of *Oleone* and other successful plays; founded the *Annual Register* (1759); leading publisher of his day.

DODSWORTH, ROGER (1585–1654), Eng. antiquary.

DODWELL, EDWARD (1767–1832), Eng. archæologist and traveller.

DODWELL, HENRY (1641–1711), Irish scholar and theologian.

DOG DAYS, see CANICULA.

DOG FAMILY (*Canidæ*), a family of Carnivora (*q.v.*) with over 100 species found wild in all parts of the world except New Zealand, Madagascar, the West Indies, and some of the East Indian islands. They are distinguished by their long, sharp muzzles, their long legs, ending in five and four toes on the fore and hind feet respectively; they walk on the toes alone, and these are tipped with blunt, non-retractile claws. A good skeletal character lies in the teeth, which are very numerous, usually 41, 20 being in the upper, 21 in the lower, jaw. The fur of members of the dog family is generally of a dull uniform colour, varying from white and grey to reddish-brown. They are carnivorous, feeding upon other mammals, cattle, sheep, goats, rabbits, etc., which many species hunt down in packs, or on smaller animals, such as mice, reptiles, fish, and even crabs. Most are nocturnal in habit.

The COMMON WOLF (*Canis lupus*) and its races are found only in the Northern hemisphere, but they are widely distributed over Europe, Asia, and America. They are large, fierce, and powerful animals, which hunt in packs, and, like jackals (*q.v.*) and domestic dogs, have a round eye-pupil and a bushy tail. Especially bushy are the tail and body of the North American COYOTE (*Canis latrans*), although its body is smaller and its temper is less savage than that of the common wolf. Its food consists of small mammals, such as rabbits and birds.

Of true dogs the only wild form is the Australian DINGO (*Canis dingo*), although it is probably descended from a species introduced by man to Australia at an early date. It varies in colour from red to black, and causes much destruction amongst sheep flocks.

The varieties of DOMESTICATED DOGS, many and diverse though they be, are all included under one species (*Canis familiaris*), originally descended from wolves or jackals, or both. Their differences are probably due to varied intercrossings and to the efforts of man to breed types suitable for different purposes. Only a few examples can be mentioned. Amongst wolf-like forms with moderately sharp muzzles and erect ears may be reckoned the mongrel PARIAH DOGS of Eastern European, Asiatic, and African villages, the ESKIMO DOG, the SHEEP DOG and COLLIE, and the POMERANIAN. DEERHOUNDS, LURCHERS, and GREYHOUNDS are distinguished by the fact that they hunt by sight, have long legs, and exceedingly long, sharp muzzles and slightly drooping ears. A more distinct ear-droop, associated with wider heads, thicker fur, and shorter legs, is seen in SPANIELS, SETTERS, NEWFOUNDLANDS, and RETRIEVERS; while smooth coats, deep muzzles with overlapping lips, and large, drooping ears characterise BLOOD-, OTTER-, and FOX-HOUNDS. BULL-DOGS, PUGS, and MASTIFFS have short muzzles with projecting under jaw, and TERRIERS, rough or smooth, have erect ears and a deep skull.

Several wild species exist, resembling, but differing anatomically from, the domestic dog, such as the bushy RACCOON DOG (*C. procyonoides*) of S. America, the WILD DOGS of Asia, the LONG-EARED DOG (*Otocyon megalotis*) and CAPE HUNTING DOG (*Lycaon pictus*) of S. and E. Africa, and the BUSH DOG (*Icticyon venaticus*) of Northern S. America. Lastly must be mentioned the FOXES (*q.v.*), valuable on account of their fur.

DOGE, name of chief official in republics of Genoa and Venice. About 700 A.D. the office was created in Venice. The d. held office for life, and frequent attempts were made to make the office hereditary. Gradually the people lessened the power of the d., and by the XIII. cent. the office was practically nominal; the real government was oligarchical. In Genoa the office dates from 1339. The office was abolished in both cities in 1797. See VENICE, GENOA.

DOG-FISHES, see SHARKS AND DOG-FISHES.

DOGGER BANK (54° 55′ N., 2° 30′ E.), sand-bank, centre of North Sea; extensive fisheries. In 1781 an indecisive battle was fought here between Eng. and Dutch fleets. During the Russo-Jap. War, mistaking them for hostile craft, a Russ. fleet on its way to the Far East fired on Hull trawlers (Oct. 1904), killing two fishermen and sinking a vessel. An international commission held Rozhdestvensky, the Russ. admiral, responsible, and Russia compensated the owners, the wounded, and the relatives of the dead.

DOGGETT, THOMAS (d. 1721), Irish actor;

founded (1715) sculling match for 'Doggett's Coat and Badge' for Thames watermen.

DOGMA means, in general, a principle, or doctrine, claimed to be laid down by authority. Thus a dogmatist is a person who makes positive assertions, without having the warrant of absolute evidence. In regard to the Christian religion the term is used as an authoritative expression of an article of faith, as represented by the Church's consciousness and recognised through her accumulated experience. It is also used to describe the collective body of tenets held at different periods in Church history.

Harnack, *History of Dogma* (Eng. trans., 1895–96).

Dogmatic Theology, the study of formulated doctrines of the Church; *dogma* may be viewed as the formulation by Councils or other ecclesiastical authority of what was previously only *doctrine*, i.e. belief.

DOGRA, race of Kashmir Rajputs.

DOGS, ISLE OF, peninsula, S.E. London, formed by bend of Thames opposite Greenwich; occupied by docks.

'DOGS-OF-THE-WATER,' see CARIBA.

DOG-TOOTH, zig-zag ornament common to Norman architecture.

DOL (48° 31′ N., 1° 51′ W.), town, Ille-et-Vilaine, France; XIII.-cent. cathedral; tanneries. Pop. 4708.

DOLABELLA, PUBLIUS CORNELIUS (70–43 B.C.), Rom. general; m. Tullia, Cicero's dau.; notorious for profligacy and perfidy.

DOLBEN, JOHN (1625–86), Anglican divine; dean of Westminster, 1662; bp. of Rochester, 1666; abp. of York, 1683.

DOLCE, LUDOVICO (1508–68), Ital. poet, dramatist, and translator.

DOLCI, CARLO (1616–86), Florentine artist; subjects chiefly devotional.

DOLDRUMS, region of calms near the equator, between N. and S. trade-winds.

DÔLE (47° 7′ N., 5° 30′ E.), town, Jura, France; Gothic cathedral, coll., and library; Rom. remains; iron foundries. Pop. 15,000.

DOLERITE, widely distributed igneous rock which is found associated with basalts; coarse-grained crystalline structure, occurring in dykes, sills, and lava streams. There are several varieties, including *quartz-dolerite* and *olivine-dolerite*. It is much in demand for road-making.

DOLET, ÉTIENNE (1509–46), Fr. humanist and printer; convicted of heresy and burned; *Life* by R. C. Christie.

DOLGELLY (52° 44′ N., 3° 53′ W.), market town, capital of Merionethshire, Wales; tourist resort.

DOLGORUKI, VASILY LUKICH, COUNT (1672–1739), Russ. diplomatist.

DOLHAIN (50° 36′ N., 6° E.), town, on Vesdre, Liége, Belgium; occupies part of site of ancient *Limburg*; cloth manufactures.

DOLICHONYX, see RICE BUNTING.

DOLL (of Gk. origin), diminutive of 'Dorothy'; Low. Scot. *doroty*; a child's toy. Such playthings were used by the early Egyptians, and by all races of the ancient as of the modern world.

DOLLAR, originally Ger. *thaler*, the name of a coin used in U.S.A., Canada, Newfoundland, Mexico, and other W. countries; its value is *c.* 4s. 2d. in U.S.A. and Canada. The derivation of the dollar mark ($) is doubtful; some make it a combination of the letters U.S.; others suggest a corruption of 8 (a *piece of eight*), or of P and S, the Spanish for *peso*.

DOLLAR (56° 10′ N., 3° 40′ W.), town, Clackmannanshire, Scotland; has celebrated academy (secondary school); ruined Castle Campbell; coal mines.

DOLLING, ROBERT WILLIAM RADCLYFFE (1851–1902), Anglican divine; extreme ritualist and worker in slums.

DÖLLINGER, JOHANN JOSEPH IGNAZ VON (1799–1890), Ger. theologian; ed. at Würzburg and Bamberg; prof. at Munich, 1826; devoted much time to study of ecclesiastical history, in which he became distinguished authority. Though never in sympathy with Protestantism, came, through experience of *curia*, strongly to dislike doctrine of papal infallibility; most learned and able of those who opposed papal policy which culminated in declaration of infallibility at the Vatican Council of 1870; refused to submit, and was excommunicated; declined to join Old Catholic Church, not liking idea of schism; wrote many works on Church history and doctrine.

Von Kobell, *Conversations of Dr. Döllinger*.

DOLMAN, hussar's uniform jacket; woman's cape-like coat.

DOLMEN, see STANDING STONES, BARROWS.

DOLNJA TUZLA (44° 29′ N., 18° 52′ E.), town, Bosnia; seat of Gk. bp.; considerable trade in salt, grain, live stock, timber, and coal. Pop. (1910) 11,333.

DOLOMIEU, DÉODAT GUY SILVAIN TANCRÈDE GRATET DE (1750–1801), Fr. geologist; travelled in many parts of Europe and in Egypt on geological expeditions; wrote several scientific works. Mineral *Dolomite* is named after him.

DOLOMITE, mineral occurring abundantly in the Permian system; chemical composition is: calcium and magnesium carbonate ($CaMg(CO_3)_2$); belongs to the same group of rhombohedral carbonates as calcite, and occurs as large rock masses in rhombohedral crystals, transparent and translucent; usually white or yellowish, but at times reddish-brown, green, grey, or even black. D. is also known by the names *pearl spar* and *bitter spar*. Its present name was given to commemorate some researches made by the Fr. geologist, Dolomieu (*q.v.*).

DOLOMITES, THE (46° 25′ N., 11° 50′ E.), group of limestone mts., S. Tirolese Alps; principal peak, Marmolata (*c.* 11,000 ft.).

Robertson, *Through the Dolomites from Venice to Toblach* (new ed., 1910).

DOLPHIN FAMILY (*Delphinidæ*), a family of toothed whales (*Cetacea*, q.v.) containing 63 species found in all seas. They possess teeth, usually numerous in both upper and lower jaws, and have no baleen or whalebone. There is only a single blow-hole, which is crescent shaped, the arms of the crescent directed forwards. Some of the common forms are the dolphin (*Delphinus delphis*) of the Atlantic Ocean and Mediterranean Sea, the jaws of which form a long beak; while its round-headed, beakless relatives include the Arctic narwhal (*Monodon monoceros*), with a long, horn-like tusk, in former days mistaken for the unicorn's horn; the cream-coloured white whale or beluga (*Delphinapterus leucas*), also most common in Arctic Seas; the smaller (5 feet long) gregarious porpoise (*Phocæna communis*), with dark back and white belly, found in the North Atlantic; and the black fish, pilot whale or ca'ing whale (*Globiocephalus melas*), occasionally driven ashore in hundreds by the inhabitants of Faroe and Shetland. All of the above are constant or occasional visitors to the coast of Britain.

DOMAT, JEAN (1625–96), Fr. legal writer.

DOMBES (*c.* 46° N., 5° E.), ancient division, Burgundy, France; bounded by Rhône, Ain, and Saône.

DOMBROWSKI, JAN HENRYK (1755–1818), Polish general; sometime in Fr. service.

DOME, in arch., convex roof; sometimes employed by the Romans, but a characteristic feature of Byzantine architecture. Famous d's are St. Peter's and the Pantheon, Rome; St. Sophia, Constantinople; St. Paul's Cathedral and the Albert Hall, London.

DOMENICHINO, ZAMPIERI (1581–1641), Ital. artist; b. Bologne; distinguished for his realism and as a colourist; famed also for landscapes.

DOMESDAY BOOK, Eng. survey carried out by order of William the Conqueror, contained in two vol's (which are still preserved); N.W. England, part of which was not yet conquered, is not included. Each county is divided into *hundreds*, and entries are given of all land, its owner, live stock, peasants, etc.; of inestimable value as an historical source, particularly

for genealogy and topography; by no means always easy to understand.

F. W. Maitland, *Domesday Book and Beyond.*

DOMETT, ALFRED (1811–87), Brit. poet and statesman; premier of New Zealand; friend of R. Browning, and subject of his poem, *Waring.*

DOMFRONT (48° 36′ N., 0° 40′ W.), town, on Varenne, France; ruined castle (XI. cent.); cloth manufactures. Pop. 4800.

DOMICILE, fixed place of residence; the country where one's home is. Thus, though a Frenchman may be living temporarily in England, his d. is in France. A person's civil status depends on his d.

DOMINIC, ST. (1170 - 1221), founder of Dominican Order; canon of Osma in Old Castile, 1195. From 1205–15 D. devoted himself to the Albigensian heretics of Languedoc, preaching and teaching and not resorting to violence of later Inquisition; closing years occupied in establishing his order; canonised by Gregory IV., 1234.

Herkless, *Francis and Dominic* (1901).

Dominicans, Friar Preachers, or *Black Friars* (from their habit), founded by St. Dominic, 1215; organised in two Chapters at Bologna, 1220–21; order to be governed by a master-general, to live at Rome; the rule of life was strict, and the order was to possess no property. Its spread was very wide, not only over W. Europe but in the East and Asia. D's generally controlled the Inquisition (*q.v.*). The order came to England, 1221.

The Dominican Order (1911, C.T.S.), Bede Jarrett.

DOMINICA, Dominique (15° 25′ N., 61° 20′ W.), island, Leeward group, Brit. W. Indies; surface mountainous; well covered with timber; fertile valleys, watered by numerous streams; of volcanic origin; contains sulphurous and thermal springs and famous 'Boiling Lake'; principal harbour, Portsmouth, on St. Rupert's Bay on N.W. coast; capital, Roseau; exports sugar, coffee, cocoa, limes, oils, fruit. D. was discovered by Columbus on a Sunday (*Dies Dominica*) in 1493. In 1761 Britain took the island from France, and by the Peace of Paris (1763) it was recognised as British. Fr. settlers again seized D. (1778), but in 1782 Rodney won a naval victory in the neighbourhood, and Britain again acquired the island. In 1805 a Fr. army plundered the island. Area, 291 sq. miles. Pop. (1911) 33,863.

DOMINICAL LETTER, see Calendar.

DOMINICAN REPUBLIC, see Santo Domingo.

DOMINIS, MARCO ANTONIO DE (1560–1624), Ital. theologian; bp. of Segni; abp. of Spalatro; left Rom. and joined Eng. Church (1616), becoming Dean of Windsor and master of the Savoy; returned to Rome, was seized, and d. in prison.

DOMINOES, game, which became popular in XVIII. cent., played usually with 28 oblong, ivory-faced pieces, or 'cards,' each piece being numbered from blank to 12. Consult *The Complete Dominoes Player,* and *Cavendish's Pocket Guide to Dominoes.*

DOMINUS, Latin equivalent of 'sir' or 'master,' formerly applied to knights, parsons, or landed proprietors.

DOMITIAN, Titus Flavius Domitianus, Rom. emperor (81–96 A.D.); s. of Vespasian; succ. his bro. Titus; attempted some reforms, but personally vicious; condemned his cousin, Flavius Clemens, for friendliness to Christianity; killed by a freedman.

Sir W. M. Ramsay, *The Church in the Roman Empire* (1903).

DOMRÊMY-LA-PUCELLE (48° 27′ N., 5° 40′ E.), village, Vosges, France; birthplace of Joan of Arc.

DON (57° 13′ N., 2° 0′ W.), river, Aberdeenshire, Scotland; flows into North Sea, 1½ miles N. of Aberdeen.

DON (47° 10′ N., 39° 10′ E.), river, Russia; ancient *Tanais*; rises in Lake Ivan, flows generally S. through Don Cossacks district, enters Sea of Azov, forming delta 130 sq. m. in extent; length, c. 1156 miles; important fisheries; navigable for 800 miles above mouth; in upper course connected with Volga by canal and railway.

DON BENITO (38° 55′ N., 5° 51′ W.), town, Badajoz, Spain; brandy, woollens, wheat, wine, and fruit. Pop. 16,565.

DON COSSACKS (48° 30′ N., 42° E.), government, S.E. Russia, in valley of Lower Don; belongs almost entirely to Steppe region; elevated in N. and W.; soil very fertile; mineral products—iron, salt, gypsum; agriculture, cattle breeding, fishing, important industries; extensive vineyards; ironworks, tobacco factories, tanneries, flour-mills. Area, 63,532 sq. miles. Pop. (1910) 3,496,300.

DON JUAN, Don Giovanni, hero of Span. story. He seduced a young lady and killed her father in a duel. The statue of the father ultimately dragged D. J. down to hell. The story was dramatised by Tirso de Molina, the Span. author, and has been treated by Molière, Byron, Dumas, and Mr. Bernard Shaw (in *Man and Superman*). Many operas have been composed on the theme, notably Mozart's *Don Giovanni,* and Zorilla's *Don Juan Tenorio.*

DONAGHADEE (54° 38′ N., 5° 32′ W.), seaport town, County Down, Ireland.

DONALDSON, SIR JAMES (1831–), Scot. scholar and educationist; vice-chancellor and Principal of St. Andrews University.

DONALDSON, JOHN WILLIAM (1811–61), Eng. critic and philologist.

DONATELLO, Donato di Betto Bardi (1386–1466), Ital. sculptor; b. Florence; perhaps the greatest master of the Early Tuscan school. His reliefs are well known, but his fame rests mainly upon his statues in Florence, e.g. *St. George* and *David.* See Sculpture.

Life, by Balcarres (1904), Meyer (1904), Maud Cruttwell (1911), Rhea (2nd ed., 1910).

DONATIO MORTIS CAUSA, legal term for a gift of property to become operative in event of the donor's death.

DONATION OF CONSTANTINE, traditional grant of both spiritual and temporal authority over Italy and provinces to Popes by Charles the Great; accepted as authentic in mediæval times, but now universally regarded as forgery (first attacked by Laurentius Valla, 1444); date and place not quite certain, but probably at Rome, c. 775 A.D.; spuriousness now admitted by R.C. scholars.

DONATISTS, a sect of Christians in N. Africa in the IV. cent., who separated from the Church on the election of Bp. Cæcilian of Carthage (311) over the question of the *lapsi* (lapsed), i.e. whether these Christians who had fallen away in times of persecution ought to be received back to the Church. The D's stood for merciless severity; the Councils of Arles (314) and Milan (316) pronounced against them, as also finally Carthage (411); they continued to exist till the VI. cent.

DONATUS, ÆLIUS (IV. cent. A.D.), Rom. rhetorician and grammarian.

DONAU, see Danube.

DONAUWÖRTH (48° 43′ N., 10° 46′ E.), town, at confluence of Wörnitz and Danube, Bavaria, Germany; several ancient buildings; machinery; here Allies defeated French, 1704; French defeated Austrians, 1805. Pop. 4747.

DONCASTER (53° 32′ N., 1° 8′ W.), market town, on Don, W. Riding, Yorkshire, England; originally Rom. station and the Saxon, *Dona Ceastre*; chief edifice, parish church (rebuilt, 1853); celebrated for annual race-meetings (St. Leger), dating from 1776; locomotive and carriage works of Great Northern Railway; has breweries and large agricultural trade; agricultural implements manufactured. Pop. (1911) 30,520.

DONEGAL (54° 54′ N., 7° 55′ W.), county, Ireland, in Ulster (*q.v.*); bounded N. and W. by Atlantic and Donegal Bay, S. and E. by Londonderry, Tyrone, and Fermagh; coast wild and rocky; many islands and much indented by bays; deepest, Lough Swilly;

inland, mountainous and marshy, with numerous moors, lakes, and rivers; chief river, Foyle; largest lough, Derg. D. produces granite, white marble, and freestone; manufactures include woollens and worsteds; extensive fisheries. Capital is Lifford; other towns: Ballyshannon, Letterkenny, Rathmelton, and Donegal. D. has ruins of forts, churches, castles, etc.; palace of N. Irish kings near Lough Swilly. Pop. (1911) 168,420.

Stephen Gwynn, *Highways and Byways in Donegal and Antrim.*

DONEGAL (54° 39′ N., 8° 6′ W.), market town, seaport, County Donegal, on Donegal Bay, Ireland; ruins of Franciscan monastery.

DONELSON, FORT (36° 29′ N., 87° 24′ W.), fortification, on Cumberland River, N.W. Tennessee, U.S.A.; scene of victory of Union forces, Feb. 16, 1862.

DONGOLA (18° 20′ N., 31° E.), province in Anglo-Egyptian Sudan, extending along both banks of Nile, waters fertile districts; capital is Merowé; Nubian Desert lies E.; Libyan Desert, W. The Wadi-el-Kab (*c.* 60 miles long) has good arable land; chief grain crops are durra and barley; dates extensively cultivated; fine horses bred. D. was retaken from Mahdi by Kitchener, 1896. Area, *c.* 141,000 sq. miles. Pop. *c.* 56,000.

DONGOLA, NEW (19° 10′ N., 30° 30′ E.), superseded Old D., now a ruined city, 75 miles farther up the Nile, as largest town of D. province (*q.v.*); trading centre.

DONIZETTI, GAETANO (1797–1848), Ital. composer; b. Bergamo; very rapid and prolific opera writer; over 60 operas, some of which rank among best of Ital. style; most successful—*Lucia di Lammermoor*, *The Daughter of the Regiment*, and *La Favorita*.

Hadden, *Favourite Operas.*

DONKIN, SIR RUFANE SHAW (1773–1841), Brit. general; served with distinction in Peninsula and India.

DONNAY, CHARLES MAURICE (1859–), Fr. dramatist; *L'Autre Danger*, *Éducation de Prince*, and other problem plays; member of Fr. Academy.

DONNE, JOHN (1573–1631), Eng. poet and clergyman; brought up as R.C.; ed. Oxford; studied law; accompanied Essex to Cadiz and the Azores, 1596–97; later changed his faith, pub. his anti-Catholic *Pseudo-Martyr*, was ordained, and became chaplain to James I.; held various livings, and was e Dean of St. Paul's, 1621. He was a powerful and popular preacher; pub. several vol's of sermons; and is deservedly famed for his poetry. His work in verse consists of religious poems, elegies, satires, epigrams, etc., and though his style is frequently crabbed, laboured, and artificial, his passion and imagination lend to much of his poetry a quality unsurpassed by any Eng. poet. He was the greatest of the 'Metaphysical Poets' (*q.v.*).

A. Jessopp, *Life of Donne* (1897); E. Gosse, *Life and Letters of Donne* (1899); Saintsbury and Chambers, *Donne* (Muses Library).

DONNYBROOK, S.E. suburb of Dublin; formerly a village; King John gave permission for holding an annual fair, which became notorious for rioting, and was abolished (1855).

DONOSO CORTÉS, JUAN, MARQUIS DE VALDEGAMAS (1809–53), Span. diplomatist and author.

DONOVAN, EDWARD (d. 1837), English naturalist; writer of popular books on natural history.

DOOBAUNT (63° 30′ N., 101° 30′ W.), lake, N.W. territory, Canada; receives Doobaunt, a small river, on west.

DOON DE MAYENCE, prominent figure in the Charlemagne epic cycle.

DOON LOCH (55° 15′ N., 4° 22′ W.), lake, Ayrshire, Scotland; length, 6 miles; breadth, ¼–¾ mile; surrounded by hills; through it flows river Doon.

DOORS, originally acted also as windows and were hinged with socket and peg; classic d's, either single or double, were surmounted by moulding (architrave) and often by frieze and cornice; the arch appeared in late Roman doorways. Gothic d's frequently possess central pilaster and richly ornamented portals; d. generally of wood with metal ornamentation. D's of iron are used to separate water-tight compartments on ships; folding and sliding d's are used to save space.

Doorway, one of the most important features in architecture, which has, from the earliest times, received much attention in regard to decorative effect. The d's of ancient Egyptian and Assyrian palaces and temples were generally large and splendidly ornamented. The Gk. d. was inclined inwards at the top. A characteristic feature of late Rom. arch. was the d. with semicircular head. This form was adopted in later styles of arch., and is particularly associated with the Norman. The d's of the older Eng. cathedrals are frequently of great richness and architectural beauty, but more elaborate ones are to be seen on the Continent, the portal of Reims Cathedral being a notable example.

DORAN, DR. JOHN (1807–78), Eng. writer on social history and antiquities.

DORAT, CLAUDE JOSEPH (1734–80), Fr. author; wrote novels, plays, and poems.

DORCHESTER.—(1) (50° 43′ N., 2° 25′ W.) market town, on Frome, Dorsetshire, England; occupies site of one of principal Rom. stations, *Durnovaria*; valuable Rom. remains; has grammar school, founded 1579; several fine churches, guild-hall, corn exchange, museum of antiquities, bronze statue of Barnes, Dorsetshire poet; centre of agricultural district. Pop. (1911) 9842. (2) (51° 37′ N., 1° 9′ W.) village on Thame, Oxfordshire, England; is the Rom. *Durocina*, and has a fine old abbey church. (3) (*c.* 42° N., 71° W.) southern district, Boston, Massachusetts, U.S.A.; chiefly residential; until 1869 it was a separate town of Norfolk County, on Massachusetts Bay.

DORCHESTER, DUDLEY CARLETON, VISCOUNT (1573–1632), Eng. diplomatist; ambassador to Holland (1616); supported Charles I.; cr. Viscount D., 1628.

DORCHESTER, GUY CARLETON, 1ST BARON (1724–1808), Brit. general; served in Canada under Wolfe; gov.-gen. of Canada, 1766–78; wise and tactful ruler.

DORDOGNE.—(1) (45° 5′ N., 0° 40′ E.) department, S.W. France; surface in N., mainly sterile plateaux; large area is forest, with few fertile valleys; minerals, wine, truffles. Area, 3561 sq. miles. Pop. (1911) 437,432. (2) (44° 50′ N., 0° 40′ E.) navigable river, S. France; rises on Puy-de-Sancy Mt., falls into estuary of Garonne.

DORDRECHT, DORT (51° 49′ N., 4° 40′ E.), town, on R. Merwede, province of S. Holland, Netherlands; picture-gallery; birthplace of John De Witt and two Cuyps; sawmills. Pop. (1910) 46,862. See DORT, SYNOD OF.

DORÉ, GUSTAVE (1833–83), Fr. artist and illustrator of Dante, Rabelais, Cervantes, Milton, Tennyson. *Life*, by Jerrold (1891).

DORIA, ANDREA (1466–1560), Genoese admiral; served both Charles V. and Francis I.; fought for Genoa, 1503 onwards; drove French from Genoa, and became censor, 1528; famous for naval exploits against Turkish Corsairs; suppressed conspiracies against himself; maintained the Genoese Republic until his death. See GENOA.

DORIANS, name given to one of the chief Hellenic peoples who are traditionally said to have been first settled at Doris, near Mount Parnassus, but they later occupied most of the country along the northern coast of the Gulf of Corinth, and subsequently, invading the Peloponnesus, founded the Spartan kingdom. They also founded Doric colonies in Italy, Sicily, and elsewhere. The Dorian people were distinguished by solidity of character, and their dialect and arch. by plainness and severity, in contrast with the orna'e

grace and decorativeness of the Ionians. See ARCHITECTURE, GREECE (Language).

DORIA - PAMPHILII - LANDI, Genoese family settled in Rome, descended from Andrea Doria (*q.v.*); their palace is a magnificent edifice.

DORION, SIR ANTOINE AIMÉ (1816–91), Canadian statesman and judge; Liberal leader; held office as Attorney-Gen. and Minister of Justice.

DORIS (38° 42′ N., 22° 20′ E.), in ancient geography, small mountainous district, S. of Thessaly, Greece.

DORISLAUS, ISAAC (1595–1649), Eng. judge and diplomatist; assisted in preparing charge of treason against Charles I.; murdered at The Hague.

DORKING (51° 14′ N., 1° 20′ W.), market town, on Mole, Surrey, England; gives name to breed of poultry. Pop. (1911) 7850.

D'ORLÉANS, LOUIS (1542–1629), Fr. pamphleteer and poet.

DORMER, window in a small gable which projects from the slated roof of a house; first employed about XIV. century.

DORMOUSE, small animal of nocturnal habits; common d. (*Muscardinus avellanarius*) belongs to family of Gliridæ or Myoxidæ; tawny in colour, with long, bushy tail; hibernates throughout winter; resembles squirrel in habits and food. See RODENTS.

DORNBIRN (47° 24′ N., 9° 45′ E.), town, Vorarlberg, Austria; cotton and metal goods.

DORNBURG (51° N., 11° 40′ E.), town, grand duchy of Saxe-Weimar, Germany; famous for its three grand-ducal castles.

DORNER, ISAAC AUGUST (1809–84), Ger. Prot. theologian; prof. successively at Tübingen, Kiel, Königsberg, Bonn, Göttingen, and Berlin; best-known work, *History of the Development of the Doctrine of the Person of Christ.*

DORNOCH (57° 33′ N., 4° 2′ W.), county town and royal burgh, Sutherlandshire, Scotland; part of cathedral (1245), restored (1837), forms parish church; holiday resort.

DOROHOI, DOROGOI (47° 48′ N., 26° 31′ E.), town, Moldavia, Rumania; is market for timber and produce of district; holds great annual fair. Pop. 13,074.

DOROTHEUS (fl. 530), Syrian writer on jurisprudence, who, at the instance of Emperor Justinian, prepared with others a book of *Institutes.*

DORR REBELLION, THE (1840–42), movement under T. W. Dorr to change state constitution with more equal representation in Rhode Island; government with Dorr as head elected April, dispersed June, 1842; representation is still unequal.

D'ORSAY, ALFRED GUILLAUME GABRIEL, COUNT (1801–52), Fr. man of fashion and London dandy; close friend of Countess of Blessington; he was author, painter, and sculptor; became Director of Fine Arts in Paris, but died a few days after appointment. See BEAU; also W. Teignmouth Shore, *D'Orsay: or The Complete Dandy* (1911).

DORSET, DUKEDOM AND EARLDOM OF.—William I. of England is said to have created the first Earl of D. Since then the title has been held by three famous houses: (1) JOHN BEAUFORT, eldest of John of Gaunt's children by Katharine Swynford, was cr. Marquis of D.; the title was held by several other Beauforts.—(2) THOMAS GREY, Lord Ferrers, s. of John, Lord Ferrers, by Elizabeth Woodville, queen of Edward IV., was cr. Marquess of D.; HENRY, third and last of this line, was cr. Duke of Suffolk, but beheaded and all his honours forfeited, 1554.—(3) THOMAS SACKVILLE was cr. Earl of D., 1604; notified Mary, Queen of Scots, of her sentence; wrote *A Mirror for Magistrates,* and, with Norton, *Gorboduc, or Ferrex and Porrex* (the first Eng. tragedy); CHARLES, 6th marquess, was envoy to Louis XIV. A Dukedom of D., cr. 1720, became, with other D. titles, extinct (1843).

DORSETSHIRE, DORSET (50° 50′ N., 2° 15′ W.), county, S. of England; bounded N. by Wiltshire, N.W. by Somerset, W. by Devon, S. by Eng. Channel, E. by Hampshire; area, c. 978 sq. miles; fine chalk-cliff scenery on coast. Special features are Poole harbour, Purbeck Isle (a peninsula), St. Alban's Head, Isle of Portland (connected with mainland by Chesil Bank), Portland harbour of refuge (a naval station). Inland are chalk hills or downs which afford pasture for sheep; soil is rich and well cultivated, particularly in Vale of Blackmore; there are fine orchards and dairy farms. Quarries in Purbeck and Portland supply building-stone, marble, pipe-clay; manufactures paper, flax, hemp, pottery. Principal towns, Dorchester—on Frome (county town), Bridport, Poole, Weymouth, Swanage, Wareham, and Shaftesbury. There are several ruined abbeys and castles; Sherborne, and Corfe Castle in Isle of Purbeck. D. is scene of many of Thomas Hardy's novels, and its dialect was used by Barnes, the *Dorsetshire poet.* Pop. (1911) 223,274.

Treves, *Highways and Byways in Dorset* (1906); C. G. Harper, *The Dorset Coast.*

DORT, SYNOD OF, held at Dordrecht by Dutch Reformed Church in 1618–19; upheld *Calvinism* against *Arminianism*; a most important date in history of Reformed Church.

DORTMUND (51° 32′ N., 7° 30′ E.), town, on Emster, Westphalia, Germany; has several fine old churches; is important industrial centre; extensive coal-fields; has iron and steel works and breweries. Pop. (1910) 214,333.

DORY, JOHN DORY, deep-bodied fish with protruding mouth; anterior portion of dorsal fin much enlarged; makes snoring noise owing to action of air-bladder.

DOSITHEUS, MAGISTER (IV. cent. A.D.), Gk. grammarian.

DOST MAHOMMED KHAN (1793–1863), Afghan ruler (from 1809); first of Barakzai dynasty; surrendered to Brit. forces, 1840; hostile again, 1846; made alliance 1855; d. just after capture of Herat.

DOSTOIEFFSKY, FEODOR MIKHAILOVITCH (1818–81), Russ. novelist; wrote very powerful stories dealing with peasant life and social problems, his masterpiece being *Crime and Punishment* (Eng. trans., 1885).

DOUAI (50° 22′ N., 3° 4′ E.), town, on Scarpe, Nord, France; has an arsenal and various educational institutions; in 1568 an Eng. Coll. was founded here by refugee R.C's from England; issued first Eng. version of Old Testament for R.C's (1609), the New Testament having been issued from Reims (1582); trade in corn, seed, and linen; coal-mining and brewing carried on. Pop. (1911) 36,314.

DOUARNENEZ (48° 5′ N., 4° 15′ W.), town, on Bay of Douarnenez, western France; sardine-fishing and rope-making. Pop. *c.* 14,000.

DOUBLE-BASS, stringed instrument larger than 'cello; usually with four strings, tuned in fourths; owing to unwieldiness it takes subsidiary part in orchestra, though Beethoven sometimes gives it prominence.

DOUBLEDAY, ABNER (1819–93), Amer. soldier and writer on military subjects.

DOUBLEDAY, THOMAS (1790–1870), Eng. Reform agitator and author.

DOUBLE-EYED FISH, see under KILLIFISHES.

DOUBS.—(1) (47° 10′ N., 6° 25′ E.) department, E. France, formed of part of ancient Franche-Comté; capital, Besançon; watered by Doubs and affluents; traversed by Jura mountains; good mountain pastures; plains produce wheat, oats, vines, fruit; chief industries, watch-making, iron-founding, brandy-distilling. Area, 2030 sq. miles. Pop. (1911) 299,935. (2) (47° 10′ N., 5° 25′ E.) river, E. France; rises in Jura mountains, flows N.E., joins Saône at Verdun.

DOUCE, FRANCIS (1757–1834), Eng. antiquary.

DOUGLAS.—(1) (54° 9′ N., 4° 29′ W.) seaport, capital of Isle of Man; favourite watering-place; old Castle Mona, formerly residence of Dukes of Atholl (Lords of Man), now a hotel. House of Keys, meeting-place of Manx Legislature, is at D. (2) (55° 33′ N., 3° 51′ W.) village, Lanarkshire, Scotland; has of Scott's 'Castle Dangerous.'

DOUGLAS, ARCHIBALD, 5TH EARL OF ANGUS (1449–1514), Scot. nobleman; nobles met to plot against James III.'s favourite, Cochrane, and, like mice in fable, hesitated to 'bell the cat'; D. volunteered, thus earning nickname, 'BELL THE CAT.'

DOUGLAS, SIR CHARLES, Bart. (d. 1789), Eng. admiral; introduced improvements in naval gunnery.

DOUGLAS, SIR CHARLES WHITTINGHAM HORSLEY (1850–), Brit. general; served in Afghan War (1879–80), Boer War (1881), Suakim expedition (1884); South African War (1899–1902); K.C.B. (1907).

DOUGLAS, GAVIN, GAWAIN (d. 1522), Scot. poet and bp.; third s. of Archibald, *Bell the Cat*; held the see of Dunkeld (1515–20); pub. first Eng. trans. of Virgil's *Æneid* (with prologues of his own); original allegorical poems, *King Hart*, and *The Palice of Honour*; one of leading poets in Middle Scots; romantic imagination, metrical ability, and florid vocabulary; shows genuine love of nature.

DOUGLAS, GEORGE (1869–1902), pseudonym of GEORGE DOUGLAS BROWN, Scot. author; ed. Glasgow Univ. and Oxford Univ.; wrote *The House with the Green Shutters* (1901), a powerful story and an antidote to sentimentalism of Scot. 'Kail-yaird' school.

DOUGLAS, SIR GEORGE BRISBANE SCOTT (1856–), Scot. author; wrote *Life of James Hogg* (1899), *Life of General Wauchope* (1904), etc.

DOUGLAS, SIR HOWARD, Bart. (1776–1861), Brit. general; entered army (1794); served in Peninsula (1808–9); Lord High Commissioner of Ionian Islands; gov. of New Brunswick (1823–29), and founder of Fredericton Univ. there; author of books on naval and military topics.

DOUGLAS, JOHN (1721–1807), Eng. churchman and author; held sees of Carlisle and Salisbury; edit. Captain Cook's *Journals*, Clarendon's *Diary and Letters*.

DOUGLAS, SIR ROBERT KENNOWAY (1838–), Eng. Chinese scholar; author of *Life of Li Hung Chang* (1895), *China* ('Story of the Nations,' 1899), *Europe and the Far East* (1904).

DOUGLAS, STEPHEN ARNOLD (1813–61), Amer. statesman; judge of supreme court of Illinois (1841–43); elected to Congress (1843); soon became known as one of the leaders of Democratic party; took part in quarrels over slavery, of which he did not disapprove; successfully contested senatorship with Abraham Lincoln (1858). D. was a forcible speaker and able politician.

DOUGLAS, FAMILY OF, famous in Scot. history, dates from XII. cent. SIR JAMES, 'The Good' (1286–1330), commanded part of Bruce's army at *Bannockburn* (1314); he d. in Spain while carrying Bruce's heart to Palestine. The 1st Earl of D. was William (cr. 1358). The 2nd earl, James, who was slain at *Otterburn* (1388), left no legitimate s., and the earldom went to Archibald, 'The Grim,' natural s. of Sir James, 'The Good.' His s., Archibald, became 4th earl (1372–1424); fought in France, and was slain at Verneuil. Archibald, 5th earl, d. in 1439, and his s., William, 6th earl, a mere boy, was murdered along with his bro. in Edinburgh Castle (1440). This incident—the 'Black Dinner of the Douglases'—broke the family's power, and its lands were forfeited. The D. lands proper fell to James, 'The Gross,' 7th earl. His s. William, 8th earl, restored the power of the 'Black Douglases,' and James II., alarmed at the strength of the family, treacherously murdered William at Stirling (1452). His bro., James, 9th (and last) earl, took arms to avenge William's death, was unsuccessful, and lost all his lands. The 'Red Douglases'—the Angus branch of the family—were granted the D. lands. Of this branch the best known are ARCHIBALD, 'BELL THE CAT,' 5th Earl of Angus, and his s., Gavin Douglas (*q.v.*). The D. title was restored in 1633, when Charles I. made William, 11th Earl of Angus, the 1st Marquess of D. Archibald, 3rd Marquess and 1st Duke of D., d. in 1761. His sister, Lady Jane D., m. Sir John Stewart of Grandtully. Twin sons were born, one died, and the other, after much litigation (it was alleged that he was not the s. of Lady Jane), secured the duke's estates. In 1790 he became Lord D. The title died with the 4th Lord D. in 1857.

Sir Herbert Maxwell, *House of Douglas* (1902).

DOUGLASS, FREDERICK (1817–95), Amer. (coloured) journalist, ex-slave, and anti-slavery agitator; *Life* by Booker Washington (1907).

DOUKHOBORS, a body of Russ. Nonconformist peasants, formed about 1750, holding property in common; like Quakers, reject ritual and a professional priesthood; persecuted by the Russ. Government from time to time; migrated to Cyprus (1898), thence to Canada (1899), where they number over 7000. Tolstoi sympathised with them, and they largely carry out simplicity of life and belief he advocated.

Aylmer and Maude, *The Doukhobors* (1905).

DOULLENS (50° 10′ N., 2° 20′ E.), town, Somme, France; mediæval stronghold; besieged and occupied by Spaniards (1595); restored to France (1598). Pop. 5300.

DOULTON, SIR HENRY (1820–97), Eng. potter; head of the famous Lambeth firm of drain-pipe and *Doulton ware* manufacturers.

DOUMER, PAUL (1857–), Fr. politician and administrator.

DOUMIC, RENÉ (1860–), Fr. literary critic.

DOUNE (56° 11′ N., 4° 3′ W.), town, on Teith, Perthshire, Scotland; remains of feudal castle.

DOURO, DUERO (41° 6′ N., 8° 34′ W.), river, Spain and Portugal; rises in Pico D'Urbion in Soria, Spain; flows generally W., and falls into Atlantic at Oporto; navigable to distance of 90 miles from mouth; length, *c.* 485 miles; crossed by Wellington, after desperate contest, 1809.

DOUROUCOLIS, OWL-FACED MONKEYS (*Nyctipithecus*), a genus of New World monkeys belonging to family Cebidæ (*q.v.* under *Primates*), with non-prehensile tails, nocturnal, vegetarian, and insectivorous; found in Venezuela, Brazil, Guiana, and Colombo.

DOUSA, JANUS, JAN VAN DER DOES (1545–1604), Lord of Noordwyck; Dutch scholar and politician; defended Leiden when besieged; curator of Leiden University.

DOUVILLE, JEAN BAPTISTE (d. 1837), Fr. traveller.

DOVE (52° 50′ N., 1° 50′ W.), river, Derbyshire and Staffordshire, England; rises S.W. of Buxton; joins Trent at Newton Solney.

DOVE, a term including several members of the *Columbidæ*, Brit. representatives being the stock-d., rock-d., ring-d., and, as a visitor, the turtle-d.; all are typical perchers, with compact body and powerful wings; grain feeders, with beak characterised by presence of two bare protuberances at base; easily domesticated. In Christian art the d. symbolises the Holy Ghost; also an emblem of purity or innocence, and, holding an olive branch, peace.

DOVER.—(1) (51° 7′ N., 1° 19′ E.) parliamentary and municipal borough in Kent, England; N.W. side of Straits of Dover, enclosed by chalk cliffs; historic town, important seaport, and fashionable watering-place; nearest port to France, and one of chief ports communicating with Continent. Commercial harbour has been greatly extended since 1893; great naval harbour opened, 1909. Great harbour extensions were made (1897–1900). Castle, standing on cliffs, contains ruins of Rom. lighthouse, ancient church, and keep. D. has some interesting old churches and forts, a town hall, museum, and college. Chief industries are ship-building, sail- and rope-making. D. is one of Cinque Ports, and has prominent place in history; scene of strife during civil and foreign wars. Pop. (1911) 43,647. Harbour, *Dover and its Surroundings* (1910). (2) (39° 7′ N., 75° 33′ W.) town, capital of Delaware, U.S.A.; fruit and fruit-canning. Pop. (1910) 3720. (3)

(43° 10′ N., 70° 59′ W.) city, Stafford County, New Hampshire, U.S.A.; cotton and woollen goods. Pop. (1910) 13,247. (4) (40° 53′ N., 74° 33′ W.) town, Morris County, New Jersey, U.S.A.; ironworks. Pop. (1910) 7468.

DOVER, GEORGE JAMES AGAR-ELLIS, Baron (1797–1833), Eng. hist. writer.

DOVER, HENRY JERMYN, EARL OF (d. 1708), Eng. duellist, gambler, and profligate.

DOVER, ROBERT (1575–1641), Eng. attorney; founder of the 'Cotswold Games.'

DOVERCOURT (51° 54′ N., 1° 16′ E.), watering-place, estuary of Stour, Essex, England.

DOW, GERHARD (1613–80), Dutch artist; pupil of Rembrandt; painted portraits and still life.

DOW, LORENZO (1777–1834), Amer. Methodist preacher, specially against R.C. Church.

DOW, NEAL (1804–97), Amer. soldier and temperance reformer.

DOWAGER, title given to widow to distinguish her from her son's wife; applied to ladies of rank.

DOWDEN, EDWARD (1843–1913), Irish poet and scholar; has pub. several works on Shakespeare; *Life of Shelley*; *Poems* (1876).

DOWDESWELL, WILLIAM (1721–75), Brit. politician; Chancellor of Exchequer (1765–66).

DOWER, widow's interest in real estate of deceased husband, in accordance with the Dower Act (1834).

DOWIE, JOHN ALEXANDER (1848–1907), Amer. religious leader; preached 'faith-healing'; founded Zion city on Lake Michigan, 1901. See CHRISTIAN CATHOLIC CHURCH.

DOWN (Fr. *dune*, a hill), undulating tract of land, covered with short grass, suited for pasture.

DOWN (54° 20′ N., 6° W.), county, Ulster, Ireland; bounded N. by Antrim, W. by Armagh, S. by Carlingford Lough, E. by Irish Sea. N. is hilly and fertile; in S. are Mourne Mts. and much waste land; Lagan Valley is richest in cultivation. Stock-raising and dairy-farming are carried on. Chief rivers are Lagan and Bann; principal towns are Downpatrick (county town), Newtonards, Banbridge; important fisheries and breweries; manufactures linen; some prehistoric remains. Pop. (1911) 304,589.

DOWNES, ANDREW (d. 1628), Eng. scholar.

DOWNING, SIR GEORGE (*c.* 1624–84), a preacher in West Indies; then soldier under Cromwell; resident at The Hague (1657); turned Royalist and was knighted at Restoration; cr. bart. (1663); Sec. to Treasury, 1667 (D. Street bears his name); he was a man of ability, but no principle.

DOWNMAN, JOHN (1750–1824), Eng. artist.

DOWNPATRICK (54° 20′ N., 5° 43′ W.), market town, capital of County Down, Ireland; cathedral supposed to contain remains of St. Patrick; linen.

DOWNS (50° 54′ to 51° 17′ N., 2° 32′ W. to 0° 20′ E.), two ranges of chalk hills, S.E. England. North Downs extend E. to W. from Hampshire, through Surrey and Kent to Dover. South Downs, in Hampshire and Sussex, terminate at Beachy Head.

DOWNS (51° 15′ N., 1° 28′ E.), name of a channel, E. coast of Kent, between N. and S. Foreland; forms roadstead, protected by Goodwin Sands; indecisive battle between English and Dutch fleets, 1666.

DOWNSHIRE, WILLS HILL, 1st MARQUIS OF (1718–93), Eng. politician.

DOWRY, the property which a wife brings to her husband at marriage.

DOXOLOGY (Gk. *Glory to God*), form of praise to the Deity in use in Christian Church; based on certain Scripture passages, e.g. *Isaiah* 6^3, *Matthew* 6^{13}. The *Greater D.* appears in Prayer Book in Communion Service; *Lesser D.* (based on *Matthew* 28^{19}) is sung at end of each psalm.

DOYEN, GABRIEL FRANÇOIS (1726–1806), Fr. artist.

DOYLE, SIR ARTHUR CONAN (1859–), Eng. novelist; nephew of Richard D. (*q.v.*); practised for several years as doctor; later achieved great popularity with hist. and detective stories; created the character of 'Sherlock Holmes'; wrote *The Great Boer War* (1900), several plays, and two vol's of verse.

DOYLE, SIR FRANCIS HASTINGS, Bart. (1810–88), Eng. poet; won much popularity with his military and heroic ballads.

DOYLE, JOHN ANDREW (1844–1907), Eng. historian.

DOYLE, RICHARD (1828–83), Eng. black-and-white artist; s. of JOHN DOYLE (1797–1868), the caricaturist, 'H. B.'; on staff of *Punch*; illustrated Dickens and Thackeray.

DOZSA, GYÖRGY (d. 1514), Hungarian revolutionist; drilled a rabble with intention of marching against the Turk; the landlords objected, and D.'s army turned against them. After prolonged rebellion D. was executed with revolting cruelty.

DOZY, REINHART PIETER ANNE (1820–83), Dutch Arab. scholar.

DRACHMANN, HOLGER HENRIK (1846–1908), Dan. poet and dramatist; wrote poems of fisher life, and love lyrics; and several successful plays: *Once upon a Time*, *Wayland the Smith*, etc.

DRACO (VII. cent. B.C.), Athenian archon, famous as lawgiver; tradition attributes to his laws the utmost severity, hence our adjective *Draconian*. Aristotle ascribes to him the remodelling of the *Constitution of Athens*, but modern scholars believe the Constitution to be of later date. D.'s code was cancelled by Solon.

DRACONTIUS, BLOSSIUS ÆMILIUS (V. cent. A.D.), early Christian poet.

DRAFTED MASONRY, in arch., stones with trimmed border, the centre being left rough.

DRAGASHANI (*c.* 44° 30′ N., 24° 14′ E.), town, Walachia, Rumania; wines. Pop. 4640.

DRAGOMAN (from Arab.), name used in Eastern countries for interpreter.

DRAGOMIROV, MICHAEL IVANOVICH (1830–1905), Russ. general and author.

DRAGON, fabulous monster, with griffin's head, scaly, winged body, huge claws, and barbed tail, and so represented in heraldry; common to ancient mythology, and frequently mentioned in mediæval poetry; saints and heroes were d. killers, *e.g.* Buddha, Thor, Zeus, Œdipus, Perseus, St. George, Beowulf. In Chin. and Jap. art the d. is common. It is also the name given to a species of flying or leaping lizards (*Draco volans*), and was the name of a mediæval short firearm, whence is derived 'dragoon.'

DRAGONETTI, DOMENICO (1763–1846), Ital. double-bass player.

DRAGON-FLY, ODONATA, are a group of hi developed insects possessing a long body, and a l bearing two large eyes, which rotate freely through a large angle owing to the small base of attachment. There are two pairs of wings of clear, membranous character. The insect's whole structure indicates specialisation for powerful flight. The food consists of smaller insects, captured on the wing, and held, it is believed, between the legs of the captor, whilst the useless parts are torn off, and the juicy body crushed by the powerful mouth. The nature of their food requirements makes d's inhabit reed-fringed areas of water, hedgerows, and the neighbourhood of wooded land, where their flashing metallic hues and rapid flight render them conspicuous objects. The larva, of sluggish habit, lies hidden among the vegetation of pond bottoms, and seizes its prey by means of a peculiar extensible organ termed the 'mask.'

DRAGOON, original name for a mounted soldier, who fought on foot, and was armed with a firearm called a 'dragon.'

DRAGUIGNAN (43° 32′ N., 6° 28′ E.), chief town, Var, France; olives, silk-culture. Pop. 9700.

DRAINAGE implies the drawing off of superfluous or standing water by means of channels, surface or underground. *Surface* d., in which the land is ploughed into ridges, with furrows between them into which the

water runs and is then carried into ditches, is unsatisfactory, and is now generally superseded by underground *pipe* d. D. systems must be adapted to the land, the main drain lying in the lowest natural depressions, and the parallel drains running into it along the lines of greatest slope. In flat land a fall is obtained by increasing the depth of the lower ends of the drains. The fall should be not less than 1 in 200. The main drain should be kept clear of trees and hedges, and its outlets protected by gratings. The number of parallel drains varies with the soil, a heavy, clayey soil requiring more than a light soil. D. operations are best carried out in late summer or autumn, and the cost per acre varies from £2 to £10 according to the soil and local cost of materials and labour.

Mitchell, *Handbook of Land Drainage.*

DRAKE, ADMIRAL SIR FRANCIS (c. 1545–95), Eng. seaman; b. Devonshire; took part in expeditions to Spanish Main under Hawkins; distinguished himself at San Juan de Ulloa; did great damage to Span. trade and shipping in S. America, 1572–73; first Englishman to sail round the world, 1577–80; burned shipping in Cadiz harbour, 1587; helped to defeat Armada, 1588; died at sea off Nombre de Dios.

DRAKE, NATHAN (1766–1836), Eng. physician and scholar; author of *Shakespeare and his Times* (1817), etc.

DRAKENBORCH, ARNOLD (1684–1748), Dutch scholar; famed for edit. of Livy.

DRAKENSBERG (25° S., 30° 30′ E.), mountain chain, S.E. Africa; extends from Great Fish River to Olifant's River; culminates in Mont Aux Sources, Giant's Castle, and Champagne Castle (10,000 to 11,000 ft.); numerous passes; De Beers and Van Reenen's Passes (over 5000 ft.) are crossed by railways connecting Orange Free State and Natal.

DRAMA (Gk. term meaning an act, a thing performed) is the general name for all stage lit. The Hindus, Chinese, and Japanese possessed a native d. as early as the V. or VI. cent's A.D., but it is to the Attic Greeks that one naturally turns for the beginnings of dramatic literature.

Greek Drama.—Attic tragedy grew out of the annual dithyrambic hymns and dances associated with the worship of Dionysus (Bacchus) at Athens. The word *tragedy* means 'goat-song' or 'goat-chorus,' derived from the fact that the performers originally wore goatskins to give them the appearance of satyrs. This lyrical tragedy then became transformed into primitive d. by the introduction of Ionian minstrels, called 'rhapsodes,' who recited poems upon heroic subjects, and it was by these minstrels that the Homeric cycle of poems was popularised. In course of time the rhapsode began to address himself to the chorus, thus becoming an actor, this innovation being credited to Thespis (VI. cent. B.C.), who is on this account regarded as the inventor of tragedy. Thespis is also said to have introduced the prologue. Amongst the earliest writers of Gk. tragedy were Phrynichus (512–476 B.C.), Chœrilus (524–465), and Pratinas (500–460), but it first achieved greatness in the hands of Æschylus (525–456), who introduced a second actor to the Gk. stage. He was in turn superseded in the estimation of the public by Sophocles (496–405), who added a third actor, while one of his plays, *Œdipus at Colonus*, required a fourth actor. The classic period of Attic tragedy ended its course in the dramatic work of Euripides (481–406). Briefly it may be said of these three writers that the great work of Æschylus was only surpassed by Sophocles in a somewhat stronger dramatic interest, while the plays of Euripides, though representing Gk. tragic art in the period of its decline, are distinguished by dramatic force, tender pathos, and picturesqueness of style and expression. The plays of Euripides also supplied the model for the Rom. tragic dramatists who came after.

The subjects of Gk. tragedy were taken from mythology and heroic legends. Besides single plays founded on one of these stories, Æschylus set the fashion of extending his subject over three plays, called a 'trilogy,' sometimes followed by a 'satyr-drama,' like the *Cyclops* of Euripides, which gave free play to the satyr or 'goat-chorus,' and was chiefly remarkable for a good deal of rough buffoonery. The Gk. tragic writers laid great stress upon the observance of the three dramatic *unities*: time, place, and action—that is to say, the story of the drama should not extend beyond the space of one day; there should be no change of scene; and the thread of the story should be strictly adhered to, thus linking together cause and effect.

Gk. *comedy*—comedy meaning 'village-song'—belongs to the same period as tragedy, and sprang likewise from the worship of Dionysus. In its beginnings it was associated with village festivals, in which dancing, singing, and jesting played a considerable part, and thus the comic or satiric spirit became dominant. Some of the earliest writers of comedy were Epicharmus, Chionides, Cratinus, Crates, and Eupolis. Attic 'Old' comedy, however, reached its highest quality in the work of Aristophanes, a contemporary of Euripides, whose peculiarities he persistently made it his business to satirise. For about forty years this great comic poet continued to lash his contemporaries with the whip of his keen satire. His work was succeeded by that of Alexis, Eubulus, and Antiphanes—the period being known as that of the 'Middle Comedy,' which subsequently gave place to the 'New Comedy,' the chief exponents of which were Philemon and Menander.

Such is a brief outline of the history of Gk. tragedy and comedy. The Gk. theatre, which was open to the sky, was shaped somewhat like a horseshoe, with the stage placed at the open end, and the rounded portion fitted with tiers of seats. Such theatres held from 20,000 to 30,000 spectators. The raised stage, which was narrow, was called the 'speaking-place,' and a flight of steps led down to the semicircular 'orchestra,' or dancing-place, which was reserved for the chorus. There were three entrance-doors at the back of the stage, painted scenery and hangings were used, and, subsequently, mechanical appliances to aid the ascent or descent of deities and others. The actors wore masks, and huge wigs to increase their stature, and, in tragedy, this was further assisted by wearing the *cothurnus*, a very thick-soled boot. See GREECE, *Literature.*

Latin Drama.—The Latins at an early period in their history developed a species of popular farcical play, the most distinct types of which were known as *Saturnæ*, and *Mimi*, but the d. proper was of Gk. origin, and came into existence in Rome when Livius Andronicus, a native of Tarentum, produced (240 B.C.) both a tragedy and a comedy in celebration of the victorious close of the first Punic War. Other writers immediately succeeding him were Nævius and Ennius. The plays of the three writers (of which none have survived) were modelled on the principal Gk. tragic dramatists; their plots were derived chiefly from the story of the Trojan War; and all three were also writers of comedy. The earliest Latin tragedies that remain were the work of the philosopher and rhetorician, Lucius Annæus Seneca (4 B.C.–65 A.D.), who was also the tutor of the Emperor Nero. His plays, which were adapted from Sophocles and Euripides, were chiefly remarkable for their rhetorical quality, and served as the model of the Fr. classical dramatists. The Rom. tragic period appears to have flickered out during the reign of Domitian. It has been pointed out that the earlier writers of Rom. tragedy also produced comedies, but the first author to give genuine distinction to comedy was Plautus (254–184 B.C.), who was succeeded by Terence (185–159 B.C.). Both borrowed their plots from the Greeks, but their genius in the elaboration of character and the originality of their dialogue give them a high place in dramatic lit., and later comedy owes much to them. Like Rom.

tragedy, comedy was subsequently extinguished by the stronger appeal of the arena and gladiatorial combats. See LATIN LITERATURE.

English Drama.—The decline of the d. was completed by the rise of the Christian Church, which, from the VI. to the XI. cent., remained persistently hostile to the stage, and prohibited all kinds of theatrical entertainments. Yet it is a curious fact that though the Church suppressed the d., it was subsequently the direct instrument of its revival. This was by means of *Miracle* and *Mystery* plays—dealing with Scripture history and legends of the saints—which were performed by ecclesiastics themselves in the churches throughout Europe. Miracle plays were first performed in London during the XII. cent. They reached their highest point of success when they were taken in hand by the civic trading companies of the great towns, of which Chester (1268–76) was apparently the first, though other towns followed the custom during the XIII. and XIV. cent's. Four collections of these plays—the Chester, York, Townley (Wakefield), and Coventry—still survive. The plays, in their later development, were performed upon a two-storeyed platform on wheels, the upper portion of which served as stage, and the lower as dressing-room, and this portable theatre was wheeled about the town, usually starting from the gates of a monastery. Miracle and mystery plays were succeeded by *Morality* plays, which were entirely allegorical and dealt with the conflict between good and evil. Prominent figures in these were the devil, and a buffoon, called Vice, who was the devil's lackey and tormentor. Perhaps the greatest of these morality plays was *Everyman* (*c.* 1530), which was revived in the early years of the XX. cent. Moralities date from the reign of Henry VI., and, together with miracle plays, continued to be performed until well into the reign of Elizabeth.

These were succeeded by the humorous *interludes* of John Heywood (*c.* 1500–77), of which one was *The Play of Love* (1533). *Pageants* and *masques* also belong to this period. The first Eng. comedy was *Ralph Roister Doister*, by Nicolas Udall (1505–56); and another early work of the kind was *Gammer Gurton's Needle*, printed in 1575, and sometimes attributed to Dr. Still. The earliest Eng. tragedy was *Gorboduc*, by Norton and Sackville, first acted by members of the Inner Temple before Queen Elizabeth (1562). To these succeeded a long series of *Chronicle plays* founded on Eng. history or derived from foreign sources, of which the chief exponents were Lyly, Kyd, Peele, Greene—and, by far the greatest of all, Christopher Marlowe, who has been described by Mr. Swinburne as 'the father of Eng. tragedy, and the creator of Eng. blank verse.' These writers are all dealt with under their separate heads. It may be noted, in passing, that Shakespeare, who succeeded to these bombastic playwrights, derived nearly all of his plots from these earlier plays. Shakespeare, Jonson, Beaumont and Fletcher, Webster, Massinger, Tourneur, Middleton, Ford, Dekker, and other master-dramatists belonging to the Elizabethan and Jacobean period are likewise dealt with individually elsewhere. It remains only to be said that the seed which was sown in *Ralph Roister Doister* and *Gorboduc* came to its full fruition in the plays of Shakespeare, his great contemporaries and immediate successors. Then followed a period of eclipse and silence. The Puritans closed the theatres, and the d. did not again raise its head until the restoration of Charles II. (1660).

With regard to the theatres of Shakespeare's day, they were rude circular buildings, open to the sky, with a bare stage and a plain draped scene for all purposes. Shakespeare paints his own scenery in words, hence the glorious descriptive passages in his plays. Women's parts were played by boys. There was no attempt to 'dress' a play, Elizabethan costume serving for a character belonging to ancient Greece or mediæval Italy. Thus in the great days of Elizabeth 'the play' was essentially 'the thing,' and not the trappings.

The connecting-link between the Elizabethan dramatic period and the stage of the Restoration was James Shirley (1596–1666). In *The Maid's Revenge* and other d's he proved himself to belong to the great line of the Elizabethans. The next considerable figure in the history of the English d. is John Dryden (*q.v.*), whose work belongs to the period following the Restoration. He practised the *Heroic* drama derived mainly from Fr. Romances; his *Conquest of Granada* shows the extravagance and bombast of this type. In his *Essay on Dramatic Poesy*, Dryden points out the way to subsequent dramatists. In his plays he first courted public favour with rhymed verse, but subsequently abandoned this form for blank verse. His comedies are disfigured by the immorality demanded by a licentious court and public, but in some of his tragedies there is not a little of the dignity and high purpose of the Elizabethan, and with him the Shakespearean school may be said to have ended. Amongst the rivals and immediate successors of Dryden may be named Nat Lee, Settle, Otway, Rowe, Shadwell, Wycherley, Vanbrugh, Farquhar, and Congreve. Of these only two need be referred to in particular. The work of Thomas Otway (1652–85) is distinguished in a marked degree by pathos and tenderness, and his plays, *The Orphan* and *Venice Preserved*, kept the stage until comparatively recent times. The comedies of William Congreve (1670–1729), though marked by the licentiousness of the age, are distinguished by their wit, polished dialogue, and masterly construction. The plays of Sir Richard Steele (1672–1729) and Joseph Addison (1672–1719) added no distinction to the drama. John Gay's *Beggar's Opera* (1728) may be regarded as the original of later musical extravaganza; and George Lillo's *George Barnwell* (1731) as an early example of crude melodrama. Amidst much that was worthless and trivial, the closing years of the XVIII. cent. were marked by a period of dramatic splendour due to the works of Oliver Goldsmith (1728–74) and Richard Brinsley Sheridan (1751–1816). The homespun virtue and good sense which distinguishes Goldsmith's *She Stoops to Conquer*, and the delicate wit and humour of Sheridan's three comedies, have served to keep these dramatists popular even to the present day.

The English d. of the XIX. century may be said to have been inaugurated by Lord Byron, who wrote a number of poetical d's not very suitable for stage presentation, though *Sardanapalus* has been staged within comparatively recent years. James Sheridan Knowles (1784–1862), however, enjoyed considerable vogue, and his *Virginius* and *The Hunchback* have still their admirers. The same may be said of Lord Lytton's *Richelieu*, *Money*, and *The Lady of Lyons*, which, though they now appear somewhat stilted and old-fashioned, have by no means exhausted their popularity. Confining our attention for the moment to the poetic d., we may note that Talfourd, Milman, and Sir Henry Taylor achieved a certain amount of literary celebrity in their own day. Browning's *Strafford* was produced by Macready with some acceptance; and Tennyson many times sought favour on the stage, though only *Becket* achieved a tentative success, that being due rather to the personality of Sir Henry Irving than the inherent quality of the play. Shelley's *The Cenci*, in the opinion of some critics, is the finest poetic play written since the time of the Elizabethans. Stephen Phillips, in *Paolo and Francesca* and *Herod*, is the only writer of recent times who has combined high poetic gifts with a real knowledge of stagecraft, but his later plays, such as *Nero*, showed a marked falling off from the high standard set in his earlier triumphs. Tom Taylor (1817–80) was a prolific dramatist, and obtained considerable success during a transition period

with *Still Waters Run Deep* and a series of historical plays. Of similar type was the dramatic work of W. G. Wills (1828–91), three of whose plays, *Charles I.*, *Eugene Aram*, and *Olivia*, were amongst the most successful plays produced by Irving. Dion Boucicault (1820–90) made his first success with *London Assurance*, but achieved a greater and more lasting popularity with his Irish plays, *The Colleen Bawn*, *The Shaughraun*, and *Arrah-na-Pogue*. To this period also belongs the work of Henry James Byron (1834–84), whose play, *Our Boys*, had a consecutive run of three years. He was also the successor of J. R. Planché as a prolific writer of burlesques, in which line he was followed with great success by Sir F. H. Burnand.

The turning-point in the recent history of the Eng. d. began with the comedies of T. W. Robertson (1829–71). Before the occupancy of the Prince of Wales Theatre (1865–70) by Sir Squire and Lady Bancroft, with whom were associated Sir John Hare and the Kendals, the Eng. stage was largely given up to Fr. adaptations and crude melodrama, and had brought itself into contempt with the intellectual public. The Bancrofts, however, set themselves to remedy this defect. They produced Robertson's *Society*, *School*, *Ours*, and *Caste*, in which false and mawkish sentimentality gave place to naturalness and true pictures of life. The result was that they attracted the thinking public; they reaped a golden harvest for themselves; and they gave the death-blow to the puerile rubbish which had too long held the stage. Immediately following the conclusion of the Bancrofts' triumphs at the Prince of Wales Theatre, was the entry into management at the Lyceum of Sir Henry Irving (1871), where the high and serious purpose which distinguished all his undertakings did as much, or more, for the Shakespearean and romantic drama as the Bancrofts had done for the plays dealing with modern life.

After the Robertsonian period of modern comedy the Eng. stage again succumbed to foreign influence for a short spell, but a new era in stage history was begun with the production of Sir A. W. Pinero's *Money Spinner* (1881), which, being followed by such brilliant farces from the same pen as *The Magistrate*, *Dandy Dick*, and *Sweet Lavender*, served to give their author a high place in modern dramatic lit. The last-named play was staged in 1888, and the following year witnessed the first presentation in London of Ibsen's *A Doll's House* and *Pillars of Society*, followed during the next two or three years by *Rosmersholm*, *Hedda Gabler*, and *The Master Builder*. The uncompromising realism of Ibsen's method of dealing with sociological problems quickly began to make itself felt in the work of Eng. dramatists. Forsaking farce, Pinero made a bid for popularity with *The Profligate* (1889), a play with a serious purpose, and followed this by his masterly studies of contemporary life, *The Second Mrs. Tanqueray* (1893), *The Notorious Mrs. Ebbsmith*, *The Gay Lord Quex*, *His House in Order*, and others. Mr. G. B. Shaw's *Widowers' Houses* (1892) also belongs to this period.

Contemporary with the earlier farcical comedies of Pinero were the spectacular melodramas by Paul Meritt, Henry Pettitt, G. R. Sims, and others, at Drury Lane, the Princess's, and Adelphi theatres. Under the control of Sir Augustus Harris (1879–96) Drury Lane became the chief home of melodrama, and the success which attended these productions has been continued under the management of Mr. Arthur Collins, whose principal authors have been Henry Hamilton and Cecil Raleigh. *The Lights o' London*, by Sims, was produced by Wilson Barrett at the Princess's in 1881; and other successful plays of the kind staged there were *Claudian* and *The Silver King*. Sims later wrote numerous melodramas for the Adelphi, in some of which he was associated with Robert Buchanan. The latter proved also a very successful adaptator of XVIII.-cent. novels, amongst which may be named *Sophia* (Tom Jones) and *Joseph's Sweetheart* (Joseph Andrews). Henry Arthur Jones, who began as a writer of melodrama, of which *The Silver King* is an example, proceeded later to work of a higher literary character, such as *Judah*, *The Middleman*, and *The Dancing Girl*; and subsequently, with such brilliant work as *The Masqueraders* and *The Case of Rebellious Susan*, was deservedly ranked with Pinero. Of the younger writers belonging to this period much excellent and varied work was given to the stage by Haddon Chambers, R. C. Carton, H. V. Esmond, Robert Marshall, and Basil Hood. Sydney Grundy was for long a successful purveyor of stage fare, one of his best efforts being *A Pair of Spectacles*, produced by Sir John Hare. John Davidson (1857–1909), though he wrote many literary plays, only achieved a stage success with a translation of Coppée's *Pour la Couronne*. The plays likewise of Stevenson and Henley, though admirable as lit., could never be successful upon the stage. The plays of Mr. J. M. Barrie, including *Quality Street*, *The Admirable Crichton*, *Peter Pan*, and *What Every Woman Knows*, all distinguished by a kindly humour, are amongst the most delightful productions of the modern theatre. The plays of Oscar Wilde, beginning with *Lady Windermere's Fan* (1892) and ending with *The Importance of Being Earnest* (1895), are marked by a distinctly individual style, and won public favour by their brilliant flow of epigram. A passing reference can only be made to the revolution caused in light opera by the delightful series of comic operas produced by Sir Arthur Sullivan and Sir W. S. Gilbert, which began with *The Sorcerer* (1877), the popularity of all of which still continues.

For some years past the most successful plays, from the manager's point of view, have been 'costume' melodramas and dramatised novels, of which *The Three Musketeers*, *Under the Red Robe*, *The Scarlet Pimpernel*, *Sweet Nell of Old Drury*, *Henry of Navarre*, *The Eternal City*, and *The Prodigal Son* may be quoted as examples. Side by side with these, however, there have been produced plays which have attacked social problems and abuses in a fearless manner, and for these there has latterly been a growing appreciation. We may perhaps regard Mr. George Bernard Shaw as the pioneer of this type of play. Amongst later writers the plays of Mr. Alfred Sutro have proved highly successful, and much work of excellent literary quality has been done by Mr. St. John Hankin, Mr. Arnold Bennett, Mr. Charles M'Evoy, and others. In *Waste*, and other of his plays, Mr. Granville Barker relentlessly probes modern social problems; and John Galsworthy in *Strife* and *The Silver Box* deals with similar themes. John Masefield, in *Nan*, has contributed to the stage perhaps the greatest tragedy of modern times; but in *Pompey the Great* his experiment in dealing with a classical subject in colloquial English has not been so successful.

One of the most remarkable theatrical movements of modern times was the establishment, a few years ago, in Dublin, of the Irish National Theatre, which was subsidised by Miss A. E. F. Horniman. This enterprise brought to light the works of many native Irish writers, but its most outstanding productions have been plays by W. B. Yeats, J. M. Synge, and Lady Gregory. In such plays as *Cathleen-ni-Hoolihan*, *The Hour-glass*, and *Deirdre*, Mr. Yeats has successfully exploited that vein of mysticism for which he has won a deserved reputation. Lady Gregory's plays are distinguished by boisterous humour and keen insight into Irish character. The plays of Synge (1871–1909), however, stand apart, and reveal their author as one of the most original playwrights of modern times. The brooding sorrow of *Riders to the Sea*, the remote atmosphere of *The Shadow of the Glen*, and the gorgeous rhetoric of *The Playboy of the Western World* are alike remarkable. Miss Horniman subsequently founded the first repertory theatre in the kingdom (Gaiety Theatre, Manchester). Repertory theatres have since been established at Liverpool and Glasgow. In 1908 a scheme was projected for the establishment and endow-

ment, in London, of a Shakespeare Memorial National Theatre, for the performance only of high-class d. The sum required is £500,000,

The development of d. in Europe, from the period of its decline under the Rom. Empire, may now be briefly reviewed. The revival began in **Italy** in the XIII. cent., but did not become remarkable before the XVI. cent., to which period belongs the work of Trissono, Rucellai, Guarini, Tasso, Asinari, and Torelli. To these succeeded Granelli, Bettinelli, and Metastasio, writers of high merit, who led on to the work of the supreme master of Ital. tragedy, Count Alfieri (1749–1803). Ital. comedy is represented by the work of Ariosto, Goldoni, and Gozzi, and numerous smaller writers since. Manzoni in XIX., D'Annunzio in XX., cent. imparted individuality to Ital. drama. See ITALY, *Literature*.

Spanish Drama was supreme in Europe at one period. Its Augustan age, when national drama flourished, began with the plays of Cervantes (1547–1616), and was continued by the masterly works of Lope de Vega and Calderon; after which followed a long period of silence, to be broken by the powerful dramas of Echegaray in the late XIX. cent.

In **France** the first great dramatic revival began with the associates of Ronsard, who constituted the 'Pléiade,' a leading member of which was Étienne Jodelle (1532–73), author of *Cléopâtre, Didon,* and *Eugène*. The classical d. found its great exponent in Corneille (1606–84), and the movement was developed and enriched by the plays of Racine and Voltaire. Molière (1622–73) proved himself to be one of the greatest humorists the world has produced; and the brilliant light comedies of Marivaux (1688–1763) belong to the glories of the Fr. stage. Reference must also be made to the comedies of Beaumarchais and de Musset, the domestic d. of Diderot, the romantic plays of Hugo, and the varied and excellent dramatic work produced by Scribe, Sardou, Augier, Dumas *fils*, Richepin, Rostand, Coppée, Bernstein, and the realistic Brieux. The Belgian Maeterlinck may also be mentioned under Fr. drama. See FRANCE, *Literature*.

In **Germany** the dramatic movement was slower, and from the period of the miracle plays down to comparatively modern times there is little to be recorded save the work of the Nuremberg shoemaker, Hans Sachs (1494–1576), who by virtue of his numerous homely tragedies and comedies has been described as the father of the Ger. popular d. Eng. theatrical companies visited Germany during the XVI. and XVII. cent's, but there was practically no native development until the rise to fame of Lessing (1729–81), who with *Minna von Barnhelm*—regarded as the first Ger. comedy worthy of the name—and his serious plays, *Emilia Galotti* and *Nathan the Wise*, first gave a dramatic lit. to Germany. His lead was followed and developed by the great d's of Goethe (*q.v.*), the historical plays of Schiller (*q.v.*), and the numerous exponents of the *Sturm und Drang* school. In recent times the best-known Ger. dramatists are Sudermann and Hauptmann, both members of the Naturalistic school. See GERMAN EMPIRE, *Literature*.

The **Scandinavian** d. is distinguished by the fine work of the Dan. comic dramatist, Baron Holberg; and by the realistic sociological plays of the Norwegians, Ibsen and Björnson, which, like the dramatic works of the Swede, Strindberg, belong to XIX. cent.

United States.—The first Amer. play to be produced was *The Contrast* (New York, 1786), by Royall Tyler; but the first drama of any importance was John Howard Payne's tragedy, *Brutus, or The Fall of Tarquin*. Translations, adaptations and imitations of French drama formed the bulk of staged plays during the greater part of XIX. cent., though Denman Thompson's *Old Homestead* and plays of the sort depended wholly on national and local conditions which they portrayed with remarkable fidelity. The farces of Charles H. Hayt and scenes from low life by Edward Harrington, though faulty in construction, were also native and independent. *Shore Acres* (1892), a New England drama by James A. Herne, followed but easily surpassed in art the *Old Homestead*; and Herne's later play *Griffith Davenport* (1898) was finer still—though all his plays dealt with the more obvious and plainer sides of human nature. Augustus M. Thomas (*Alabama, The Witching Hour*), Clyde Fitch (*The Climbers*, 1900; *The Girl with the Green Eyes*, 1902), William Vaughan Moody (*The Great Divide*, 1907), Eugene Walter (*The Easiest Way*, 1909), Edward Sheldon (*Salvation Nell*), Percy Mackaye (*Jeanne d'Arc*, 1906), David Belasco, William Gillette and Charles Vlein are all dramatists of ability. Bronson Howard (1842–1908), the greatest of Amer. dramatists, was much influenced by the Fr. school. His *Young Mrs. Winthrop* is a very fine piece of work, and *Saratoga*, an amusing farce, was played in Berlin.

Ward's *History of English Dramatic Literature*; C. Dibdin's *Complete History of the English Stage*; and R. W. Lowe's *Bibliographical Account of English Dramatic Literature*; Wm. Archer, *Playmaking* (1911).

DRAMBURG (50° 30′ N., 15° 45′ E.), town, on Drage, Prussia; cottons, woollens. Pop. 6106.

DRAMMEN (59° 47′ N., 10° 18′ E.), seaport town, Norway; timber; sawmills. Pop. (1910) 24,895.

DRANE, AUGUSTA THEODOSIA (1823–94), Eng. poetess and historical writer; R.C. Dominican nun at Stone (Staffs).

DRAUGHTS, game played with 'draught-men' on a checkered board; supposed to be of very early invention; some such game was played by the ancient Egyptians and Greeks. The game is played between two persons, each having twelve 'men,' or pieces, those of one player being dark, the other light. It is played on a draught-board, divided into sixty-four spaces, alternately light and dark, the pieces being placed on one colour only. Lots are cast for the choice of men; black moves first; and the object of the game is to clear off all the opponent's pieces.

DRAVE, DRAVA (45° 30′ N., 18° 45′ E.), river, Austria-Hungary; rises in Tyrol; flows generally E.; joins Danube 14 miles E. of Eszeb.

DRAVIDIAN, collective Sanskrit name for a very ancient, black-skinned tribal people, inhabiting Southern India, and their various languages. They were settled in India before the arrival of the Aryans, and now number about 58,000,000. They have about twelve languages, which include Tamil, Kanarese, Gōndī, Telugu, Malayalam. See INDIA (*Language*).

DRAWING, expression of form by means of pencil, pen, etc., is conventional, for a sketch of a pail shows an outline non-existent in the object. In pen-drawing merit depends on an artist's appealing to the imagination by using minimum of lines (*e.g.* Phil May in figure-work, Herbert Railton in arch.).

D. taught in schools includes d. and shading from still life—vases, flowers, etc.—in charcoal or B.B. pencil; *free-arm*, d. on blackboard with chalk; *designing* of panels, book-covers, etc., generally associated with colour-work. Technical classes study *machine-d.*, *building construction*, etc., in which mathematical instruments are used. See PERSPECTIVE, ILLUSTRATION.

DRAWING AND QUARTERING, treason penalty imposed in England from XIII. to XIX. cent. The culprit was first hanged, cut down alive, disembowelled, and his entrails burned; he was then beheaded and his body cut in four.

DRAYTON, MICHAEL (1563–1631), Eng. poet; wrote *Polyolbion* (1613), a gazetteer of England in verse, *The Barons' Wars, England's Heroical Epistles, Nymphidia*; wrote 'Agincourt' poem and great sonnet, 'Since there's no help, come let us kiss and part.'

DREAMS, or conscious processes during sleep, are (like sleep itself) not well understood. The savage's theory is usually that during sleep the soul may leave the body or be visited by the souls of others, living or dead; and at a later stage d's are still considered prophetic. Telepathic communication is believed to occur comparatively frequently during sleep. Dream-

less sleep is probably common; nor is the rapidity of d.-processes probably so great as is popularly supposed. Adults often forget their d's on waking, though a casual clue sometimes recalls them; children remember their d's more easily and are more liable to confuse d.-experiences with actual occurrences. D's are most commonly of objects of vision and hearing, though many kinds occur. A rare but important type is that in which the sleeper dreams that he has a d. Usually d's are distinguished as due to (1) central excitation, corresponding, *e.g.*, to memories of interesting objects, and (2) stimulation from visceral and other processes in the body—*e.g.* the 'flying' d. has been attributed to the movements of breathing—and from temperature and other external stimuli. Freud's theory that d's are the expression of a latent wish has attracted much attention: he maintains that the apparently nonsensical sequences so common in d's are really elaborate symbolism corresponding to deep-rooted wishes of which the subject may be totally unaware.

Mitchell, *About Dreaming, Laughing, and Blushing.*

DRED SCOTT CASE.—Dred Scott, a slave of Missouri, was taken to Illinois (1834) and to Minnesota (1836) where slavery was prohibited, and back again to Missouri, 1838. In 1848 he sued for freedom on ground that residence in free territories had removed his status as slave. He was non-suited by the Supreme Court, U.S.A., on ground that slaves or descendants of slaves had no status in Federal Courts.

DREDGING, operation of removing mud, silt, and other deposits from the bottom of harbours, canals, or rivers. The simplest form of dredger is the bag-and-spoon apparatus. This consists of a large spoon-shaped iron hoop, attached to which is a stout leather bag perforated with small holes. The hoop is shaped so as to scoop up into the bag the soft matter at the bottom. A chain is attached to the spoon, which is raised by a winch. For d. on a large scale, as in keeping a clear channel for large ships, or in deepening the bed of a river, the steam dredger is now universally employed. An endless chain, carrying a succession of iron buckets, passes over a frame or ladder, which is adjustable so as to regulate the depth at which the work is carried on. The buckets tear up the material at the bottom, and ascend on the upper side of the frame. When the top is reached they turn over to descend on the under side of the frame, and in so doing they empty their contents into *hoppers*, which are provided with hinged flaps at the bottom, through which the dredgings are discharged when a suitable place of deposit is reached.

Dredgers are also used for excavating and sifting soil from river beds containing gold. D. also includes the operation of dragging the sea bottom for oysters or for shells, plants, and other material for scientific observation. The oyster dredge consists of an iron frame with bag and suspending apparatus. One side of the frame is provided with a scraper, by means of which oysters are lifted and passed into the bag as the dredge is drawn over the sea bottom. The dredges used by naturalists are mostly modifications of the oyster dredge, adapted for use at great depths.

DRENTE, DRENTHE (52° 50′ N., 6° 35′ E.), province of Holland; capital, Assen; bounded N. and N.E. by Groningen, E. by Prussia, S.E. by Hanover, S. and S.W. by Overyssel, W. by Friesland; area, 1030 sq. miles; flat, sandy fenland, overrun by canals for business of peat-digging; more fertile along banks of rivers; stock-rearing; few important centres or industries owing to land and isolated position. Pop. (1910) 176,043.

DRESDEN (51° 2′ N., 13° 43′ E.), capital of Saxony, Germany; beautifully situated on Elbe; *Altstadt* on left bank, *Neustadt* on right bank, connected by fine bridges; educational, sport, and tourist centre; favourite residential resort for foreigners, especially Americans and English; within easy reach of beautiful Saxon Switzerland. Among finest buildings are royal palace with Green Vault (state treasury), Zwinger, a rococo edifice erected by Augustus the Strong (1694–1733) as Court of uncompleted palace (now a museum); magnificent royal opera house (perhaps most popular in world), royal theatre, royal picture-gallery (containing Raphael's *Sistine Madonna* and other masterpieces), Johanneum (rich in Dresden porcelain), Albertinum, and other museums; Rathaus, Frauenkirche, R.C. church, royal Belvedere concert hall on Brühl Terrace (famous promenade along Elbe bank), and royal conservatory of music. Chief manufactures are pianos, sewing-machines, leather wares, etc., and celebrated china ware (Royal factories at Meissen). D. was made capital by Henry the Illustrious, 1270; seat of Albertine line of dukes, 1485; flourished in XVIII. cent. under Augustus I. (the Strong) and Augustus II.; suffered severely during Seven Years War; famous battle of D., 1813, in which Napoleon defeated Allies. Pop. (1910) 546,882.

DRESS, see COSTUME.

DREUX (48° 44′ N., 1° 22′ E.), town, on Blaise, France; ancient *Durocasses*; from among ruins of castle rises the Chapel of St. Louis, burial-place of Orleans family; scene of defeat of Huguenots by Montmorency, 1562; boots and shoes. Pop. 7921.

DREW FAMILY, Amer. actors. **John Drew** (1825–62), b. Dublin, made first appearance in New York, 1846. His wife, **Louisa Lane D.** (1820–97), b. London, made début, Philadelphia, 1828; played Lady Teazle, 1834; most famous rôle was Mrs. Malaprop. Their son, **John** (1852), a comedian, was leading man in Daly's Company (1879); famous rôles, Petruchio, Charles Surface and leading parts in *The Liars, Richard Carvel*, etc.

DREW, SAMUEL (1765–1833), Eng. Wesleyan theologian; wrote *Essay on the Immateriality and Immortality of the Soul*; edit. the *Imperial Magazine.*

DREWENZ (53° 4′ N., 18° 55′ E.), river, Germany, rises near Hohenstein, flows S.W., and enters Vistula.

DREXEL, ANTHONY JOSEPH (1826–93), Amer. banker; founder of Drexel Institute, Philadelphia.

DREYFUS, ALFRED (1859–), Fr. soldier; Alsatian Jew; victim of shameful political plot, 1894, due to Anti-Semitism (*q.v.*); rehabilitated, 1906.

DRIBURG (51° 44′ N., 9° 3′ E.), town, Westphalia, Germany; mineral baths.

DRIFFIELD (54° N., 0° 26′ W.), market town, Yorkshire, England; oil-cake. Pop. (1911) 8680.

DRIFT (geol.), name formerly used to describe earth and rocks deposited on surface of land by icebergs or glaciers in Pleistocene epoch; (mining) direction of course of tunnels between two shafts in a mine.

DRINKING CUPS.—From the earliest times when domestic vessels of any sort were used, it is probable special ones were fashioned for drinking purposes; sometimes natural vessels were used, such as coco-nuts, or large eggs. Among remains of the New Stone and Bronze Ages, vessels have been unearthed which, it is supposed, were intended for drinking. Among the remains of Ægean and ancient Gk. civilisation, many drinking cups, some of beautiful shape, have been discovered—one, the golden cup of Mycenæ, with handles on each side. Endless shapes are found in pottery. In the Middle Ages drinking horns were frequently used, some very large; plain bowls are also found.

The finest examples, however, of cups, are the chalices of the Church; these were often richly ornamented, and of very beautiful workmanship. At the Reformation in England the chalice gave place to simpler communion cups. For common use in the Middle Ages wood was employed. Among the few gold cups that remain is that of the Eng. kings (made about 1380), which, after various adventures, has found its way into the Brit. Museum, being bought for £8000. A big drinking cup was sometimes called a *hanap*, the ancestor of our 'loving cup.' A favourite table ornament in the Middle Ages was a *nef* (Lat. *navis*, ship), the object of which was to hold napkins and cutlery; it became an article of table decoration rather than of use. Among abnormal forms were the

glass 'yard of ale,' and globe-shaped vessels—rather a favourite form in Germany. Tankards were favourites once, and tea and coffee cups are modern; the former at first had no handles.

DRISLER, HENRY (1818-97), Amer. scholar.

DRIVER, SAMUEL ROLLES (1846-), Eng. theologian.

DRIVING, act of impelling, forcing along, keeping an animal or machine in motion. The word is more generally applied to the art of directing horses or other draught animals, and as such dates back to the earliest hist. period. D., as a modern Eng. sport, may be said to have begun about the end of the XVIII. cent. with the introduction of springed carriages and macadamised roads, the latter being named after the inventor, John Loudon Macadam (1756–1836). The first amateur driving club was formed about 1807. The driving of two horses side by side is known as 'double-harness'; one behind the other, 'tandem'; four horses in couples, 'four-in-hand.'

Duke of Beaufort, *Driving* ('Badminton Library').

DROGHEDA (53° 42′ N., 6° 21′ W.), seaport, Ireland, in Louth, Leinster, on river Boyne; industries include milling, brewing, iron-casting, and tanning; manufactures linen and cotton; trades chiefly with Liverpool. Poynings' Laws were enacted here (1494). D. was stormed by Cromwell (1649); surrendered to William III. (1690); near site of *Battle of Boyne*; remains of ancient ecclesiastical buildings and town walls. Pop. (1911) 12,425.

DROIT, legal term meaning certain rights, or dues; *d's of Admiralty* are perquisites formerly belonging to Court of Admiralty, now to the nation; they include treasure, derelict, whales, goods taken from an enemy.

DROITWICH (52° 16′ N., 2° 9′ W.), town, Worcestershire, England; brine springs, 170 ft. deep and producing annually 100,000 tons of salt, have been worked since time of ancient Britons; brine-baths. Pop. (1911) 4146.

DRÔME (44° 40′ N., 5° 10′ E.), department, S.E. France; formed of parts of Dauphiné and Provence; capital, Valence; traversed by numerous streams; surface mountainou , E. and S., partly forested; valley of Rhône fertile; produces wheat, olives, fruit, and wine; minerals include iron, lignite, lead, copper; silk-worm rearing, flour-milling; iron and woollen goods. Area, 2533 sq. miles. Pop. (1911) 290,894.

DROMEDARY, see under CAMEL FAMILY.

DROMORE (54° 25′ N., 6° 9′ W.), market town, County Down, Ireland; cathedral contains tomb of Jeremy Taylor.

DRONE, name given to the large pipes in a bagpipe, each emitting a single note, the melody being supplied by the chanter.

DRONFIELD (53° 18′ N., 1° 28′ W.), town, on Drone, Derbyshire, England; collieries. Pop. (1911) 3943.

DRONTHEIM, see TRONDHJEM.

DROPSY, accumulation of watery fluid in any of the cavities or tissues of the body, most often due to heart or kidney disease. Different terms are applied to d. in different positions: *anasarca*, in subcutaneous tissues; *ascites*, in the abdominal cavity; *hydrothorax*, in the pleural cavities; *hydropericardium*, in the pericardium; *hydrocephalus*, in the cavities of the brain.

DROSTE-HULSHOFF, ANNETTE ELISABETH, COUNTESS VON (1797–1848), Ger. authoress; wrote tales and lyric verse.

DROUAIS, JEAN GERMAIN (1763–88), Fr. artist; religious and hist. subjects.

DROUET, JEAN BAPTISTE (1763–1824), Fr. Revolutionist; instrumental in capture of Louis XVI.

DROWNING, death by submersion in water or some other liquid, due to asphyxia, through the liquid's preventing air going into the lungs. It was in former times a method of capital punishment, dating at least from the Romans, the last occurrence in Britain being the drowning of the Wigtown martyrs (1685). In attempting to rescue a drowning person the rescuer should approach from behind to avoid being grasped if the person struggles, turn him on his back, and then, lying on his own back, the rescuer should swim away, holding the other at arm's length. It may be necessary to overpower the struggling person by holding him under the surface of the water by the nose and chin, or by raising his arms up from behind, with the rescuer's arms under his armpits, so that further struggling is impossible.

Artificial respiration should be attempted at once with a person who is apparently drowned, and should not be discontinued for hours until it is quite certain that resuscitation is impossible. Various methods of artificial respiration have been devised, particularly by Marshall Hall, Silvester, and Howard, but experiments and practice have shown that the method of Professor Schäfer is the best. The apparently drowned person is laid on the ground face downwards, while the person who is operating kneels astride his body at the level of the knees, facing the head. He places his hands one at each side over the lowest ribs, and throws the weight of his body forward to produce firm pressure, so that air and water are driven out of the patient's lungs. Then the operator raises his body, thus relieving the pressure, but keeping his hands in the same position, and this swaying backwards and forwards is repeated from 12 to 15 times a minute. The advantages are that the amount of air exchanged at each respiration is much greater than by any other method, water and mucus very easily find an exit through the mouth, while it is the least fatiguing method to the operator.

DROYSEN, JOHANN GUSTAV (1808–84), Ger. historian; prof. of History, Kiel, Jena, and Berlin; wrote *Geschichte Alexanders des Grossen*, *Geschichte des Hellenismus*, and *Geschichte der preussischen Politik*.

DROZ, ANTOINE GUSTAVE (1832–95), Fr. novelist; author of *Monsieur, Madame et Bébé*, etc.

DROZ, FRANÇOIS-XAVIER JOSEPH (1773–1850), Fr. scientific writer.

DRUG (21° 8′ N., 81° 15′ E.), town and district, Chattisgarh division, Central Provinces, India. Area, 3807 sq. miles. Pop. 628,885.

DRUG, any substance used as a medicine or in the composition of medicines (see PHARMACOLOGY); often particularly meaning a poison; term applied to an unsaleable article—'a drug on the market.'

DRUGGISTS, see PHARMACY.

DRUIDISM, religion of ancient Gaul; also of Britain, where it reached its highest point of development. The Druids practised divination and human sacrifice. The use of the mistletoe in England is a survival of D. Druids wore white robes and a coronet of oak. Modern D. is merely a picturesque revival.

Anwyl, *Celtic Religion* (1906); Rhys, *Celtic Britain* (3rd ed., 1904).

DRUIDS, ORDER OF, masonic society, founded in London (1781), with offshoots now in America, Australia, and Germany.

DRUMCLOG, moor on borders of Ayrshire and Lanarkshire, Scotland; scene of unimportant victory of Covenanters over king's troops under Graham of Claverhouse, 1679.

DRUMMOND, HENRY (1786–1860), Eng. politician; associated with Edward Irving (*q.v.*) in founding Catholic Apostolic Church.

DRUMMOND, HENRY (1851–97), Scot. scientist; wrote *Natural Law in the Spiritual World*, *Ascent of Man*, etc.

DRUMMOND, WILLIAM, OF HAWTHORNDEN (1585–1649), Scot. poet; ed. Edinburgh High School and Univ. Being possessed of ample private means, he devoted his life to verse-writing and mechanical invention. His best work is contained in his sonnets. He was the entertainer (1619), at his home, near Edinburgh, of Ben Jonson; his often-quoted *Conversations* with that great Elizabethan have caused much controversy, and were not intended for publication.

DRUMMOND ISLAND (46° N., 83° 40′ W.), island, Lake Huron, Michigan, U.S.A.

DRUMMOSSIE MOOR, see CULLODEN.

DRUMS, musical instruments, are of three kinds: *Bass* d's, *Kettle* d's, and *Side* d's. They consist of cylinders covered at each end with vellum. The two latter are tuned by means of screws on the rim of the instrument; the first-named is regulated by means of leather braces fixed upon the zig-zag cord round the cylinder.

DRUNKENNESS, see LICENSING LAWS, TEMPERANCE.

DRURY, SIR WILLIAM (1527–79), Eng. soldier and administrator.

DRUSES, an Eastern people, largely of Arab stock, who are traditionally said to have been established in the neighbourhood of Lebanon since the IX. cent. They now inhabit, besides the mountainous parts of Lebanon, parts of Anti-Lebanon and Hauran (Syria), and their numbers are estimated at from 100,000 to 150,000. Their religious system, which is very complex, is a mixture of Muhammadanism, Christianity, Judaism, and other creeds. They believe in one supreme, incomprehensible God, who has revealed Himself to men by numerous incarnations, the last of which was in the person of Hakim Biamrillah (996–1021 A.D.), sixth Fatimite Caliph, who announced himself as the Deity (1016) at Cairo. They are a handsome race; the women are always closely veiled; polygamy does not exist amongst them.

Lord Carnarvon's *Recollections of the Druses*.

DRUSIUS, JOHANNES (1550–1616), Flem. Orientalist.

DRUSUS CÆSAR (d. 23 A.D.), only s. of Emperor Tiberius; poisoned by his wife and her paramour, Sejanus.

DRUSUS, MARCUS LIVIUS, Rom. statesman; tribune with Gaius Gracchus, 122 B.C.; consul, 112; fought in Macedonia. His s., of same name, was tribune (91 B.C.); reformed senate; murdered (91 B.C.).

DRUSUS, NERO CLAUDIUS (38–9 B.C.), s. of Livia, and bro. of Emperor Tiberius; Rom. general; fought in Ger. campaign, 12–9 B.C.; pushed forward frontier by defeating Rhæti; m. Antonia, dau. of M. Antonius; his sons were Emperor Claudius and Germanicus, f. of Emperor Gaius (Caligula).

See *Tiberius the Tyrant*, by Traver (1902).

DRY ROT, disease which attacks timber; caused by damp, or lack of fresh air. It is due to a fungus which eventually reduces the wood to powder.

DRYADES (or Dryads), in classical myth., nymphs associated with woods and trees.

DRYANDER, JONAS (1748–1810), Swed. botanist; one of the founders of Linnæan Society.

DRYBURGH ABBEY, Præmonstratensian abbey, on Tweed, near Melrose, Berwickshire, Scotland; founded (probably) 1150; burnt by Edward II., 1322; restored but finally destroyed, 1545; burial-place of Sir Walter Scott.

DRYDEN, JOHN (1631–1700), Eng. poet and dramatist; b. Aldwinkle; s. of a Northamptonshire rector; ed. Westminster, and Trinity Coll., Cambridge; m. dau. of Earl of Berkshire; Poet Laureate and Historiographer Royal (1670). D. was a voluminous dramatist during the greater part of his life, but much of his dramatic work is characterised by the gross immortality of his age; he wrote Heroic plays in rhyme, and later adopted blank verse, as in his best-known play, *All for Love*. D. began his career as poet with *Heroic Stanzas on the Death of Oliver Cromwell* (1658), followed by *Astræa Redux* (1660), in celebration of the Restoration. One of his strongest poems, *Annus Mirabilis* (commemorating the Fire of London and Dutch War), appeared in 1667; *Absalom and Achitophel* (political satire), in 1681; *The Medal*, in 1682; *MacFlecknoe* (satire on the poet Shadwell), in the same year; *Religio Laici* (religion of a layman), in 1683; and *The Hind and the Panther* (defence of Church of Rome), in 1687. The strong, vigorous English of these poems, their keen invective, and satirical quality, give D. very high rank amongst Eng. poets. His poems, like his earlier plays, popularised 'heroic verse' (rhymed decasyllabic couplets) as opposed to 'blank verse.' The lyrical poems, *Ode for St. Cecilia's Day*, and *Alexander's Feast*, written in his later years, served but to increase his fame. Nor must his *Essay on Dramatic Poetry* (1668) be forgotten; it is valuable for its critical qualities and as a masterly piece of prose. D. rescued poetry from the bombast of Elizabethan decadent poets, prose from the prolixity and ornateness of writers like Milton and Clarendon; he was one of the great pioneers of Eng. criticism. Saintsbury, *Life*.

DRYING-MACHINE, apparatus for drying fabrics. A common type used in laundries is a perforated cylinder revolving within a metal cylinder at a great rate; by centrifugal force the water flies from inside to outside cylinder. Cotton may be dried by passing over rollers heated internally by steam, but linen is marred by this process.

DRYOPHIS, WHIP-SNAKE, genus of tree-dwelling snakes; not venomous; native of India, Africa, America.

DRY-POINT, see ETCHING.

DUBARRY, COMTESSE, see BARRY, COMTESSE DU.

DU BARTAS, GUILLAUME DE SALUSTE, see BARTAS.

DU BELLAY, GUILLAUME, see BELLAY, GUILLAUME DU.

DU BELLAY, JEAN, see under BELLAY, GUILLAUME DU.

DU BELLAY, JOACHIM, see BELLAY, JOACHIM DU.

DU BOIS-REYMOND, EMIL (1818–96), Ger. physiologist; prof. of Physiology at Berlin (1858); made many important researches in physiology, particularly on animal electricity.

DU CANGE, CHARLES DUFRESNE (1610–88), Fr. historian and scholar; wrote valuable *Glossarium ad Scriptores mediæ et infimæ latinitatis* (1678) and *Glossarium ad Scriptores mediæ et infimæ græcitatis* (1688).

DU CHAILLU, PAUL BELLONI, see CHAILLU, PAUL BELLONI DU.

DU CHÂTELET-LOMONT, MARQUISE, see VOLTAIRE.

DU CHESNE, ANDRÉ (1584–1640), Fr. historian and geographer.

DU GUESCLIN, BERTRAND (*c.* 1320–80), constable of France; served in many campaigns, 1341 onwards; at first for Charles of Blois, then for Fr. king; fought against English in France from 1356; constable, 1370; recovered from English Poitou, Auvergne, and Guienne; d. in laying siege to Château-neuf-Randon.

DU MARSAIS, CÉSAR CHESNEAU (1676–1756), Fr. philologist.

DU MAURIER, GEORGE LOUIS (1834–96), Eng. artist and novelist; was an analytical chemist in early life, but later adopted the profession of art, achieving fame as a *Punch* artist and book-illustrator. He wrote three novels: *Peter Ibbetson*, *Trilby*, and *The Martian*—the second and most popular of which was successfully dramatised by Paul Potter. Sons are LIEUT.-COLONEL GUY LOUIS BUSSON DU M. (1865–), author of play *An Englishman's Home*, and GERALD DU M. (1873–), actor-manager.

DU PIN, LOUIS ELLIES (1657–1719), Fr. Catholic divine; wrote *Bibliothèque universelle de tous les auteurs ecclésiastiques*; projected scheme for union with Anglican and Gk. churches.

DU PONT DE NEMOURS, PIERRE SAMUEL (1739–1817), Fr. statesman; served under Turgot; pres. of Constituent Assembly, 1790; afterwards on king's side; narrowly escaped execution; went to U.S., 1799; returned to France, 1802; finally to America, 1815.

DU PRÉ, JULES (1812–89), Fr. landscape artist.

DU RYER, PIERRE (1606–58), Fr. playwright; his best-known works are *Alcionée* (1638) and *Scévole* (*c.* 1645).

DU VAIR, GUILLAUME (1555–1621), Fr. political

lawyer and writer; b. Paris; employed on mission to England, 1596; Keeper of the Seals, 1621; his writings, which influenced Fr. style, include *La Philosophie morale de Stoïques* and *De l'éloquence française*.

DU VERGIER DE HAURANNE, JEAN (1581–1643), Fr. ecclesiastic; pioneer of the Jansenist revival; author of *Petrus Aurelius*.

DUALISM, any theory, philosophical or theological, based on two opposite principles. In metaphysics it means co-eternity of mind and matter; in theol. that there are good and evil gods, specially developed in Zoroastrianism (*q.v.*) and Manichæism (*q.v.*), whence it influenced later Judaism and Christianity; difficulty of reconciling evil with omnipotence of a good God tends to dualism. D. is the opposite of Monism (*q.v.*).

DUALLA, negro people of Kamerun district, W. Africa; noted for fine physique.

DUBAWNT.—(1) Lake, Canada (63° N., 101° 30′ W.); discovered, 1770. (2) River, Canada, rising 60° 15′ N., 104° 20′ W., and flowing through D. Lake into Hudson Bay; length, 750 miles.

DUBBO (32° 21′ S., 148° 39′ E.), town, New South Wales, Australia; sawmills. Pop. 4000.

DUBITZA (45° 11′ N., 16° 41′ E.), town, Bosnia; fortified. Pop. c. 3000.

DUBLIN (53° 20′ N., 6° 15′ W.), maritime county, Ireland, in Leinster; smallest Irish county except Louth and Carlow; area, 342 sq. miles. Special features are: promontory of Howth; beautiful bays of Dublin and Killiney; islands of Dalkey, Lambay, Ireland's Eye, and many islets, including Inispatrick (supposed landing-place of St. Patrick). N. is mostly level and occasionally boggy; S. is mountainous, with magnificent ravines, moor, and marshland. Principal river is Liffey. Chief towns are Dublin (*q.v.*), Kingstown, important port, Pembroke, Balbriggan, and Blackrock. Industries outside D. city include salmon and other fisheries; agriculture, dairy-farming; quarrying; lead and copper mines. Pop. (1911) 476,909.

F. E. Ball, *History of the County of Dublin*; D'Alton, *History of Dublin County*.

DUBLIN (53° 21′ N., 6° 16′ W.), city, seaport, parliamentary borough, capital of Dublin county and of Ireland, beautifully situated at mouth of Liffey on D. Bay; well-laid-out city, built mostly on flat ground, with spacious streets, squares, and parks, and many handsome buildings. Principal business streets are in centre; Sackville Street, most important thoroughfare, contains some fine buildings, including Post Office, Nelson Pillar, and O'Connell's monument; finest squares are St. Stephen's Green, Merrion Sq., Fitzwilliam Sq., and Rutland Sq.; most notable buildings include Bank of Ireland (formerly Houses of Parliament), 'Four Courts,' Custom House, National Art Gallery, Museum of Natural History, Science and Arts Museums, National Library, Leinster House (once town house of Duke of Leinster, now seat of Royal Dublin Soc.), city hall, Rotunda, and many monuments and statues; D. Castle is unimposing structure; most interesting churches are Prot. cathedrals of Christ Church (XI. cent.) and St. Patrick (XII. cent.).

D. contains Dublin Univ. or Trinity Coll., founded 1591, by Elizabeth, and is seat of National Univ., founded 1909. Residential parts lie mostly in S.E.; Phœnix Park in W. contains viceregal residence, barracks, military school, racecourse, zoological gardens, and Wellington monument; principal suburbs are Kingstown, Pembroke, Rathmines, Clontarf, Dalkey, and Killiney; Howth, Sutton, Malahide, and Bray are popular watering-places in neighbourhood. River Liffey is crossed by 12 bridges within limits of 'Circular Road'; banks lined with quays; near mouth of river are extensive docks.

Christianity was introduced by St. Patrick, c. 450, but little known of history of D. till IX. cent. when captured by Danes; city more or less in hands of Danes till XII. century. D. is of little commercial importance; manufactures porter, whisky, and poplin; has foundries, water-works, shipbuilding yards, and considerable export trade in agricultural implements. Pop. (1911) 309,272; including suburbs, 403,030.

DÜBNER, JOHANN FRIEDRICH (1802–67), Ger. scholar.

DUBOIS (41° 7′ N., 78° 46′ W.), town, Pennsylvania, U.S.A.; coal and lumber centre; ironworks. Pop. (1910) 12,623.

DUBOIS, GUILLAUME (1656–1723), Fr. cardinal; tutor to Duc de Chartres, 1687; sec., 1701; minister to him as Regent, 1715; formed with England and Holland Triple Alliance against Spain; unprincipled as statesman.

DUBOIS, JEAN ANTOINE (1765–1848), Fr. Catholic missionary in India; possessed great insight and sympathy with Hindus; wrote valuable works on Ind. life and religion.

DUBOIS, PAUL (1829–1905), Fr. artist and sculptor; statue of *Joan of Arc*.

DUBOIS, PIERRE (fl. 1300), Fr. lawyer and publicist; supported Philip the Fair in ecclesiastical conflict with Boniface VIII.

DUBOIS, THÉODORE (1837–), Fr. composer; Director of Paris Conservatoire; operas, ballets, overtures, masses, etc.

DUBOIS DE CRANCÉ, EDMOND LOUIS ALEXIS (1747–1814), Fr. Revolutionist; deputy to states-general, 1789; pres. of Convention, 1793; minister of war, 1799; opposed to Empire.

DUBOS, JEAN-BAPTISTE (1670–1742), Fr. author; wrote *L'Histoire de la Ligue de Cambray*, etc.

DUBOWKA (49° 8′ N., 44° 48′ E.), town, Saratov, Russia. Pop. 16,370.

DUBUQUE (42° 31′ N., 90° 41′ W.), chief city of Dubuque County, Iowa, U.S.A., on Mississippi; seat of Catholic and Protestant Episcopal bp's; contains Catholic cathedral, Iowa institute; institute of science and arts; various theological seminaries; lead and zinc mines; extensive manufactures of machinery, etc. Pop. (1910) 38,494.

DUCAMP, MAXIME (1822–94), Fr. author and traveller; wrote history of the Commune.

DUCANGE, VICTOR HENRY JOSEPH (1783–1833), Fr. dramatist and novelist.

DUCAS, Byzantine family of eminence IX. to XII. cent's; one member, Constantine X. (1059), was Emperor of the East.

DUCAS, XV.-cent. Byzantine historian.

DUCASSE, PIERRE EMMANUEL ALBERT, BARON (1813–93), Fr. historian.

DUCAT, coin, of gold or silver, originally struck by Duke of Apulia, and current in Europe until XIX. cent.; Austria-Hungary retains the d. (9s. 4d.).

DUCHENNE, GUILLAUME BENJAMIN (1806–75), Fr. physician; celebrated for application of electricity in muscular and nervous diseases, and author of works on use of electricity.

DUCHESNE, LOUIS MARIE (1843–), Fr. ecclesiastic and scholar; author of famous works on early history of Christianity.

DUCIS, JEAN FRANÇOIS (1733–1816), Fr. dramatist; tragedies; also adapted Shakespeare.

DUCK FAMILY (*Anatidæ*), a family containing over 200 species of birds, comprising swans, geese, and ducks, and found in all parts of the world. They are typical swimming birds with webbed feet and short legs set far back on long bodies, so that they swim strongly, but walk on land with stilted, awkward gait. Their wings are strong and carry their heavy bodies with great speed through the air. The bill is characteristic: flattened, covered with soft, sensitive skin, and fringed by a series of fine, tooth-like plates, which interlock and form a sieve through which the mud wherein they seek their food is strained. They live upon worms, molluscs, and aquatic insects; and although they are found most frequently in flocks near rivers and lakes, in winter they betake themselves to the kindlier seashore. Many are migratory, so that of forty-two British species, only four are residents, while sixteen are

uncertain visitors and twenty-two are regular visitors, many of them staying to breed. Some of these and their relatives are mentioned below.

The **Swans** are familiar to all on account of the graceful so-called mute swan (*Cygnus olor*), distinguished by the black tubercle or 'berry' between its eyes. It is almost a domesticated bird, common on some rivers and lakes, but occasionally it reverts to a semi-wild state. Less graceful is the WILD SWAN or WHOOPER (*C. cygnus*), which carries its neck straight as it swims, a winter visitor to Britain. Almost as familiar as these, on account of its presence in ornamental parks, is the BLACK SWAN (*Chenopsis atrata*) of Australia.

Amongst the **Geese**, all of which are winter visitors to British shores, many be mentioned the GREY-LAG GOOSE (*Anser cinereus*), which still breeds in summer in the north of Scotland and the Hebrides, and is the probable ancestor of DOMESTICATED GEESE; the black-headed BRENT GOOSE (*Brenta brenta*); and the Greenland white-faced BERNICLE GOOSE (*Bernicla leucopsis*).

The true ducks, the male of which is known as a drake, are smaller, with shorter necks and more varied plumage than the swans and geese, and may be divided into sea- or diving-ducks and non-diving-ducks. The former, whose names indicate their habit, include many winter visitors, such as the POCHARD or DUNBIRD (*Fuligula ferina*), with dense black collar and breast, nearly related to the North American CANVAS-BACKED DUCK (*Aythya vallisneria*); the SCAUP (*Fuligula marila*); the GOLDEN EYE (*Clangula clangula*); the EIDER (*Somateria mollissima*), which breeds in north Scotland, as does the COMMON SCOTER (*Œdemia nigra*), while the MERGANSER (*Mergus merganser*) nests also in Ireland. Amongst the non-diving-ducks are British residents, such as the SHELD-DUCK (*Tadorna cornuta*), the TEAL (*Nettium crecca*), smallest of British ducks, and the 'WILD DUCK' or MALLARD (*Anas boscas*); best known as winter visitors are the GADWALL (*Chaulelasmus streperus*), the WIDGEON (*Mareca penclope*), and the SHOVELLER or 'SPOONBILL' (*Spatula clypeata*), and a solitary rare spring visitor is the GARGANEY (*Querquedula querquedula*).

DUCKBILL, DUCKMOLE, see ORNITHORHYNCHUS.

DUCKING STOOL, chair fixed on end of see-saw beam, projected over pond, in which scolding women, alleged witches, and others were 'ducked' by way of punishment; used in England XVII. to XIX. cent.

DUCK-WEED, minute perennial plant (*Lemna minor*) with long roots; floats on still water.

DUCKWORTH, SIR JOHN THOMAS (1748–1817), Brit. admiral; commanded naval brigade at *Minorca*, 1798; won *San Domingo*, 1804; criticised for treatment of Turks.

DUCLAUX, MARY F. (1856–), Eng. poet; *Collected Poems* (1902); literary and biographical studies; formerly wrote under maiden name, Robinson, and later as Madame Darmesteter.

DUCLOS, CHARLES PINOT (1704–72), Fr. historian; wrote *History of Louis XI.*, etc.

DUCOS, PIERRE ROGER (1754–1816), Fr. politician; member of Directory; gained high positions under Empire, but eventually turned against Napoleon.

DUCTILITY, power of extension, differing from elasticity in that latter implies extension and resumption of original position; most metals are ductile and can be drawn into wires.

DUCTLESS GLANDS, inclusive term applied to a number of glandular organs in the body, the secretions of which are not conveyed away by ducts or tubes, but by the blood or lymph vessels draining them. See SPLEEN, THYROID GLAND, THYMUS GLAND.

DUDERSTADT (51° 31′ N., 10° 15′ E.), town, Hanover, Germany; has number of interesting churches; cottons, woollens manufactured. Pop. 5795.

DUDEVANT, MADAME, see SAND, GEORGE.

DUDLEY (52° 31′ N., 2° 5′ W.), market town, Worcestershire and Staffordshire, England; in midst of 'Black country'; has remains of castle supposed to date from VIII. cent.; important seat of iron trade; extensive coal-fields; limestone quarries. Pop. (1911) 51,092.

DUDLEY, BARONY AND EARLDOM OF.—1st baron created (1342); the grand-dau. of 9th baron married into Ward family, and in 1763 John Ward became Viscount D. His grandson became Earl D. and the title died with him. A kinsman was made Earl D. in 1860, and the 2nd earl of this line, William Humble Ward (1867–), was Lord-Lieut. of Ireland (1902–6), and Gov.-Gen. of Australia (1908–11). DUD DUDLEY (1599–1684), who first used coal instead of wood in iron-making, was natural s. of 9th baron.

DUDLEY, EDMUND (*c.* 1462–1510), Speaker of House of Commons; principal minister of Henry VII.; notorious for extortions along with Empson (*q.v.*); executed.

DUDLEY, ROBERT, see LEICESTER, EARL OF.

DUDLEY, SIR ROBERT (1573–1649), titular Duke of Northumberland and Earl of Warwick; s. of Robert D., Earl of Leicester; deserted his wife and married abroad; died in Italy. Wrote *Arcano dell mare*, a book on naval matters.

DUDLEY, THOMAS (1576–1853), Amer. colonist, of same family as Earl of Leicester; became extreme Puritan; went to America, 1630; deputy gov. of Massachusetts several times; helped to found Harvard Coll.; sternly opposed religious toleration; father of JOSEPH DUDLEY (1647–1720), gov. of Massachusetts.

DUDO (fl. *c.* 1030), Norman historian.

DUDWEILER (49° 17′ N., 7° 2′ E.), town, Rhine Province, Prussia; coal mines and ironworks. Pop. 19,431.

DUELS.—The *duel* as it is in modern times did not exist in ancient Greece and Rome. In the Middle Ages trial by compurgation of oath was developed, and form that judicial combat. The modern d. differs from this latter in that it has no elaborate sanction of law or religion. Duelling seems to have developed first in France, and more widely there than in any other country. Frequent attempts were made by legislature to check it (*e.g.* by Richelieu), but without avail. In the years 1601–9, 2000 men of gentle family are said to have met their death in duelling. At the time of the Revolution it was hoped by some that this would disappear together with other ancient abuses, but though checked for a time it soon 'came in' again, and d's still take place in France.

There were few d's in England before the early XVII. cent. Several famous d's took place in England in the first half of the XIX. cent. in which, amongst others, the Duke of York, Lord Byron, and the Duke of Wellington took part. The latter said once in reference to a d. between two officers that 'the probability of the Hussars having a fight or two' was 'a matter of no consequence'; 172 d's (of which 91 proved fatal to one of the combatants) were fought during the reign of George III. In the 'duelling' amongst Ger. students precautions are taken to protect all vital parts of the body. But real duelling still sometimes takes place in the Ger. army.

Millingen, *History of Duelling* (1841); Thimm, *Bibliography of Fencing and Duelling* (1896).

DUFAURE, JULES ARMAND STANISLAS (1798–1881), Fr. statesman.

DUFF, ALEXANDER (1806–78), Scot. missionary; went out to India, 1829; won many converts, introducing Eng. Bible and Western civilisation; returned home at intervals, permanently, 1864, devoting himself to religious work; prof. of Evangelistic Theology in Free Church of Scotland, 1867.

DUFFERIN AND AVA, MARQUIS OF, FREDERICK TEMPLE HAMILTON TEMPLE BLACKWOOD (1826–1902), Brit. diplomatist; succ. his f. as Baron D., 1841; commissioner in Syria, 1860–61; Under-Sec. of State for India, 1864–66; chancellor of duchy of Lancaster, 1868–72; cr. Earl of D., 1871; gov.-gen. of Canada, 1872; ambassador to Russia, 1879; Turkey, 1881; commissioner in Egypt, 1882–83; Viceroy of India, 1884–88; cr.

Marquis of D. and A., 1888; ambassador to Rome, 1888; Paris, 1892–96; a gifted diplomat.

Life, by Sir Alfred Lyell (1905).

DUFF-GORDON, LADY LUCIE (1821–69), Eng. authoress; *Letters from the Cape*, etc., and numerous translations.

DUFFTOWN (57° 27′ N., 3° 8′ W.), town, health-resort, Banffshire, Scotland; lime-works and distilleries.

DUFFY, SIR CHARLES (1816–1903), Irish author and politician; member of 'Young Ireland' party; subsequently emigrated to Australia, and became Prime Minister of Victoria; edit. *Ballad Poetry of Ireland*, and wrote numerous original works.

DUFOUR, WILHELM HEINRICH (1787–1875), Swiss general; instructor of Louis Napoleon; completed trigonometrical survey of Switzerland; repressed revolt of Catholic cantons, 1847.

DUFRESNY, CHARLES (1648–1724), Fr. dramatist; wrote lively comedies; patronised by Louis XIV.

DUGAZON, JEAN HENRI (1746–1809), Fr. comedian.

DUGDALE, SIR WILLIAM (1605–86), Eng. antiquary; author of *Monasticon Anglicanum*.

DUGONG (*Halicore*), herbivorous mammal inhabiting Red Sea, Indian Ocean, and N. Australian waters; length, 5–15 ft.; d.-fishing practised on Queensland coast; blubber made into oil.

DUGUAY-TROUIN, RENÉ (1673–1736), Fr. admiral; harried coasts of England and Ireland; celebrated for amazing daring in attacks on Eng. and Dutch ships; captured Rio Janeiro (1711).

DUHAMEL, JEAN BAPTISTE (1624–1706), Fr. natural philosopher; author of scientific works.

DUHAMEL DU MONCEAU, HENRI LOUIS (1700–82), Fr. scientist; made discoveries in science, chiefly in bot.; made improvements in Fr. navy.

DÜHRING, EUGEN KARL (1833–1901), Ger. thinker; became totally blind; works on philosophy and economy; in many ways follower of Comte; patriotic and materialistic.

DUIGENAN, PATRICK (1735–1816), Irish politician and lawyer; opposed Grattan and Catholic emancipation.

DUIKER, term including various varieties of African antelopes; also used of small agile animal found in S. Africa.

DUILIUS, GAIUS (fl. 260 B.C.), Rom. consul; performed brilliant services against Carthagenians.

DUISBURG (51° 26′ N., 6° 45′ E.), manufacturing town and port, Rhine Province, Prussia; at confluence of Rhine and Ruhr: ironworks. Pop. (1910) 229,478.

DUKAS, PAUL (1865–), French musical composer of advanced school. Wrote *Ariani et Barbe Bleu* (1907), a symphony, etc.

DUKE (Lat. *dux*, leader), now highest title in Eng. peerage. Elsewhere than in England, d's were generally sovereign princes. Edward, the Black Prince, cr. D. of Cornwall, 1337, was first Eng. d. The premier Eng. dukedom is Norfolk. A d's coronet has eight strawberry leaves. D's are formally addressed as *His Grace the D. of*, etc.

DUKE OF EXETER'S DAUGHTER, colloquial name for instrument of torture similar to rack, dating from XV. century.

DUKER, CARL ANDREAS (1670–1752), Ger. scholar.

DUKERIES, district, N.W. Nottinghamshire, England; so called from number of ducal mansions in neighbourhood.

DUKES, LEOPOLD (1810–91), Hungarian Hebrew scholar.

DUKINFIELD (53° 30′ N., 2° 5′ W.), town, Cheshire, England; now included in parliamentary borough of Stalybridge; extensive collieries.

DULCIMER, musical instrument, derived from Jewish psaltery, consists of wooden frame, with strings stretched across, which are struck with hammer.

DULCIGNO (41° 54′ N., 19° 12′ E.), small seaport town, Montenegro, on Adriatic; fishing; boat-building. Pop. 5000.

DULKEN (51° 16′ N., 6° 21′ E.), town, Prussia, in Rhine province; iron foundries. Pop. 10,033.

DULONG, PIERRE LOUIS (1785–1838), Fr. scientist; made valuable researches in chem. and physics; prof. of Physics (1820) and director (1830) of the Polytechnic School, Paris.

DULUTH (46° 48′ N., 92° 15′ W.), city, capital of St. Louis County, Minnesota, U.S.A.; at W. end of Lake Superior, at head of navigation on Great Lakes; terminus of several railways; fine natural harbour; extensive dockyards; large trade in grain, iron-ores, lumber; outlet to important mineral area; iron and steel manufactures; seat of Prot. Episcopal and R.C. bp's. Pop. (1910) 78,466.

DULWICH (51° 27′ N., 0° 6′ W.), suburb of London, in borough of Camberwell; D. Coll. (founded 1619 by Edward Alleyn, and comprising two schools), contains celebrated collection of pictures. Pop. (1911) D. division of Camberwell, 101,737.

DUMA, see RUSSIA (*History*).

DUMAGUETE (9° 20′ N., 122° 30′ E.), town, Negros, Philippine Islands; on S.E. coast; district fertile and agricultural. Pop. 14,000.

DUMANJUG (10° 4′ N., 123° 26′ E.), town, port, at mouth of Dumanjug, Cebú, Philippine Islands; important coast trade. Pop. 30,000.

DUMAS, ALEXANDRE (1802–70), Fr. novelist and dramatist; b. Villers Cotterets (Aisne); s. of a general; grandson of a marquis and Haitian negress. His early years were spent in poverty, and he received little education. He came to Paris, received an appointment in the bureau of the Duke of Orleans, and took to playwriting. His first play, *Henry III. and his Court* (1829), started the Fr. Romantic Drama. It was followed by many more, notably *Anthony* and *The Tour de Nesle*. In 1836 he began writing Fr. history in a series of novels, of which the most famous are *The Three Musketeers* (1844), *Twenty Years After* (1845), and *Margaret of Valois* (1845); in all his many novels D. was helped by collaborators, with whom he afterwards quarrelled. Besides hist. novels, he wrote his masterpiece, *The Count of Monte Cristo*. After making and giving away several fortunes, he d. a poor man. His work is notable for its imagination, exuberant vitality, and chivalric spirit.

Life, by Fitzgerald (1873), Davidson (1902), Spurr (1902).

DUMAS, ALEXANDRE, *fils* (1824–95), Fr. novelist and dramatist; natural s. of Alexandre D. and a dressmaker. He achieved his first success with a novel, *La Dame aux Camélias* (1848), which he afterwards dramatised. Other famous works are *Le Demi-Monde* and *L'Affaire Clémenceau*. His work is didactic, treating mainly of the 'sex question.' As a dramatist he is great in dialogue and dramatic situation alike.

DUMAS, GUILLAUME MATHIEU, COUNT (1753–1837), Fr. general; fought in Turkey, Holland, Revolutionary campaigns, and under Napoleon and Louis XVIII.; wrote *Précis des événements militaires*.

DUMAS, JEAN BAPTISTE ANDRÉ (1800–84), Fr. chemist and politician; made many important researches and pub. several new theories in chem.; was Minister of Agriculture (1850–51) and a senator.

DUMBARTON (55° 57′ N., 4° 34′ W.), town, capital of Dumbartonshire, Scotland; parliamentary and royal burgh; rising seaport; old capital of Strathclyde; has historic castle on rock (250 ft. high) on banks of Clyde; one of four fortresses maintained in terms of Articles of Union; shipbuilding yards. Pop. (1911) 21,989.

DUMBARTONSHIRE (56° N., 4° 40′ W.), maritime county, on Firth of Clyde, W. Scotland; area, 267 sq. miles; chief towns, Dumbarton, Clydebank, Helensburgh. Northern district round Loch Lomond and Loch Long is mountainous, with grand scenery; central region less wild; southern

district, with Clyde seaboard, Vale of Leven, and main portion of county is rich and pleasantly varied; favourite summer resorts. Agriculture is improving; extensive sheep-farming; industries include cotton works, calico-printing, bleaching, dyeing, paper-making, ship-building, fisheries, coal-mining. D. (once part of Lennox) became united to Scot. kingdom, 843; scene of much warfare from Rom. invasion onwards. Pop. (1911) 139,831.

DUM-DUM, (22° 38′ N., 88° 28′ E.), town and cantonment, Paraganas district, Bengal, India; ammunition factory; gives name to *Dum-dum* or soft-nosed bullet, which expands on striking. Pop. 11,000.

DUMESNIL, MARIE FRANÇOISE (1713–1803), Fr. actress.

DUMFRIES (55° 4′ N., 3° 36′ W.), picturesque town, on Nith, S.W. border of Dumfriesshire, Scotland; capital of county; royal and parliamentary burgh; seaport of little importance since era of railways; cattle markets; manufactures tweeds and hosiery; assize town for S.W. counties, and practically the metropolis of a great part of southern Scotland; associated with Robert Burns (*q.v.*). Pop. (1911) 16,062.

DUMFRIESSHIRE (55° 10′ N., 3° 30′ W.), border county, Scotland, bounded on S. by Solway Firth; length, 21–46½ miles; breadth, 13–32 miles; area, 1103 sq. miles. Boundary line consists mainly of mountainous watersheds, summits of which include Hartfell (2651 ft.), Queensberry (2285), Blacklorg (2231). Northern region constitutes part of Southern Highlands of Scotland. Southern region is divided into three large basins, through which run the Nith, Annan, and Esk. D. is an agricultural and pastoral county. Commerce is mostly conducted through Dumfries (*q.v.*), the capital. Manufactures include hosiery (in Thornhill and Lochmaben) and tweeds; Langholm manufactures coarse linen; woollen fabrics are made at Sanquhar and Moffat. Pop. (1911) 72,824.

Maxwell, *History of Dumfriesshire* (1896).

DÜMICHEN, JOHANNES (1833–94), Ger. Egyptologist.

DÜMMLER, ERNST LUDWIG (1830–1902), Ger. historian; wrote chiefly on Middle Ages.

DUMONT, ANDRÉ HUBERT (1809–57), Belg. geologist and mineralogist; prof. of Geol. and rector of Liége Univ.; made a valuable geological map of Europe.

DUMONT, FRANÇOIS (1688–1726), Fr. sculptor.

DUMONT, FRANÇOIS (1751–1831), Fr. miniature artist; patronised by Louis XVI. and other kings.

DUMONT, JACQUES (1701–81), Fr. artist; bro. of above.

DUMONT, JEAN (d. 1726), Fr. author and publicist.

DUMONT, PIERRE ÉTIENNE LOUIS (1759–1829), Fr. author; admirer of Jeremy Bentham, whose works he edited.

DUMONT D'URVILLE, JULES SÉBASTIEN CÉSAR (1790–1842), Fr. navigator; went voyage in S. Atlantic, 1826–29; brought deposed Charles X. to England, 1830; voyage in S. Polar regions, 1837–40.

DUMOULIN, CHARLES (1500–66), Fr. jurist and legal writer.

DUMOURIEZ, CHARLES FRANÇOIS (1739–1823), Fr. general; fought in Seven Years War, and then in Revolution campaigns; Minister of Foreign Affairs, 1792; defeated Prussians at *Valmy* and Austrians at *Jemappes*, 1792; lived latterly in England.

DUNBAR (56° N., 2° 31′ W.), royal burgh and seaport on N.E. coast of Haddington, Scotland; a place of historic interest, with ancient ruined castle on rocks projecting into the sea, and before introduction of gunpowder considered impregnable. Near D. Cromwell defeated Scots, 1650. D. has a beautiful seashore, well cultivated land, and is a popular holiday resort. Pop. (1911) 3346.

DUNBAR, GEORGE (1774–1851), Scot. scholar; compiled noted Gk. lexicon.

DUNBAR, PAUL LAURENCE (1872–1906), Amer. negro poet and novelist.

DUNBAR, WILLIAM (*c.* 1465–1530), Scot. poet of Chaucerian school. His *Golden Target* and *The Thistle and the Rose* show the allegory-work of the time, but in *The Twa Maryit Wemen and the Wedo*, *The Dance of the Seven Deadly Sins*, and *Kind Kyttok* he is far ahead of the Chaucerians in imagination and realism. These qualities along with his whimsical humour and biting satire make him perhaps the greatest Scot. poet. Works edit. by Scot. Text Soc. (1893).

DUNBIRD, see under DUCK FAMILY.

DUNBLANE (56° 12′ N., 3° 57′ W.), market town, on Allan, Perthshire, Scotland; ancient cathedral, recently restored, serves as parish church; associated with the name of Robert Leighton, who was bp., 1661–70; mineral spring; large hydropathic; woollen mill. Pop. (1911) 2978.

DUNCAN I. (d. 1040), king of Scots; succ. Malcolm II. (1034); murdered by Macbeth.

DUNCAN II. (d. 1094), king of Scots; s. of Malcolm III., and grandson of above.

DUNCAN, ADAM, 1st Viscount (1731–1804), Brit. naval officer; b. Scotland; entered navy, 1746; commander-in-chief of North Sea fleet, 1795; won great victory of *Camperdown*, 1797, and cr. Viscount D. of Camperdown; his s. received earldom.

DUNCAN, PETER MARTIN (1824–91), Eng. physician and geologist; prof. of Geol. at King's Coll., London (1870); conducted researches on fossil corals.

DUNCAN, THOMAS (1807–45), Scot. artist; portraits and hist. subjects.

DUNCANSBY HEAD (58° 39′ N., 3° 1′ W.), in Caithness; most north-easterly point of Scotland.

DUNCE, synonym for blockhead, derived from Duns Scotus (*c.* 1300), whose followers were nicknamed 'Duns' by those opposed to his methods.

DUNCKER, MAXIMILIAN WOLFGANG (1811–86), Ger. politician and historian.

DUNCKLEY, HENRY (1823–96), Eng. journalist; edit. *Manchester Examiner*.

DUNCOMBE, SIR CHARLES (1648–1711), Eng. politician; Lord Mayor of London (1709).

DUNCOMBE, THOMAS SLINGSBY (1796–1861), Eng. politician.

DUNDALK (54° N., 6° 24′ W.), seaport, Ireland, capital of Louth, at mouth of Castleton, Dundalk Bay; grain, dairy produce, brewing and distilling; here Irish and English defeated Scots under Edward Bruce, 1318. Pop. (1911) 13,128.

DUNDAS.—(1) (43° 17′ N., 80° 4′ W.) Town, Ontario, Canada. Pop. *c.* 3700. (2) (55° 58′ N., 3° 25′ W.) Castle, Linlithgowshire, Scotland. (3) (76° 5′ N., 95° 2′ W.) Island, Brit. N. America.—**D. Strait** (11° 20′ S., 131° 45′ E.), strait, N. Australia. **D. Mountain** (31° 5′ S., 150° 42′ E.), mountain, New South Wales, Australia.

DUNDEE (56° 27′ N., 2° 59′ W.), third largest city in Scotland; royal burgh, great seat of manufacture, and extensive seaport, Forfarshire, on N. side of Firth of Tay, at end of Tay Bridge. D. is rich in hist. associations, but few buildings of antiquarian interest remain. Univ. Coll. is incorporated with St. Andrews Univ.; excellent schools and other institutions. The harbour is one of the finest, safest, and most convenient in U.K.; shipbuilding; naval base for submarines; headquarters of Scot. whalers; extensive fisheries. D. is great seat in Britain of jute, flax, hemp, and coarse linen industries; marmalade and confectionery manufactured; tanning; engineering and iron-founding. D. has been royal burgh since XIII. cent.; early and eagerly espoused Reformation; destroyed by Monk, 1651. Pop. (1911) 165,000.

Barrie, *City of Dundee* (1890).

DUNDEE (28° 10′ S., 30° 8′ E.), town, Natal, S. Africa; coal mining.

DUNDEE, JOHN GRAHAM OF CLAVERHOUSE, VISCOUNT (*c.* 1649–89), Scot. leader of Stewart cause; s. of Sir William Graham; served

under Montrose (1678) in suppression of Covenanters; defeated by Covenanters at *Drumclog* (1679); killed Richard Cameron at Aird's Moss after *Bothwell Brig*; in 1688 served in interest of James II., and was cr. Viscount D. His followers failed to support him in Stewart interest, and he was himself then denounced as traitor. On July 27, 1689, he was killed in the moment of victory at *Killiecrankie* (q.v.); a strong but ruthless man.

Life, by Terry (1905), Ian Maclaren (1908), Barrington (1911).

DUNDERLANDSDAL, valley, N. Norway, rich in iron ore; possesses underground streams and stalactite caves.

DUNDONALD, THOMAS COCHRANE, 10TH EARL OF (1775–1860), Brit. admiral; M.P. in 1806; attacked naval abuses; given order of Bath for engagement in Basque Roads; tried and condemned for alleged fraud on Stock Exchange, 1814; fought for Chile, Brazil, and Greece; held Amer. command and fought in Crimea.

DUNEDIN (45° 52′ S., 170° 31′ E.), town, New Zealand, capital of Otago province, on hilly site at end of Otago Harbour, S.E. coast of South Island; chief commercial centre of colony; founded and called after Edinburgh by Scot. settlers, 1848; has Otago univ. (affiliated to univ. of New Zealand), athenæum, and museum; seat of R.C. and Anglican bp's; in neighbourhood of gold-fields (discovered, 1861); wool, frozen meat. Pop. (1911) 41,529; with suburbs, 64,237.

DUNES, BATTLE OF THE, Dunkirk (June 4, 1658), when French and English defeated Spaniards under Don John of Austria, and secured capitulation of Dunkirk.

DUNFERMLINE (56° 4′ N., 3° 28′ W.), city, S.W. Fife, Scotland; royal and parliamentary burgh of great hist. interest; ruined royal palace (probably built *c.* 1300; birthplace of David II., James I. of Scotland, Charles I.); abbey (dating from 1072); tombs of Bruce and other royalties; Tower of Malcolm Canmore (*c.* 1060) crowns steep eminence rising from beautiful Pittencrieff Glen. Modern D. owes much to its native, Mr. Andrew Carnegie, who gave (1903) £500,000 for its benefit; burgh limits now include Rosyth; seat of damask linen trade; coal-fields. Pop. (1911) 28,103.

DUNFERMLINE, ALEXANDER SETON, 1ST EARL OF (*c.* 1555–1622), Scot. statesman; s. of George, 5th Lord Seton; lord of session, 1588; chancellor, 1604; promoted Anglo-Scot. union.

DUNFERMLINE, JAMES ABERCROMBY, 1ST BARON (1776–1858), Brit. politician.

DUNGANNON (54° 31′ N., 6° 47′ W.), town, Tyrone, Ireland; until 1607 chief seat of O'Neills, linens and muslins.

DUNGARPUR (*c.* 24° N., 74° E.), native state, Rajputana, India. Area, 1447 sq. miles. Pop. (1911) 159,192.

DUNGARVAN (52° 4′ N., 7° 37′ W.), seaport town, Waterford, Ireland; remains of ancient castle; woollen mills.

DUNGENESS (50° 57′ N., 1° 2′ E.), headland, with lighthouse, S. extremity of Kent, England.

DUNKELD (56° 34′ N., 3° 35′ W.), town, Perthshire, Scotland, on river Tay, opposite village of Birnam; seat of Culdees from VIII. to XII. cent's; choir of XIV.-cent. cathedral recently restored, serves as parish church; in vicinity is seat of Duke of Athole; angling resort.

DUNKIRK, Dunkerque.—(1) (51° 7′ N., 2° 39′ E.) fortified seaport town, Nord, France, on Strait of Dover; magnificent harbour; has fine church of St. Eloi (1560); chapel of Notre Dame des Dunes (1405); town hall; extensive and varied manufactures and exports, and important fisheries; burned by English, 1388, taken by them in 1658, but sold to Louis XIV. by Charles II., 1662. Pop. (1911) 38,891. (2) (42° 27′ N., 79° 20′ W.) city, port of entry, on Lake Erie, New York State, U.S.A.; has extensive lake trade; iron and lumber manufactures. Pop. (1910) 17,221.

DUNLOP, JOHN COLIN (1785–1842), Scot. author; wrote *History of Fiction* (1814).

DUNMORE (41° 25′ N., 75° 38′ W.), town, Pennsylvania, U.S.A.; anthracite coal-fields. Pop. (1910) 17,615.

DUNMOW, GREAT (51° 52′ N., 0° 22′ E.), market town, on Chelmer, Essex, England. **Dunmow, Little,** village, 2 miles E. of Gt. Dunmow; custom of *Dunmow Flitch*, awarded to married couples who for a year and a day after marriage have had no quarrel and have not repented of their union, dates from 1244.

DUNNE, FINLEY PETER (1867–), Amer. journalist; author of the 'Mr. Dooley' series of humorous Irish-Amer. sketches.

DUNNOTTAR CASTLE, historic stronghold near Stonehaven, Kincardineshire, Scotland; dating from 1392; dismantled, 1720.

DUNOIS, JEAN, COUNT OF (1403–68), Fr. general; natural s. of Duke of Orleans; commonly known as the 'Bastard of Orleans'; famous for military exploits.

DUNOON (55° 57′ N., 4° 56′ W.), watering-place, Argyllshire, Scotland; on W. shore Firth of Clyde; remains of ancient castle. Pop. (1911) 6859.

DUNRAVEN AND MOUNT-EARL, EARL OF, Windham Thomas Wyndham-Quin (1841–), Eng. politician; acted as war correspondent in Abyssinian and Franco-Prussian Wars; celebrated yachtsman; author of several books; famous as promulgator of devolution scheme for Ireland; pres., Irish Reform Association, 1905.

DUNROBIN CASTLE, near Golspie, Sutherlandshire, Scotland; seat of Duke of Sutherland.

DUNS (55° 46′ N., 2° 19′ W.), market town, Berwickshire, Scotland; woollen industry; reputed birthplace of Duns Scotus.

DUNS SCOTUS, JOHN (1265 or 1275–1308), mediæval schoolman, studied at Oxford and Paris; critical theologian, and antagonist of St. Thomas Aquinas over Immaculate Conception, reason, and revelation.

Life, by Werner (1880).

DUNSINANE (56° 28′ N., 3° 17′ W.), peak of Sidlaws, Perthshire, Scotland; remains of 'Macbeth's castle.'

DUNSTABLE (51° 52′ N., 0° 32′ W.), market town, near Chiltern Hills, Bedfordshire, England; was a Rom. station; remains of church of Augustinian Priory (founded, 1131) now included in parish church; straw-plaiting. Pop. (1911) 8062.

DUNSTAFFNAGE (56° 27′ N., 5° 26′ W.), ruined castle, on Loch Etive, Argyllshire, Scotland; 3 miles N.N.E. Oban.

DUNSTAN, ST. (924–988), abbot of Glastonbury, 945; bp. of Worcester, then of London; abp. of Canterbury, 959.

DUNSTER (51° 11′ N., 3° 27′ W.), market town, Somersetshire, England.

DUNTOCHER (55° 51′ N., 4° 27′ W.), town, Dumbartonshire, Scotland.

DUNTON, JOHN (1659–1733), Eng. bookseller and author; Whig pamphleteer; useful book of memoirs.

DÜNTZER, JOHANN HEINRICH (1813–1901), Ger. philologist and historian.

DUNWICH (52° 17′ N., 1° 38′ E.), watering-place, Suffolk, England; was E. Anglican capital and episcopal see, founded VII. cent.; now almost swept away by inroads of sea.

DUPANLOUP, FÉLIX ANTOINE PHILIBERT (1802–78), bp. of Orleans (1849); opposed papal infallibility, but later submitted.

DUPERRON, JACQUES DAVY (1556–1618), Fr. R.C. theologian; s. of Prot. minister; cardinal; abp. of Sens, 1606.

DUPIN, ANDRÉ MARIE JACQUES (1783–1865), Fr. statesman, advocate, and author.

DUPLEIX, JOSEPH FRANÇOIS (1697–1763), Fr. administrator; gov.-gen. of all Fr. establishments

in India, 1742; tried to establish Fr. supremacy in India, but Clive (*q.v.*) frustrated his plans. D. was recalled in 1754. See *Life* by Biddulph (1910).

DUPLICIDENTATA, a sub-order of Rodents (*q.v.*).

DUPONT, PIERRE (1821-70), Fr. song-writer; words and music of *Le Chant des Ouvriers*, and other popular songs.

DUPONT DE L'ÉTANG, PIERRE ANTOINE, COUNT (1765–1840), Fr. general; fought under Napoleon, distinguishing himself in Italy, but defeated in Peninsula; served under Louis XVIII.

DUPONT DE L'EURE, JACQUES CHARLES (1767–1855), Fr. statesman and lawyer.

DUPORT, ADRIEN (1759–98), Fr. politician.

DUPORT, JAMES (1606–79), Eng. scholar and ecclesiastic.

DUPPEL (54° 56′ N., 9° 44′ E.), village, Schleswig-Holstein, Germany; Germans defeated by Danes, 1848; stormed by Bavarians and Saxons, 1849; by Prussians, 1864.

DUPRÉ, JULES (1813–89), Fr. romantic landscape painter.

DUPUIS, CHARLES FRANÇOIS (1742–1809), Fr. scientist, politician, and author; prof. of Rhetoric at Lisieux (1766), and prof. of Humanity in Collège de France, Paris (1788); prominent part in politics of the Revolution; wrote on astron. and mythology.

DUPUY, CHARLES ALEXANDRE (1851–), Fr. statesman; premier and Minister of Interior, 1894; in office when Dreyfus was condemned; resigned, 1899.

DUPUY, PIERRE (1582–1651), Fr. scholar; prolific writer on hist. and antiquarian subjects.

DUPUY DE LÔME, STANISLAS CHARLES HENRI LAURENT (1816–85), Fr. engineer and inventor; invented method of converting sailing battleships into steamships; introduced building of iron ships into France, etc.

DUPUYTREN, GUILLAUME, BARON (1777–1835), Fr. surgeon; prof. of Clinical Surgery in Hôtel-Dieu, Paris (1815); a brilliant operator, lectured to great numbers of students, and had enormous surgical practice.

DUQUE DE ESTRADA, DIEGO (1589–c. 1640), Span. soldier and writer; b. Toledo; fled after having killed his affianced wife and her lover; captured and tortured; escaped and led life of adventure, taking part in many campaigns; wrote memoir entitled *Commentarios*.

DUQUESNE (40° 24′ N., 79° 50′ W.), town, Pennsylvania, U.S.A.; steel-works. Pop. 15,727.

DUQUESNE, ABRAHAM, MARQUIS (1610–88), Fr. naval officer; distinguished himself in wars with Spain; defeated combined Dutch and Span. fleets off Sicily, 1676; cr. marquis by Louis XIV.

DURÁN, AUGUSTIN (1789–1862), Span. scholar.

DURANCE (43° 46′ N., 5° 15′ E.), Fr. river; rises in Hautes-Alpes; falls into Rhône 3 miles S.W. Avignon; length, *c.* 220 m.; fierce current.

DURAND, ASHER BROWN (1796–1886), Amer. artist and engraver.

DURAND, GUILLAUME (*c.* 1230–96), Fr. canonist; lectured at Modena; in 1274 legate at Council of Lyons; wrote *Rationale Divinorum Officiorum*, *Speculum Juris*.

DURANDO, GIACOMO (1807–94), Ital. statesman and general.

DURANGO (24° N., 105° W.), state, N.W. Mexico; mountainous; climate dry and healthy; soil very fertile; few streams; chief minerals, gold and silver; wheat, tobacco, fruits. Area, 38,009 sq. miles. Pop. (1910) 436,147. The capital, DURANGO, has a cathedral; cotton and woollen factories. Pop. (1910) 34,085.

DURANI, Afghan tribe of the highest rank.

DURANTE, FRANCESCO (1684–1755), Ital. composer of church music.

DURÃO, JOSÉ DE SANTA RITA (1720–84), Brazilian epic poet.

DURAZZO (41° 18′ N., 19° 26′ E.), decayed seaport, on Adriatic, Albania; ancient *Epidamnus* or *Dyrrachium*; founded by Corcyreans, VII. cent. B.C.; scene of Pompey's successful resistance to Cæsar, 48 B.C.; taken by Turks, 1501.

DURBAN, PORT NATAL (29° 52′ S., 31° E.), chief seaport and largest town, Natal (*q.v.*); excellent harbour with projecting 'Bluff'; beautifully laid-out city, with fine town hall, parks, gardens, Victoria Embankment, and ocean beach; Berea, handsome suburb; much of Transvaal and Orange Free State imports and exports pass through Durban; shipping, coaling-port, preserves, whale and other fisheries; exports tea, sugar, coffee, maize, wool, hides, skins, angora hair, etc.; wireless station; fortified. Pop. (1911) 69,000 (32,000 white; many Indians).

D'URBAN, SIR BENJAMIN (1777–1849), Brit. soldier-administrator; entered army, 1777; fought in Peninsula, 1808; gov. of Antigua, 1824; gov. of Cape Colony, 1834–38; slavery abolished and Great Trek of Dutch farmers commenced, 1836; *Durban* in Natal named after him; held military command in Canada, 1847–49.

DURBAR, Indian state ceremonial; also name for native state council. D's were held at Delhi (*q.v.*) when Queen Victoria was proclaimed Empress (1877); King Edward, Emperor (1903); and King George V., Emperor (1912).

DÜREN (50° 47′ N., 6° 30′ E.), town, Rhine province, Prussia; woollen cloth. Pop. (1910) 32,511.

DÜRER, ALBRECHT (1471–1528), Ger. artist and engraver; b. Nuremberg; s. of a goldsmith, to whose craft he was apprenticed; eventually placed under Michael Wolgemut, a local artist who employed assistants in the production of cheap devotional pictures. His apprenticeship ended in 1490, and until 1494 D. travelled about Germany to improve himself in his art. He married Agnes Frey (1494), but had great difficulty in making a living, and, to improve his position, took up etching and wood-engraving. In later years he lived in Venice and the Netherlands, but the greater part of his working life was spent in Nuremberg. Amongst his most famous paintings are the *Feast of the Rosary*, *Adoration of the Magi*, *The Crucifixion*, *Madonna and Child*, *SS. John and Peter*, *SS. Paul and Mark*, and many portraits; his most famous copper-plates include *St. Jerome in his Study*; *Knight, Death, and the Devil*; *Adam and Eve*, *Death's Coat-of-Arms*, besides numerous sets of woodcuts. His writings include *The Art of Mensuration*, *Treatise on Fortification*, and other scientific works. He ranks as the greatest of Ger. artists, and though there is little positive beauty in his painting it is distinguished by mastery of composition, grasp of character, and forcible colouring. His work as an engraver on copper and wood is no less distinguished, and has undoubtedly exercised a greater influence on later art than his painting.

Dürer, by H. E. A. Furst (T. C. & E. C. Jack); *Life*, by W. B. Scott; also one by Mrs. Heaton.

DURESS, legal term for a plea of compulsion; means also illegal constraint or imprisonment.

D'URFEY, TOM (1653–1723), Eng. dramatist and song-writer; many songs set to music by Purcell, Blow, and Farmer.

DURFORT (44° 14′ N., 1° 7′ E.), village, Tarn-et-Garonne, France; was seat of ancient lordship.

DURGA, wife of Siva in Hindu mythology.

DURHAM.—(1) (54° 46′ N., 1° 34′ W.) city, Durhamshire; Parliamentary and municipal borough; beautifully situated round rocky hill, with cathedral and castle on summit, and almost surrounded by river Wear. Cathedral (founded XI. cent.) is one of finest in England; built on site of church which enshrined St. Cuthbert's bones; Norman architecture; high central and two highly decorated western towers. Castle, erected by William the Conqueror, once occupied by Bishops of D., is now property of D. Univ. (founded 1832). Manufactures include ironware, carpets, and mustard; coal mines in neighbourhood. Pop. (1911) 17,550. (2) (36° 2′ N.,

78° 56′ W.) city, capital of Durham County, N. Carolina, U.S.A.; seat of Trinity Coll.; tobacco factories. Pop. (1910) 18,241.

DURHAM (54° 46′ N., 1° 45′ W.), maritime county, N. England; area, 1014 sq. miles; bounded N. by Northumberland, W. by Westmoreland and Cumberland, S. by Yorkshire, E. by North Sea. In W. are branches of Pennine Range where chief rivers (Derwent, Tees, Wear) rise, and stretches of bare moorland rich in minerals; farther E. are fertile and well-wooded valleys where celebrated cattle are reared. D. coal mines are among most productive in England. D. also produces limestone, slate, black marble, lead, zinc, firestone, and ironstone. Chief industry is shipbuilding; extensive and important yards on Tyne. Manufactures include iron, glass, chemicals, salt and earthenware. Chief towns are Durham (county town), Sunderland, Stockton, S. Shields, E. and W. Hartlepools, Jarrow (important shipbuilding ports), Gateshead, and Darlington. D. has some interesting old churches, crosses, castles, and ruins of peel-towers; most noteworthy castle and cathedral being in Durham city. D. was at one time part of kingdom of Northumbria, and scene of many border raids from Scotland; one of Counties Palatine. Pop. (1911) 929,340.

Durham, Victoria County Histories.

DURHAM, JOHN GEORGE LAMBTON, 1ST EARL OF (1792–1840), Brit. statesman; became strong Radical; opposed Corn Tax and advocated parliamentary reform; cr. Baron D., 1828; intimate friend of the Duchess of Kent and Queen Victoria. In 1830 D. became Lord Privy Seal in the Grey ministry; played a considerable part in framing the great Reform Bill; went as ambassador to Russia in 1832, and again 1835–37; cr. Earl of D., 1837; Gov.-Gen. of Canada, 1838; provoked opposition in England, and returned home, Dec. 1838; wrote a valuable *Report on the Affairs of British North America*.

S. J. Reid, *Life and Letters of the First Earl of Durham*.

DURIS (fl. 300–275 B.C.), Gk. writer; b. Samos; athlete and for a time tyrant of Samos; wrote work on Gk. history from 371–281 B.C., and various treatises; an untrustworthy source of information.

DÜRKHEIM (49° 28′ N., 8° 10′ E.), town and health-resort, Rhenish Bavaria, Germany; salt baths. Pop. 6000.

DURLACH (48° 59′ N., 8° 29′ E.), town, grand-duchy of Baden, Germany; iron manufactures. Pop. 13,000.

DÜRNSTEIN (48° 24′ N., 15° 35′ E.), town, Austria; here Russians and Austrians defeated French, 1805.

DUROCHER, JOSEPH MARIE ELIZABETH (1817–58), Fr. geologist and mineralogist; prof. at Rennes (1844); propounded new geological theories.

DURSLEY (51° 41′ N., 2° 21′ W.), town, Gloucestershire, England. Pop. (1911) 7591.

DURUY, JEAN VICTOR (1811–94), Fr. historian and educationist; Minister of Education (1863–69); did much for educational reform, and wrote histories of Greece, Rome, and France.

DUSE, ELEANORA (1861–), Ital. actress; famed for realism.

DUSSEK, JOHANN LUDWIG (1761–1812), Bohemian composer and pianist.

DÜSSELDORF (51° 13′ N., 6° 45′ E.), town, Prussia, on Rhine; busy river port; has churches of St. Lambert and St. Andrew, famous art academy, beautiful public gardens (Hofgarten); manufactures iron, chemicals, pianos, cotton, paper, glass, etc.; attained height of prosperity under Elector John William (1690–1716); became Prussian possession (1815); birthplace of Heinrich Heine. Pop. (1910) 357,702.

DUSSERAH, Hindu moon festival, celebrated in October.

DUST, earth or other matter reduced to very fine dry particles. We can observe its presence in the atmosphere by seeing a beam of light reflected by suspended motes each acting as a minute planet. D. is carried into the air by evaporation and air currents, and is, no doubt, largely due to physical causes, such as volcanic action, and also to artificial causes, of which the chief is the combustion of coal for commercial purposes. Some is due to meteors, and in this connection it has been stated that a layer of meteoric d. 12 inches thick would accumulate on the earth's surface in 1,000,000 years. It is supposed that the blue colour of a cloudless sky is due to the reflection of light by particles of d., and that owing to its presence atmospheric vapour is able to condense and form clouds.

In 1880 Aitken invented a method of counting d. particles which were beyond the power of a microscope. He caused them to become centres of condensation, and so being increased in size they were visible by optical aid, a principle used for numbering units of electricity.

DUST-LICE, see BOOK-LICE.

DUTCH EAST INDIA COMPANY, THE, founded by charter (1602) to protect Dutch trade, and also as a weapon in struggle with Spain and Portugal; governed by directorate of 60 members; it dealt principally with China and Japan, also with Malay Archipelago; founded settlement at Cape of Good Hope as half-way house to India; declined in XVIII. cent.; dissolved, 1798.

DUTCH EAST INDIES, Sumatra, part of Borneo, Java, and other E. India islands (6° N. to 11° S., 95° to 141° E.); capital, Batavia, Java; pop. 42,000,000; area, 740,000 sq. miles; export tobacco and spices; formerly property of Dutch East India Company, but since end of XVIII. cent. administered by crown officials.

DUTCH GUIANA, see GUIANA.

DUTCH LANGUAGE AND LITERATURE, see HOLLAND.

DUTCH PAINTING, see PAINTING.

DUTCH WARS, see HOLLAND.

DUTCH WEST INDIA COMPANY, THE, founded (1621) for the purpose of colonisation in American and African continents, to secure the supply of slave labour from Africa, and to plunder Span. and Portug. shipping.

DUTENS, LOUIS (1730–1812), Fr. writer on religious and antiquarian subjects.

DUTROCHET, RENÉ JOACHIM HENRI (1776–1847), Fr. biologist and physiologist.

DUTT, MICHAEL MADHU, SUDAN (1824–73), Ind. poet; wrote several plays, but fame rests on great blank-verse epic, *Meghanad-Badha*.

DUTY, that which one ought, or is required by the moral law, to do. See ETHICS.

DUVAL, ALEXANDRE VINCENT PINEUX (1767–1842), Fr. actor and dramatist; elected to Academy (1812).

DUVAL, CLAUDE (1643–70), Eng. highwayman; famed for his gallantry; hanged at Tyburn.

DUVEYRIER, HENRI (1840–92), Fr. explorer and geographer; explored Sahara (1858–61).

DUX (50° 47′ N., 13° 44′ E.), town, Bohemia, Austria; lignite mines; glass-works. Pop. 12,000.

DUXBURY (42° 3′ N., 70° 40′ W.), town, summer resort, Massachusetts, U.S.A., on Massachusetts Bay.

DVINA, NORTHERN, DWINA (64° N., 41° E.), river, Russia; has origin in two head-streams in Vologda; flows N.W.; enters White Sea, near Archangel, by several mouths, which form a delta; length, 760 miles.

DVINA, WESTERN, DÜNA (57° N., 24° E.), river, Russia; rises in Tver; flows S.W., then N.W.; falls into Gulf of Riga; length, 640 miles; navigable nearly to source.

DVINSK, DÜNABURG (55° 53′ N., 26° 23′ E.), fortified town, on Dvina or Duna, W. Russia; formerly

capital of Polish Livonia; important military and commercial centre; sawmills, linen. Pop. 110,354.

DVOŘÁK, ANTONÍN (1841–1904), Bohemian composer; director of Prague Conservatoire; choral works include *Stabat Mater* and *The Spectre's Bride*; also symphonies and miscellaneous pieces of high melodic quality.

DWARF (or 'pygmy'), name given to small-statured adult human beings, still found in different parts of the world, notably in Central Africa. Amongst these may be named the African 'Bushmen,' and the Bambute tribes of Uganda, averaging about 4 ft. 7 in. in height. Famous dwarfs of history have been Jeffery Hudson (1619–82), and 'General Tom Thumb' (d. 1883).

DWARFED TREES, common ornament in China and Japan; growth curtailed by placing them in shallow flower pots and preventing free flow of sap.

DWARKA (22° 14′ N., 69° 5′ E.), town, Kathiawar, Brit. India. Its sacred temple of Krishna is visited annually by many pilgrims.

DWARS (c. 26° 30′ N., 90° E.), tract of country, N.E. India; consists of two divisions, E. Dwars and W. Dwars; formerly part of Bhutan; ceded to British, 1865.

DWIGHT, JOHN (d. 1703), Eng. potter; pioneer of the industry in England.

DWIGHT, JOHN SULLIVAN (1813-93), Amer. musical critic.

DWIGHT, THEODORE WILLIAM (1822–92), Amer. jurist, educationist, and reformer.

DWIGHT, TIMOTHY (1752–1817), Amer. educationist and author; was Congregational preacher; pres. of Yale Coll.; voluminous writer of verse and prose.

DYAKS, DAYAKS, wild native tribes of Borneo, notorious for head-hunting, though this custom is now said to be little practised; skin reddish-brown, but other physical characteristics similar to the darker Malays; weapons are sword and spear, and they are very skilful in use of the blow-pipe; practise spinning, weaving, and other crafts, and possess considerable intelligence.

DYCE, ALEXANDER (1798–1869), Eng. dramatic editor and critic; edit. Shakespeare and other Elizabethan dramatists, and later Eng. poets.

DYCE, WILLIAM (1806-64), Scot. artist and etcher; R.A. (1848); *Descent of Venus*, *Bacchus*, *Madonna and Child*, etc.; typical examples in House of Lords, Tate Gallery, and at Edinburgh.

DYCK, VAN, see VANDYCK.

DYEING is the art of colouring materials, so that the colours will not be readily removed by washing, rubbing, or light. Silk, wool, cotton, straw, leather, and textile materials are those most usually requiring to be dyed. The process causes a permanent union between the material to be dyed and the colouring matter applied. The union is probably a chemical one, though the physical characters of the material may help in the process. Wool dyes most readily, cotton least so. Silk is intermediate between the two, a fact probably due to its different chemical composition. D. is usually carried on at high temperature, and is effected by allowing an aqueous solution of the dye-stuff with or without additions (acids, alkalies, salts) to act on the material to be dyed. Uniform distribution of the dye is ensured by moving the material in the liquid, or circulating the liquid through the material. Before 1856, when the first aniline colour, mauve, was isolated by Perkin, dyes were manufactured from natural products obtained from plants and animals. Since then dyes have been manufactured from coal-tar, and their range, vividness, and permanency have so steadily increased that the natural dyes have been ousted.

Dyes are classified according to their chemical constitution into Nitro-, Azo-, and Hydrazone colours, or according to the method by which they work—Direct, Acid, Basic, Developed, Mordant. *Acid* dyes colour animal fibres (wool and silk) in an acid bath; they do not dye cotton. *Nitro*-compounds and some *azo* ones are included in this group. They give red, brown, orange, green, blue, violet, and black colours. The dyeing power of *basic* colours lies entirely in the basic part of the salts of the organic colour bases. In the free state they are colourless and insoluble. With acids, coloured soluble salts are formed which dye silk and wool in a neutral bath. They have little affinity for cotton, unless it is steeped in tannic acid, which forms insoluble colour compounds (lakes) with the bases of the basic colours. The tannic acid is fixed into the fibre with a metallic oxide. The cotton is then said to be *mordanted*. The earlier coal-tar colours belonged to this class, and were remarkable for brilliancy. They were fugitive to light. *Direct* colours dye cotton without mordanting. They are also called *substantive* cotton colours. The group includes Benzo-, Diamine-, and Congo colours. *Diazo* compounds dye almost every variety of colour. Wool and silk can be dyed with the addition of a little acetic acid to the bath. On cotton the colours are not very fast to light or washing, but boiling with copper sulphate afterwards improves this.

Sulphide colours are only suitable for dyeing vegetable fibres. If the cotton is worked in the colour dissolved in an alkaline-reducing agent subsequent oxidation with bichromate of soda in acetic acid develops the colour. These colours are constantly increasing in number, and are fast to light, alkalies, acids, and washing. *Developed* colours are *azo* dyes which produce colour upon the fabric itself during the successive application of the constituent elements. After impregnation with alkaline solution of phenol the dried material is passed into cold solution of diazo compound. Fast to soap, but rather fugitive to light. Paranitraniline red is the chief. *Developed direct* colours are produced on cotton by developing it after diazotising in phenol solutions, and thereby obtaining azo-dyes of various hues—blue, red, brown, grey, and black. They are not very fast to light, and too sensitive to acids. Benzo- and nitrol colours can be dyed on cotton, and then developed by passing into diazo solutions. A new deeper and faster colour is formed by the reaction.

Mordant colours act like weak acids forming insoluble lakes with metallic oxides. The most stable are combined with alumina and lime. The object is to precipitate the coloured lakes within and upon the fibre. All dyed fabrics must undergo finishing.

Knecht, Rawson, and Loewenstein, *Manual of Dyeing*.

DYER, SIR EDWARD (d. 1607), Eng. courtier and poet; friend of Raleigh and Sidney; famed for pastoral verse.

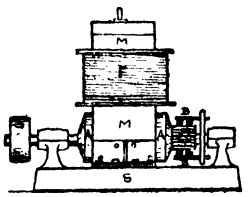
DYER, JOHN (1700–58), Brit. poet; b. Wales; author of *Grongar Hill*, *Ruins of Rome*, etc.

DYER, THOMAS HENRY (1804–88), Eng. historian and antiquary; histories of Modern Europe, Athens, Rome, etc.

DYKE.—(1) Wall raised to prevent inundation; used in Holland, the Fen-country in England, and in other low-lying lands. (2) (in Geology) A wall or slab of igneous rocks, common in N. of England and in Scotland; always found in neighbourhood of volcanic vent.

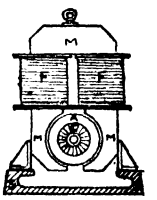
DYMOKE, name of Eng. family who have held office of King's Champion since reign of Richard II.

DYNAMICS is the science which treats of force and its action upon bodies, and since force may be regarded as acting in one or other of two distinct ways, there is, usually, a corresponding division of the science into two branches. To the first of these, which treats of the action of force in producing or changing motion, the term *Dynamics* is properly given. To the second, which treats of the action of force in maintaining rest or preventing change of motion, the term *Statics* is given. But a statical problem is only a particular case of some more general dynamical problem, and hence this division of the subject is somewhat artificial.



The study of dynamics involves, as a necessary preliminary, a study of the motions of points, lines, and surfaces, without reference either to the mass of any particular portion of matter which may move or to the particular force which may produce motion. This preliminary forms the science of *Kinematics*, and it is obviously concerned only with problems of space and time. Dealing next with dynamics proper, we have first to frame definitions of the principal terms used, such as mass, force, momentum, energy, work, etc., and to settle the *Units* (q.v.) in terms of which they may be quantitatively expressed. The next point is the consideration of the fundamental principles on which, or on deductions from which, dynamical science is built. These are Newton's Three Laws of Motion, viz.: (1) That every body continues in its state of rest or of uniform motion in a straight line except in so far as it is compelled by impressed forces to change that state; (2) that change of momentum is proportional to the impulse of the impressed force, and takes place in the direction of that force; and (3) that to every action there is an equal and contrary reaction. The best evidence for the truth of these laws is the fact that, using them as hypotheses to explain the motions of the solar system, we can predict the position of a planet or a satellite at any future time, and that such predictions are fulfilled with rigorous exactitude. The applications of these principles may for convenience be classified according to the nature of the problem dealt with—*e.g.* simple particles, systems of particles, and rigid bodies. (Their applications to elastic bodies and to fluids are dealt with under *Elasticity* (q.v.) and *Hydromechanics* (q.v.).) In each such application, the general method is to arrange the data of the problem so as to provide an *equation of motion*. On solution, this gives information regarding the position, or speed, or acceleration of the moving particle or body. Lastly, the principles of kinematics are employed so as to present the result in any particular form which may be desired. Taking the first of the divisions mentioned—the dynamics of a particle—we have to deal with problems which may be classified according to the species of curve described by the moving particle—*e.g.* rectilinear motion, parabolic motion, the motion of particles attracted towards a centre by a force which varies with the distance according to some prescribed law, motion of a particle which is constrained to move in a certain path, motion in a resisting medium, impact of a particle upon a fixed plane, etc.

In the second division—systems of particles—problems arise such as those of the impact of spheres, the motion of particles connected by strings, and the dynamics of flexible inextensible strings. In the third division we are introduced to several new conceptions, such as centre of mass, moment of a force, moment of inertia, moment of momentum, etc. In forming the equations of motion of a free rigid body, it is to be noted that any such body has six degrees of freedom, *i.e.* there are six independent ways in which it may be regarded as being free to move. For, regarded as a particle, it could move east or west, north or south, and vertically up or down. Again, regarded as an extended body it could rotate upon axes fixed in these three directions. It has, therefore, three degrees of freedom of translation and three of rotation. Consequently, we require six independent equations of motion, embodying the data provided, in order to determine the motion of a free rigid body.



It will probably be readily seen that, in general, every dynamical problem has a statical aspect. For, on framing the equation of motion, if we insert the condition that equilibrium is maintained, the solution of the equation will give the condition contemplated in the statical treatment of the question. To take a very simple case, consider a particle which is placed upon a rough inclined plane. The forces involved are (1) the weight of the particle acting vertically downwards, (2) the force of friction acting opposite to the direction in which the particle moves or tends to move, and (3) the reaction of the plane acting perpendicularly to the plane. Treating the problem dynamically, these forces are *resolved* in the direction of the plane, *i.e.* their components in that direction are found, and the algebraic sum of these components is equated to the product of the mass of the particle and its acceleration. The solution of this equation would give the acceleration, and any other detail of the motion could be deduced by kinematical principles. Treating the problem statically, the condition of equilibrium is inserted into the equation by making the acceleration zero. The equation may then be solved so as to give the value of any of the quantities involved.

DYNAMITE, an explosive invented by Nobel; consists of a mixture of 25% Kieselguhr (mainly pure silica) with 75 % nitroglycerine. All modifications consist of nitroglycerine and a substance capable of absorbing it. See BLASTING.

DYNAMO.—A dynamo is a machine which turns mechanical into electrical energy, and depends on the principle that an electrical pressure, and consequent current, is created in a conducting circuit when the magnet field, passing through it, varies. This variation is produced by the motion of the circuits relative to the field or *vice versa*. When a rectangular coil, forming part of a circuit, is rotated in a magnetic field, the direction of the induced pressure changes each time the coil is at right angles to the magnetic lines and an 'alternating' current results. In a direct current d. the induced alternating current is made uniform and continuous in the outside circuit by the commutator. D's thus fall into two main classes: (1) CONTINUOUS CURRENT DYNAMOS; (2) ALTERNATORS. The parts of the former are: the *field-magnets* or *electromagnets* producing the magnetic field, the current used being derived from the machine itself; the armature, called *drum*, *ring*, or *disc* according to the construction, in which the circuits are grouped and the current generated. The first type which is most common is built up from thin iron stampings often

DYNAMO. Side View.

End View (bearing and brushes removed).

M, field-magnet; *F*, field-magnet coils; *S*, sole plate; *A*, armature; *C*, commutator; *B*, brushes.

separated by thin paper, threaded on to a three or four armed 'spider' keyed to the driving shaft. The resulting cylinder, hollow for ventilation, has slots on the surface parallel to the shaft, and into these insulated coils, previously wound on a frame or former, are slipped and fixed by wood strips and steel binding wire; the commutator, a small cylinder on the shaft and insulated from it, formed of copper and mica segments alternately, each of the former having the junction between two armature coils joined to it; the brushes, previously of copper gauze, now of hard carbon coppered where held in the brush-holder. These press upon the rotating commutator, the pressure being regulated by a spring, and deliver the current to the outside circuit.

Direct or continuous current d's are classed according to the method of exciting the field-magnets. *Series-wound machines* have the field-magnet coils, the armature coils, and the external resistance connected in series. The electrical pressure generated is thus equal to the sum of the pressures lost by the current in

passing through these three resistances. Originally used for lighting arc lamps in series, this type has been largely replaced by *shunt-wound machines* in which the field-magnet coils are joined to the brushes, *i.e.* are in parallel with the outside circuit. Only part of the current is shunted round the magnets; in large machines 2–3 % of the energy is thus consumed. Shunt machines are suited for charging accumulators, driving motors, and lighting. *Compound-wound machines* have a few series coils as well as shunt coils round the magnets, the number of turns being such that the pressure difference at the dynamo terminals is nearly constant with altering current. By increasing the series turns the pressure may be made to rise with increase of current. This is over-compounding. Compound-wound machines are sometimes constructed so that a switch can cut out the series coils, giving a shunt machine. A further distinction between machines lies in the number of *field-magnets* or *poles*. A two-pole machine has one north magnetic pole facing one south magnetic pole; a multipolar has an even number of poles spaced equally and alternately north and south. The latter, adopted in large installations, generate a high pressure with comparatively slow driving of the armature.

The capacities of any d. are represented graphically by its characteristic curves, introduced by Hopkinson, in which the pressure is plotted against the current for any particular speed. The external characteristic curve gives the relation between current in the external circuit and pressure difference at the d. terminals; the internal characteristic shows the pressure lost in the machine as the current varies; and the total characteristic gives the relation between the total pressure generated and the current. With increasing current these illustrate for a series machine increase of pressure to a maximum then decrease, for a shunt machine decrease; hence the combined effect in a compound-wound machine can produce level pressure and over-compounding an increasing pressure.

ALTERNATORS possess generally the same parts as direct current d's, omitting the commutator. The name *rotor* is applied to the rotating part whether armature or field-magnets; *stator*, to the fixed part, field-magnets or armature. Large alternators have invariably a fixed ring-shaped armature, laminated like that of a direct current d., inside which rotates a fly-wheel carrying radial magnetic poles alternately north and south at the circumference. A separate direct current for magnetisation is supplied from brushes through slip-rings on the shaft. In a single-phase machine the conductors in the armature are connected in series. In a two-phase alternator there are two independent sets of conductors, the portions of one set being placed half-way between those of the other, so that when the pressure in one set is a maximum, in the other it is zero. If a complete cycle, period, or wave of pressure be denoted by 360°, the pressure in one set is 90° (the phase difference) ahead of the other. In a three-phase machine the states of the pressures in the three windings are relatively at 0° in the first, 120° in the second, 240° in the third. While supplying power for local work, alternators are used specially along with *transformers* in long-distance economical transmission of energy derived from fuel and water-power. See ELECTRICITY (ELECTROSTATICS), TRANSFORMER.

DYNAMOMETER, an instrument for measuring force or power. Mechanical d's are of two kinds—*absorption* and *transmission* d's. In the former a known force in the form of a brake is applied to a wheel rotated by the engine whose power is to be measured. In the latter, the power, after being measured, is transmitted for use. In some machines the power is passed on from one shaft to another by means of a spring, the deformation of which measures the power so transmitted. Where a belt is used the difference in tension between the driving and slack sides gives the required measure, and this is obtained by passing the belt round a freely suspended pulley and measuring the force required to prevent the latter being displaced. The *electro-d.* measures strength of current, not force, the latter being easily calculated from the dimensions of the coils in the instrument.

DYSART (56° 8′ N., 3° 7′ W.), seaport town, Fife, on Firth of Forth, Scotland; contains Dysart House, seat of Earl of Rosslyn; ruins of ancient castle, Ravenscraig, in vicinity; flax factory. Pop. (1911) 4197.

DYSENTERY, an infectious disease, characterised by ulceration of the large intestine, with diarrhœa and the passage of blood and mucus, occurring in marshy and malarial districts. Somewhat different types are due to different organisms, the *amœba hystolytica*, and two differing *bacilli dysenteriæ*, and infection is supposed to be generally from drinking contaminated water. The onset of the disease is usually sudden, with griping pain, and frequent discharges from the bowel. An attack often lasts only a week, but it may become chronic. The treatment is to rest the affected part, giving only barley water and the very lightest nourishment; laudanum and ipecacuanha are useful drugs in attacks.

DYSPEPSIA, INDIGESTION, general term applied when the digestive organs, especially the stomach, are unable properly to perform their function of digesting the food, and thereby cause various disagreeable symptoms. D. may be due to derangement of the organs themselves, or to faults of the person affected. Under the former head may be classed weakness of the digestive organs after fevers, etc.; deficiency of the digestive juices of the stomach, of the pancreas, or of the liver; or, a frequent cause, bad teeth. Under the latter come intemperance in eating or drinking, or both; swallowing the food hurriedly without chewing it properly; drinking too much, or too often, tea, coffee, alcohol; insufficient exercise, or hard mental or physical work immediately after food; worry and mental strain; unclean, but not actually decayed, teeth.

The symptoms experienced usually include loss of appetite, headache, giddiness, a feeling of fulness or discomfort or dull pain in the chest after food, flatulence, nausea, and vomiting, but only one or two of these may be present.

The treatment is to correct any fault of the individual, to take plenty of fresh air and exercise, to keep to a carefully regulated diet, and to keep the bowels open and regular. Drugs should not be used if there is improvement without, and those employed depend of course on the actual condition present; but bismuth to soothe irritation, alkalies before meals to promote secretion, pepsin and hydrochloric acid to assist digestion, and tonics with strychnine and hydrochloric acid are all valuable in different cases.

DYSTELEOLOGY, denial of purpose in nature, as opposed to doctrine of design.

DYTISCIDÆ, see under CARABOIDEA.

DZUNGARIA, DSONGARIA (45° N., 85° E.), region, prov. Ili, N. China; was nucleus of a Mongolian kingdom which reached its zenith in XVII. cent.; subjugated by China about mid.-XVII. cent.

E, fifth letter of Eng. alphabet, having various long and short sounds; occasionally sounded as *ă* (clerk); final *e* is now usually mute, but was originally sounded.

EA, water-deity, associated, in the religion of Babylon, with the Persian Gulf. See BABYLONIA.

EADBALD, king of Kent; s. of Æthelberht; reigned, 616–40.

EADMER (c. 1064–1124), Eng. historian; Benedictine monk; sec. and biographer of St. Anselm.

EADS, JAMES BUCHANAN (1820–87), Amer. engineer; built steel arch bridge over Mississippi and famous jetties to deepen and clear river mouth.

EAGLE, a fierce and extremely powerful bird of , of strong flight and keen vision; the 'king of s.' Two species occur in Britain, though rarely, the golden e. (*Aquila chrysœtus*) nesting in the Scot. Highlands, and the sea e. (*Haliaëtus albicilla*). The rest, or *eyrie*, is generally built on precipitous crags, and consists of a large mass of sticks and heather lined with fur and wool. The e. feeds on game, lambs, and the like, but does not, however, refuse fresh carrion. Unless molested, it seldom attacks mankind. About half a dozen other varieties are found in Europe, including the imperial eagle.

The e. was an emblem of Jove, and so became the symbol of Roman sovereignty. The German imperial e. is one-headed, and its claws are outstretched; the Austrian is two-headed, and it grasps a sword and sceptre in the right claw, an orb in the other; the Russian, likewise two-headed, carries only the sceptre and orb. The United States have adopted a one-headed eagle holding arrows and an olive branch.

EAGLE ISLAND (54° 17′ N., 10° 5′ W.), island, Mayo, Ireland. EAGLE ISLANDS are dependencies of Mauritius; also called Trois Frères.

EAGLEHAWK (36° 50′ S., 144° 20′ E.), town, Victoria, Australia; gold mines. Pop. 8000.

EAGRE, tidal wave of unusual height, rushing up an estuary (*e.g.* Humber, Trent, Severn).

EAKINS, THOMAS (1844–), Amer. artist; portraits and genre pictures.

EAMES, EMMA (1867–), Amer. soprano; studied under Marchesi; Juliet (1889) in Gounod's opera a great success; sang in London, 1891, and m. Julian Story; New York (1891), and later at Madrid, Monte Carlo, etc.; m. Emilio de Gogorza, 1911.

EAR, the organ of hearing, is divided in man into external, middle, and internal ear. The EXTERNAL EAR consists of two parts, the *auricle*, or *pinna*, a fibro-cartilaginous framework covered with skin, the purpose of which is to catch the vibrations of the air, and the *auditory meatus*, a bony and in part cartilaginous canal passing into the temporal bone and ending at the *tympanic membrane*, which separates it from the middle ear. The auditory meatus is lined with skin, the glands of which secrete wax. The MIDDLE EAR, or cavity of the tympanum, is a small cavity situated in the petrous portion of the temporal bone, the purpose of which is to transmit to the internal ear the sounds which strike the tympanic membrane. It is filled with air (from back of nasal cavity through *Eustachian tube*), so as to preserve uniform temperature, to increase action of the sound conveyers, and to keep pressure equal on each side of the tympanic membrane.

Between the middle ear and the internal ear are two fine membranes covering little openings called the *fenestra rotunda* and the *fenestra ovalis*; and the vibrations caused by sounds are transmitted from the tympanic membrane to the membrane of the fenestra ovalis, and thus propagated to the internal ear, by a chain of little bones in the middle ear, called from their shapes the *malleus*, *incus*, and *stapes* (*i.e.* hammer, anvil, and stirrup).

The INTERNAL EAR is composed of a series of cavities in the petrous portion of the temporal bone, comprising the *vestibule*, the central cavity, into the superior part of which open three canals, named from their shape the *semicircular canals*, while the front part of the vestibule is prolonged into a spiral canal resembling the shell of a common snail, the *cochlea*. A spiral bony shelf divides the cochlea incompletely into two passages: an upper, or *scala vestibuli*, and a lower, or *scala tympani*. Within the bony cavities is contained a series of membranous canals which closely follow them in shape, but, being much smaller in calibre, are not in close contact with their walls. Between the walls of the two series of canals is a space filled with a special fluid, the *perilymph*, while the membranous canals are filled with another fluid, the *endolymph*.

In the vestibule the membranous labyrinth is divided into a small sac, the *saccule*, into which the membranous canal of the cochlea opens, the *utricle*, into which the membranous semicircular canals open, and a slender blind canal, the *endolymphatic duct*. The membranous semicircular canals are only about a quarter-width of the corresponding bony canals, and at one end of each is a large dilatation, or *ampulla*, into which the hairs of hair-cells project. The membranous cochlea, or *cochlear duct*, lies in the bony canal between the free edge of the bony shelf and the outer wall, and along its base extends a minute structure, the *organ of Corti*, the essential part of which consists of hair-cells projecting into the endolymph.

PHYSIOLOGY OF THE EAR.—When vibrations of a body set up air-waves (which cause the sensation called sound) they are reflected by the external ear and pass into the auditory meatus, and strike the tympanic membrane. The vibrations are transmitted by the chain of ossicles, and, the base of the stapes being attached to the membrane of the fenestra ovalis, are then transferred to the perilymph. The waves in the perilymph set up corresponding waves in the endolymph, and these affect the nerve endings to the different parts. The utricle and saccule can only perceive sounds as sounds, the analysis of tone is the function of the cochlea, its hair-cells being irritated by the waves of endolymph, and the sensation communicated to the brain by their fine nerve filaments. The function of the semicircular canals is concerned with the sense of equilibrium, the hair-cells of the ampullæ being irritated by the waves of endolymph caused by change of position.

DISEASES OF THE EAR may affect either the external, middle, or internal ear. The auditory meatus may be impacted with wax (the commonest cause of temporary deafness), the products of inflammation, etc., or the tympanic membrane may be thickened, have adhesions, be the subject of other diseases, or suffer from wounds caused by violence. Another common cause of deafness is the closure of the Eustachian tube at its opening into the upper part of the throat. A serious and common cause of pain in the ear is inflammation, suppurative or not, of the tympanic cavity (middle ear). This often has a discharge coming from it, and its seriousness is due to its proximity to the brain, to which inflammation may extend and cause death. As soon as possible the ear should be syringed out with a mild antiseptic solution, and the external meatus plugged with cotton wool to dry

up the moisture. A skilled ear specialist should always be consulted in regard to ear conditions, as their sequel may be very serious.

FOREIGN BODIES in the ear can usually be removed by syringing with warm water or by dropping in warm glycerin. See DEAF AND DUMB, SOUND.

EARL (Dan. *jarl*), Eng. title, corresponding to foreign count (note *countess* for an e.'s wife), one of five ranks of Eng. peerage. Anglo-Saxon earls were more like vassal kings, and in Norman times earldoms were powerful and extensive. Like other titles it became personal rather than territorial. The oldest existing earldom is Mar (Scot.—early XI. cent.). Some mediæval Eng. earldoms still survive.

EARL MARSHAL, position held by Duke of Norfolk, who as such is head of College of Arms, and has organisation of Coronations and State ceremonies.

EARLE, JOHN (d. 1665), Eng. bp.; famed for humorous *Microcosmographie.*

EARLE, RALPH (1751–1801), Amer. artist; portraits and hist. subjects.

EARLOM, RICHARD (1742–1822), Eng. mezzotint engraver.

EARLSTON (55° 39′ N., 2° 40′ W.), market town, Berwickshire, Scotland; traditional abode of Thomas the Rhymer (*Ercildoune*).

EARLY, JUBAL ANDERSON (1816–94), Amer. soldier; practised law; served in Mexican war; general in Confederate army in Civil War.

EARN (56° 23′ N., 4° 11′ W.), loch, Perthshire, Scotland; drained by river EARN, which, issuing from E. end, flows E. and enters Firth of Tay; course, 40 miles.

EAR-RING, pendent ornament to hang from the lobe of the ear, used both by savage and civilised races, and, in some countries, by both sexes. The use is of great antiquity, and there is reference to these ornaments in *Genesis.*

EARTH.—The earth is the third planet from the sun, round which it revolves in 365·26 days, and it also rotates about its own axis once in every 23 hrs. 56 min. 4·09 secs. It is a globe poised in space. Among the ancients the e. was thought to be a large disc surrounded by water, and various means of support were ascribed—by the Greeks, columns which in their turn were upheld by the god Atlas; by the Egyptians and Hindus, elephants, who stood on an enormous tortoise swimming in the sea.

Aristotle was the first to teach that the e. was spherical, and his arguments were similar to those used at the present time, viz. all heavenly bodies are round; the shadow of the e. on the moon during an eclipse is round; the appearance of the sky at night varies when viewed from different parts of the e.'s surface; the masts of ships appearing and disappearing on the horizon are first and last to be seen. It was not, however, until the world had been circumnavigated that its spherical form was firmly established.

The exact determination of the e.'s size and shape is one of the most brilliant achievements of applied mathematical science, and is of the utmost value in astron., where a number of measurements can only be expressed in terms of the e.'s radius. The e. is not a perfect sphere. It is slightly flattened at the poles, and bulges at the equator, the lengths of the equatorial and polar diameters being 7925·6 and 7899·14 miles respectively. In shape it is, therefore, an *oblate spheroid,* that is, the figure produced by the revolution of an ellipse about its shorter axis. But the deformation is so small that it is only revealed by careful measurements and observations such as the following: If the e. were truly spherical, the length of a degree of latitude would be the same wherever measured. This is, however, found to increase with distance from the equator, which could only be the case if the deviation from the spherical form was of the nature just mentioned. The actual measurement of a meridian is a very laborious and delicate process, and the final calculation is dependent on the measurement, correct to a couple of inches, of a 'base' line four or five miles long. In 1743 Clairault published a mathematical investigation on the figure of the e., and showed that its ellipticity could be obtained from a knowledge of the centrifugal force (due to the e.'s rotation) and the value of gravity at the equator, together with that of gravity at one or two places in different latitudes. The effect of the centrifugal force is slightly to counteract that of gravity, which is itself dependent on distance from the e.'s centre. If the e. were therefore a true sphere which did not rotate, the force of gravity would be the same at all places on its surface. Now the centrifugal force can be calculated, and gravity at any place can be determined from the length and time of swing of a simple pendulum. Biot, in 1808, was the first to make such observations, which have since been repeated by many others, notable among whom was an Englishman, Captain Henry Kater, who devised a special pendulum for the purpose. These observations prove that places at high latitudes are nearer the centre of the e. than those on the equator.

Further evidence of the e.'s ellipticity is supplied by careful measurements of the planets, which reveal a similar flattening at the poles—a result proved mathematically to be entirely due to rotation about an axis, and depending on the speed with which it is accomplished. The planet Jupiter serves as a beautiful illustration of this, the difference between the polar and equatorial diameters being immediately apparent without any refined measurements. The time of rotation of Jupiter is under 10 hours. The *precession* of the e.'s axis is also only explicable on the ground that the e. is elliptical. As the means of observation and measurement become more and more refined, greater precision in our knowledge of the e.'s figure and size is obtained. Thus, only recently it has been discovered that the equatorial circle is slightly elliptical. See TIDES, MAGNETISM (TERRESTRIAL).

Sir Robert Ball, *The Story of the Heavens.*

EARTH CURRENTS, see under TELEGRAPH.

EARTH-NUT, root-stock of *Conopodium denudatum,* an umbelliferous European plant; about size of chestnut; edible.

EARTHENWARE, see POTTERY.

EARTHQUAKE, see SEISMOLOGY.

EARTHWORM, small regularly segmented invertebrate, devoid of specialised sense organs, which feeds on the decaying vegetable matter in soils, this being effectively turned over and broken up in the process.

See Darwin, *Vegetable Mould and Earthworms.*

EARWIG (*Forficula auricularia*), a brownish insect, abundant in gardens, characterised by possession of a pair of pincer-like processes at posterior end of body; name derived from *supposed* habit of creeping into ears of sleeping persons.

EASDALE (56° 17′ N., 5° 39′ W.), island, near Oban, Scotland; has slate quarries.

EASEMENT, legal term meaning the use of, or benefit in, land or property, without proprietorship, which may arise in one of three ways: (1) by express or implied grant of the owner; (2) by virtue of the doctrine of lost grant; and (3) by virtue of the Prescription Act (1832). Thus it is provided by this Act that where a person has enjoyed a right to the free and uninterrupted flow of light over his neighbour's [illegible] years, unless he has obtained the written consent of the owner of the property for the use and enjoyment of the light, he obtains a perpetual right to enjoy that light, and he can obtain an injunction to restrain his neighbour from building on the land in such a way as to interrupt the flow of light. Similar claims apply to right of way.

EAST AFRICA, see BRITISH EAST AFRICA, GERMAN EAST AFRICA, PORTUGUESE EAST AFRICA.

EAST, SIR ALFRED (1849–), Eng. landscape artist and etcher; A.R.A. (1882); Pres. R.B.A. (1906).

EAST ANGLIA, kingdom of Anglo-Saxon England; probably founded early in VI. cent.; converted to Christianity VII. cent.; Sigeberht was a famous king;

under Mercian supremacy till 825, when Egbert of Wessex was acknowledged lord.

EAST CHICAGO (41° 38′ N., 87° 27′ W.), city, Indiana, U.S.A.; iron and steel manufactures. Pop. (1910) 19,098.

EAST DEREHAM (52° 41′ N., 0° 57′ E.), market town, Norfolk, England; has interesting cruciform church; iron foundries. Pop. (1911) 5729.

EAST GRINSTEAD (51° 7′ N., 0° 1′ W.), market town, Sussex, England. Pop. (1911) 7090.

EAST HAM (51° 32′ N., 0° 3′ E.), town, Essex, England. E. suburb of London. Pop. (1911) 133,504.

EAST INDIA COMPANY (popularly known as 'John Company') was founded in England in 1600. Its sphere included both what is now called India and the East Indies. For about fifty years it did not progress much, having to struggle against the Dutch. Its activities soon became confined to India, and the foundations of Brit. Imperial power were laid. Its power was consolidated and brought more under control of the Government in 1773. It became political rather than commercial, and was abolished when Ind. Government was taken over by Crown in 1858. See INDIA.

EAST INDIES, loose collective name formerly applied to India, Farther India, and Malay Archipelago; now restricted to last-mentioned.

EAST LIVERPOOL (40° 40′ N., 80° 31′ W.), city, on Ohio, Columbiana County, Ohio, U.S.A.; extensive potteries. Pop. (1910) 20,387.

EAST LONDON (32° 59′ S., 27° 52′ E.), important seaport town, Cape Province, S. Africa. Pop. (1911) 21,277 (including 12,552 whites).

EAST LOTHIAN, see HADDINGTONSHIRE.

EAST ORANGE (40° 44′ N., 74° 15′ W.), city, New Jersey, U.S.A.; residential suburb, 12 miles W. of New York; electrical machinery. Pop. (1910) 34,371.

EAST PROVIDENCE (41° 47′ N., 71° 27′ W.), town, Providence County, Rhode Island, U.S.A.; chemical works. Pop. (1910) 15,808.

EAST PRUSSIA (54° N., 21° E.), N.E. province, Prussia, Germany, on Baltic Sea; corresponds to ancient duchy of Prussia. Surface, generally low, contains numerous small lakes, while lagoons known as Frisches Haff and Kurisches Haff extend along Baltic coast; chief rivers, Memel and Pregel. Soil is mostly fertile; amber found; leading industry, agriculture; horse-breeding; capital, Königsberg. Area, 14,266 sq. miles. Pop. (1910) 2,064,175.

EASTBOURNE (50° 46′ N., 0° 17′ E.), watering-place, on Eng. Channel, Sussex, England. Pop. (1911) 52,544.

EASTER, annual festival commemorating Christ's resurrection; falls about the time of the vernal equinox, *i.e.* the next Sunday following the first full moon of the calendar on or after March 21; forms the opening of the ecclesiastical year. In England method of computing the date was fixed by a synod held at Whitby (664). Previous to this time E. had been kept according to an earlier method of computation, which was rejected by the Western and retained by the Eastern Church. In 664, however, Britain adopted the practice of the Western Church. The name is derived from a Saxon goddess (Eastre) whose festival occurred about the same time, synchronising with a festival kept in classical times. The eating of 'hot-cross' buns on Good Friday is a survival of an ancient custom of making special 'Easter cakes' for the festival. See CALENDAR.

EASTER ISLAND (26° S., 110° W.), in Pacific Ocean, belonging to Chile and about 2000 miles W. of coast; of volcanic origin, contains number of extinct craters; area, 45 sq. miles; fertile soil, little cultivated; natives, Polynesians; noted for gigantic prehistoric statues; discovered by Davis, 1686; visited by Roggeveen, 1722; by Cook, 1774.

EASTERN BENGAL AND ASSAM, former province, India; created in 1905 out of E. portions of Bengal, consisting of Dacca, Chittagong, Rajshahi, Malda, Hill Tipperah, and whole of Assam; capital, Dacca. Area, 106,130 sq. miles; abolished, 1912, part being reunited to Bengal (*q.v.*) and part reconstituted as Chief-Commissionership of Assam (*q.v.*). Pop. (1911) 34,018,527.

EASTERN QUESTION, name given to complicated political problem produced by gradual break-up of Turk. Empire. In XIX. cent. first Greece became independent, then Rumania, Servia, Montenegro, and Bulgaria (until 1908 under Turk. suzerainty). Mutual jealousies of European Powers lest any one of them should seize some advantage, and possibilities of further disruption produced recurring political anxieties. Internal reforms in Turkey (1908–9) seemed to promise renovation of the Ottoman Empire, but the Turco-Italian War (1911–12) in Tripoli (*q.v.*) continued the process of disintegration, and the victorious campaign (1912–13) of the Balkan Allies in the Turco-Balkan War (*q.v.*) may be regarded as the long-expected death-bed scene of the 'Sick Man of Europe.' See also MACEDONIA, BALKAN PENINSULA, TURKEY, ARMENIA, ALBANIA.

Macdonald, *Turkey and the Eastern Question* (Jack, 1913).

EASTERN RUMELIA, see BULGARIA.

EASTHAMPTON (40° 57′ N., 72° 12′ W.), town, Suffolk County, New York, U.S.A., at E. extremity of Long Island.

EASTHAMPTON (42° 16′ N., 72° 40′ W.), town, Hampshire County, Massachusetts, U.S.A.; seat of Williston Seminary; cotton and rubber goods. Pop. (1910) 8524.

EASTLAKE, SIR CHARLES LOCK (1793–1865), Eng. artist; Pres. R.A. (1850); Director of National Gallery; subjects various; wrote several books on art.

EASTON (40° 43′ N., 75° 17′ W.), city, Pennsylvania, U.S.A., at junction of Delaware and Lehigh; seat of Lafayette College; iron and wire works. Pop. (1910) 28,523.

EASTPORT (44° 53′ N., 67° 2′ W.), city, seaport, Maine, U.S.A., on Moose Island; trade in lumber; fishing centre; sardine-canning. Pop. 5000.

EASTWICK, EDWARD BACKHOUSE (1814–83), Eng. Orientalist.

EATING, see DIGESTION, DIETETICS.

EATON, DORMAN BRIDGMAN (1823–99), Amer. lawyer; wrote on legal subjects and Civil Service reform.

EATON, THEOPHILUS (d. 1658), Eng. colonist; one of founders, and first gov. of New Haven, Mass. (1638).

EATON, WILLIAM (1764–1811), Amer. soldier; consul to Tunis, 1790; led expedition in Tripoli in 1805; took Derna.

EATON, WYATT (1849–96), Amer. artist; chiefly portraits.

EAU CLAIRE (44° 40′ N., 91° W.), city, Wisconsin, U.S.A., at mouth of Eau Claire; lumber, sawmills. Pop. (1910) 18,310.

EAU-DE-COLOGNE, scent; first made by Farina, an Ital. perfumer, at Cologne, during XVIII. cent.

EAUX-BONNES (42° 59′ N., 0° 24′ W.), watering-place, Basses-Pyrénées, France; mineral springs.

EBBW VALE (52° 46′ N., 3° 11′ W.), urban district, Monmouthshire, England; coal, iron, steel. Pop. (1911) 30,559.

EBEL, HERMANN WILHELM (1820–75), Ger. philologist.

EBEL, JOHANN GOTTFRIED (1764–1830), Prussian writer; author of Swiss guide-book.

EBER, PAUL (1511–69), Ger. theologian.

EBERBACH (49° 28′ N., 9° 3′ E.), town, on Neckar, Baden, Germany. Pop. 6136.

EBERHARD I. (1445–96), first duke of Württemberg; made pilgrimage to Jerusalem; founded Tübingen Univ.; gave constitution to Württemberg; cr. duke, 1495.

EBERHARD, CHRISTIAN AUGUST (1769–1845), Ger. poet.

EBERHARD, JOHANN AUGUSTUS (1739–

1809), Ger. thinker, theologian, and writer; prof. at Halle, 1778; a broad-minded and learned man.

EBERLIN, JOHANN ERNST (1702–62), Ger. composer.

EBERS, GEORG MORITZ (1837–98), Ger. Egyptologist; wrote many novels which gave, in popular form, the results of his researches.

EBERSWALDE (52° 50′ N., 13° 48′ E.), town, Germany, Pruss. province of Brandenburg; iron-works, nail-making. Pop. (1910) 26,064.

EBERT, FRIEDRICH ADOLF (1791–1834), Ger. bibliographer.

EBINGEN (48° 12′ N., 9° 2′ E.), town, Württemberg, Germany; cotton and wool. Pop. (1910) 11,423.

EBIONITES (Hebrew *Ebhyon*, poor), name given to early sect of Jewish Christians believing in Christ as Messiah but not in Incarnation; observed Jewish law, some trying to force it on all Christians.

EBNER-ESCHENBACH, MARIE (1830–), Austrian novelist.

EBOLI (40° 37′ N., 15° 4′ E.), town, Campania, Italy; ancient *Eburum*. Pop. 9577.

EBONY, the hard, black heart-wood of certain species of *Diospyros*, notably *D. reticulata*, found in Mauritius, and *D. Ebenum*, found in Ceylon.

EBORACUM, Rom. name of York (*q.v.*).

EBRARD, JOHANNES HEINRICH AUGUST (1818–88), Prot. theologian; prof. at Erlangen; wrote several works.

EBRO (40° 43′ N., 0° 53′ E.), river, N.E. Spain; rises in Cantabrian mountains; flows with southerly course for 440 miles, and enters Mediterranean below Tortosa; navigable for *c.* 180 miles; ancient *Iberus*.

EÇA DE QUEIROZ, JOSÉ MARIA (1843–1900), Portug. novelist; famous as stylist; Eng. trans. of several stories, including *Sweet Miracle*.

ÉCARTÉ, card game played by two persons with thirty-two cards, the small cards, two to six (inclusive), being removed from pack. Five cards are given to each player, and the eleventh turned up for trumps. King ranks highest, and the others in order are queen, knave, ace. The scoring is for king and the greater number of tricks, the game being five up; consult Cavendish's *Laws of Écarté*.

ECBATANA (34° 46′ N., 48° 30′ E.), supposed ancient capital of Media, at foot of Mt. Orontes (now *Elvena*); summer residence of Persian and Parthian kings.

ECCARD, JOHANN (1553–1611), Ger. composer.

ECCELINO DA ROMANO, EZZELINO (1194–1259), Ghibelline leader; served under Frederick II.; excommunicated for great cruelties; figures in Dante's *Inferno*.

ECCENTRIC, a device to produce a reciprocating motion from a rotary one; is used also to actuate the valves of engines, etc. It is a small crank. In detail, a disc carries the crank-shaft at some distance from its centre. This disc or 'sheave' is made in two pieces to embrace the crank shaft, and the pieces are held together by a steel clip or strap. The centre of the disc moves round the shaft on a circular path.

ECCLES (53° 28′ N., 2° 21′ W.), extensive suburb, Manchester, England; cotton mills. Pop. (1911) 41,946.

ECCLESFIELD (53° 22′ N., 1° 28′ W.), town, W. Riding, Yorkshire, England; cutlery. Pop. (1911; Registration sub-district) 22,409.

ECCLESHALL (52° 52′ N., 2° 16′ W.), market town, Staffordshire, England; remains of former palace of bp's of Lichfield. Pop. 3700.

ECCLESIA (Gk. *ekklesia*=assembly), name given to the ancient Athenian assembly. It was given certain powers by Solon's legislation, but their exact nature is uncertain. Probably the *Thetes* were admitted to it, and it elected *Eupatrid*, magistrates. Its powers were increased later. Any Athenian over eighteen could be elected to it. From the IV. cent. onwards members received payment. All matters brought before the e. were first dealt with by the *boule* (council). Its decision was called a *psephisma*, and had the force of law. It also possessed certain administrative and judicial functions.

ECCLESIASTES, or the 'Preacher,' one of the books of the Wisdom lit. of the Old Testament. Its leading idea is expressed in the words, 'Vanity of vanities—all is vanity.' The only thing a man can do is to enjoy life while it lasts. The author is not an atheist, or even a materialist, but he is without the vivid faith of the prophets. To get pleasure, though not vicious pleasure, is the only thing to be done. There is no definite hope of immortality. The preacher regulates his life by wisdom; his whole attitude is that of not very cheerful moralising. It is questionable whether the work shares the influence of Gk. thought; some say there is nothing which cannot have been developed from earlier tendencies of Hebrew religion. The authorship is quite and the date somewhat uncertain, though undoubtedly late—probably B.C. 250–200. Some place it as late as Herod the Great. It cannot be earlier than the late Persian period. Its composite nature has been asserted by some critics—though on insufficient grounds. The style is unclassical, and words and constructions appear which are frequent in Aramaic and the Mishnah.

Driver, *Introduction to Lit. of Old Testament*; recent commentaries by Barton, Martin, M'Neile.

ECCLESIASTICAL.—The Gk. word *ekklesia* used to mean generally the assembly of freeborn citizens, and in the Septuagint the assembly of Israel was used by Christ to designate the visible society of His own foundation, whence the term 'ecclesiastical' has come to describe something which is connected with or bears upon the Church.

The **Ecclesiastical Commissioners**, or 'Ecclesiastical and Church Estate Commissioners for England,' is a body of sixty clerical and lay members, with various duties relating to Church property, particularly administering certain estates for a common fund to augment livings and help poor parishes.

Ecclesiastical Jurisdiction is the term applied to that authority exercised by the Church over its own members, whether in spiritual or temporal concerns, or over the laity. From the beginning, the Christian Church undoubtedly possessed certain disciplinary powers over those within it, and instances of this can be found in the New Testament. But they were generally confined to spiritual matters. Until the Edict of Milan the Church was an illegal institution, and hence could not really have any rights within the Rom. Empire. Nevertheless, from about 250 A.D. rights were sometimes recognised, for the deposition of Paul of Samosata by the Church of Antioch was recognised by the Imperial authorities. From the time of Constantine, when Christianity became the State religion, its power grew in judicial as in other matters. The authority of the Church is, now onwards, backed up by the State. Bp's were often tried not only for doctrinal but for moral offences, and the system of appeal was developed. In the V. cent. dioceses were grouping themselves into large units, and thus the great patriarchs come into being, Rome attaining pre-eminence—witness Gratian's rescript (378) entitling the Rom. bp. to judge bp's in consultation with others. Rome was now the centre of appeal from all the West, except the Celtic Churches. Constantinople held a similar position for the East. Meanwhile a practically double system of punishment was developing by which an offender might be punished spiritually by public penance or otherwise 'for the good of his soul,' and also in the ordinary civil courts. Under Theodosius secular power was first given to ecclesiastical tribunals.

Between the IV. and IX. cent's the Church punished chiefly by excommunication and exclusion from the sacraments; clerical offenders were suspended or deposed. Banishment and other punishments also came to be inflicted. In the later Middle Ages, however, an elaborate system of canon law came to be developed, and the Church Courts possessed great and far-reaching powers. Feudalism contributed its

share to this process, *e.g.* bp's, like other feudal lords, appointed officials to preside over their courts. Archdeacons also obtained authority, and by the Constitutions of Clarendon (1164) it was provided there was to be appeal from their courts to those of the bp. The Constitutions—one of the most important documents, be it noted, for the relation of Church and State in mediæval England—also allowed appeal from the bp. to the Metropolitan. Things became more complicated, and a number of special jurisdictions emerged. An endeavour was made to check appeals to Rome, and in several European countries there was provision made for appeal to a secular prince, and certain limits were set by the State to papal jurisdiction. The Constitutions of Clarendon had prohibited appeals to Rome, but the reaction which followed the murder of Becket made the provision of no effect. The termination in a way which displeased him of the divorce suit between Henry VIII. and Catherine of Aragon (which had been taken to Rome) was the cause of the king's anti-papal legislation. At first, appeals to Rome were restricted, no mention being made of the authority of the king, then they were abolished altogether, and were to go in future to the king in Chancery.

The *jurisdiction* of the Church Courts was wide, and included cases of matrimony and legitimacy, testamentary and succession cases, Church lands if held in *frankalmoigne*, i.e. by a spiritual tenure (from the XIII. cent. these were transferred to the King's Court), titles to benefices, administration of gifts to churches, questions arising from promises given on oath, etc. The jurisdiction of these courts over laymen included moral offences, also heresy, schism, and witchcraft; over the clergy, all these, and in addition offences of misconduct in their sacred office. The *punishments* inflicted were various, and might include fines, imprisonment, deprivation, suspension, deposition, and the more purely spiritual penalties of suspension, interdict, and excommunication. Death, usually by burning, could be inflicted as punishment for heresy. Many of these powers are still possessed by Ecclesiastical Courts in England to-day, at least theoretically, though many, too, have been taken over by the State. The Church Discipline Act of 1892 empowers the Courts to try clerks for immorality, with appeal to the Privy Council. At the present time the **Ecclesiastical Courts** have power over the discipline of the clergy, and of the laity (nominally) in morality, of lay office holders, claims to ecclesiastical offices, and church buildings. They have (not now in England the authority they had formerly; they are *Court of Arches*, with a 'Dean,' since 1874 app. by abp's to exercise jurisdiction in ecclesiastical cases; *Court of Faculties*, with a master (who as Judge of the Provincial Courts of Canterbury and York presides over the Ecclesiastical Courts as a whole), *Vicar-General's Office* and *Court of Peculiars*, also *Dean and Chapter of St. Paul's Court*. The *Church of Scotland* has a *Kirk-Session*, a *Presbytery*, *Synod*, and *General Assembly* (the supreme court). The Anglican Church in its colonial branches has no lay jurisdiction except in purely spiritual things. Since the Reformation, ecclesiastical jurisdiction in the Prot. Churches abroad has ceased, though it still flourishes in the Rom. and particularly in the Eastern Churches.

Pollock and Maitland, *History of English Law*; Maitland, *Roman Canon Law in the Church of England*.

Ecclesiastical Law, that body of law dealing with the Church in relation to the State, or in its internal government. The Canon Law (*q.v.*) of the Rom. Church is much more elaborate than that of Anglican or Prot. Churches, and can only be controlled by the State so far as is allowed by the Church itself. The Eng. Church is governed by Parliament, Convocation possessing little real power. The non-established churches only come under the law if they contravene it, or so far as they hold property.

ECCLESIASTICUS (Gk. versions, the *Wisdom of Jesus, S. of Sirach*) is in Old Testament Apocrypha (but accepted as canonical by the R.C. Church); consists of a number of religious and ethical sayings; tone is individualistic, moral rather than spiritual, and has no hope of immortality; exact date is uncertain, probably about 180 B.C.; was written originally in Hebrew, but for long only known in Gk. and other versions; Hebrew fragments have been recently discovered, but it has been doubted whether these are of the original or trans. of a version.

The Apocryphal Books, Andrews (Jack); *Apocrypha*, Wace and Salmon.

ECGBERT (*c.* 802–39), king of West Saxons.

ECGBERT, ECGBERHT (d. 766), abp. of York, 735; successor of Paulinus.

ECGFRITH (*c.* 671–85), king of Northumbria; killed in battle with Picts.

ECHEGARAY Y EIZAGUIRRE, JOSÉ (1833–), Span. mathematician, statesman, and dramatist; b. Madrid; prof. of Math's; Minister of Education and Finance (1868–74); on restoration of monarchy took to lit., winning celebrity with striking dramas (e.g. *El Gran Galeoto*), which rank him as Spain's foremost modern dramatist; again app. Minister of Finance, 1905.

ECHIDNA, PORCUPINE ANT-EATER, egg-laying mammal of order *Monotremata*; common e. (*Echidna aculeata*) is found in Australia, Tasmania, and in New Guinea, where the three-toed e. (*Proechidna*) is also found. They are spiny and roll into a ball when attacked; the tongue is long and sticky, and is thrust into ant-nests.

ECHINODERMATA (Gk. *echinos*, a hedgehog; *derma*, the skin), **PRICKLY-SKINNED ANIMALS**; the diverse marine animals, Starfishes, Brittle Stars, Sea Lilies, Sea Urchins, and Sea Cucumbers, are ranged together in this group or *phylum*. They possess a radially symmetrical body and a skeleton of limy plates or rods, evident in the vast majority as projecting prickles or spines. These characters are so distinct that Echinoderms are unlikely to be confounded with any other kind of animal. But they have other characters in common, of which three are very apparent. Their habit of life is sluggish, for the Sea Lilies are generally fixed to rocks or stones, and the other members lie at ease or creep slowly on the sea-floor. Their movement is accomplished by means of sucker- or tube-feet (an external expression of a peculiar and characteristic 'water-vascular' system), which may be modified, as in Brittle Stars and Sea Lilies, to act mainly as organs of sense, respiration, or food-catching. Lastly, most have an extraordinary power of regenerating lost parts—Starfishes and Brittle Stars can lose and re-grow arm after arm, Sea Cucumbers and Sea Lilies can, on occasion, eviscerate themselves and replace the lost by new organs.

A better idea of the characters of the E., however, will be obtained by a short discussion of the five groups into which they fall.

CLASS I., **Starfishes, Asteroidea** (Gk. *aster*, a star; *eidos*, shape), star-shaped, hard-skinned creatures with five or more arms not distinct from the body; common in rock pools and in the sea at all depths. The mouth is in the centre of the lower side, and from it grooves run along the arms (ambulacral grooves), from which the sensory and locomotor tube-feet project. Within the arms are prolongations of the food tract. Starfishes are carnivorous, feeding chiefly upon bivalve molluscs, the shells of which they tear open by main force.

CLASS II., **Brittle Stars, Ophiuroidea** (Gk. *ophiouros*, serpent-tailed; *eidos*, shape), Echinoderms with a circular disc-like body on the margin of which are inserted five long snake-like arms. These are covered by an armour of plates, the ambulacral groove is replaced by a closed canal, and they contain none of the food tract. From the readiness with which the arms break has arisen the name Brittle Star. The mouth is on the under surface, and on it the animals creep by horizontal wrigglings of their arms aided occasionally

by their tube-feet. Their digestive system is of a simple nature, for their food consists of small worms and crustacea or more often simply of mud from which they extract the organic content.

CLASS III., **Sea Urchins, Echinoidea** (Gk. *echinos*, hedgehog; *eidos*, shape), globular, heart-shaped, or disc-like animals (Regular, Heart, or Cake Urchins), whose common name indicates their spiky appearance. The shape of a Sea Urchin is due to a complete cuirass of large limy plates arranged in five series, corresponding to the five arms of a Starfish. On the plates are hinged movable spines, which, with the tube-feet, serve as locomotor organs. Sea Urchins live mainly on seaweed, which they chew with a peculiar five-toothed mill (*Aristotle's lantern*) situated in the mouth on the under side of the body. The ovaries of Sea Urchins are esteemed as food in many countries.

CLASS IV., **Sea Cucumbers, Holothuroidea** (Gk. *holothurion*, a Sea Cucumber), sausage-shaped, mostly soft-bodied animals in which the limy skeleton characteristic of Echinoderms is frequently reduced to small plates buried in the skin. A Sea Cucumber crawls, wormlike, by muscular contractions of its body, aided in some cases by tube-feet. Respiration, in most, is carried on by a pumping of water in and out of the hinder end of the food canal—the cloaca. A ring of tentacles or feelers surrounds the mouth, and these collect mud and sand from which the organic substance is extracted for food, or form a resting-place for minute animals, which are afterwards engulfed. Some Sea Cucumbers are considered great delicacies, the best known being the Pacific 'Trepang' or 'Bèche-de-Mer.'

CLASS V., **Sea Lilies and Feather Stars, Crinoidea** (Gk. *krinon*, a lily; *eidos*, shape), graceful animals, which, at least in early life, are attached by a stalk to the sea-bottom. The mouth is on the upper surface, and the tube-feet are of service only in wafting to it currents of water, laden with minute animals for food. Stalk, body, and the delicately branched arms seem to be formed almost altogether of limy joints and plates, and make up elegant plant-like forms, sometimes three feet high. Sea Lilies and Feather Stars live in the deep sea, but their modern representatives are few in comparison with the hosts of extinct 'Lily-encrinites,' which inhabited the oceans of Palæozoic times.

ECHINOIDEA, see ECHINODERMATA.

ECHINUS, sea-urchin; in arch. rounded moulding of capital in Doric column.

ECHIUROIDEA, a group of specialised marine worms, characterised by possession of a highly extensible proboscis, at the base of which the mouth is situated, and by the occurrence of two recurved chitinous hooks on the anterior ventral surface of the body. This latter is sausage-shaped and unsegmented, and terminates posteriorly in the anus. In *Bonellia viridis*, one of the best-known forms, the male is minute and degenerate, living parasitically in the *nephridium* (excretory organ) of the female. The *Echiuroidea* lie hidden in rock clefts, the proboscis, which is used for collecting food, alone being visible.

ECHMIADZIN, ITSMIADSIN, monastery in Russ. Transcaucasia, founded (traditionally) by Gregory the Illuminator, 302; has a valuable library of Armenian literature.

ECHO (classical myth.), mountain nymph, one of the Oreades, who pined for love of Narcissus, till only her voice was left. See also SOUND.

ECHTERNACH (49° 48′ N., 6° 23′ E.), town, on Sure, Luxemburg; annual religious dancing procession probably originated in an effort to charm away an epidemic of St. Vitus' dance. Pop. 4200.

ECHUCA (36° 7′ S., 144° 48′ E.), town, river port, on Murray, Victoria, Australia; has extensive wool-stores and sawmills. Pop. 4075.

ECIJA (37° 32′ N., 5 9′ W.), town, on Genil, Seville, Spain; ancient *Astigi*; textiles and shoes. Pop. 24,372.

ECK, JOHANN MAIER (1486–1543), Ger. theologian; b. at Eck; app. prof. at Ingolstad, 1510; a learned and clever controversialist; one of the ablest Catholic apologists; replied to Luther's theses in his *Obelisci*; disputed with Luther, 1519; *Enchiridion locorum communium* very popular; disputed also with Zwingli, and helped to draw up reply to Augsburg Confession, 1530.

ECKERMANN, JOHANN PETER (1792–1854), Ger. poet; friend of Goethe; wrote *Conversations with Goethe*.

ECKERNFÖRDE (54° 27′ N., 9° 50′ E.), seaport town, Schleswig-Holstein, Germany, on inlet of Baltic; fisheries. Pop. 7500.

ECKERSBERG, KRISTOFFER (1783–1853), Dan. artist; classical subjects and landscapes.

ECKHART, JOHANNES (*c.* 1260 to *c.* 1327), Ger. Dominican theologian and preacher; called a 'speculative mystic'; follower of Aristotle and speculative theologian; suspected of unorthodoxy; some writings survive.

ECKHEL, JOSEPH HILARIUS (1737–98), Austrian antiquary and numismatist.

ECKMÜHL, EGGMÜHL (48° 52′ N., 12° 11′ E.), village, Bavaria, Germany; Austrians defeated by French, 1809.

ECLAMESIA, a symptom of epilepsy (*q.v.*); a sudden attack of convulsions (*q.v.*) incidental to pregnancy, especially the first.

ECLECTICISM, term for any system in philosophy or theol. which is composed out of several others. Taking ideas from opposing schools may be sometimes advantageous, but owing to tendency to gloss over fundamental differences by confusion of thought, E. is sometimes spoken of contemptuously. Later Gk. philosophy specially was eclectic.

ECLIPSE.—When one heavenly body enters the shadow of another it is said to suffer an eclipse. With a large source of light like the sun, the shadow cast by a smaller body such as the earth or the moon consists of a long, conical shadow (*umbra*) where no light at all (apart from light refracted by the atmosphere) reaches, and a partial shadow (*penumbra*) surrounding the former. An e. of the moon can obviously only occur when the moon is in opposition, *i.e.* at the time of full moon. Similarly, an e. of the sun can only occur when the moon is in, or nearly in, conjunction, *i.e.* at the time of new moon. But since the moon's orbit is inclined to the ecliptic about 5°, an e. of the sun is impossible unless conjunction of the sun and moon takes place within about 16° of one of the nodes of the moon's orbit. The corresponding limit for a lunar e. is about 11°. E's of the sun may be *total*, *partial*, or *annular*. Total e's can only be seen at places within the umbra of the moon's shadow, but as this is only about 236,000 miles long, and the mean distance of the moon is about 238,000 miles, total e's, when such occur, can only be visible over a small portion of the earth's surface. When the umbra does not reach the earth, as when the moon is near apogee, an annular e. is visible at places in line with the point of the shadow. In a total lunar e. the whole of the moon enters the umbra of the earth's shadow, and may then frequently be seen shining with a reddish coppery light, due to light from the sun being refracted by the earth's atmosphere, only the longer red rays being transmitted. In a partial lunar e. only a portion of the moon enters the umbra. Successive e's occur at regular intervals. One of these (*Saros*), of 18 years 11 days, has been known from remote antiquity. Much of our knowledge of the sun has been obtained from observations only possible during total e's. Thus, a few seconds before totality, the red light of the chromosphere is seen; and during totality observations of the prominences, the 'reversing layer,' and the corona have yielded much information.

Total Eclipses, Todd (Sampson Low); *Astronomy for Everybody*, Newcomb (Isbister).

ECLIPTIC, great circle of the celestial sphere,

plane of which contains sun's yearly path. Eclipses occur near this circle—hence name. See ARIES.

ECLOGITE, green and red rocks, consisting of omphacite and garnet or of smaragdite and garnet.

ECLOGUE, see POETRY.

ECOLOGY, the study of the adjustment and response of plants and plant communities to various environmental factors, these being on the one hand climatic or geographical, and atmospheric, and on the other edaphic, that is, concerned with soil characters. Warming has recently classified the atmospheric (*a*) and edaphic factors (*b*) as follows: (*a*) light, temperature, atmospheric humidity and precipitations, movements of the air; (*b*) the nutrient substratum, its constitution, structure, air, water, temperature, dimensions and nutriment, the kinds of soil, the problem as to the chemical or physical action of soil. Under the influence of these and certain other factors plants fall into thirteen ecological classes, viz.: *Hydrophytes*, purely aquatic, including plankton and marine floras, and the submerged vegetation of lakes, etc.; *Helophytes*, marsh formations, including tropical swamps; *Oxylophytes*, on acid soils such as peat; *Psychrophytes*, on cold soils such as tundras; *Halophytes*, saline soil formations; *Lithophytes*, rock formations such as lichens; *Psammophytes*, formations of sand-dunes and the like; *Chersophytes*, waste land formations; *Eremophytes*, desert and steppe formations; *Psilophytes*, savannahs; *Sclerophyllous* formations, Mediterranean maqui, karroo; *Coniferous forests*; *Mesophytes*, meadow and forest of temperate climes living under average conditions without great extremes.

Warming, *Œcology of Plants*; Tansley, *Types of British Vegetation*.

ECONOMICS (Gk. *oikos*, house; *nomos*, law), originally the 'art of household management,' is now the science or study of wealth—that is, of the material and exchangeable possessions of the individual, the family, and the State. The term 'economy' has come to be thought of in relation to saving; as a matter of fact, economy is rather the art of a wise expenditure, an art best achieved by the person or State with some knowledge of the science of political economy. (Hence economics is sometimes called an art and sometimes a science. Both terms are accurate. In the collection and investigation of the facts of wealth production and distribution, and in our arrival at various laws which the facts demonstrate, we treat economics as a science. In the use we make of this scientific knowledge, personally or nationally, we prove that economy is an art.)

The real importance of economics is recognised today, for unless there is some knowledge of how nations are maintained, and of what expenditure is profitable and what useless or mischievous, and some grasp of the principles of finance, nations and individuals alike are brought to ruin and bankruptcy. The economics of housekeeping imply knowledge of market prices in the matter of food, clothes, and rent, and the ability to put that knowledge into operation. National economics imply similar knowledge for the whole people. The statesman-economist will be aware of the general standard of life, and will understand whether the industrial conditions are raising, depressing, or keeping stationary that standard in the community. As the domestic budget on examination reveals either good or false economy, so the annual budget of the Chancellor of the Exchequer makes it plain whether the revenue of the State is being wisely raised and profitably expended, or whether, in defiance of all economy, the methods of supply are oppressive and the expenditure wasteful and extravagant. The material prosperity of a nation depends so largely on the knowledge of economics in its Chancellor of the Exchequer and its legislators, and on the resolution to act upon knowledge, that whole communities languish in misery, devastated by disease and premature death, where this knowledge and resolution are lacking. The social questions of the day, relations of labour and capital, housing, land tenure, tariff reform, etc., are only to be solved satisfactorily by the growth of economic knowledge. (Of course scientific knowledge alone may not cure all social ills, there must be persons of good will to carryout the conclusions of economic science.)

Practically the science of economics is modern, not dating back earlier than the XVII. cent., though the scientific learning of the Middle Ages covered the social relations of man and his fellows. The discovery of America and the wide development of foreign trade made political economy inevitable, and Adam Smith was its greatest expounder in the XVIII. century. Many economic theories of Adam Smith and his followers have been discarded as knowledge has increased, and the data for establishing theories have changed (notably the theory of the 'economic man,' whose sole motive in life was the pursuit of riches, who bought cheap and sold dear, and who if he was a workman readily transplanted himself to the other end of the earth for the sake of a rise in wages).

Marshall, *Principle of Economics*; W. J. Ashley, *Economic History*; Cannan, *History of Theories of Production and Distribution*.

ECSTASY, a vividly emotional state, or, in its religious usage, the absorption of the mental faculties in religious contemplation to such an extent that the normal sense action is suspended. The fact of conscious mental activity differentiates e. from catalepsy, but it is not clear that the phenomena are incapable of a purely psychological explanation.

ECTOPROCTA, a class of Polyzoa (*q.v.*).

ECUADOR (1° 30′ N. to 4° 45′ S., 73° 30′ to 81° W.), republic, N.W. of S. America, on both sides of Equator (hence name).

E. is bounded N. by Colombia, E. by Brazil, S. by Peru, W. by Pacific Ocean (coast-line of *c.* 600 miles); area, 116,000 sq. miles. Surface consists of low-lying coastal region stretching inland to foot-hills of the Cordillera; hill country along Andes themselves, with plateaux 9000 ft. above sea-level; and woodland of Provincia del Oriente, on slope from Andes eastward by head-waters of Amazon; great part of this district is claimed by Peru (*q.v.*). Many of peaks of Andes in E. are active volcanoes; principal summits, Chimborazo (20,500 ft.), Cotopaxi (19,610 ft.). Ecuador is drained to E. of Andes by Napo, Cururay, and other streams of Amazon system; on W. are Daule, Vinces, Guayaquil, and other rivers flowing to Pacific. Lakes include Anatico, Supay, Aucacocha, in Provincia del Oriente, while in mountain districts are many tarns. Chief towns are Quito (capital), Guayaquil, Cuenca, and Riobamba. The Galapagos Islands, 730 miles off W. coast, belong to Ecuador. Climate is tropical in lowlands, mean temperature being over 82° Fahr.; in highlands there is an equable perpetual spring. In the E. there is heavy rain throughout year; in W. and mountain plateaux there is hot rainy season from Dec. till May. Ecuador is subject to earthquakes.

History.—For many cent's before the discovery of America, chief power in E. was held by the Shiris of Quito, last of whom was defeated by Husina Capac, Inca of Peru, towards end of XV. cent.; E. was thus annexed to Inca kingdom, with which it was conquered by Spain about 1532; became presidency of Span. Peru in 1548, and so remained (except for twelve years in early XVIII. cent.) until, like other Span. colonies, it attained independence in 1822; formed part of republic of Colombia until 1830, when it became a separate republic; since then its history has been one of constant insurrections and revolutions, while boundary disputes with Colombia and Peru have occurred.

Government is republican; executive is in hands of Pres. (chosen by popular vote for four years); there are two legislative houses, a senate of 32 members and a lower house of 48 deputies; these are both elected by popular vote. Pres. is assisted by vice-pres., 5

ministers, and a council of state, of which the vice-pres. and ministers are members. E. is divided into 16 provinces and one territory for purposes of local administration. Education is free and compulsory. State religion is R.C. There is a small army numbering some 8000. Military service is compulsory by Law of 1902. Most of the population is Indian, those of mixed blood forming one-third, and whites about one-twelfth. Pop. (1910) *c.* 1,500,000.

Resources.—For a S. American country E. is poor in minerals; gold is found, and was produced to the value of £25,000 at Zaruma in 1910; silver, platinum, petroleum, copper, and other minerals exist, but, owing to difficulties of transport, have not been greatly developed. Vegetation is everywhere luxuriant; cocoa is at present the staple produce, and sugar, coffee, and rubber are also cultivated; cereals, tropical fruits, tobacco, and cotton are produced, and in forests are valuable medicinal and other plants—sarsaparilla, balsams, cinchona, vegetable ivory, caoutchouc, etc. Industries are unimportant; straw hats and woollens are manufactured. Chief exports are cocoa, ivory-nuts, rubber, silver, straw hats, sugar, coffee, gold; chief imports, textiles, machinery, food-stuffs, oil, iron goods, wood. Railway mileage is about 400 miles.

Kean and Markham, *Central and South America*, vol. i. (1909).

ECUMENICAL, see ŒCUMENICAL.

ECZEMA, catarrhal inflammation of the skin; in the first stage the skin is swollen and reddened with little pimples and has vesicles, which burst easily, letting a fluid out; in the second stage the external layer of the skin is peeled off, leaving a swollen, red, encrusted surface; and if the disease goes on to a third stage and becomes chronic without treatment, the discharge disappears, and a scaly patch is left. Any part of the body may be the site of the disease, and there is a burning or intensely itching feeling.

The treatment differs with the different stages; in the early stage rest, soothing applications, *e.g.* zinc oxide, lead, or bismuth, as lotions or powders, and saline aperients, and antimony, or, for children, calomel, internally. In the later stages tar, carbolic acid, salicylic acid should be added as external stimulants. In chronic stages ointments of the above should be smeared on thickly, while tonics and a change of air are beneficial.

EDAM (52° 31′ N., 5° 3′ E.), town, Netherlands, province of N. Holland, with port on Zuider Zee; cheese. Pop. (1910) 6623.

EDDA, two Icelandic works dealing with Scandinavian myth. The 'Elder' E. consists of thirty-three mythological and legendary poems written during IX., X., and XI. cent's, the existence of which was discovered by Brynjulf Sveinsson in 1643. The 'Younger' or prose E., written by Snorri Sturluson, about 1230, only came to light in 1628. It contains the fullest information extant upon Norse myth.; also treatises on poetry and prosody. Eng. trans. of latter in Mallet's *Northern Antiquities* (Bohn's Series).

EDDIUS (VII. cent.), Anglo-Saxon author; wrote *Life of St. Wilfred.*

EDDY, MARY BAKER GLOVER (1821–1910), Amer. religious leader, founder of Christian Science (*q.v.*).

EDDYSTONE, see LIGHTHOUSE.

EDELINCK, GERARD (1649–1707), Flemish engraver; foremost of his time.

EDEN.—(1) (54° 57′ N., 3°5′ W.) river, Westmoreland, England. (2) (56° 22′ N., 2° 53′ W.) river, Fife, Scotland.

EDEN, GARDEN OF (*Genesis* 2[8]), may mean 'pleasure, delight,' but probably from Assyrian word for 'plain,' *i.e.* alluvial plain of Tigris and Euphrates; has been identified with various regions, *e.g.* Armenia, Palestine, Mongolia, by different writers.

EDEN, SIR ASHLEY (1831–87), Anglo-Ind. official; some time Lieut.-Gov. of Bengal.

EDEN HALL, LUCK OF, goblet of painted glass at Cumberland home of the Musgraves, upon which the family's safety and welfare is said to depend.

EDENBRIDGE (51° 12′ N., 0° 4′ E.), market town, on Eden, Kent, England.

EDENKOBEN (49° 18′ N., 8° 11′ E.), town, Bavarian Palatinate, Germany. Pop. 5144.

EDENTATES (order *Edentata*), an order of primitive Eutherian mammals found in America, Asia, and Africa. Their name, signifying 'Toothless Animals' is misleading, for while functional teeth are absent in some, in others a series of similar teeth, lacking enamel, develops. In all forms, however, front or incisor teeth are absent, in most there are no functional milk teeth, and Ant-Eaters have no teeth at all. The feet are furnished with long, strong, non-retractile, and curved claws, adapted for climbing or burrowing, but causing the animals to walk with awkward gait. They are vegetarian, or in the majority of cases insectivorous. Fossil forms have been found in Upper Cretaceous formations in S. America.

The Order EDENTATA falls into 2 distinct sub-orders, with few structural features to connect them:—

The New World forms are grouped in Sub-Order I., XENARTHRA, the members of which have accessory articulations on the lumbar and posterior dorsal vertebræ. They include the SLOTHS (*Bradypodidæ* or *Tardigrada*), arboreal mammals which move back downwards amongst the branches in South and Central American forests, clinging always with their curved claws. They are shy, nocturnal, dull creatures, and live on leaves, young shoots of trees and fruits. ANT-EATERS (*q.v.*) (*Myrmecophagidæ*) are confined to Central and S. America, but ARMADILLOS (*q.v.*) (*Dasypodidæ*) range northwards to Texas. Remains of many extinct forms have been found in the Tertiary formations of America; the gigantic GROUND SLOTHS (*Megatherium*, etc.), rivalling the elephant in bulk of body, and somewhat resembling sloths and ant-eaters; the scarcely less large MYLODON, with dermal bony plates; the herbivorous GLOSSOTHERIUM, probably domesticated by prehistoric Patagonians; and the armadillo-like GLYPTODON and its relatives, with body protected by a coat of bony plates.

The Old World Edentates form Sub-Order II., NOMARTHRA or EFFODIENTIA, without accessory articulating processes on the lumbar and dorsal vertebræ; only two distinct families: PANGOLINS (*Manidæ*), found in Africa, India, and S.E. Asia, burrowing creatures with strong, horny scales, which completely shield them when they roll into a ball, no teeth, but a long protrusible tongue for catching termites on which they mainly feed. The AARD-VARKS (*q.v.*) (*Orycteropodidæ*) are confined to Africa.

EDENTON (36° 3′ N., 76° 37′ W.), town, port, N. Carolina, U.S.A.; near mouth of Chowan River; fisheries. Pop. 3000.

EDESSA, ancient capital of Macedonia; modern Vodena.

EDESSA (37° 11′ N., 39° E.), ancient city, N. Mesopotamia, between Aleppo and Diarbekir; figures prominently in early Church history. In 137 B.C. E. became capital of an independent kingdom; Rom. military colony, 216 A.D.; near E. Caracalla was murdered, 217; became a seat of Christianity and Syrian learning, with many schools and monasteries; city held sacred by Moslems as home of Abraham; taken by Moslems, *c.* 640. A Christian principality founded here by Crusaders (*c.* 1100) was destroyed by Muslims, *c.* 1150; since 1637 E. forms part of Turkish Empire. E. has interesting archæological remains. Modern town, called URFA, is a flourishing centre for cotton industry and has large grain trade; inhabitants mostly Christian Armenians. Pop. 55,000.

EDFU (24° 59′ N., 32° 41′ E.), town, on Nile, Upper Egypt; ancient *Apollinopolis Magna*; has most perfect existing example of Egyptian temple (*c.* 200 B.C.). Pop. 14,267.

EDGAR, THE PEACEFUL (944–975), Eng. king; s. of Edmund I.; succ. his bro. Eadwig in 959; became

emperor of Britain; rowed on the Dee by six vassal kings.

EDGAR ATHELING (*c.* 1058–1125), Eng. prince; grandson of Edmund Ironside; after death of Edward the Confessor was next heir to Eng. throne, but his claim was never strongly advanced, and he subsequently lived on peaceful terms with the Norman kings.

EDGEHILL (52° 7′ N., 1° 30′ W.), ridge, Warwickshire, England; scene of first battle in Civil War, Oct. 23, 1642.

EDGECUMBE, EDGCOMBE, famous W. of England family, to which belonged Barons (now Earls) of Mount E.

EDGEWORTH DE FIRMONT, HENRY ESSEX (1745–1807), Fr. ecclesiastic; confessor to Louis XVI. at his execution; author of *Memoirs*.

EDGEWORTH, MARIA (1767–1849), Irish novelist; dau. of Richard Lovell E. (*q.v.*); her first novel, *Castle Rackrent* (1800), was followed by *The Absentee*, *Ormond*, and other stories. She excelled as a delineator of Irish character, and her works were otherwise distinguished by humour and originality. Her success inspired Scott to undertake the 'Waverley' novels.

Lawless, *Life* (English Men of Letters).

EDGEWORTH, RICHARD LOVELL (1744–1817), Eng. author; Irish landlord and M.P.; devoted to agriculture and mechanical science; invented several useful contrivances; friend of Thomas Day (*q.v.*), who wrote *Sandford and Merton* at his suggestion; works miscellaneous; *Memoir* by his dau., Maria E. (*q.v.*), upon whose character and writings he exercised great influence.

EDGREN-LEFFLER, ANNE CHARLOTTE, DUCHESS OF CAJANELLO (1849–92), Swed. authoress; stories and realistic sketches of Swed. life.

EDHEM PASHA (1815–90), Turk. grand vizier.

EDINBURGH (55° 59′ N., 3° 15′ W.), capital of Scotland, on Water of Leith, adjoining Leith (*q.v.*) and skirting Firth of Forth at Portobello and Granton (suburbs). E. is famed for its natural beauty, stirring history, literary and romantic associations, and educational institutions. Its situation—built on and amid hills (Castle Rock, Calton, Arthur's Seat, Blackford Hills, Braids, Corstorphine, etc.)—near the sea, its architecture, and its renown as a centre of learning have earned E. title of 'Modern Athens.' The Castle—containing St. Margaret's Chapel (XI. cent.), Queen Mary's Room, Scottish Regalia, etc.—overlooks both Old and New Town. Historic High Street runs down to ruined Holyrood Abbey (begun *c.* 1128 on site of earlier church: royal tombs) and Palace (dating from XV. cent.: Queen Mary's and Darnley's Apartments). Other notable features of Old Town are lofty houses and quaint 'closes,' streets, and squares, St. Giles' Church (XV. cent.), Parliament House (Law Courts), Tron Kirk (1637), Municipal Buildings, John Knox's House, Tolbooth, Moubray, Moray, and Huntly Houses, and Greyfriars' Church.

Princes Street in New Town ranks among finest streets in world; Scott Monument, Royal Institution, National Picture Galleries, Register House, and many handsome buildings; unfinished National Monument, Nelson's Monument, etc., on Calton Hill; beautiful gardens and view of Castle. Other notable features of E. are M'Ewan and Usher Halls, National and Antiquarian Museums, Royal Infirmary, Waverley Station (largest in U.K.), Public Library, Advocates' Library, National Portrait Gallery, Royal and City Observatories, Botanical Gardens, St. Bernard's Well, many fine parks (King's Park, Meadows, etc.), historic mansions, dignified streets, and pleasant suburbs.

Although a residential, professional city rather than manufacturing town, E., in printing, publishing, bookbinding, insurance, banking, and retail shop-keeping, claims to be second to London alone in U.K.; other industries include brewing, distilling, milling, baking, rubber-works, engineering, chemicals, scientific instruments, paper-making, fisheries. Education is called E.'s 'chief industry'; one of the greatest educational centres in world; Univ. (founded 1582; great medical school); many fine secondary schools, including Royal High School (XVI. cent.), George Heriot's School (1659), four Merchant Company Schools, Academy, Fettes College, Merchiston; Donaldson's Hospital and other charitable schools; Heriot-Watt College (technical and commercial), Royal College of Surgeons, Dental, Veterinary, Agricultural, Art, Training, and other Colleges.

Edwin of Northumbria founded E. (*Edwin's Burgh*) *c.* 620, on site of ancient Celtic stronghold; E. made a royal burgh by David I., early XII. cent.; took prominent part in Civil and Anglo-Scottish Wars; Leith port assigned to E. by Robert Bruce, 1329; charter granted by James III., 1482; thenceforward recognised capital of kingdom and hub of its history; James VI. removed Court to England, 1603; Union abolished Scot. Parliament and threatened E. with ruin, 1707; Prince Charlie entered E., 1745; New Town begun in later XVIII. cent.; great literary outburst under Scott (*q.v.*), *c.* 1800. Pop. (1911) 320,318.

Geddie, *Romantic Edinburgh* (1911); *Official Guide* (1912).

EDINBURGH REVIEW, founded 1802; famous journal edit. by Jeffrey (*q.v.*); in it Macaulay's *Essays* appeared.

EDINBURGHSHIRE, see MIDLOTHIAN.

EDISON, THOMAS ALVA (1847–), Amer. inventor of phonograph, megaphone, aerophone, cinematograph, incandescent light system, microtasimeter for estimating temperature changes, carbon telephone transmitter, multiplex telegraphic system, Gold and Stock printing telegraphs; has improved electric traction. *Life*, by Dyer and Martin (2 vols., 1910).

EDMONTON (51° 37′ N., 0° 3′ W.), town, Middlesex, England; burial-place of Charles Lamb. Pop. (1911) 64,820.

EDMONTON (53° 30′ N., 113° 5′ W.), town, Alberta, Canada, on Saskatchewan; lignite coal-mining centre; fur trade. Pop. (1911) 24,882, estimated (1913) 55,000.

EDMUND (fl. 855–70), king of East Anglia; defeated and slain by Danes; canonised as saint for religious constancy.

EDMUND I. (d. 946), king of the English; s. of Edward the Elder; succ. his half-bro., Athelstan, in 941; successful warrior.

EDMUND (1245–96), Earl of Lancaster and king of Sicily; Crusader.

EDMUND 'IRONSIDE' (989–1016), Eng. king; s. of Ethelred II.; renowned for valour.

EDMUND, ST. (d. 1240), Edmund Rich, a distinguished scholar of Paris and Oxford, became treasurer of Salisbury, then abp. of Canterbury on death of Stephen Langton; a zealous churchman and pious ascetic; wearied with ecclesiastical quarrels, he returned into monastic life.

EDMUNDS, GEORGE FRANKLIN (1828–), Amer. politician and lawyer; Senator (1866–91).

EDOM was the country S. of Palestine, where people were closely akin to the Jews. According to *Genesis* the Edomites were descendants of Esau; genealogy in *Genesis* 36 reflects the tradition of mixed descent from Canaanites, Ishmaelites, and Horites. Land of E. in Old Testament times is Mount Seir, now a desolate region. In 711 B.C. E. joined the league with Philistia, Judah, and Moab against Assyria; and then, like the rest, submitted. Later, however, Edomites were sternly denounced by the prophets; finally conquered by John Hyrcanus in 109 B.C. The Edomite language, of which only a few proper names are preserved, was closely akin to Hebrew.

Libbey and Horkins, *The Jordan Valley and Petra*.

EDRED (d. 955), Eng. king; friend of St. Dunstan.

EDRIC (fl. 1007–17), Mercian ealdorman; notorious for treachery.

EDUCATION, the science or art of training the

mind or body. The term e. is now most commonly applied to a system of mental training, but the ancient Greeks placed physical training in the forefront of their educational system, at least for males. This was particularly the case with the Spartans. Reading, writing, and simple arithmetic were included in training, but military dexterity was reckoned of the chief importance. The Athenians favoured a wider system of culture, in which music and singing held a place, but physical exercise received attention in various forms of gymnastics, running, leaping, and wrestling. Plato took the best from both systems when developing his educational methods in the *Republic*. Under the Romans boys remained in the care of their mothers up to the age of seven, afterwards attending school, where their elementary e. was continued up to the age of fourteen, when, if intended for a learned calling, they took up the study of poetry, philosophy, and other advanced subjects. Gk. tutors were largely employed, both privately and in the schools, and Gk. language and lit. constituted an important part of the educational system.

England.—The term Dark Ages reflects the almost complete extinction of learning from the time of the fall of the old Rom. Empire until the Renaissance (*q.v.*). In the middle of the XVI. cent. there were Eng. nobles who could not write, and, until Tudor times, a man who could read was entitled at law to 'Benefit of clergy' (*q.v.*). The first effort at resuscitation is seen in Charlemagne's schools under supervision of Alcuin of York (735–804). Towns like Bologna, Paris, and Oxford gradually became known as centres of learning, and developed (from XII. cent. onwards) UNIVERSITIES (*q.v.*) which have remained schools of higher e. throughout the Middle Ages and modern times. E. in the **Middle Ages** flourished in the monastery, trade guild, and noble household. The beginnings of Secondary e. are to be found in the pre-Reformation coll's and grammar-schools which were instituted for boys attached as choristers to chantries or collegiate churches; there were 16 at the commencement of the Tudor period, and numerous others were founded, although many of the 63 new schools of Edward VI. represent dissolved chantry schools refounded with smaller endowment. Among famous mediæval schools were Winchester (1387) and Eton (1440); others prominent among the numerous PUBLIC SCHOOLS of England are St. Paul's (1509), Shrewsbury (1551), Christ's Hospital (1552), Westminster (1560), Merchant Taylors' (1561), Rugby (1567), Harrow (1571), Charterhouse (1611), Marlborough (1843), Wellington (1856), and Clifton (1862). In St. Paul's school, founded by Colet (*q.v.*), an effort was made to humanise teaching methods. The humanist Erasmus expressed himself against the old convention of breaking children's spirits, but even Sir Thomas More, noted for indulgence, believed that they should stand and serve in the presence of their elders.

There are at present various kinds of **Secondary School** in England. The Secondary School has been defined by the Eng. Board of Education as 'any Day or Boarding School which offers to each of its scholars, up to and beyond the age of sixteen, a general education, physical, mental, and moral, given through a complete graded course of instruction of wider scope and more advanced degree than that given in Elementary Schools.' This definition includes higher elementary schools, private schools, high-schools for girls, and grammar-schools for boys. There is no technical difference between public and other secondary schools, but that name (Public) is usually assumed only by large, important schools, which are modelled on the old foundations mentioned above; small schools like that of Beverley, once a well-known mediæval school, retain the name GRAMMAR-SCHOOL. These schools are generally privately endowed and so distinguished from the Secondary School known by that name alone, subsidised by the Board of Education and County Council. A Public School is usually divided into senior and junior school, the former subdivided into classical side (in which preparation is made for the univ's, certain professions, and higher branches of the Civil Service) and modern side (in which preparation is made for army, navy, or commerce). There is a *Public Schools Year-Book*. Endowed secondary schools are subjected to the Charity Commissioners instead of the Endowed Schools Commission, 1874.

There was considerable provision of free e. for the poor before the XIX.-cent. movement of **elementary e.**, and it was an e. which left no social stigma, for the poor child, although taught gratuitously, received his e. in the same schools and on the same lines as the rich child. Rom. Catholics and Protestants at the close of the XVII. cent. began to erect CHARITY SCHOOLS; specially active was the Soc. for the Promotion of Christian Knowledge. Robert Raikes started Sunday Schools (1781), and in 1796 the Quaker Joseph Lancaster began his work; the Royal Lancasterian Institution, afterwards called the Brit. and Foreign School Soc., was formed (1805), and provided instruction for the poor. The National Soc. for Educating the Poor was founded (1811), and established Church of England Schools on Dr. Bell's lines. The Ragged School Union was formed in 1844, and the Charity Commission published reports on e., 1819–40, while in 1834 the Government commenced the system of annual grants. The schools now rapidly increasing in numbers were mostly sectarian (National, Wesleyan, Catholic, etc.), but in 1870 W. E. Forster's E. Act, hotly opposed by religious bodies, was passed, establishing School Boards to build BOARD SCHOOLS, supplementary to the *Voluntary Schools*, and supported partly by Government grants, partly by the rates; the Cowper-Temple Clause of the Act forbade denominational teaching in Board Schools, and a Conscience Clause (1863) allowed parents to withdraw children from religious instruction.

In 1876 e. was made compulsory (between five and thirteen), and in 1891 free between three and fifteen. COUNCIL SCHOOLS: The E. Act of 1902 (applied, with modifications, to London, 1903) substituted for the School Boards committees of the County, Borough, and Urban District Councils, and placed under their control secular education in both Voluntary and Board Schools (now called Non-Provided and Provided respectively), and gave both equal title to rate aid; alleged preference shown to Established Church led to 'passive resistance' of many Nonconformists—*i.e.* refusal to pay rates. The Act brought Elementary Schools into closer relation with the Secondary Schools already largely helped and controlled by the Councils through their Technical Instruction committees. The committee of the Privy Council on e. was established 1839, and became known as the E. Department in 1856. The BOARD OF EDUCATION was established by Act, 1899, amalgamating the Science and Art Department at S. Kensington with the E. Department at Whitehall; its function is to ensure the efficiency of all primary, technical, secondary, and higher schools in the country, while leaving their financial and particular administration to the local councils. The HIGHER ELEMENTARY SCHOOLS are for promising pupils leaving the elementary school; these pupils are trained for lower Civil Service examinations, scholarships, etc. Continuation Schools and various evening classes (provided for by Act of 1890) are run in connection with Council Schools.

Lancaster was largely enabled to do his work by his device of employing senior pupils to teach junior pupils; in the Board Schools the PUPIL-TEACHER system was much used, with evil result to both teacher and scholar. The evils of the system have, however, been removed by the E. Act of 1902, by which the minimum age of a pupil-teacher is sixteen, and facilities for e. in Secondary Schools are given to candidates; at the same time inducements are given to ordinary Secondary students to become elementary teachers, so that poor children may have the advantage of training from people in

higher social position. Denominational TRAINING COLLEGES for teachers in elementary schools obtained Government recognition in 1846.

The 'passive resisters,' who held large demonstrations in Hyde Park and made a great Free Church protest in an Albert Hall meeting (1903), and the opposition of Wales to the E. Act of 1902, led to the ill-fated E. Bill of the Liberal Government (1906). This Bill proposed to refuse recognition as public elementary schools to Voluntary Schools, to purchase the Voluntary Schools and re-found them as Council Schools, and to prevent any religious instruction by the school staff, except in urban areas (of over 5000 inhabitants) where parents of ¾ of the scholars wished for special instruction and there was school accommodation for the remaining ¼. The Bill met with much Conservative and Anglican opposition, passed the Commons, but after many amendments (not accepted in the Lower House), by the Lords, was dropped. Power was granted in 1908 to local e. authorities to provide meals for school children when necessary, and in this year a general system of medical inspection was established. The L.C.C. has since established open-air schools for delicate children at Bostal-Heath, Forest Hill, Kentish-Town, and Shooter's Hill.

The establishment of the GIRLS PUBLIC DAY SCHOOL Co. in England in 1874 marks the advance of the feminist movement. Women were elected members of the London School Board in 1873, and in 1874, besides the Public Day School Co., a medical school for women was opened and the Working Women's Coll.; the Women's E. Union followed (1871).

Scotland introduced elementary e. almost three cent's before England did. Led by John Knox, the Gen. Assembly decreed in 1560 that there should be a Latin school in every parish church, and later acts provided for their maintenance by the Church. David Stow established in 1816 a Sunday School, and in 1826 a Normal Seminary (for training elementary teachers) in Glasgow. The parochial schools received, like Eng. Voluntary Schools, Government grants (1839 onwards). Secularisation of the schools commenced in 1861, when the examination of teachers, previously conducted by the presbyteries, was given to the univ's; the teacher, however, had to be a Presbyterian. Lowe's Revised Code, establishing regular examinations and relation of grant to results, was extended with modifications to the whole kingdom (1862). Young's Scot. E. Act (1872) established School Boards with much the same powers as those created under the Eng. Act (1870). In 1885–89 the Scot. E. Department was separated from that of England. A Board of Commissioners was appointed for **Ireland** in 1831, and Board Schools constructed in which Rom. Catholicism is taught to R.C. children; Protestant scholars, safeguarded by conscience clauses, are nevertheless always sent to Protestant schools.

In CANADA elementary e. is free and nominally compulsory. Schools are unsectarian, but in Quebec, Ontario, Alberta, and Saskatchewan there are R.C. schools, controlled mainly by R.C. clergy. AUSTRALIA has a universal system of elementary e., controlled by the E. Ministers of each province. In THE UNION OF S. AFRICA higher, *i.e.* univ., e. is under control of The Union Minister of E. Until 1915 school e. (primary and secondary) remains under the Provincial Councils of Cape, Transvaal, Natal, and Orange Free State. For white children e. is compulsory, but not yet free throughout the Union. English and Dutch languages are used in instruction. Schools in INDIA are largely run by missionary enterprise, with help from the State; there is a strong current of modern feeling in favour of larger use of native teachers. The U.S.A. have no central Board of E., but there is a Federal Commissioner of Education and the laws require each State to make certain provision for e. All the States have excellent free primary schools for children up to ten years of age, and free grammar-schools for children from ten to fourteen; but in some States e. is not compulsory. Some of the States provide further e.

In FRANCE by Act of 1881 elementary e. became free, and by Act of 1882 compulsory between ages of six and thirteen in Fr. *écoles primaires*. Before the *école primaire* is the *école maternelle*; above the *écoles primaires* are the *écoles secondaires* and *supérieures*. The Secondary Schools are the *lycées*, which receive Government grants, and the *collèges*, which, like Eng. public schools, depend on their endowments and fees. In all schools which receive State aid the teachers (by the Act of 1886) must be laymen, but there is a large amount of conventual e. Fr. e. is controlled by the Ministry of Public Instruction, assisted by a *Conseil départmental de l'instruction publique*; the country is divided for e. administration into eighteen academies, each under a rector. In GERMANY e. is more highly organised than in any other country. The States of the empire differ in various particulars, but in all e. is compulsory and free between the ages of six and fourteen. Elementary e. is regulated by the Falk Acts of 1872, expanding the Pruss. Code of 1854. The *Gymnasien* and *Realgymnasien* correspond to Brit. grammar-schools and public schools; their *Realschulen* are for modern, not classical e. The *Höhere Töchterschulen* are girls' high-schools. In nearly every civilised country but RUSSIA free elementary e. is to be found. Russia has a Board of Instruction and gives some aid to secondary e., but on the whole definitely discourages e.

Infant Schools were established at New Lanark in Scotland in 1815, in London in 1818, but had already been established at Waldbach in Alsace. France, the parent of the *créche* and the *salle d'asile*, formed the *écoles maternelles* as Infant Schools under the Act of 1886. The Jesuits, who wrote a well-known book, the *Ratio Studiorum*, on e., made the important pronouncement that a human being's character is formed by the age of five, the point at which e. generally begins. The mother of the Wesleys began to train them immediately after birth, and Froebel recommends an early date. The old view as expressed by Locke (*Thoughts Concerning Education*, 1693) was that a child's mind should be left alone for the first few years; the new view recognises the immense receptivity of man in his earliest years, and also tends to recognise an inherent individuality which cannot be destroyed and must be trained to the height of its own particular type. Rousseau initiated this respect for individuality, and was followed by Pestalozzi (1746–1827), whose idea of the teacher's function was that of a gardener tending plants, and by Froebel (1782–1852), who fo the first KINDERGARTEN at Blankenburg in Germany, 1837, and the system was introduced into England (1858). In 1874 the Froebel Soc. was founded and a kindergarten training college established in connection with the Brit. schools. Various kindergarten societies formed the National Froebel Union (1887). The Board Schools at once adopted kindergarten in their infant departments. Froebel's system took the form of *Gifts* and *Occupations*. The Gifts are: (1) six balls of wool of primary and secondary colours; (2) wooden sphere, cube, and cylinder; (3) six wooden cubes divided in various ways. These Gifts are used to convey elementary knowledge. The Occupations continue these lessons and teach use of fingers in mat-plaiting, paper-flower-making, brush-work, clay-modelling, etc. Dr. Maria Montessori in XX. cent. established *Casa dei Bambini*, where she applied to children of 3–6 a new system of auto-education based partly on kindergarten methods, partly on methods she had devised for defective children. The Ger. philosophers, Fichte (1762–1814) and Herbart (1776–1841), have had great influence on modern educational theory.

Technical Education.—Trade apprenticeship has been largely supplemented in modern times by TECHNICAL SCHOOLS, which for moderate fees give a scientific

as well as practical knowledge of every industry, and have thus become important centres of secondary e. The inclusion of industries like wood-carving and sculpture in their curriculums has necessitated a good art side. A Polytechnic school was established in Darmstadt, 1830, and the example was speedily followed in other Ger. towns, some of the schools taking the form of working-men's guilds. Such establishments were also formed in England at this time. The Science and Art Department (formed 1853), at South Kensington, exercised an important influence on this movement by organising evening classes and granting certificates and prizes. London city companies took a great interest in the subject, and in 1878 was instituted the City and Guilds of London Institute for Advancement of Technical E., which resulted in 1881 in the Central Institution at S. Kensington. Technical Instruction Acts, passed 1889, 1891-92, the Local Taxation Act, 1890, and the E. Act, 1902, empowered local authorities to provide for these branches of e. which also receive government aid. By the E. Act of 1902 the Technical Instruction committees were absorbed in the general e. committees. There are now numerous Technical Institutes and Polytechnics, many of which are day schools where children as well as older students can commence industrial e. The Royal Polytechnic Institution, Regent St., London, opened 1839, bought by Quintin Hogg, 1882, and converted into the Polytechnic Young Men's Christian Institute, was the first of the London Polytechnics. Sir Joseph Whitworth (1803–87) charged a considerable estate with the provision of scholarships (given on results of Board of Education examinations), to encourage engineering and mechanics. In London and other large towns TRADE SCHOOLS have been established to train boys and girls leaving the elementary school in such a way as to fit them to be apprentices or improvers in skilled trades; the L.C.C. 'Central School of Arts and Crafts' is in Southampton Row, W.C.

Co-education is a system by which pupils of both sexes are taught the same subjects, in the same room, by the same teacher, and on equal competitive terms. C. was practised to some extent among the Greeks, the Academy being in certain subjects open to women. Luther took an important step towards establishing of co-education, as he advocated that girls should receive the same Biblical training as boys. Presbyterianism favoured it as being economical and improving to both sexes, and in Scotland it is the prevailing system. Another stronghold of C. is the U.S.A. In infant and kindergarten schools co-education is almost universal, but opinion is divided as to its desirability in secondary and higher-grade schools. Some hold that it is healthy and stimulating to both sexes; others hold that it has a deteriorating effect on the virtues of both girls and boys. In the universities co-education is widely adopted. Women are admitted as members to all the provincial universities of Britain, but in Oxford and Cambridge, though they may attend lectures and sit examinations, they are not recognised as members. See EXAMINATIONS.

Leach, *Eng. Schools at the Reformation*; Davidson, *History of Education* (1900); Browning's *History of Educational Theories* (1881); Compayré, *History of Pedagogy* (1888); Munroe, *Text-Book in the History of E.* (1905); Graham Balfour, *Educational Systems of Great Britain and Ireland* (2nd ed., 1903); Fletcher (edit.), *Sonnenschein's Cyclopædia of E.* (1906).

EDWARD I. (1239-1307), king of England; s. of Henry II. and Eleanor of Provence; succ. his f., 1272, being himself then a Crusader; had already fought in Civil War against Simon de Montfort. E.'s reign is one of the most important in Eng. history. Numerous measures were passed, the Statute of Westminster, Winchester, Mortmain, etc., and the Jews repelled. Wales was conquered, and an unsuccessful attempt made to subdue Scotland. Important also were wars with France. Eng. parliamentary life developed in his reign, and he can fairly be called the creator of the House of Lords and the House of Commons. He was a good man, and a strong king; m. (1) Eleanor of Castile and (2) Margaret of France.

Tout, *Edward I.*

EDWARD II., OF CARNARVON (1284–1327), king of England; succ. his f., Edward I., 1307; fell under power of his favourite, Piers Gaveston; total rout of *Bannockburn* destroyed Eng. supremacy in Scotland; government of England went from bad to worse. E.'s queen, Isabella of France, plotted against her husband. He was deposed and murdered in Berkeley Castle; a bad king and weak man.

EDWARD III., OF WINDSOR (1312–77), king of England; succ. on deposition of his f., Edward II., 1327. In 1337 broke out the Hundred Years War with France, in which were won the famous victories of *Crécy* (1346) and *Poitiers* (1356). England was ravaged by the Black Death in 1349. Peace with France was made at Bretigny in 1360, securing to England a considerable part of S.W. France. E. gave up claiming the throne of France, which he had made a pretext for war. In the later wars with France the English were not so successful. Lollardy broke out under the leadership of Wycliff. Towards the end of the reign the country was governed by favourites, and generally went down in prosperity. E. married Philippa of Hainault, and had seven s's and five dau's.

Mackinnon, *History of Edward III.* (1900).

EDWARD IV. (1442–83), king of England; s. of Richard, Duke of York, whose claim to throne caused Wars of Roses; succ. on deposition of Henry VI., 1461, and reigned till his death, except during Henry's short restoration, 1470–71; a firm ruler and good soldier, but not a noble man; m. Elizabeth Grey.

EDWARD V. (1470–83), king of England; s. of Edward IV.; murdered in Tower, by order of uncle, Richard III.

EDWARD VI. (1537–53), king of England and Ireland; s. of Henry VIII. and Jane Seymour; succ. his f. in 1547. His short reign is important for religious history; a precocious boy of strong character.

EDWARD VII. (1841–1910), 'By the Grace of God of the United Kingdom of Great Britain and Ireland and of the Brit. Dominions beyond the Seas, King, Defender of the Faith, Emperor of India'; Albert Edward, e. s. of Queen Victoria and Prince Albert; b. Buckingham Palace, Nov. 9. As Prince of Wales he travelled extensively, visiting Canada and U.S.A., 1860; India, 1875. In 1863 he married Alexandra, the king of Denmark's eldest dau.; their children being Albert Victor, Duke of Clarence, b. Jan. 8, 1864 (d. 1892); George (GEORGE V.), b. June 3, 1865; Louise (Princess Royal), b. Feb. 20, 1867; Victoria, b. July 6, 1868; Maud (Queen of Norway), b. Nov. 26, 1869. After a long apprenticeship for the royal *métier*, the Prince of Wales became king, Jan. 22, 1901, and until his death devoted himself unsparingly to his kingly duties; Coronation (postponed, owing to severe illness, from June 26), ug. 9, 1902. Notable events of his reign were end of South African War (1902) and formation of Union of South Africa (1909–10); House of Lords Crisis (1909–10); Anglo-Japanese Alliance (1902); cementing of *Triple Entente* with France and Russia (1904–10). King Edward died, May 6, 1910. During his brief reign he earned the title of 'Edward, the Peacemaker,' by his tact and diplomacy, and won the affection of 's own people and the respect of foreign nations; a good sportsman, a man highly endowed with common sense and *savoir-faire*, and a conscientious and successful ruler.

Life, in Dictionary of National Biography (by Sir Sidney Lee); *King Edward in his True Colours*, by Legge (1912); *Life and Times* (2 vols., 1910–11), edit. by Holmes.

EDWARD, PRINCE OF WALES (1330–1376), see BLACK PRINCE, THE.

EDWARD THE CONFESSOR (d. 1066), king of

England; s. of Ethelred II.; succ. on the death of Canute II. (1042); m. Edith, dau. of Earl Godwine; his reign peaceful, and himself a religious man; brought Norman influences into Eng. Church.

EDWARD THE ELDER (d. 924), king of the Angles and Saxons; s. of Alfred the Great, whom he succ. in 901; subdued the Welsh and became 'Emperor of Britain.'

EDWARD THE MARTYR (d. 978), Eng. king; murdered at Corfe Castle, Dorset.

EDWARDES, SIR HERBERT BENJAMIN (1819–68), Eng. soldier-statesman; fought in 1st Sikh war; C.B., 1849; commissioner on Peshawar frontier, 1853–57; at outbreak of Mutiny secured friendship of Afghanistan; returned to England owing to bad health, 1865.

EDWARDS, AMELIA BLANDFORD (1831–92), Eng. novelist and Egyptologist; founder of Egyptian Exploration Fund.

EDWARDS, BELA BATES (1802–52), Amer. journalist, educationist, and Hebrew scholar.

EDWARDS, BRYAN (1743–1800), Eng. politician and historian; opposed abolition of slave trade; wrote *History of the British Colonies in the W. Indies.*

EDWARDS, GEORGE (1693–1773), Eng. antiquarian; celebrated ornithologist.

EDWARDS, HENRY THOMAS (1837–84), Welsh Anglican divine; dean of Bangor.

EDWARDS, JONATHAN (1703–58), Amer. theologian, was proficient in Gk., Latin, and Hebrew at thirteen, when he entered Yale Coll.; grad. with high honours in 1720; became a preacher in 1722, tutor in Yale Coll. (1723); pastor of Congregational Church at Northampton (1727). He held that the Lord's Supper was for the converted only, and was dismissed his church; went as missionary to Indians; became Pres. of Princeton Coll. (1757); author of many books. He was a man of great learning and deep piety, a vigorous defender of the Calvinistic theol. A recent writer says that his career 'marks at once the tendency of Amer. theol. to depart from experience in its search for ideal truth, and the tendency of Amer. life to separate the things of this world from those of the next.'

Life, by Hickman, by Allen (1889).

EDWARDS, LEWIS (1809–87), Welsh Methodist preacher; moderator of Gen. Assembly of Welsh Calvinistic Methodists, 1866 and 1876.

EDWARDS, THOMAS CHARLES (1837–1900), Welsh Calvinistic Methodist preacher and scholar; principal of Univ. Coll. at Aberystwyth, then of Theological Coll., Bala.

EDWARDSVILLE.—(1) (41° 15′ N., 75° 53′ W.) town, Pennsylvania, U.S.A. Pop. (1910) 8407. (2) (38° 46′ N., 85° 59′ W.) town, Illinois, U.S.A. Pop. 4157.

EDWIN, Edwine (585–633), king of Northumbria; succ., 617; baptized, 627; founded Edinburgh; slain in battle with Penda, king of Mercia.

EDWIN, JOHN (1749–90), Eng. comic actor; also author of jest books. **Edwin, John** (1768–1805), s. of above, also a noted actor.

EDWY THE FAIR (959), Eng. king; s. of Edmund and Ælfgifu; succ. Eadred (955); his favour towards Wessex offended Mercia and Northumbria, and Edgar Ætheling supplanted him as ruler over these kingdoms.

EECKHOUT, GERBRAND VAN DEN (1621–74), Dutch painter of religious subjects.

EECLOO (51° 12′ N., 3° 33′ E.), town, E. Flanders, Belgium; woollens, cottons. Pop. 12,000.

EEL-POUT, see Burbot.

EELS (*Anguillidæ*, etc.), long snake-like bony fishes, without ventral or tail fins, and with small scales set in groups; found in all temperate and tropical seas down to 2500 fathoms, and many in fresh and brackish waters. E's appear to spawn only in the deep sea, and to reach suitable grounds adult females migrate from the rivers. The young return as transparent 'glass-eels,' and ascend streams and brooks in incredible numbers—'eel-fairs'—sometimes swarming through the grass on the banks. Brit. forms are the common e. (*Anguilla vulgaris*), the gigantic marine conger (*Conger vulgaris*), and the rare murry or moray (*Muræna helena*), a Muræoid e. (*Muræniдæ*) common in the Mediterranean. The last, like many of the e's, is much esteemed as food.

EFFENDI, respectful form of address used towards males in Turkey.

EFFIGIES, SEPULCHRAL, sculptured figures, or figures in relief, upon monumental tombs which, in England, date from the XII. cent. At first there was probably little attempt to produce a portrait of the person commemorated, but during the XV. cent., and later, very careful attention was given to portraiture and details of armour and costume. E's are now esteemed as invaluable in tracing the development and changes in the history of costume, arms, and armour. Worcester Cathedral contains the e. of King John; Westminster has many royal e's; and most of our cathedrals and older parish churches contain e's of hist. importance.

EFT, see Newts.

EGAN, PIERCE (1772–1849), Eng. humorist and ing writer; author of *Tom and Jerry's Life in* n, *Life of an Actor.*

EGAN, PIERCE (1814–80), Eng. novelist; s. of above.

EGBO, W. African native secret society devoted to worship of a jungle spirit; assists Brit. administrators in maintaining law and order.

EGEDE, HANS (1686–1758), missionary in Greenland; principal of Missionary coll., Copenhagen.

EGER.—(1) (50° 5′ N., 12° 22′ E.) town, Bohemia, Austria, where Wallenstein was assassinated (1634); has ruined citadel; manufactures machinery, textiles, beer. Pop. (1911) 27,949. (2) (47° 55′ N., 20° 23′ E.) town, Hungary; archiepiscopal see; produces wine; also called Erlau. Pop. (1910) 28,052.

EGER, AQIBA (1761–1837), Jewish rabbi and scholar.

EGERIA (classical myth.), female deity, one of the Camenæ, held in veneration by ancient Italians; said to have initiated Numa Pompilius in religious innovations.

EGG, AUGUSTUS LEOPOLD (1816–63), Eng. artist; famed for hist. pictures; associated with Dickens group of amateur actors.

EGGENBERG, HANS ULRICH VON, PRINCE (1568–1634), Austrian statesman; Chancellor to Emperor Ferdinand, whose policy he dominated during Thirty Years War.

EGGER, ÉMILE (1813–85), Fr. scholar.

EGGER MOTHS (*Lasiocampidæ*): Oak Egger (*Gastropacha quercus*), a yellowish moth, is common; the Lappet Moth (*Gastropacha quercifolia*), rare in Britain.

EGGLESTON, EDWARD (1837–1902), Amer. novelist and historian.

EGGMÜHL, see Eckmuhl.

EGHAM (51° 26′ N., 0° 33′ W.), town, Surrey, England; has Royal Holloway Women's Coll. Pop. (1911) 12,551.

EGIN (39° 16′ N., 38° 55′ E.), town, Asiatic Turkey; scene of Armenian massacre, 1896. Pop. *c.* 15,000.

EGINHARD, see Einhard.

EGLANTINE, poetic name for Sweet Briar (*Rosa rubiginosa*), a garden plant.

EGLINTON, EARLDOM OF, held by Scot. family of Montgomerie; 1st earl cr., 1508; Alexander, 6th earl (1588–1661), was a Covenanter and opposed Charles I., but later supported Charles II.; 13th earl (1812–61), Lord-Lieut. of Ireland (1852 and 1859), spent *c.* £40,000 on a tournament at E. Castle (1839), a forerunner of the XX.-cent. pageant (see Buchan's *Eglinton Tournament*); he was cr. Earl of Winton (1859). Present earl (1848–) is 15th Earl of E., 3rd Earl of Winton.

EGMONT, EARLDOM OF, first conferred (1733) on

John Perceval, one of the founders of Georgia (U.S.A.), and a noted genealogist; present holder, Charles John Perceval (1858–); succ., 1910.

EGMONT, LAMORAL, COUNT OF (1522–68), Flemish soldier; supported Prince of Orange in opposing attempt of Philip of Spain and helped Charles IX. of France to suppress Huguenots; seized by Duke of Alva, he was beheaded.

EGOISM.—(1) the theory that only selfish conduct is possible. (2) the theory that only selfish action is reasonable. (3) loosely, actual selfishness, or a self-centred disposition. See ETHICS.

EGORIEVSK (55° 27′ N., 39° E.), town, in Ryazan, Russia; grain and hides exported. Pop. 23,932.

EGREMONT (54° 28′ N., 3° 32′ W.), town, Cumberland, England; has ruined castle. Pop. (1911) 6305.

EGREMONT, EARLDOM OF, first conferred upon Algernon Seymour (1749), who was also Duke of Somerset; afterwards passed to the Wyndhams of Orchard Wyndham; became extinct on death of George Francis W. (4th earl) in 1845.

EGYPT is situated in N.E. Africa, and extends from the Mediterranean Sea southwards to 22° N., *i.e.* the Nile basin as far as Wadi Halfa where the Anglo-Egyptian Sudan begins, a distance of 680 miles. Tripoli forms the W. boundary. On the east Egypt extends to the Red Sea and includes the peninsula of Sinai, the boundary line running from the head of the Gulf of Akaba N. to Er Rafa on the Mediterranean. The total area is about 400,000 miles, of which the Nile delta and narrow valley and a few oases are the only inhabited parts.

Physical Features.—Primitive rocks appear in the mountain peaks; the general subsoils are sandstone, said to be Cretaceous, limestone and alluvium in the valley, the soils gravel, clay, desert sand. The delta was probably covered by the sea in prehistoric times, as no borings have reached bed-rock. Porphyry, diorite, verde antique, and alabaster have been quarried from ancient days; gold, silver, copper, and gems are found in small quantities. The hard red granite (syenite) of Aswan (Syene) was worked under the earliest Pharaohs. Salt is obtained in large quantities from Lake Mareotis. Herodotus named Egypt 'the gift of the river.' The Nile deposits, before reaching the delta, at the rate of 4 inches a century, a dark, fertile sediment. In Upper Egypt (that is, from Wadi Halfa to Cairo, about 600 miles) mountains approach closely to the stream; Lower Egypt (Bahari or the delta and surrounding lands) is a plain through which the Nile passes, dividing above Cairo and entering the sea by two mouths, that of Damietta to the east, Rosetta to the west, more than 100 miles apart.

Upper Egypt is an undulating plateau ranging on the west from 400 to 700 ft. in height, on the east from 1500 to 2000 ft., with higher peaks and ridges rising from 5000 to 6600 ft.; the highest mountains are Gebel Gharib, G. Attakah, G. Dukhan, and, in the Sinaitic peninsula, G. Serbal, G. Musa, and G. Catherine. The chief oases are the Siweh, Bahrier or Lesser, Farafreh, Dakhla, the Greater or Khargeh, and Selimeh, which stretch N. to S. within a few weeks' journey of each other, and have been used immemorially by caravans. In the oasis of Siweh are ruins of the temple of Jupiter Ammon, and in the Greater Oasis the ruined temple of Amen-Ra. The Nitrian valley in the Libyan desert contains 10 lakes, which yield salt and natron. Here was the anchorite settlement from which the Brit. Museum acquired priceless codices. To the S.W. is the 'river without water,' the Bahr Belama.

The Sinaitic peninsula of Arabia, which now belongs politically to Egypt, is bounded by the Gulf of Suez to the W., the Gulf of Akaba to the E. The Suez Canal (*q.v.*), commenced in 1859 by the Suez Canal Co., was finished in 1869, and connects the Mediterranean with the Red Sea. At its N. mouth is Port Said, at its S. mouth Port Suez. It requires constant labour to keep the mouth of the canal free from deposits. Twelve miles below Cairo the Nile divides, its two branches, flowing N.W. and N.E. respectively, forming the delta; at the two mouths are Rosetta and Damietta. In ancient days the river entered the sea by seven channels at this point, the Canopic, Bolbetine (the present western channel), Sebennytic, Phatnitic (the present eastern channel), Mendesian, Tanitic, and Pelusiac. The S. part of the DELTA is extremely fertile, the N. part sandy and marshy. The sea-water lakes near the coast (Mareotis, Edku, Burlus, and Menzala) have almost the nature of bays. On the N. bank of L. Mareotis stands Alexandria. The Canopic branch of the Nile issued, it is thought, in Aboukir Bay. The Sebennytic mouth was the issue of L. Burlus into the Mediterranean. Into L. Menzala, which has an area of 780 sq. miles, flow canals representing the Tanitic, Mendesian, and Pelusiac Nile.

The Suez Canal struck the final blow to the greatness of Alexandria (*q.v.*), which is the finest natural port on the Mediterranean. A large mole connects Alexandria with the island of Pharos, named from the lighthouse which was one of the wonders of the world. The mole protects the western harbour from the sand deposits, which form the greatest engineering problem of this coast, and it is still further secured by the modern breakwater, nearly two miles long, built westward from the island of Pharos. Mehemet Ali constructed the Mahmûdîyeh Canal in 1819 from Alexandria to Cairo, and this was soon followed by the railway. In 1904 a line was commenced westwards from Alexandria towards Morocco. The chief relic of antiquity here is Pompey's Pillar, a red granite monolith 67 ft. high, a prominent object to ships at sea. At Rosetta was found in 1799 the stone, now in the Brit. Museum, which first gave a clue to the hieroglyphic alphabet.

Other important towns of the Delta are Tanta, where the famous festivals of Ahmad el-Bedawy are held, Damanhûr, which has large cotton factories, Zagazig, a canal centre and the chief cotton town, Samanud, where pottery is manufactured, Mehalla el Kobra, with large silk and cotton factories, Shebin el-Kôm, a cotton town, Menuf, an agricultural centre, Mataria, fishing town.

HISTORY.

The history of E. before the Macedonian conquest (332 B.C.) was written for Ptolemy Philadelphus by Manetho, high-priest of Heliopolis. This work disappeared, but its substance is preserved in the writings of Julius Africanus (fl. 300 A.D.), Eusebius (d. c. 340), and Syncellus (fl. VIII. cent.), and has been confirmed, except in chronology, by archæological evidence. Other sources are the Table of Kings at Abydos, the fragmentary Turin papyrus compiled during the 19th dynasty, the Bible, and the accounts of Herodotus, Josephus, etc., but Manetho's account remains the most important. Its great lack is any standard of Chronology. Events were recorded as taking place in a certain year of the reign of a certain king, or as happening in the year of some notable event. The Egyptian 12-month year of 3 seasons or 365 days (each month containing 30 days, the 5 odd days belonging to no month) was an immemorial institution possibly dating back to the 5th millennium B.C. The year was in early times held to begin with the rising of the Nile, and as this took place at the same time as the rising of Sirius (Sothis), Egyptian chronology (still used by the Copts) has became known as the *Sothic* system. The Ptolemies introduced the Leap Year day to correct this chronology, and it was enforced by the Romans, whose system, the Alexandrian Era, commenced 24 B.C. The Era of Diocletian (known as the Era of the Martyrs) commenced when Egypt was made a Byzantine province at the reorganisation of the Rom. Empire, 284 A.D.

Manetho's history accounted for 31 dynasties

before the Macedonian conquest, and gave dates to the rulers; but these dates have been found inaccurate, when compared with monuments, etc. A great deal has been discovered from the astronomical data furnished by the Egyptians. The monuments cannot with certainty be dated before the dynastic period, but numerous excavations have discovered palæolithic (possibly eolithic) and neolithic remains in Middle and Upper E.; some of these precede, others coincide with, the first three dynasties. The men of these primitive times became in later legend dynasties of gods, who ruled for 13,900 years, and of demi-gods, who ruled for 4000 years. Two of the leading Egyptologists, Mariette and Brugsch, have respectively dated the commencement of the 1st dynasty as 5004 and 4400 B.C. History before that date is a problem of ethnology.

Old Kingdom.—The 1st dynasty is known as the THINITE, its members having their seat at Abydos (Lower Egypt was of no importance until the 21st dynasty), in the nome of which This was the capital. The first king, Menes, is said to have conquered Lower Egypt (probably racially distinct, and also under monarchical rule), founded Memphis, and built the temple of Ptah. His tomb was opened in 1897. Other tombs of the 8 kings of the 1st dynasty, and of the 9 kings of the 2nd, are at Abydos, and all show traces of the Egyptian habit of burying needments and luxuries for the dead. The early kings of the 3RD DYNASTY (4449 or 3966–4235 or 3733, established at Memphis) built tombs, and Zoser erected the pyramid of Sakkara. Senoferu conquered Sinai, and worked its copper, and built two pyramids. The most famous Egyptian works of art date back to the 4TH DYNASTY (4235 or 3733), when King Cheops (Khufu) built the great pyramid, Khafra the second pyramid, at Gizeh. The Sphinx was possibly modelled, and the Book of the Dead painted. Pyramids continued to be made by succeeding kings until the end of the OLD KINGDOM with the 8th dynasty (*c.* 3358).

The period from *c.* 3358 to *c.* 1703, in which dynasties 9–17 flourished, is known as the **Middle Kingdom.** Its founder came from Heracleopolis Magna in Middle Egypt, and overthrew the Memphite monarchy. His descendants were in their turn overthrown by Theban rulers; magnificent remains of this dynasty (the 12th) are found at Thebes, Beni Hasan, etc.; three dynasties (15–17) of Hyksos or SHEPHERD KINGS ruled in Lower Egypt, *c.* 2214–*c.* 1703. They were probably Asiatic conquerors, and the Hebrew Joseph of *Exodus* was possibly chief minister of Pharaoh at this period.

The Empire (dynasties 18–20) was founded by kings from Upper Egypt, who overthrew the Shepherd Kings, and lasted *c.* 1703–*c.* 1110. Thothmes I. turned Egypt into an empire. He and his daughter, Hatshepsut adorned the famous temple at Karnak, to which Thothmes III., the great conqueror, contributed the obelisks. Thothmes III. won the long-sung battle of Megiddo over the Syrians, whom he reduced year after year; all surrounding nations paid him tribute. Amenhotep III. built the great avenues at Karnak, the temple of Luxor, etc. He is depicted in the Colossi of Thebes. Amenhotep IV. temporarily overthrew the cult of Ammon (Amen-Ra) in favour of that of the sun-god, Aton, changing his own name to Akhenaton (follower of Aton). The new cult was speedily abandoned after his death.

The 19th and 20th dynasties were those of the renowned RAMESIDES, and almost equalled in architectural splendour the age of the Pyramids. Rameses I., Seti, and Rameses II. (the Sesostris of Asiatic legend) built the great hall at Karnak, the famous temple at Abydos, etc., and a colossus of Rameses II., greater than those at Thebes, was erected at Tanis, but is not now to be traced. Rameses II. captured Jerusalem and defeated many scriptural nations. Under the

last of the race, Rameses XII., Upper Egypt asserted its independence, and after his death the empire broke up.

Tanite, Bubasite, and Saite Dynasties (21–24) ruled (*c.* 1100–700) over Lower Egypt, with varying authority over Upper Egypt. Under the Ethiopian rulers of the 25th Dynasty, hateful to the Egyptians, Assyrian invasions (under Esarhaddon and Assur-bani-pal) commenced, and the brief Saite restoration, *c.* 666 (26th Dynasty), was followed by a succession of foreign conquests. Psammetichus I. (664–610), the founder of this dynasty, not only drove the Assyrians from E., but carried the war into the enemy's country; his son, Necho (610–594), won back the Egyptian empire in Syria, but was fatally defeated by Nebuchadnezzar (605). The Assyrians were, however, too busy combating the Persians to reduce Egypt again, and Egypt soon found herself face to face with the victorious Persians. Cambyses of Persia annexed Egypt in 525.

The Persian or 27th Dynasty was overthrown in 405, and three Saite Dynasties (28–30) followed, but the last native ruler was driven into exile by Artaxerxes III. of Persia in 340 B.C. After a brief unhappy period of Persian domination (31st Dynasty), Egypt became in 332 a Macedonian Province, with its capital at Alexandria, newly founded by Alexander the Great. The Macedonian empire broke up at Alexander's death (323), and Egypt, under its Gk. rulers, the Ptolemies (*q.v.*), became the centre of Mediterranean culture. It was absorbed in the Roman Empire, 30 B.C., but continued to keep alive Gk. learning, and, like N. Africa generally, was the home of Fathers of the Christian Church and of numerous sects and heresies. Gnosticism, Manichæism, Arianism, Neo-Platonism, etc., flourished here in the first 6 cent's A.D. Not only the Greeks, but the subject native races eagerly embraced Christianity, and Coptic versions of the Scriptures have survived. Greeks and Copts might have amalgamated under the continued influence of Christianity and the equal pressure of Rom. rule, but for the permanent Muhammadan conquest of the early VII. cent. Diocletian had made Egypt a member of the Eastern Empire at his reorganisation of the Rom. provinces in 284 A.D.; and Constantine confirmed this arrangement. A successful effort was made to retain Egypt (a source of considerable riches from its cornfields, etc.) when Italy, Spain, and N. Africa fell into the hands of the Goths, but it was impossible to protect it from the fierce onslaughts of the Arabs, especially as no assistance was given by the Egyptians, who peacefully submitted, 639–41. Constans II. made one ineffectual attempt to regain possession in 654, but otherwise the Muhammadans reigned in peace until the days of the Crusades.

Arab Rule (641–1517).—Egypt became a member of the eastern caliphate, and was the last possession retained by the Abbasid caliphs; Turk. encroachments on Arab possessions ended when Egypt also became a Turk. province in 1517. The Arabs were cruel and extortionate, and it was not for two cent's that Egyptian revolts ceased. The Arab governor of [illegible]t, Ahmad ibn Tûlûn, established a virtual independence of the caliphate in the IX. cent. His house, the Tûlunîs (868–905), was succeeded first by the Ikhshîdîs (935–69), and then by the famous line of the Fatimites. Jôhar, who conquered Egypt for the Fatimite caliph of Tunis in 969, founded the city of El-Kâhirah (the victorious), which became the modern Cairo, the previous Arab capital receiving in later times the name of Old Cairo. The rule of the Fatimites was noted for prosperity, art, and learning, but ended in decadence. The early Muhammadan conquerors had annexed Syria to Egypt, but the Crusaders and the Turks now conquered Syria, and Egypt, torn by internal strife, was besieged by the Franks in 1163, and a force of Kurds, under Saladin (s. of Ayyûb), who had made an agreement with the Franks, took possession of Alexandria. Saladin secured from the caliph his own appointment as vizier in 1169, and proclaimed the Fatimites' deposition in favour of the caliph in 1171. On the death of Nureddin, in 1174, Saladin assumed the rank of sultan, and, as leader of Islam, won back much of Syria from the Crusaders.

The hopes of the Crusaders revived after Saladin's death, 1193. They captured Damietta, 1219, but al-Kâmil, nephew of Saladin, forced them to purchase retreat by agreeing to leave Egypt alone. The Christians lost Jerusalem in 1244, and Egypt became a great object as an approach to Palestine; therefore, in 1249, St. Louis of France invaded Egypt, and again Damietta was captured, but was lost, after crushing defeat by the Muhammadans, in 1250. The Ayyubites were overthrown in 1250 by the Mamelukes, a body of Turk. troops introduced into the palace by the last Ayyubite.

The Mameluke rule was the great age of Saracen art. It was a dynasty of slave origin, but kept up a splendid court and retained foreign respect until its close. Moreover, the Abbasid caliphs had lost Bagdad through the Tartar invasion of 1258, and Egypt became the seat of the Commander of the Faithful, who exerted his authority under the Mameluke wing. At last, however, the Sonnite Muhammadans under the fanatical Selim I. of Turkey determined to crush the Shiite Muhammadans of Syria and Egypt. Selim conquered Syria in 1516, Egypt in 1517, sending the last Abbasid caliph, Motawakkel, to Constantinople and himself assuming the style of Commander of the Faithful, which henceforth belonged to the Sultan of Turkey. The Mamelukes, however, retained their importance for nearly three more cent's.

Turkish Rule.—Egypt became a Turk. pashadom unmolested by Christians until Napoleon appeared before Alexandria, June 30, 1798. He met with little resistance, owing to native resentment of Mameluke ill-rule, defeated the Mamelukes near the Pyramids, and was soon installed in Cairo. On Aug. 1, however, the great battle of Aboukir Bay totally destroyed the Fr. fleet, and in 1801 France was forced by Britain to evacuate Egypt, Turk. power being restored. This was the beginning of Britain's interference in Turk. affairs. Mehemet Ali (*q.v.*), being made pasha in 1805, took all their offices from the Mamelukes; a Brit. attempt to restore them only resulted in their wholesale slaughter, 1811. He restored the prosperity of Egypt, building the Mahmoud Canal from Alexandria to the Nile (1820), introducing European reforms, drilling a native army, and extending his territory southward. He soon endeavoured to cast off the rule of Turkey, but aided Turkey against Greece, his s. Ibrahim leading the Turk. forces. In 1831 he dispatched Ibrahim to conquer Syria, and the sultan's forces were defeated at Konieh, 1832. The pasha then occupied Constantinople with Russ. aid, and by the treaty of Kutayah, 1833, added Syria to his territories. As the sultan refused to grant him the pashalik in fee he again sent Ibrahim to Syria in 1839, when the Turks were defeated at Nezib. A coalition of Britain, Russia, Austria, and Prussia was now formed to subdue this rebellious vassal of Turkey, and after the loss of Acre (1840), Mehemet Ali agreed in 1841 to give up his claim to Syria for recognition as hereditary viceroy of Egypt. He became mentally deranged and Ibrahim became pasha in 1848, but died in the same year. Mehemet died in 1849. Turkey raised the tribute paid from the viceroyalty from £400,000 to £750,000 in 1861, but Egypt and Turkey remained on good terms.

In 1866 the viceroy assumed the title of khedive, and the sultan agreed to the succession being settled on the sons in the usual European way instead of descending, according to Turk. fashion, to the eldest male kinsman. In 1869 the khedive, Isma'il, agreed not to impose taxes or contract loans without consent of Turkey, but in 1873 received all sovereign rights except those of making treaties, increasing his armed force or coining money. Isma'il's buildings, railways, schools, and various reforms led to financial

ruin and to interference of the Powers, who also made the misrule of the slave-owners in the Sudan their concern. Brit. and Fr. Dual Control was established, 1876. Isma'il quarrelled with Nubar Pasha, the finance minister, approved by Britain and France, and in 1879 dismissed his cabinet. The Powers immediately demanded the appointment of European ministers and requested Turkey to depose the khedive. Isma'il was deposed and his s. Tewfik appointed (1879), and Baring (afterwards Earl Cromer) and Blignières became comptrollers-gen.

Ahmed Arabi Bey began in 1881 to voice national feeling against foreign interference; he became under-sec. of war in 1882, secured a large following, and overrode the khedive's government; he refused to submit to a sentence of exile, and the khedive obtained Fr. and Brit. aid; Europeans fled from the country, and when the allied fleets appeared at Alexandria, massacres took place. Arabi commenced to fortify Alexandria, whereupon it was occupied by Seymour, the Brit. admiral, after bombardment; in the meantime it had been burned by the Arabs, and all Europeans slain. The Khedive was imprisoned in the palace of Ras el-Tin, on the island of Pharos, while Arabi with a large force strove to stir up the country to a holy war. Several hot skirmishes took place before Wolseley landed in Aug. Wolseley quickly fought his way from Alexandria to Tel-el-Kebir, put Arabi to flight, and entered Cairo, Sept. 14, 1882.

British Occupation.—The Egyptians soon surrendered, and Britain, having borne the total burden of the war, assumed solo control at the close of 1882. A Brit. resident (Major Evelyn Baring) and army of occupation, and a constitution drawn up by Lord Dufferin, were agreed upon, 1883. The Sudan now became the great problem of Britain in Northern Africa. Gordon, appointed Gov.-Gen. in 1884, perished in Khartum before the relieving force could reach him. The Sudan was abandoned, but as a result of Lord Kitchener's operations, 1896–98, was again brought under Anglo-Egyptian control. Under Lord Cromer (Consul-General, 1884–1907) and his successors (Lord Eldon Gorst, 1907–11; Viscount Kitchener, 1911–) E. has progressed rapidly. The Anglo-French agreement of 1904 made financial reorganisation possible and set revenue free for development of the country. By the construction of the Assuan Dam (*q.v.*) and barrages at Esna, Assiut, and Zifta, perennial irrigation has been secured and over two million acres added to cultivation. The condition of the people has vastly improved; forced labour has been abolished. Education has advanced; in 1911 there were 45,173 boys and 5500 girls in the elementary schools. Provincial Councils were instituted, 1883, and reconstituted, 1910, as the elementary education authority and with restricted powers of local government. A feature of recent years has been the rise of a nationalist party antagonistic to the British occupation; cf. plot to murder Khedive, Kitchener, and the Premier (July 1912).

Archæological Remains:—Practically all Egyptian secular buildings have perished, and the reason for this appears in the only two towns which have been traced, Tell-el-Amarna and Kahun in the Fayum, where the hovel and the magnate's villa seem to have been alike made of sunburned brick. At Tell-el-Amarna a royal palace remains in stone, but the practically complete disappearance of such buildings points to their also having been constructed of clay. The rock-cut tombs at Gizeh perhaps perpetuate the style of the earliest Egyptian dwellings. The Sphinx at Gizeh, perhaps the oldest example of non-domestic arch. in the world, though usually ascribed to the 4th dynasty, the pyramids of this district, the temples and tombs of the Nile valley and delta (*vide supra*), and an important body of Gk. and Rom. remains constitute Egyptian antiquities. Probably all the rulers of the Memphitic dynasties erected pyramids (*q.v.*); that of Meydûm has been with certainty ascribed to Senoferu of the 3rd dynasty, the three greatest, at Gizeh, to Cheops, Chephren, and Mycerinus of the 4th dynasty. The step-pyramid at Sakkara belongs to the earliest dynasties. See ARCHITECTURE.

The centre of art shifted with the capital from Memphis to Thebes. In the 12th dynasty the famous tombs at Beni Hasan were built, and the column first entered on its architectural career. This period fell far behind that of the Pyramids; but a Renaissance commenced during the 12th dynasty; the great temple at Karnak, commenced at that period, was one of the glories of Egyptian arch., and many other temples, in which the utmost effect was obtained from the now highly evolved column, were constructed round Thebes. The Deltaic dynasties were poor in art, and the art of the Hellenistic and Rom. periods had little Egyptian character. Many ruined cities of this time remain; coins are seldom found before the Gk. period; statues, bas-reliefs in the tombs, hieroglyphics, are found from the times of the Pyramids. The famous *Book of the Dead* is ascribed to the 19th dynasty, and wall-paintings became excellent at this time. Beads appear in the earliest tombs, and jewellery became an important Egyptian art.

The art of coloured glass-making was known here from the beginning of history, and there are many remains of earthenware. For MSS. finds see PALÆOGRAPHY. Handbooks on hieroglyphics are: Birch, *Introduction to the Study of the Hieroglyphics* (1857); Budge, *First Steps in Egyptian* (1895).

Ancient Religion.—There is proof in the inscriptions of the Pyramids that the Egyptians of the age preceding the 1st dynasty believed in the resurrection of the dead, at least of dead royalties. From various inscriptions and papyri, chief of which are those that compose *The Book of the Dead*, and from the writings of Herodotus, Plutarch, and other Gk authors, some of the characteristics of Egyptian creeds have been discovered. In the earliest times every town and nome had its separate deity, and when provinces were joined, as was probably the case with Upper and Lower Egypt when the 1st dynasty was established, a deity was adopted to protect the whole area. A tendency to monotheism is seen in the religious strife of the 18th and 19th dynasties, and apart from this the gods of the ruling city tended to receive universal adoration. All appear to have originated in the tribal fetishes of the Stone Age, and continued to be represented by animals; thus the hawk represented Horus, the ibis represented Thoth, the cat Bast and Sekhet, the bull of Apis Ptah, the cow Hathor or Isis, the lotus blossom Nefertem. In the later dynasties animals of these sacred classes were mummified after death. The fetishes sometimes appear, even in the earliest representations, with human figures. The nature-myths also appear at an early date (Ra, the sun, and Hapi, the Nile, being prominent characters). Various inanimate objects were conceived as having organic life and will, and what we consider subjective emotions were regarded as external powers which possessed a man.

Much of the higher philosophy of Egypt is now merely matter of speculation, but it was probably already highly developed in this mystical race at the time of the construction of the Pyramids (5th to 4th millenniums B.C.). Those great artistic works presupposed high scientific attainments, and it is not to be supposed that the Egyptians of that date were childish savages in their religious views. Memphis became the capital in the 3rd dynasty, and, to the Greeks, Ptah (with his goddess Sekhet and their s. Imhotep), Ra, the sun-god, Osiris, Seth, Typhon and Horus, Memphite gods, then became the leading deities. In the Pyramid inscriptions, Ra and Osiris, who became national gods, were assigned the chief place, and Ptah remained a mere local deity. The recognised tradition at that time was that Ra (ancestor of the Pharaohs), born in a lotus blossom, was parent of Show and Tefnut, parents of Keb and Nut, parents

of Osiris, Isis, Seth, and Nephthys. Keb and Nut were afterwards interpreted as time and space. Osiris, slain by Seth, was carved into pieces, and although the pieces were collected and put together again by Isis, Osiris remained among the *manes* as king of the dead. Death occupied the thoughts of the Egyptians almost as much as life, and consequently Osiris divided their homage almost equally with Ra.

The Egyptians are believed to have discovered the relation of our planet to the universe, but in primitive times they thought that Ra, the sun, passed in the night in a boat through the kingdom of the dead, where Osiris reigned, and ascended from those under-regions for his day's course. In the under-world Osiris judged the dead and decided on their future destiny. Both the soul (*ba*) and the astral body (*ka*) of a mortal were dependent on the preservation of the body with which they had previously been associated. The *ba* was perhaps forced to leave the happy land and suffer reincarnation when the body perished. The sycamore tree seems to have been an astral plane translated out of the fourth dimension. When it fell the souls which had taken refuge in it perished. The body was preserved by embalming, of which the process is known, accompanied by religious rites. Symbols of all the accessories of life were, and still are, placed in the tombs; the papyrus rolls and inscriptions on the walls often contain directions by which the soul is to find its way to the realm of Osiris. This way is nearly related to that of the Greeks by Charon's ferry. The soul's boat is often elaborately depicted on the walls of the tombs. Osiris remained, but the worship of Ra gave place to that of Ammon. The Greeks said that the Theban gods who replaced the Memphitic in the 12th dynasty were Amen (Ammon), Mentu, Atmu, Shu, etc. The original character of Amen is not known, but he usurped the traits of Ra and took the name Amen-Ra, while some of the Pharaohs assumed the name Amenophis. Neit became the chief divinity in the Saite period.

Prof. Flinders Petrie (in *Religion in Ancient Egypt*) has analysed Egyptian religion into four elements corresponding to racial differences established by foreign invasions in pre-dynastic days. These elements are—(1) negro animistic deities, probably including the sycamore tree and *ka* and *ba*; (2) Libyan gods, *i.e.* the Osirian triad (Osiris, Isis, and Horus), and other anthropological figures like Amen and Neit; (3) Mesopotamian gods, Ra, Aten, and other aspects of the sun, whose predominance was due to the priests of Heliopolis; (4) deified ideas, such as Ptah, the creator, Maat, 'abstract truth and law,' Imhotep, son of Ptah, the 'peace and learning which follows law and order,' obtained from Phœnician invaders, who also introduced the cow-goddess Hathor, henceforth associated with Isis. Foreign gods introduced in the dynastic period were the Syrian Baal, Ashtaroth, Kedesh, and Bes (possibly Arabian and identical with the Egyptian lioness-god Bast). Serapis (the Hellenised Apis), Isis, and, above all, Horus, were worshipped in the Gk. and Rom. periods. Magic, much practised in primitive times, revived in the period of Egyptian decline, and there is much lit. for study of the subject.

Government.—Egypt is governed by an hereditary khedive nominally subject to the sultan of Turkey, to whom he pays a tribute of £720,000, but with very large independent rights, including those of concluding commercial treaties with foreign powers and of maintaining armed forces. Since 1883 the country has been under Brit. influence; the Brit. Agent and Consul-General exercises complete financial and extensive political powers, while the Sirdar, or commander-in-chief, and all the higher officers belong (since 1882) to the Brit. army, and there is a Brit. army of occupation of some 6000 men. The Legislative Council is partly nominated by the khedive, partly representative, and there are representative General Assembly and Provincial Councils. No new loan can be raised or new tax imposed without the Assembly's consent, but it has no direct legislative functions. Besides the pres. of the Council, who holds the ministry of the Interior, there are ministers of Education, Finance, Foreign Affairs, Justice, Public Works, War, and Marine.

Egypt is divided for local government into 5 governorships (*mohafzas*), with seats in 5 towns, and 14 provinces (*mudirias*), subdivided into *markaz*, collections of townships. There are several systems of justice. Under the Capitulations (*q.v.*) foreigners are tried in special courts. Mixed tribunals were established in 1876 for trial of matters between natives and foreigners, with appeal to the Court of Appeal at Alexandria; cases between foreigners of different nationalities, or cases between foreigners on matters of local interest, are also tried in these courts, but cases between foreigners of the same nationality are usually tried in Consular courts. There are certain exemptions for natives who are not Muhammadans, but, as a rule, the natives are subject to the Mehkemmeh courts, presided over by Cadis, for matters touching personal law, and to the Native Tribunals (established in 1884–89) of various kinds, with appeal to the Court of Appeal at Cairo. Military service is theoretically obligatory, but only a small proportion of the population is called upon to serve.

Communications.—The Nile, navigable throughout Egypt, is still the great thoroughfare for trade and travel, but there are, exclusive of the Sudan line, over 2000 miles of railway rapidly extending; of the total, two-thirds are in the delta; the larger amount belongs to the government, which in 1909 acquired the Upper Egypt Auxiliary Railways and Western Oases Railway. Lines from Alexandria and Port Said unite at Cairo and proceed up the Nile valley, beside the stream as far as Shellal, whence steamers run to Wadi Halfa, whence the Sudan railways run to the Red Sea and southwards towards the heart of Africa (see CAPE TO CAIRO RAILWAY). Other lines run from Damietta to Cairo, from Cairo by Zagazig to Ismailia, from Port Said by Ismailia to Suez. Caravan routes run in all directions. There is good postal, telegraphic, and telephonic communication.

Climate.—The Delta is not very wholesome for Europeans, but the rainless, dry climate of Upper Egypt has made it a health-resort. In Upper Egypt the temperature sometimes rises to 110°–140° Fahr., in Lower Egypt it varies from 50°–60° Fahr. in winter (Dec. to March), when there are cold, damp, northerly winds, and from 85°–90° Fahr. in summer (especially May and June), when hot, sand-laden winds from the east and south prevail. Snow occasionally falls on the highest mountains. The true Egyptian seasons are, however, not those of the sun, but of the Nile, and were so reckoned in the immemorial Sothic system.

Resources.—The Nile rises regularly at the end of July owing to the melting of the snows on the Abyssinian hills and the spring rains of the tropics, commences to sink in the middle of October, and returns to its natural level in April. From April to July, therefore, nothing can be grown, rain being absent, except where irrigation is possible. Cotton, sugar, and rice are grown from March to Oct., dhurra and vegetables, July to Oct., wheat, barley, and other cereals, Nov. to May. The chief crops are cotton, sugar-cane, rice, maize, wheat, barley, millet, and dates; about £23,000,000 of cotton is exported yearly, over £18,000,000 being to Britain, which also imports from Egypt £2,000,000 worth of cotton seeds, besides onions, oil-seed cake, beans, eggs, and manufactured tobacco; to Britain and other countries Egypt also sends raw wool, hides, cane-sugar, oranges, dates, gum, rice, henna, lentils, and tomatoes. Egyptian cigarettes are chiefly manufactured at Cairo and Alexandria, attar of roses at Cairo and in the towns of the Fayum, where there are large rose gardens.

Population.—The prevailing religion is Muhammadanism, there being in 1907 about 10,400,000 Muhammadans, 700,000 Copts (native Christians), 175,000

Christians of various denominations, and 39,000 Jews. The Coptic religion is very similar to that of the Gk. Orthodox Church. Under the patriarch of Alexandria there are three Egyptian archbishoprics and twelve bp's. The famous univ. of El Azhar at Cairo was established in 972, and is still flourishing. Another large Muhammadan school is the mosque of El-Ahmadi at Tanta. Technical, secondary, and higher education are extremely well provided for, chiefly by private initiative; 34 Higher Primary Schools (for Europeans) and 146 Kuttab schools (for natives) are directly under the Egyptian Board of Education; 3279 Kuttabs have received government aid since 1897.

More than half the native population is engaged in agriculture; it is chiefly composed of an Arab element intruded in the VII. cent., a Turk. element introduced shortly afterwards, and the Coptic substratum. The origin of the Copts (*q.v.*) is not certainly known, but racial types are to be discerned in the inscriptions on the pyramids. The ruling race is believed to have landed from Asia on the Red Sea coast and taken up its abode at Koptos on the Nile. A second element is believed to be from Mesopotamian immigration in primitive times, the third and fourth the probable negro and Libyan substrata. The total population at 1907 Census was about 11,300,000, of whom 151,000 were foreigners (chiefly Gk., Ital., Brit., Fr., Austrian, Russian, German, and Persian).

Egypt, by Lane-Poole (1881), Budge (1902), Petrie (1903), Breasted (1906); Milner, *England in E.* (1892); Cromer, *Modern E.* (2 vols., 1908); Newberry and Garstang, *Short History of Ancient E.* (1912).

EHRENBREITSTEIN (50° 22′ N., 7° 38′ E.), town, on Rhine, Prussia; important fortress. Pop. (1910) 5055.

EIBAR, town, Guipuzcoa, Spain; manufactures weapons. **Eibar Work** is damascened arms. See DAMASCENING.

EIBENSTOCK (50° 29′ N., 12° 36′ E.), town, Saxony, Germany; cattle market; chemical and tobacco manufactories. Pop. (1910) 9522.

EICHENDORFF, JOSEPH, FREIHERR VON (1788–1857), Ger. romance-writer and lyrical poet.

EICHHORN, JOHANN GOTTFRIED (1752–1827), Ger. theologian; prof. at Jena and Gottingen; wrote works on Oriental subjects, Biblical criticism, and history.

EICHHORN, KARL FRIEDRICH (1781–1854), Ger. jurist; pub. important works on constitutional law.

EICHSTÄTT (48° 53′ N., 11° 12′ E.), town, Bavaria, Germany; has cathedral. Pop. (1910) 8031.

EIDER (54° 10′ N., 8° 40′ E.), river, Prussia, enters North Sea; connected with Baltic by Kaiser Wilhelm Canal.

EIDER DUCK, see under DUCK FAMILY.

EIFEL (50° 23′ N., 6° 50′ E.), hilly region, Germany, bounded by Rhine, Moselle, and Belgium; of volcanic origin; has many extinct volcanoes and small lakes.

EIFFEL TOWER, colossal iron structure, built 1887–89, by Alexandre Gustave Eiffel, on the Champs-de-Mars, Paris. It is 985 ft. high, consists chiefly of lattice-work, is of three storeys, and served by lifts. It cost *c.* £250,000, a sum paid up in admission fees.

EIGG, Egg (56° 55′ N., 6° 13′ W.), island, Hebrides, Scotland; columnar cliffs.

EIGHT, PIECE OF, PIASTRE, PESO, old Span. coin. See DOLLAR.

EIKON BASILIKE, *The Portraiture of His Sacred Majestie in his Solitudes and Sufferings*, book pub. just after Charles I.'s execution; claims to be work of Charles, but Dr. Gauden's claim to authorship is generally accepted. Milton attacked it in *Eikonoclastes* (1649).

EILDON HILLS (55° 36′ N., 2° 45′ W.), three hill peaks, in Roxburghshire, Scotland; highest, 1385 ft.

EILENBURG (51° 27′ N., 12° 37′ E.), town, Saxony, Germany. Pop. (1910) 17,398.

EILITHYIA, ancient Egyptian city, on Nile, 40 miles S. of Thebes; site of temples and royal tombs.

EIMEO, AIMEO (17° 28′ S., 149° 53′ E.), one of the Society Islands; area, 50 sq. miles; French possession; devastated by tidal wave, 1903; centre for London Missionary Society.

EINBECK, EIMBECK (51° 49′ N., 9° 51′ E.), town, Hanover, Germany; manufactures textiles. Pop. (1910) 9430.

EINDHOVEN (51° 26′ N., 5° 28′ E.), town, in Brabant, Holland; flourishing industrial centre. Pop. 4730.

EINHARD, EGINHARD (770–840), Ger. historiographer; associate and biographer of Charlemagne.

EINHORN, DAVID (1809–79), Amer. Jew, introduced various ritual reforms; strong opponent of slavery.

EINSIEDELN (47° 7′ N., 8° 45′ E.), town, Switzerland; has Benedictine monastery. Pop. (1910) 8420.

EISENACH (50° 59′ N., 10° 19′ E.), town, Saxe-Weimar, Germany; Luther translated Bible in the Wartburg here. Pop. (1910) 38,353.

EISENBERG (50° 58′ N., 11° 54′ E.), town, Saxe-Altenburg, Germany. Pop. (1910) 10,750.

EISENERZ (47° 33′ N., 14° 53′ E.), town, Austria; rich ore quarried in district; iron and steel foundries. Pop. (1910) 7557.

EISLEBEN (51° 33′ N., 11° 33′ E.), town, Saxony, Germany; Luther's birthplace; centre of mining district. Pop. (1910) 24,627.

EISTEDDFOD (pl. *Eisteddfodau*), Welsh bardic congress, of very ancient origin; earliest description of one, held at Conway, dates from VI. cent. The modern annual celebration began in 1819. The purpose of the ceremony is the cultivation and encouragement of Welsh poetry, music, and tradition. See *History of Eisteddfod*, by Roberts (1909).

EJECTMENT, Eng. legal action for recovery of land by writ of summons demanding immediate possession. In Scotland the process is by summary ejection.

EKASILICON, see GERMANIUM.

EKATERINBURG (56° 52′ N., 60° 42′ E.), town, Perm, Russia, in centre of mining district. Pop. (1910) 51,740.

EKATERINODAR (45° 3′ N., 38° 53′ E.), town, on Kuban R., Caucasia, Russia. Pop. (1910) 93,800.

EKATERINOSLAV (48° 15′ N., 36° E.), government, S. Russia; area, 24,477 sq. miles; surface undulating; produces coal, iron, wheat, fruits; cereals exported in large quantities. Pop. (1910) 3,061,300. **Ekaterinoslav** (48° 28′ N., 35° 7′ E.), capital, on river Dnieper. Pop. (1910) 148,870.

EKHOF, KONRAD (1720–78), Ger. actor; highly esteemed by Goethe.

EKRON (31° 51′ N., 34° 51′ E.), ancient town, Palestine; modern AKIR.

EL BASSAN, town, in vilayet of Monastir, European Turkey; iron and copper manufactures; seat of Gk. bishop. Pop. 15,000.

EL DORADO, name given by Spaniards to undiscovered 'land of gold' in S. America; many expeditions searched vainly for it from 1531 to 1595, when Raleigh (*q.v.*) was liberated by the avaricious James I. to endeavour to find the 'city of Manoa in El Dorado'; term now used metaphorically for land where acquirement of wealth is easy.

EL OBEID (13° 16′ N., 29° 48′ E.), chief town, Kordofan, Sudan; extension of Cairo to Khartum railway was opened to El O., 1912; Hicks Pasha with Egyptian army defeated here by Mahdi, 1883; important trade centre for gum, ivory, cattle. Pop. *c.* 10,000.

EL PASO (31° 45′ N., 106° 25′ W.), town, Texas, U.S.A., on Rio Grande; important trading and railway centre; lead smelting carried on; railway carriages manufactured. Pop. (1910) 39,279.

EL RENO (35° 32′ N., 97° 59′ W.), town, Oklahoma, U.S.A. Pop. (1910) 7872.

EL TEB (*c.* 18° N., 37° 30′ E.), place near coast of Red Sea, Sudan.

EL WAD (33° 20′ N., 6° 56′ E.), town, Sahara, Algeria, Africa. Pop. 7586.

ELABUGA (55° 45′ N., 52° E.), town, Nyatka, Russia; exports corn. Pop. 9776.

ELÆOCARPUS, family of plants of order *Liliaceæ*; found in E. Indies and Australia.

ELAGABALUS, see HELIOGABALUS.

ELAM (*c.* 31° 20′ N., 49° 20′ E.), Bible name for Persian province Susiana. Capital is Susa or Shushan. Exact extent uncertain; excavations at Susa shed light on early history. E. figured in Babylonian myth.

ELAND (*Oreas canna*), a fawn-coloured African antelope; males and females with strongly ridged horns; male with large dewlap; height, 6 ft.—the largest of antelopes.

ELANDSLAAGTE, small town, Natal; battle between British and Boers fought here, Oct. 21, 1899.

ELASMOSAURUS, see REPTILES.

ELASTICITY.—This term denotes that property of matter in virtue of which it tends to recover from any change of shape or volume which has been produced by an applied force. A body can be given such a change in a variety of ways, for it can be compressed, elongated, twisted, bent, or sheared. In each case the force applied is termed a *stress*, and is measured by the number of units of force acting per unit area. The resulting change or deformation is termed a *strain*, and is generally measured by the amount of change in each unit which undergoes the change. But as different materials yield by different amounts to the same stress, it is necessary to have for each material a quantity which will specify or measure the behaviour of the material under a stress of each particular kind. Such quantities are termed *elastic moduli*, and they are generally defined for any particular kind of stress as the ratio of the stress applied to the strain produced. The first is known as *Young's modulus*, which is applied to cases of linear extension. Suppose a heavy mass is attached to the lower end of a vertical wire whose upper end is fixed. The stress is the weight of the mass divided by the area of cross section of the wire. The strain is the amount by which the wire stretches, divided by the length of the wire. The ratio of stress to strain is known as Young's modulus.

The second is known as *Poisson's ratio*, and it arises in the following way: if a wire elongates under tensile stress (as in the example given), its diameter must contract. The ratio of the transverse (or diametral) strain to the longitudinal or extensional strain is Poisson's ratio.

The third modulus is the *rigidity*, a simple conception of which may be obtained as follows. Let a large number of square sheets of paper, equal in size, be laid exactly one above another on a horizontal surface, so as to form a cube. Keeping the lowest sheet at rest, slide each sheet over that below it so that a vertical face of the cube becomes a plane inclined to the vertical. The deformation thus produced is termed a *shear*. In the case of a solid cube, it could be produced by equal forces acting tangentially in opposite directions on two opposite faces of the cube. The shearing stress is measured by the force thus acting on unit surface, and the shearing strain is measured by the angle (supposed small) through which one face of the cube rotates from its unstrained position. The ratio of the stress to the strain is the rigidity.

Lastly, we have the modulus of volume elasticity, or *bulk modulus*. Suppose a cube, whose edges are unit length, is subjected to an equal pressure on all its faces. Owing to compression, each edge will diminish in length. If this diminution be l, the volume of the cube will be decreased by $3l$ (approximately). If the applied pressure per unit area be P, the modulus of volume elasticity will be $\frac{P}{3l}$. Frequently, the reciprocal $\frac{3l}{P}$ of this modulus is used, and is known as the compressibility. Between these four ratios or moduli, two relations are known. Consequently, if any two of the four are determined experimentally, the remaining two can readily be calculated.

In all cases of deformation of a solid body, *Hooke's law* applies. This is to the effect that, so long as the deformation is small, the strain produced is proportional to the stress applied. Thus, so long as Hooke's law applies, the action is said to be within the limits of perfect elasticity. When the stress and strain are large, the body passes the *yield point* beyond which the law is no longer applicable, and a *permanent set* is produced.

The values of the elastic constants for a substance vary with temperature, with the mechanical or thermal treatment it has received, and with its freedom from impurity.

ELATERIUM, drug, prepared from a deposit of the juice of the fruit of the 'squirting cucumber' plant (*Ecballium elaterium*), in the form of slightly curved, greyish cakes of bitter taste. It is a violent purgative, producing watery evacuations, the active principle in it being a neutral body, *elaterin*. E. is used in ascites and Bright's disease, to assist in removing the surplus fluid from the body.

ELBA (42° 46′ N., 10° 15′ E.), island, Mediterranean, off Tuscan coast, Italy; surface mountainous; produces iron, granite, manganese, wine, fish; Napoleon lived here, 1814–15. Pop. 25,043.

ELBE (53° 53′ N., 9° 10′ E.), large river, Germany; rises on Bohemian side of Riesengebirge; flows S., W., and N.W., in Bohemia; N.W. and W., passing through magnificent scenery of Saxon Switzerland; through Prussia N.W., sometimes N.E.; 8 miles above Hamburg divides into several streams (which reunite at Blankenese), and enters Ger. Ocean at Cuxhaven; chief tributaries, Tser, Moldau, Eger, Schwarze-Elster, Elder, Mulde, Saale, Havel; principal towns, Dresden, Hamburg, Magdeburg, Wittenberge, Torgau. E. is navigable as far as Melnik (junction of Moldau, Bohemia); total length, 725 miles, of which over 500 are navigable; connected with Baltic, Trave, Havel, and Oder by canals. E. often figures in history, especially during Austro-Pruss. Wars.

ELBERFELD (51° 15′ N., 7° 9′ E.), town, Prussia, situated on river Wupper; great cotton centre; manufactures textiles, carpets, machinery, hardware, paper, and has large export trade; has some fine public buildings; many churches, schools, and charitable institutions. Pop. (1910) 170,118.

ELBEUF (49° 17′ N., 1° 7′ E.), town, Seine-Inférieure, France. Pop. 17,800.

ELBING (54° 10′ N., 19° 25′ E.), port, Prussia; shipbuilding, machinery. Pop. (1910) 58,515.

ELBOW, see SKELETON.

ELBURZ, ALBURZ (*c.* 36° 40′ N., 50′ E.), mountains, N. Persia to S. of Caspian Sea; length of range, *c.* 600 miles; highest peak, Demavend (19,400 ft.); slopes facing Caspian covered with woodland, and watered by many streams; an important pass is Kharzan.

ELCHE (38° 15′ N., 0° 41′ W.), town, Alicante, Spain. Pop. 27,308.

ELCHINGEN (48° 47′ N., 10° 16′ E.), village, Bavaria, Germany; Fr. defeated Austrians, 1805.

ELCHO, DAVID, see WEMYSS.

ELDAD BEN MAHLI (IX. cent.), Jewish traveller; supposed author of work relating to Lost Tribes.

ELDER, genus *Sambucus*, natural order *Caprifoliaceæ*, deciduous shrubs and trees; common elder, with black berries (*S. nigra*), is used medicinally and for turned articles, *e.g.* pegs and combs.

ELDER, a title existing in the ancient Jewish Church; thence in Christianity. The exact relation between the primitive e., or presbyter, and bp. is open to dispute; e's exist now in Presbyterianism.

ELDON, JOHN SCOTT, 1ST EARL OF (1751–1838), Eng. lawyer; Attorney-Gen. (1793); Lord Chief-

Justice of Common Pleas (1799); Lord Chancellor (1801); violently Conservative, he opposed abolition of capital punishment for minor offences.

ELEAN-ERETRIAN SCHOOL, a Gk. philosophical school, of which little is known, founded in Elis, his native city, by Phædo, who as a youth had been a disciple of Socrates, and subsequently removed to Eretria.

ELEANOR OF AQUITAINE (*c.* 1122–1204), dau. of William V., Duke of A.; m. Louis VII. of France; divorced, she m. Henry II. of England—a union which led to Anglo-French Wars.

ELEATIC SCHOOL, a Gk. school of philosophy founded by PARMENIDES OF ELEA (fl. V. cent. B.C.). Parmenides expounded his philosophy in a poem consisting of two parts, the *Way of Truth* and the *Way of Opinion*. The *Way of Truth* argues that only what is can be thought, and it must be one, without past or future, indestructible, indivisible, immovable, finite (because complete), and equal in every direction like a sphere. But, since the distinction of material and immaterial had not yet arisen, 'what is' (or Being) meant, for Parmenides, Body, and 'what is not' meant empty space. The *Way of Opinion* seeks to show that a belief in change, motion, etc., leads to difficulties even greater than the denial of them.

This attempt was carried further by his pupil, ZENO, also of Elea, who in a series of puzzles, of which that of Achilles and the Tortoise is the best known, argued the unintelligibility of multiplicity and of space and motion.

The E. view was in extreme opposition to that of Heraclitus (*q.v.*), and may be called a materialistic monism. The problem occupied Anaxagoras and Empedocles (*qq.v.*); but the growth of the distinction between mind and matter gave a new turn to the controversy in the next century.

ELECAMPANE (*Inula Helenium*), perennial European plant of order *Compositæ*; height, 2 to 5 ft.; yellow flowers; contains helenin (C_6H_8O) and inulin ($C_{12}H_{20}O_{10}$).

ELECTION, parliamentary and municipal, is under certain regulations. In U.K. any male with certain qualifications can be elected to Parliament; infants, women, aliens, lunatics, clergy, criminals, and holders of certain offices are ineligible. Electors must possess either Household, Occupation, Lodger, or Service Franchise or certain others, with slight variations in Scotland and Ireland; members are also elected by the Univ's of Oxford, Cambridge, London, Dublin, and the Scot. Univ's. Voting is now by ballot, a cross being marked against the name of the candidate for whom the vote is given. The votes are counted by the returning officer. E. expenses are regulated by Act of Parliament; bribery, corruption, treating, etc., can be heavily punished; a guilty candidate if elected can be unseated.

In *Municipal* e's the burgesses elect to town councils. Women can elect, but are not eligible. There are certain property qualifications. In England the council elects aldermen and mayor on November 9. In Scottish burghs the parliamentary electors vote, with the addition of qualified women.

Vote (Lat. *votum*, a vow), the deliberate expression of a wish or preference by one or other of various methods—*e.g.* acclamation, shouting ('ayes' and 'noes'), show of hands, rising to feet, 'dividing' (into separate lobbies), or by secret ballot (*q.v.*). Univ. electors may vote by post; shareholders and others often vote by proxy. Voting machines are used to record and count votes in some countries (*e.g.* America), the Bardwell votometer and Standard machine being the most successful. Qualifications for a parliamentary or municipal v. differ in various countries, the commonest being those of age, sex, education, property, residence, sanity. 'One man, one vote' is advocated by opponents of plural voting; 'one vote, one value' goes further and requires constituencies equal in number of electors, so that each man's vote is the same in value. Under Proportional Representation the elector has a single 'transferable' vote, so that if, among several candidates, his favourite is not elected, his vote may not be lost, but help to return the candidate he considers second-best.

In UNITED STATES elections are *national* (for Congress, or electoral college to choose president), *state* (for officials of state—governor, etc.), and *municipal* (town, city or county). Although most states accept in theory principle of universal manhood suffrage (and several extend vote to women), Cal. Conn. and Mass. insist on minimum of education; and several Southern states do likewise or impose taxes, to exclude indigent and ignorant negroes. In La. disqualified persons may vote if they were entitled on Jan. 1, 1867, or are sons or grandsons of people then voters

ELECTION, in Calvinism, PREDESTINATION (*q.v.*).

ELECTORAL COMMISSION, created to settle U.S.A. presidential election dispute (1876); candidates were Tilden (Democrat) and Hayes (Republican); verdict in Hayes' favour was partisan. An Act of 1887 provides for settling disputes conclusively.

ELECTORS, the Ger. princes (Kurfürsten), originally seven, who elected Ger. kings and Holy Rom. emperors—royal titles almost invariably held by one and the same man. The Ger. kingship, like that of other countries, was partly elective, partly official, though for several reasons the elective element came to predominate, partly because the Rom. Imperial tradition was maintained, and the old Empire had always been elective. By the XII. cent. the usual e's were the three Rhenish abp's (Köln, Mainz, and Trier) and the great dukes. The Golden Bull of Charles IV. (1356) recognised as lay e's the Palatine of the Rhine, Duke of Saxony, Margrave of Brandenburg, and King of Bohemia; two other votes were cr. for Bavaria (1623) and Hanover (1708). See EMPIRE, HOLY ROMAN, GERMAN EMPIRE, *History*.

ELECTRA (classical myth.).—(1) One of the Pleiades. (2) Dau. of Agamemnon and Clytæmnestra, and sister of Orestes. Subject of tragedies by Æschylus, Sophocles, and Euripides, and opera by Strauss.

ELECTRIC EEL (*Gymnotus electricus*), most formidable of electric fishes, capable, by electric shock, of overturning horses; found in rivers of Brazil and Guiana, 6 to 8 ft. long; not related to true eels.

ELECTRICITY. *Current e.* treats of e. in motion, while *electrostatics* treats of e. at rest. It is seen that e. flows between two points at different pressures when joined by a conductor. If the flow is to continue, the pressure difference or difference in potential must be sustained. This is achieved by *batteries* and *dynamos*. The existence of the current appears from the properties acquired by the conductor; it becomes heated, a magnetic field is created round it, and if it is severed and the ends connected to plates of certain substances placed apart in certain liquids these are decomposed.

The practical unit of current is the *ampère*, the unit difference of pressure, the *volt*. As shown by the heating effect, any conductor resists the passage of a current, and the unit of resistance is the *ohm*. The relation between current C, pressure loss E in, and resistance R of, a conductor is given by OHM'S LAW, viz. $E=RC$. If any two of these are known the third is fixed. So if a cable carries 300 ampères and the pressure difference between the ends is 6 volts, the resistance is $6 \div 300 = \cdot 02$ ohms; or if the resistance is known ·02 ohms and the current is 300 ampères, the drop in volts will be 6; or if the drop is to be 6 volts and the current 300 ampères, a cable of resistance 0·2 ohms must be chosen.

When conductors are joined on end or in series, their joint resistance equals the sum of the separate resistances. When they branch out from one point and join together at another or are in parallel, a current divides between them, the smallest resistance passing the greatest current. This is comparable to water in a pipe-line dividing between two pipes of different diameter. With resistances a, b, current C, a passes $\frac{b}{a+b}$. C, b passes $\frac{a}{a+b}$. C. Any number of resistances

in parallel are equivalent to one resistance = product of the single resistances ÷ their sum. In the special case of n equal resistances, each R, the equivalent is $\frac{R}{n}$.

The heat developed in a resistance, which will produce light with a suitable resistance, is expressed by JOULE'S LAW: Calories = $\cdot 24EC t = \cdot 24C^2Rt$, t being the time in seconds. The total energy of radiation corresponds to the loss in pressure E. Arago discovered that iron filings in the neighbourhood of a conductor carrying a current set themselves in definite positions, and Oersted found that a magnetic needle set itself at right angles to the conducting wire. A cylindrical coil, in fact, when carrying a current behaves as a magnet with north and south ends. The magnetism is concentrated by inserting a core of soft iron, which becomes a temporary electro-magnet.

Electrostatics.—It was known to the Greeks that amber (ēlektron) when rubbed became capable of attracting light bodies. This property, imparted by friction, is shown in different degrees by all substances when suitably rubbed, and the body is said to be electrified or possess electrification. It appears by experiment that there are two kinds of electrification produced in equal quantities at the same time. Glass, rubbed with silk, is said to be positively electrified; vulcanite, rubbed with fur, negatively electrified. Also similarly electrified bodies repel, dissimilarly electrified bodies attract each other. Now some bodies such as metals do not exhibit these properties when held and rubbed, but do so if given a glass handle. Such bodies are called *conductors*: glass, vulcanite, and such-like are *insulators*. A positively charged or electrified body is at a higher electrical pressure than the earth, and if it is connected to earth by a conductor, electricity flows from it till the pressures become equal. A negatively charged body is at a lower pressure or potential than the earth, and when connected receives electricity. The earth's potential is assumed zero for convenience. There can be no flow of electricity without difference of potential, which corresponds to difference of temperature or difference of head with water.

A positively charged body, such as a sphere in the centre of a room, tends to discharge itself and therefore the air round it is strained. An electric field is thus created and an insulated conductor placed in it is electrified negatively on the side next the sphere, positively on the side distant from the sphere. This is electrostatic induction. The transmitting medium (air) is a *dielectric*. If a sheet of glass or mica be now interposed, the inductive effect is increased. These and similar substances are said to have a higher specific inductive capacity (S.I.C.) than air, the specific inductive capacity of which is taken as 1.

Electrostatic measurement starts from the law that the force between two charges is proportional to their product divided by the square of their distance apart. The unit charge is such that it repels an equal charge 1 centimetre distant in air with a force of 1 dyne. The *potential* again at any point is the work done in moving a unit positive charge against the force to that point from an infinite distance: and the potential is 1 if the work done is 1 erg. For a sphere, the potential = charge ÷ radius. Lastly, the *capacity* is the charge when the potential = 1. The fundamental equation, charge = capacity × potential connects the three. An arrangement of conductors separated by a thin dielectric has high capacity and is termed a *condenser*.

ELECTROSTATIC MACHINES, appliances for producing positive and negative electricity separately, in large quantities. The earlier forms of machine depended on Friction, but these have given way to machines depending on Induction, by which is meant that a positive charge on a conductor will 'induce' (*i.e.* produce) an equal negative charge on another conductor placed near it, and conversely for a negative charge. The simplest of this type of machine is the *Electrophorus* (q.v.). All electrical machines consist essentially of two parts, one for producing and one for collecting the electricity. The *Wimshurst Influence Machine* is typical of others. It consists of two circular glass plates, placed close together and arranged to rotate in opposite directions. To the outer surface of each are attached an even number of metal strips. A small charge (positive or negative) is given to one of the strips, and as the plates rotate the others become charged by induction, the charges increasing with rotation. The charges are collected by wire combs touching the plates, and stored in metal knobs. More correctly, the combs neutralise the charges and induce similar charges in the knobs. Other induction machines are: Holtz Electrical Machine, Kelvin's Water-dropping Apparatus, Kelvin's Mouse Mill, Toepler's Influence Machine.

Modern Views of Electricity, Lodge (Macmillan); *The Principles of Electricity*, Campbell (Jack).

Electric Waves.—If a condenser, such as a Leyden jar, be discharged through a good conductor, electric oscillations are set up in the conductor, the charge surging to and fro as if it had overshot the mark each time, just as is the case in the swinging of a pendulum. The same occurs if there is a short air gap in the conductor, the first part of the discharge making the gap a good conducting path. The time of a complete oscillation is $2\pi\sqrt{LC}$, where C is the capacity of the circuit and L the self-induction. Direct evidence of the oscillatory nature of a spark discharge may be obtained by a photograph or by revolving mirrors.

If the oscillations are very rapid, electric (more correctly, electro-magnetic) waves are set up in the surrounding air. These waves travel away from the apparatus with the velocity of light, and consist of electric and magnetic disturbances taking place at right angles to each other and to the direction in which the waves are travelling. Hertz (*q.v.*), who investigated the subject in 1888, detected the waves by means of a 'resonator,' consisting of a thick copper wire bent into a circle and ending in two knobs, the distance between which was adjustable. When the resonator was 'in tune' a spark passed between the knobs. He proved that electric waves are capable of reflection, refraction, polarisation, and interference according to the same laws which govern waves of light, and that they travel with the same velocity. It is now believed that light waves are simply electric waves of very short wave length and high frequency.

In the application of electric waves to Wireless Telegraphy the oscillations take place along the aerial and the detector is a 'coherer' (see TELEGRAPH).

Electro-kinetics treats of the properties of the electric current. These may be generalised under four heads: (1) *The production of a magnetic field* (ELECTRO-MAGNETISM).—Owing to this the mechanical action of one current on another is such that parallel circuits will attract each other if the current flow in the same direction in both, and repel if the current flow in opposite directions. This has found practical application in Weber's Electro-dynamometer and Kelvin's Ampère Balance. (2) *The production of heat.*—Even the best conductors oppose a resistance to the passage of a current, which therefore has to perform work in overcoming this resistance; this work results in the production of heat. The quantity of heat produced in a second by a current C against a resistance R is C^2R. Also the thinner the conductor, the greater the resistance; hence in a thin filament like that of an electric lamp the heat is sufficient to cause it to glow brightly given a sufficient strength of current. (3) *Chemical effects* (ELECTROLYSIS).—This forms the basis of the present legal definition of the practical unit of current (the AMPÈRE), viz. 'That current which deposits ·001118 grammes of silver per second.' Properties (2) and (3) have been put to great commercial use in metallurgical processes (ELECTRO-

METALLURGY). (4) *Induction*, discovered by Faraday in 1831. He found that currents can neither be created nor destroyed instantaneously. This is similar to the property of 'inertia' in material bodies. Transformers, in use at all generating stations, and induction coils depend on this principle. Faraday further discovered that if a conductor is moved so as to cut the lines of force of a magnetic field a current is 'induced,' *i.e.* generated, in it, the strength of the induced current being proportional to the rate of motion of the conductor. This discovery has made possible the commercial production and use of the electric current. The dynamo works on this principle, a number of coils revolving in a magnetic field produced by electro-magnets. The current so generated, however, changes its direction twice in each revolution (alternating current), but by means of a commutator this is changed into a current which always flows in the same direction.

J. J. Thomson, *Elements of the Mathematical Theory of Electricity and Magnetism*; Poynting and Thomson, *Magnetism and Electricity*.

Supply.—Electric current is produced by one or more dynamos (*q.v.*), driven by a steam or gas engine or water-power, and is conducted, either overhead or underground, by copper cables. In the interior of buildings the conductor is a rubber-covered copper wire laid in a wood or fireproof casing. The current generated by a dynamo is alternating, *i.e.* it changes in direction twice in each revolution of the dynamo coils, but this can be changed by means of a commutator into a continuous current, always flowing in one direction. The supply will be either a continuous or an alternating current system, according to the purpose for which it is required; thus, for traction, a continuous current of between 500 and 600 volts is needed, while for lighting either one or the other will do.

The continuous-current system is either a low or high pressure system (low or high voltage). The first is suitable for supplying an immediate neighbourhood, the current being produced at between 450 and 500 volts, and by means of a three-wire system supplied to users at half this voltage. At such stations, it is usual, for economic reasons, to utilise storage batteries, which make a small plant, worked all the time, a possibility—when a sudden extra demand is made on the supply, the batteries discharge together with the dynamo, and on the demand falling, the excess produced by the dynamo charges the battery.

The high-pressure system is used where current has to be supplied to some distance from the generating station. In the ordinary way, there would be a great loss of power owing to the heating by the current of a long conductor. This could be avoided either by using a very thick cable, and thus reducing its resistance, or by generating a high voltage. The first would involve a heavy outlay on copper, and the second grave risks on the part of consumers in case of accidental contact. To prevent loss of power, therefore, the current is either (*a*) produced at low pressure, changed at the station into a high-pressure current by a *step-up* transformer (*q.v.*), transmitted at this high pressure to subcentres, where it is changed back to a low-pressure current by *step-down* transformers, and *then* supplied to users from these centres; or (*b*) produced at high pressure straightway, and changed to low pressure at the subcentres.

The alternating-current system is either single phase or polyphase, and the above remarks with regard to high and low pressure currents apply. The single-phase system cannot be used with storage batteries, and consequently the polyphase system is now commonly employed.

In small towns where the station supplies power for both traction and lighting, double current dynamos are used, giving a continuous current for the former and an alternating current for the latter purpose.

For private plants, a dynamo is usually employed. It is advisable to have storage batteries in connection with it, not only as a safeguard in case of stoppage, but also because the dynamo and driving engine require constant skilled attendance. See LIGHTING.

A. Gay and C. Y. Yeaman, *Central Station Electricity*; C. H. Wordingham, *Central Electrical Stations*; L. Andrews, *Electricity Control*; W. Perren Maycock, *Electricity Wiring, Fitting, Switches, and Lamps*.

Electrolysis.—If the platinum wires from the terminals of a battery are dipped into either (1) pure water, or (2) pure hydrochloric acid, no change takes place, but if a small amount of (2) is added to the water, on the passage of a current, certain chemical changes ensue. Therefore the solution of hydrochloric acid in water is a conductor of electricity, which pure water and pure hydrochloric acid are not. The term *electrolyte* is applied to substances which in aqueous solution conduct electricity; salts, acids, and basics are electrolytes. The same substances dissolved in chloroform do not conduct electricity; therefore they are present in some special condition in water. This condition is called dissociation, and it is supposed that when an electrolyte, sodium chloride, is dissolved in water, it splits into metallic radicles, or *cations*, carrying positive and negative radicles, or *anions*, carrying negative electricity.

In the case of an aqueous solution of sodium chloride there are sodium ions and chlorine ions. These, it must be observed, do not show the properties of the elements chlorine and sodium, because they are modified by the charge of electricity they carry. The dissociation varies in different electrolytes, and increases with the dilution till a maximum is reached. This splitting into ions, neither of which interferes with the action of the other, explains why two series of reactions, one belonging to the metal radicle, the other to the salt radicle, are obtained from a solution of a salt.

When a current from a battery is passed through a solution of sodium chloride, the electric forces direct the anions or chlorine ions to the positive pole or *anode*, and the cations or sodium ions to the negative pole or *cathode*. This movement of the ions is termed 'migration of ions.' At the anode the negative charge of the chlorine ion and at the cathode the positive charge of the sodium ion are neutralised, and these become ordinary atoms; the chlorine molecule is liberated, bubbling up from the anode, which the sodium attacks, the water yielding hydrogen, which is liberated, and sodium hydroxide, which alkalinises the water round the cathode. If the sodium had no action on water, it would simply fall to the bottom of the tank. This decomposition, which results from passing an electric current through an electrolyte, is termed *electrolysis*. It forms the basis of many industrial processes for the isolation and refining of metals. It can also be used as a laboratory method of analysis. See also ELECTRO-THERAPEUTICS.

Electroplating is one of the adaptations; the article to be plated is attached to the negative pole of a battery, and immersed in a bath of suitable solution of some salt of the metal to be deposited. If the substance to be coated is non-conducting, it is coated with graphite to render it conducting. The anode is made of the metal of which a coating is desired, and as it dissolves it maintains the strength of the bath approximately constant. The same amount of electricity deposits the same amount of metal. Copper, silver, nickel, and gold can be deposited. An adherent and regular deposit is obtained by regulating the concentration of the bath and the strength of the current.

Electrotyping is the electroplating of a plaster, wax, or gutta-percha mould from an engraved wooden block. The moulds are coated with plumbago.

Thermoelectricity.—If the ends A, B, of a copper wire are soldered to the ends X, Y respectively of an iron wire, and if one of the junctions, *e.g.* AX, is heated, a current of electricity will flow round the circuit so as to pass from the copper to the iron across the heated junction. The same effect will be produced if the junction BY is cooled to a temperature below that of the AX junction. Such currents are termed

thermoelectric currents, and they are said to be due to a thermoelectromotive force set up by the difference in temperature between the two thermoelectric junctions. They can be produced in any pair of metals and even by samples of the same metal which have received different mechanical treatment. Again, if the junction BY be kept in melting ice, while the junction AX is gradually raised in temperature, the current increases in strength at first, reaches a maximum when AB is at a temperature of about 270° C., then decreases until it is zero, at about 540° C., and for higher temperatures flows in the reverse direction. The temperature at which the current reaches a maximum is termed the *neutral point*, and it lies midway between the temperatures of the two junctions when the current reverses its direction. If the circuit is made up of a number of metals, the total thermoelectromotive force in the circuit is the sum of the thermoelectromotive forces due to the separate junctions. Hence the thermoelectric effect of including any additional metal in the circuit is zero if its ends are at the same temperature.

The above phenomena have their converse shown when a current from some separate source is sent round the circuit. In the example taken above, if this separate current flows from the copper to the iron across the junction which was heated, it is found that heat is absorbed at this and evolved at the other junction. This, named after its discoverer, is known as the *Peltier effect*. Thermoelectric circuits are largely used in scientific work for the measurement of temperature. The principle is also applied in the thermopile, which is used for the detection of radiant energy.

Tait, *Heat*; Stewart, *Magnetism and Electricity*.

ELECTRO-CHEMISTRY is based on electrolysis, and comprises the isolation and purification of metals. The electric current is used in industrial chemistry to obtain sodium and potassium from their fused hydroxides, and lithium and magnesium from their fused chlorides; the essentials are a containing vessel, cathode and anode unaffected by temperature and metal, and a device for preserving the metal pure. Copper obtained by smelting ore is very impure, but by using a cathode of refined copper, an anode of the impure metal, and a cupric salt as electrolyte, pure copper is deposited on the cathode on passage of a current.

ELECTROCUTION, term used for the execution of a criminal by electricity, a method employed in America, first in the State of New York in 1890. The criminal is seated in a special chair, his body, arms, and legs secured by straps; one electrode is fastened to his head, and another to one leg, and a current of electricity passed through the body several times for a few seconds at a time, at varying strengths. The first application, at 1600–1800 volts, destroys consciousness and stops the circulation and respirations at once, and the subsequent applications prevent any possibility of the recovery of these functions. Death is painless, and the process less revolting than hanging or beheading by the guillotine.

ELECTRO-MAGNETISM, the science dealing with the relation between magnetism and electricity, was first fully investigated by Ampère (*q.v.*). An electric current produces a magnetic field in its neighbourhood, and hence will deflect a magnetic needle—a fact utilised in the construction of all forms of *galvanometers* (instruments designed to measure the strength of currents). If the electric circuit is in the form of a circle of radius r, the strength of the magnetic field at the centre due to a current C is $\frac{2\pi C}{r}$. From this the definition of the electro-magnetic or C.G.S. unit of current is obtained, viz.: 'That current which, passed through a wire 1 centimetre long, bent into an arc of a circle of 1 centimetre radius, will exert a force of 1 *dyne* on unit magnetic pole placed at the centre of the circle.' The practical unit (the *ampère*) is $\frac{1}{10}$ of the electro-magnetic unit. Ampère introduced the notion of treating a circular coil through which a current is passing, as a magnetic shell, for one face of such a circuit possesses north-seeking polarity, and the other south-seeking polarity. If a large number of such coils be placed parallel and closely together (and this can be done by winding a wire round a cylinder), a *solenoid* is obtained, having a strong magnetic field in the central space if a current is passed, and the solenoid will behave as a bar magnet. If such a winding be made about a piece of iron in the form of a horseshoe, the iron will become a strong magnet on passing a current. Such a magnet is called an *electro-magnet*, and is usually made of soft iron, as this has the property of quickly losing its magnetism when the current is stopped. The electro-magnet is a very useful factor in many electrical devices; its invention made the electric telegraph, and later the dynamo, a possibility.

J. J. Thomson, *Elements of the Mathematical Theory of Electricity and Magnetism*; Poynting and Thomson, *Magnetism and Electricity*.

ELECTRO-METALLURGY, metallurgical processes in which an electric current is used. They are of three kinds: (1) *Electrothermal process*, in which the current is used to produce a high temperature in order to permit certain chemical reactions to take place—a process used in the manufacture of calcium carbide, graphite, phosphorus, carborundum; (2) *Electrolytic process*, where the current is used to act chemically on a solution of a metal salt in order to deposit the metal—as in electroplating, electrotyping, the production of pure copper from impure copper salts; (3) A process combining (1) and (2). In this, the current first acts as a heating agent, fusing a salt into a liquid, and then electrolytically on the liquid. It was in this manner that Davy first produced sodium and potassium. Magnesium and aluminium are also manufactured by this process.

ELECTROMETER, an electrical instrument for measuring differences of electrical potential. The usual form is the 'quadrant electrometer.' A light flat paper needle, dumb-bell in shape, is thinly coated on one side with metal, and symmetrically suspended by a quartz fibre in a flat metal cylindrical box, which is insulated and cut into equal quadrants, slightly separated from each other. Opposite quadrants are connected by wires, and the needle to one pair of quadrants. If the quadrant pairs are now charged to different potentials, the needle is attracted by one pair and repelled by the other pair, and thus twisted by an amount proportional to the square of the potential difference. This method (*idiostatic* method) is used for measuring large differences of potentials or rapidly alternating potentials. For measuring small potential differences the needle is disconnected and independently charged to a high potential (*heterostatic* method).

ELECTRON, see MATTER.

ELECTROPHORUS, the simplest form of electrical induction machine; invented by Volta; consists of circular cake of resin or ebonite and a metal disc of same diameter having an insulating handle.

ELECTROSCOPE, an instrument for detecting small charges of electricity. It consists of a stout wire with two gold leaves attached to one end, enclosed in a case from which it is insulated. When a charge is brought near the instrument, both leaves become charged with the same kind of electricity and repel each other. The electroscope can also be used to determine whether the charge is positive or negative. In some instruments only one leaf is used, the wire itself taking the place of the other leaf. The electroscope has recently been largely used in the study of radio-activity.

ELECTRO-THERAPEUTICS, term applied to the use of electricity for the cure of disease. In diagnosing various conditions, especially of the nasal passages, larynx, and the urinary bladder, small electric lamps attached to instruments suitable for the exploration

of such parts of the body have proved of great value, while in the location of foreign bodies and of urinary calculi, in the diagnosis of fractures and diseases of bones and of other conditions, the X-rays discovered by Röntgen have created a revolution, and examination with them is becoming more and more a routine in surgical diagnosis. In the treatment of lupus and other skin diseases the best method is by making use of the action of the X-rays or of other rays discovered by Finsen, special electric lamps being employed, while the X-rays have also proved of benefit in certain cases of cancer and other new growths, retarding their progress and diminishing their size, in leucocythæmia by diminishing the size of the spleen, and in several other obscure diseases. Electrolysis is the best method of removing superfluous hair and moles, and it is also used to promote the coagulation of blood in the sacs of aneurisms, for the treatment of inflammation of the internal lining of the uterus, for rodent ulcer, for ankylosis (*q.v.*) or adhesions of joints, and for adhesions in the pleura and elsewhere, while the sphere of its application is being gradually extended.

In the diagnosis of conditions due to nervous degenerations two forms of electricity are employed: the galvanic or continuous current, and the faradic or interrupted current, the former stimulating the muscles directly, and the latter the nerves directly and the muscles only through their nerve supply, the diagnosis depending on the excitability of the muscles. Both forms are used in the treatment of nervous affections, infantile paralysis, neurasthenia, sciatica, chorea, etc., in wasting conditions after anæmia or any prolonged illness, for lumbago, rheumatism, and other painful conditions, very often in combination with massage. The so-called 'electric' belts, rings, etc., depend, however, for their therapeutic powers, not on electricity, but on the faith of the individual who wears them.

Guilleminot, *Electricity in Medicine*; Dawson Turner, *Practical Medical Electricity* (4th ed., 1904).

ELEGIT, WRIT OF, in Eng. law, writ issued by sheriff to judgment creditor who, as 'tenant in elegit,' holds debtor's lands until the full amount of debt has been discharged out of rents.

ELEGY, stately poetic monody. Amongst the ancients the e. was not always funereal, often being patriotic or amatory. The classical form was an alternation of hexameter and pentameter verses, and famous early writers of the e. were Callimachus, Euphorion, Theocritus, Bion, Propertius, Tibullus, and Ovid. The form has long been a favourite with Eng. poets—Spenser, Milton, Donne, Gray, Shelley, Tennyson, Arnold, William Watson, Bridges, and others. See Bailey's *Eng. Elegies* (1900).

ELEIA, see ELIS.

ELEMENT is the term applied to such substances as cannot be broken up into other substances with different properties, and which, either combined with other substances, or, more rarely, uncombined, form all matter. Many substances thought to be elements are in reality compound substances, and possibly substances now included among the elements will yet prove to be compound substances. The number of known elements is being augmented, *e.g.* by the discovery of the *argon* group of elements, and by the discovery of *radium*. The fact that the element *radium* can change itself into the element *helium*, and also induce changes in other elements, may cause modification of the law of conservation of elements.

Elements are built up of *atoms*, which are the smallest possible particles of matter that can take part in a chemical change, and which, since an atom cannot be broken up, are identical. Assuming the weight of an atom of the lightest known element, *hydrogen*, as unity, by various methods, *e.g.* chemical methods, methods based upon volumetric relations, the ratios of the weights of the atoms of the different elements to the weight of an atom of hydrogen may be found, these being termed *atomic weights*. The elements at present known, eighty-one in number, are the following, the symbol of each being given immediately after it: Aluminium, Al; Antimony, Sb; Argon, A; Arsenic, As; Barium, Ba; Bismuth, Bi; Boron, B; Bromine, Br; Cadmium, Cd; Cæsium, Cs; Calcium, Ca; Carbon, C; Cerium, Ce; Chlorine, Cl; Chromium, Cr; Cobalt, Co; Columbium or Niobium, Cb or Nb; Copper, Cu; Dysprosium, Dy; Erbium, Er; Europium, Eu; Fluorine, F; Gadolinium, Gd; Gallium, Ga; Germanium, Ge; Glucinum or Beryllium, Gl or Be; Gold, Au; Helium, He; Hydrogen, H; Indium, In; Iodine, I; Iridium, Ir; Iron, Fe; Krypton, Kr; Lanthanum, La; Lead, Pb; Lithium, Li; Lutecium, Lu; Magnesium, Mg; Manganese, Mn; Mercury, Hg; Molybdenum, Mo; Neodymium, Nd; Neon, Ne; Nickel, Ni; Nitrogen, N; Osmium, Os; Oxygen, O; Palladium, Pd; Phosphorus, P; Platinum, Pt; Potassium, K; Praseodymium, Pr; Radium, Ra; Rhodium, Rh; Rhubidium, Rb; Ruthenium, Ru; Samarium, Sa; Scandium, Sc; Selenium, Se; Silicon, Si; Silver, Ag; Sodium, Na; Strontium, Sr; Sulphur, S; Tantalum, Ta; Tellurium, Te; Terbium, Tb; Thalium, Tl; Thorium, Th; Thulium, Tm; Tin, Sn; Titanium, Ti; Tungsten, W; Uranium, U; Vanadium, V; Xenon, X; Ytterbium, Yb; Yttrium, Y; Zinc, Zn.; Zirconium, Zr.

When the elements are arranged in order of their atomic weights, those which correspond in order in each series of eight have similar chemical and physical properties (Mendeléeff's law)—a law now modified by the inclusion of the argon group of elements (inert gases), and there are many gaps in the series representing elements which have not yet been discovered. This law is applied in grouping the elements,—the

PERIODIC SYSTEM OF ELEMENTS.

	Group 0 (Inert Gases).	Group I.	Group II.	Group III.	Group IV.	Group V.	Group VI.	Group VII.	Group VIII.
1	—	H	—	—	—	—	—	—	—
2	He	Li	Be	B	C	N	O	F	—
3	Ne	Na	Mg	Al	Si	P	S	Cl	—
4	A	K	Ca	Sc	Ti	V	Cr	Mn	Fe, Co, Ni
5	—	Cu	Zn	Ga	Ge	As	Se	Br	—
6	Kr	Rb	Sr	Y	Zr	Nb	Mo	—	Ru, Rh, Pd
7	—	Ag	Cd	In	Sn	Sb	Te	I	—
8	X	Cs	Ba	La	Ce	Nd	—	Sa	—
9	—	—	—	Gd, Tm	—	—	—	—	—
10	—	—	—	Yb	—	Ta	W	—	Os, Ir, Pt
11	—	Au	Hg	Tl	Pb	Bi	—	—	—
12	—	—	—	Th	—	—	U	—	—
13	—	—	Ra	—	—	—	—	—	—

periodic system. The properties of the elements *Dysprosium*, *Erbium*, *Europium*, *Lutecium*, *Praseodymium*, and *Terbium* are not sufficiently known to place them in their proper group, while the discovery of the radio-active elements may disturb Mendeléeff's grouping.

In the preceding diagram the elements are arranged in lines from left to right in order of their atomic weights, while the vertical lines cut them off into groups in which the elements resemble one another chemically and physically, each group being again arranged in two vertical columns of those elements which, in each group, most resemble one another. There are certain exceptions to this rule, *e.g.* argon should come after potassium in the order of atomic weights, but it must be put before to bring it within its proper group; these exceptions are due to some unknown disturbing factor which cannot yet be explained.

ELEMI, resin used in varnishes, exported from Philippine Islands.

ELEPHANT.—The two modern species of elephants and their extinct relatives are grouped in a sub-order of Ungulates, PROBOSCIDEA, but they are far removed from the Even- and Odd-Toed groups of that order. They present strange contrasts, for, although their skull, trunk, and teeth are peculiar and highly specialised, their limbs and vascular system are of an elementary character.

Modern elephants are large, clumsily built animals, with enormous heads and ears. Their skin is thick and hard, furnished with few bristly hairs; their limbs thick, with low knee-joint in the hind leg, and terminating in broad circular five-toed feet. Most peculiar is the extension of the nose into a long, mobile, sensitive proboscis or trunk, which bears the nostrils at its end, and is produced into two lips capable of grasping the foliage and shoots upon which the animals feed. The teeth also are peculiar, for the upper incisors are prolonged into huge tusks of solid ivory, while the back teeth or molars are very large; their grinding surfaces present many transverse ridges, and, although six or seven occur on each side, only one or portions of two are in use at once, these, as they become worn, being ejected and replaced by another of the series. The only living species are the frequently domesticated INDIAN ELEPHANT (*Elephas maximus*), found in India, Ceylon, Burma, Siam, Malay, Sumatra, and Borneo, and the AFRICAN ELEPHANT (*E. africanus*), occurring in Africa in the Sudan and southwards to the Zambesi. The former has moderate ears, parallel ridges on the teeth, the upper lip of the proboscis long and finger-like, and four or five hoofs on the hind feet; the latter has very large ears, lozenge-shaped ridges, no finger-like process, and only three hoofs on the hind feet.

The gigantic extinct MAMMOTH (*E. primigenus*), of Pleistocene times, had enormously long, curved tusks and a long, hairy coat. It roamed in the prehistoric forests of Britain. The MASTODON, whose remains are found in Tertiary formations in Europe, India, and America, had almost straight tusks; while in the European and Asiatic *Dinotherium* the tusks, pointing vertically downwards, were set in lower jaw.

ELEPHANT SEAL, see under CARNIVORA.

ELEPHANT SHREW, JUMPING SHREW (*Macroscelides*), African insectivorous mammal with long snout; long hind legs facilitate jumping gait.

ELEPHANTA ISLE (18° 56′ N., 72° 54′ E.), island, off Bombay, India; has rock temples containing Hindu religious statues; named after stone elephant which formerly stood near landing-place.

ELEPHANTIASIS, BARBADOS LEG, tropical disease, due to the obstruction of the lymphatics by parasites, filaria, and their embryos, affecting mainly the leg and scrotum. The treatment is the excision of the parasites or removal of as much as possible of the affected part by surgical operation.

ELEPHANT'S FOOT, TORTOISE PLANT, HOTTENTOT BREAD (*Testudinaria elephantipes*) S. African twining plant (*Dioscoreaceæ* order); bark resembles elephant's hide.

ELETS (52° 45′ N., 38° 30′ E.), town, Orel, Russia; cattle and grain. Pop. 51,708.

ELEUSIS (38° 2′ N., 23° 32′ E.), ancient Gk. city, in Attica, about 14 miles N.W. of Athens; of great antiquity and famed mostly for its mysteries. Excavations have revealed many ancient buildings, possibly destroyed by Goths (396 A.D.); now small village.

ELEUSINIAN MYSTERIES, see MYSTERIES.

ELEUTHEROBLASTEA, see under HYDROMEDUSÆ.

ELEUTHEROPOLIS (31° 36′ N., 34° 56′ E.), former town, Palestine, near Jerusalem.

ELEVATORS, mechanical contrivances for raising or lowering material or people from one level to another. An e. consists of a cage, guide rails, a counterpoised weight, and steam, hydraulic, or electric motive power. The lighter lifts for passing food from hotel kitchens to serving-rooms are operated by hand. In Amer. 'sky-scrapers' the e's travel 6000 feet per minute. Safety devices are—(1) air-cushions at bottom of shaft, (2) catches under floor of cage, which, if cable breaks, bite the framework and hold the cage *in situ*. See also GRAIN ELEVATORS.

ELF, mischievous supernatural dwarf, the cause of many ills and much tangling of human affairs.

ELGAR, SIR EDWARD (1857–), Eng. composer; b. Worcester; knighted, 1904; works, *The Dream of Gerontius* (1900), *The Apostles* (1903), oratorios, symphonies, violin concerto, Coronation March (1911).

ELGIN.—(1) (57° 39′ N., 3° 19′ W.) city and royal burgh, in Elginshire, Scotland; has ruins of a fine cathedral (founded 1224); scenery in neighbourhood, the 'Garden of Scotland,' is very beautiful. Pop. (1911) 8656. (2) (42° 2′ N., 88° 18′ W.) town, Illinois, U.S.A.; manufactures watches. Pop. (1910) 25,976.

ELGIN AND KINCARDINE, EARLDOM OF.—Earldom of Elgin (cr. 1633) became united in 1747 with Earldom of Kincardine (cr. 1647). Most important earls: THOMAS (1766–1841), 7th E. of Elgin and 11th of Kincardine, diplomatist; brought the famous Elgin marbles from Greece (now in Brit. Museum). JAMES (1811–63), 8th earl, s., special commissioner and plenipotentiary to China, Postmaster-General, and Gov.-Gen. of India (1862). VICTOR ALEXANDER (1849–), 9th and present earl, Viceroy of India (1894–99), Sec. of State for Colonies (1905–8).

ELGINSHIRE, or MORAY (57° 39′ N., 3° 19′ W.), county on S. shore of Moray Firth, Scotland, forming central division of old Province of Moray. Capital, Elgin. Total area, 485 sq. miles. Climate is very mild, and the hardier kinds of fruit—apples, pears, plums—grow abundantly, and apricots, nectarines, and peaches are grown outside. Rather more than half E. is drained by the river Spey and tributaries; the Lossie drains the centre and the Findhorn the W. part. Principal lochs are Lochindorb and Loch of Spynie; the mountainous parts are woody; the lower lands are rich, and cattle-breeding flourishes. Pop. (1911) 43,427.

ELGON, LIGONYI, MASAWA (1° N., 34° 40′ E.), extinct volcano, Uganda, Africa; slopes produce bamboos, bananas, and are inhabited by various negroid peoples.

ELI, high priest and judge of Israel; suffered because of evil courses of his sons Hophni and Phinehas; on hearing of capture of the Ark of the Lord E. fell from his seat and broke his neck (*1 Samuel* 4[18]).

ELIAS (1180–1253), follower of St. Francis of Assisi; general of the order, but deposed, 1232, then excommunicated, but reconciled.

ELIAS, JOHN (1774–1841), Welsh Calvinist Methodist divine.

ELIAS LEVITA (1469–1549), Jewish grammarian; famed for criticism of the *Massora*, and inquiry into scriptural punctuation.

ELIE (56° 12′ N., 2° 50′ W.), town, Fife, Scotland; watering-place. Pop. (1911) 1147.

ÉLIE DE BEAUMONT, JEAN BAPTISTE ARMANDE LOUIS (1798–1874), Fr. geologist; was prof. of Geol. at *École des Mines et Collège de France*; member of Academy (1835); perpetual sec. of same (1856). Along with Dufrénoy prepared a great geological map of France.

ELIJAH, Old Testament prophet, appears suddenly in *1 Kings* 17; fed by ravens and received by widow of Zarephath. The greatest scene in his life is that with the prophets of Baal on Mount Carmel; not less wonderful is the scene on Mount Horeb when the Lord was in the 'still small voice.' E. is commanded to anoint Jehu as king; later he denounces Ahab; calls down fire from heaven to destroy soldiers of Ahaziah; at length is translated to heaven.

Robertson Smith, *Prophets of Israel.*

ELIJAH WILNA (1720–97), celebrated Talmudist.

ELIOT, CHARLES WILLIAM (1834–), Amer. educationist, chemist, mathematician; pres., Harvard Univ. (1869–1909); author of remarkable education reforms and reports.

ELIOT, GEORGE (1819–80), Eng. novelist and poetess; pseudonym of MARY ANN EVANS. She early began to abandon orthodox views on religion and morals. In 1846 she produced a trans. of Strauss's *Life of Jesus.* She undertook a continental tour in 1849; and in 1851 became associated with the *Westminster Review.* Amongst her friends of this period were Herbert Spencer, Carlyle, and George Henry Lewes (*qq.v.*), and with the last-named she formed an irregular connection which lasted until his death in 1878. Lewes undoubtedly inspired most of her best work. She married J. W. Cross in 1880, but died soon after. Her first effort in fiction was *Amos Barton*, which appeared in *Blackwood's* in 1857, and was followed by the two other stories which make up *Scenes of Clerical Life* (1858). *Adam Bede* came out in 1859, met with instant success, and is generally considered to be her finest work. Succeeding this came *The Mill on the Floss* (1860), *Silas Marner* (1861), and other novels. Besides these, she wrote a volume of essays, *Theophrastus Such* (1876); *The Spanish Gypsy* (1868), a drama; and *The Legend of Jubal and other Poems* (1874). Her place is amongst the greatest writers of Eng. fiction. She excelled as a painter of middle-class life and character, and her work is marked by much pathos and humour.

Lives by J. W. Cross, Sir Leslie Stephen, Mathilde Blind, Oscar Browning; Gardner, *Inner Life of George Eliot* (1912).

ELIOT, JOHN (1604–90), 'The Apostle of the Indians'; ed. at Cambridge and emigrated to New England, where he devoted his life to preaching to the Indians; translated the Bible into their tongue; man of deep piety and splendid character.

ELIOT, SIR JOHN (1592–1632), Eng. statesman, knighted, 1618; in 1626 became leader of the House of Commons and helped to secure Buckingham's impeachment; imprisoned in the Tower several times; finally, 1630, for his continued opposition to the king's absolutism; d. in prison refusing to submit; a great orator but not a great statesman. *Life*, by Forster.

ELIS (37° 53′ N., 21° 22′ E.), ancient city, Elis, Greece; traditional founder, the Ætolian, Oxylus; had various temples and gymnasia.

ELIS, or **ELEIA** (37° 50′ N., 21° 30′ E.), district, S. Greece, coast of Peloponnesus; was divided into three portions: N., Elis, capital, Elis; centre, Pisatis, capital, Pisa; S., Triphylia, capital, Pylos; country held sacred and inhabitants privileged, owing to Olmypic festival which took place near Pisa every four years; prosperity ended by Peloponnesian War.

ELISABETHVILLE, town, Katanga, Belg. Congo; copper mines; connected by rail with Cape Town.

ELIS, PHILOSOPHICAL SCHOOL OF, see ELEAN-ERETRIAN SCHOOL.

ELISAVETGRAD (48° 32′ N., 32° 18′ E.), town, Kherson, Russia; important trade centre. Pop. 68,710.

ELISAVETPOL (40° 30′ N., 46° 30′ E.), province, Transcaucasia, Russia; area, 16,991 sq. miles; includes parts of Kur valley, Armenian plateau, Caucasus. Pop. (1910) 1,007,800. Chief town, **Elisavetpol** (40° 42′ N., 46° 17′ E.). Pop. 46,334.

ELISHA, Old Testament prophet, successor of Elijah (*q.v.*), with whom he is closely associated. His life is a loose collection of incidents, with many miracles wrought by him. He appears a gentler and kindlier figure than his master. The healing of Naaman the Syrian of leprosy (*2 Kings* 5) suggests the healing miracles of Christ.

ELIZABETH (40° 39′ N., 74° 17′ W.), town, New Jersey, U.S.A.; important coal-shipping dépôt; manufactures sewing-machines, iron ware; occupied by English, 1776 and 1780. Pop. (1910) 73,409.

ELIZABETH CITY (36° 13′ N., 76° 19′ W.), town, N. Carolina, U.S.A. Pop. (1910) 8412.

ELIZABETH (1533–1603), Queen of England and Ireland, dau. of Henry VIII. and Anne Boleyn; b. London; placed after Edward and Mary in list of succession, was imprisoned for two months in the Tower for suspected complicity in Wyat's rebellion (1554). The Protestant party welcomed her accession (1558) after Mary's persecutions; she at once endeavoured to impose uniformity in religion. Her foreign policy was always diplomatic, her finance economical, but diplomacy and economy developed into vacillation and parsimony. She was intensely jealous of Mary Stuart, and indeed of all women, but, largely for political reasons, was unable to marry and had to console herself with flirtations; her affection for Essex was certainly genuine. E.'s work terminated with the destruction of the Armada; she had carefully husbanded England's resources in case of war, and when England's position was made secure she had achieved her end. She grew old and peevish, embittered by the fact that she was the last of her line. As her successor she favoured James VI. of Scotland. For her public life, see ENGLAND (HISTORY).

Creighton, *Queen Elizabeth* (1896); Beesly, *Life of E.* (1892).

ELIZABETH (1596–1662), e. dau. of James I. of England; m., 1613, Frederick V., Elector Palatine and king of Bohemia; was mother of Sophia, wife of Ernest, Elector of Hanover, mother of George I., on whose descendants the Brit. Crown is settled by Act of Parliament.

ELIZABETH, EMPRESS OF AUSTRIA, AMÉLIE EUGÉNIE (1837–98), dau. of Duke Maximilian in Bavaria; m. Emperor Francis Joseph II. of Austria; murdered at Geneva.

ELIZABETH MARIE HÉLÈNE (1764–94), Fr. princess; usually called 'Madame Elizabeth'; sister of Louis XVI., to whose cause she was devoted, and for which she was guillotined.

ELIZABETH PETROVNA (1709–62), Empress of Russia; dau. of Peter the Great and Catherine I.; during the reign of the Empress Anne, E. lived chiefly in retirement; in 1741, however, by a bold and swift plot she seized the throne; she made peace with Sweden; during the Seven Years War she did her utmost for Russia and to counteract Prussia. With serious faults, she was a capable ruler.

ELIZABETH, QUEEN OF RUMANIA, PAULINE ELIZABETH OTTILIE LOUISE (1843–), dau. of Hermann, Prince of Wied; m., 1889, Prince Charles, now king of Rumania; a gifted writer under pseudonym, *Carmen Sylva.*

ELIZABETH, ST. (1207–31), of Hungary; m. Lewis IV., landgrave of Thuringia; woman of deep piety; subject of Kingsley's *Saint's Tragedy.*

ELIZABETH STEWART (1635–50), Eng. princess; 2nd dau. of Charles I.; celebrated for her gentle and affectionate disposition; d. of fever at Carisbrooke, and buried at Newport (I. of W.).

ELK, see under DEER FAMILY.

ELKHART (41° 38′ N., 85° 54′ W.), town, Indiana, U.S.A.; iron and brass foundries. Pop. (1910) 19,283.

ELL, 'arm-length,' measure used chiefly for cloth; Eng. e. was 45 inches, Scot. 37, old Dutch, 27.

ELLA, or ÆLLA (d. 588), 1st king of the Deirans after their separation from the Bernicians (559). The latter recovered Deira (*q.v.*) after his death. E. was also the name of a S. Saxon king (fl. 477–515); and of a Northumbrian king (d. 867), famed for his exploits against the Danes.

ELLAND (53° 41′ N., 1° 50′ W.), town, Yorkshire, England. Pop. (1911) 10,678.

ELLENBOROUGH, EDWARD LAW, 1ST BARON (1750–1818), Eng. lawyer; Attorney-Gen., 1801; cr. baron, 1802; Lord Chief Justice of King's Bench, 1802–18; Chancellor of Exchequer, 1806.

ELLENBOROUGH, EDWARD LAW, EARL OF (1790–1871), Brit. statesman; ed. Eton and Cambridge; M.P. for St. Michael's, Cornwall; succ., 1818; Lord Privy Seal, 1828; app. Gov.-Gen. of India, 1841. He was severely criticised for his conduct of the Sind campaign and general Ind. policy; cr. earl on his return to England, and resumed his part in political life.

ELLESMERE (52° 55′ N., 2° 55′ W.), town, Shropshire, England; has fine old church. E. Canal joins Severn, Dee, and Mersey.

ELLESMERE, FRANCIS EGERTON, 1ST EARL OF (1800–57), Eng. statesman and poet; Irish Sec. (1828–30); subsequently Sec. for War; trans. Goethe and other Ger. poets, and wrote some original poetry; art patron.

ELLICE ISLANDS, Lagoon Islands (5° 30′ to 11° 20′ S., 176° to 180° E.), Brit. islands, Pacific Ocean, N. of Fiji. Pop. 2400.

ELLICHPUR, Illichpur (21° 16′ N., 77° 30′ E.), town, Berar, India; has trade in cotton and forest produce. Pop. 26,082.

ELLIOTT, EBENEZER (1781–1849), Eng. poet; 'Corn Law Rhymer'; pub. *Corn Law Rhymes* (1831) and other volumes dealing with working-class life.

ELLIPSE is defined as the locus of a point the sum of whose distances from two fixed points is constant. It is also an equation of the secondary degree, the highest terms of which represent two imaginary lines. The orbit of a particle, moving under the influence of a central force, which varies inversely as the square of the distance of the particle is an ellipse. Certain sections of cones and cylinders are e's. See Conic Section.

ELLIS, ALEXANDER JOHN (1814–90), Eng. philologist and miscellaneous writer.

ELLIS, GEORGE (1753–1815), Eng. man-of-letters; friend of Sir W. Scott; chiefly known by *Specimens of Early English Poets* (1790) and *Early English Metrical Romances* (1805).

ELLIS, SIR HENRY (1777–1869), Eng. librarian and antiquary; Chief Librarian, Brit. Museum (1827–56).

ELLIS, ROBINSON (1834–), Eng. classical scholar.

ELLIS, WILLIAM (1794–1872), Congregationalist missionary in South Sea Islands and Madagascar; wrote *Polynesian Researches* (1829).

ELLISTON, ROBERT WILLIAM (1774–1831), Eng. actor; excelled in Shakespearean plays.

ELLORA (20° 2′ N., 75° 11′ E.), village, Hyderabad, India; its rock temples and caves are among finest in India.

ELLORE (16° 41′ N., 81° 8′ E.), town, Madras, India. Pop. 33,521.

ELLSWORTH (44° 31′ N., 68° 31′ W.), town, Maine, U.S.A. Pop. (1910) 3549.

ELLSWORTH, OLIVER (1745–1807), Amer. statesman; Chief Justice, Supreme Court, U.S.A., 1796; helped to arrange treaty with France, 1800.

ELLWANGEN (48° 58′ N., 10° 10′ E.), town, Württemburg, Germany; had Benedictine monastery. Pop. 5000.

ELLWOOD, THOMAS (1639–1713), Eng. Quaker author; wrote several polemical works, religious poems, and autobiography; intimate friend of Milton.

ELM, genus *Ulmus*, natural order *Ulmaceæ*, trees and shrubs. Common elm (*U. campestris*) grows throughout Europe; has rugged bark, doubly serrate ovate leaves, numerous spreading, often pendulous, branches, and membranous green one-seeded seed-vessels.

ELM BEETLES, see under Rhynchophorous Beetles.

ELMALI (39° 39′ N., 40° 5′ E.), town, Asia Minor. Pop. c. 4000.

ELMES, HARVEY LONSDALE (1813–47), Eng. architect; s. of James E. (*q.v.*).

ELMES, JAMES (1782–1862), Eng. architect and civil engineer; author of several books on arch. and allied arts.

ELMHAM, THOMAS (c. 1415), Eng. chronicler and ecclesiastic; chaplain to Henry V., whose life he wrote.

ELMINA (5° 8′ N., 1° 28′ W.), town, Gold Coast, Brit. West Africa; well fortified. Pop. 5079.

ELMIRA (42° 8′ N., 76° 55′ W.), city, New York, U.S.A.; railway centre; manufactures rails, railway plant, leather, woollens; has reformatory. Pop. (1910) 37,176.

ELMSHORN (53° 45′ N., 9° 38′ E.), town, Schleswig-Holstein, Germany. Pop. (1910) 14,789.

ELMSLEY, PETER (1773–1825), Eng. classical scholar.

ELNE (43° 37′ N., 3° E.), town, Pyrénées Orientales, S.W. France. Pop. 3026.

ELOI, ST., Eligius (588–659), bp. of Noyon; first a goldsmith, then ordained and won converts in Netherlands.

ELPHINSTONE, family name of Lords Balmerino (*q.v.*).

ELPHINSTONE, MOUNTSTUART (1779–1859), Ind. statesman; went to India, 1796; served under Wellesley, showing great military capacity; Resident at Poona, 1811; distinguished in war of 1817; the real founder of system of education of natives.

ELPHINSTONE, WILLIAM (1431–1514), Scot. statesman; a lawyer, afterwards bp. of Aberdeen, and lord high chancellor; helped to found univ. of Aberdeen, 1498.

ELSASS, see Alsace.

ELSINORE (56° 2′ N., 12° 36′ E.), port, Denmark, on island of Zealand; shipbuilding and repairing; chief export, agricultural produce. Pop. (1911) 13,783.

ELSSLER, FANNY (1810–84), Viennese dancer; rival of Taglioni.

ELSTER (50° 18′ N., 12° 13′ E.), town, Saxony, Germany; mineral springs.

ELSTER, Schwarze (51° 46′ N., 13° 5′ E.), river, Germany, enters Elbe above Wittenberg.

ELSTER, Weisse (51° 7′ N., 12° 12′ E.), river, Germany, enters Saale.

ELSWICK (54° 58′ N., 1° 37′ W.), township, Newcastle-on-Tyne, England. Pop. (Registration sub-district, 1911) 58,359. Elswick Works, founded by Armstrong (1847) for manufacture of hydraulic machinery; later introduced gun manufacture; now great dépôt for warship building, artillery and ammunition manufacture, owned by Messrs. Armstrong, Whitworth, & Co. Ltd.

ELTON, CHARLES ISAAC (1839–1900), Eng. lawyer and antiquary; pub. *Tenures of Kent, Law of Copyholds, Custom and Tenant Right, Origins of English History.*

ELTVILLE, Elfeld (50° 1′ N., 8° 6′ E.), town, Hesse-Nassau, Germany. Pop. 3700.

ELTZ (50° 13′ N., 7° 20′ E.), river, Germany; joins Mosel at Moselkern.

ELVAS (38° 48′ N., 7° 7′ W.), town, Portugal. Pop. 13,881.

ELVIRA, SYNOD OF, held near Granada, Spain, in 305 or 306, attended by nineteen bp's; legislated on ecclesiastical discipline, morals, and ritual.

ELWOOD (40° 16′ N., 85° 50′ W.), town, Indiana, U.S.A. Pop. (1910) 11,028.

ELY (52° 23′ N., 0° 15′ E.), city, Cambridgeshire, England, in Isle of Ely, on Ouse; famous for beautiful cathedral (founded XI. cent.; combines Saxon, Norman, and Gothic styles; western and central octagonal towers especially fine). Formerly there existed a convent (VII. cent.), burned by Danes; and monastery (IX. cent.), taken by William the Conqueror; bishop's palace and other old buildings survive; manufactures — oil and earthenware. Pop. (1911) 7917.

ELY, RICHARD THEODORE (1854–), Amer. economist; prof. of Political Economy (Wisconsin); pub. *Outlines of Economics, Monopolies, and Trusts, Socialism and Social Reform*, etc.

ELYOT, SIR THOMAS (*c.* 1490–1546), Eng. diplomatist and scholar; clerk of assize, 1511–28; wrote *The Governour* (1531); ambassador of Henry VIII. to Charles V.; friend of Thomas More; M.P. for Cambridge, 1542; much renowned as a scholar; pub. earliest large Latin dictionary (1538), also *The Castell of Health*, etc.

ELYRIA (41° 23′ N., 82° 9′ W.), town, Ohio, U.S.A. Pop. (1910) 14,825.

ELYSIUM (classical myth.), also called 'Elysian Fields,' the abode of the blessed after death; variously placed in the lower world, the Western confines of the earth, and the Isles of the Blest.

ELZE, KARL (1821–89), Ger. scholar and critic; student of Eng. lit.

ELZEVIR, name of a family of famous Dutch printers who issued beautiful editions of the classics, etc., 1592–1681. Genuine examples of their work are now rare and valuable.

EMANCIPATION (1) of slaves, see SLAVERY; (2) of Catholics, see ROM. CATHOLICISM; (3) of women, see WOMEN.

EMANUEL I. (1469–1521), king of Portugal; succ. John II. (1495); noted for religious enthusiasm, promotion of foreign trade, and zeal for exploration through Vasco da Gama and other discoverers.

EMBALMING, method of preserving dead bodies from corruption by means of aromatic and antiseptic preparations. The art was carried to a high state of perfection by the ancient Egyptians, and some of the bodies which have been thus preserved date back to 3600 B.C. The intestines were removed by means of an incision in the left side, the cavity filled with myrrh and cassia; the body afterwards being steeped for about seventy days in a preservative liquid, and subsequently swathed in gummed cloth.

Myers, *Text-book of Embalming* (1900).

EMBARGO, the detention by a State of vessels within its ports, or the prohibition of trade between certain ports.

EMBASSY.—(1) mission headed by ambassador (*q.v.*). (2) residence of an ambassador. E's in London are: *French*, Albert-Gate House, Hyde Park, W.; *Russian*, Chesham House, S.W.; *German*, 9 Carlton House Terrace, S.W.; *Italian*, 20 Grosvenor Square; *Austro-Hungarian*, 18 Belgrave Square, S.W.; *U.S.A.*, 5 Carlton House Terrace, S.W. Among Brit. e's are: Berlin, W., 70 Wilhelmstrasse; Paris, N.W., 5 Pariser Platz; Vienna, 3 Moltkestrasse; St. Petersburg, 4 Quai de la Cour. See DIPLOMACY.

EMBER DAYS, four periods set apart for fasting and prayer in the Christian Church, viz. Wednesday, Friday, and Saturday after the 1st Sunday in Lent; after Whitsunday; after Sep. 14; and after Dec. 13.

EMBERIZIDÆ, BUNTINGS, small, stumpy-billed, seed-eating birds which differ from finches in that the two halves of the bill do not fit closely; mainly inhabitants of northern portions of Old World, though some occur in Asia. The Arctic SNOW-BUNTING (*Plectrophenax*) breeds in Britain only in the Grampians; Brit. REED, COMMON, and YELLOW BUNTINGS (the last known as YELLOW-HAMMER), and European ORTOLAN belong to genus *Emberiza*.

EMBEZZLEMENT, crime by clerk or other employee who converts his master's money to his own use. It must be shown that the person charged was regularly employed in an official capacity. The maximum punishment is fourteen years' penal servitude.

EMBLEMENTS, in law, the cereal or vegetable products of the earth, which are the property of a tenant.

EMBOSSING, process of stamping under a press, or of beating out a relief pattern upon metal, leather, or other substance. It is distinguished from *stamping*, in which the lamina is pressed by a form into a mould, whereas the under surface in e. is a plane face of felt or other yielding material. *Repoussé* work is the e. of thin metal by beating upon the reverse side.

EMBRACERY, legal term for the act of any person who intimidates or otherwise attempts to influence a court or jury.

EMBRASURE, door or window; also opening for cannon in battlements; a crenelle.

EMBROIDERY is the working of a needlework pattern upon a fabric with threads of silk, wool, metal, or other material. It is a method of ornamentation subsequent to the process of weaving, and is thus distinguishable from tapestry, where the weaving involves the creation of the pattern. It may be machine-worked, or a kind of art needlework done by hand. Examples of Egyptian e. date back to the XVI. cent. B.C. The art was introduced to Europe from Byzantium, where magnificent work was produced, and it is amongst Eastern peoples that it is still most generally practised. In Europe the art flourished chiefly during the Middle Ages, when it was first employed in the working of heraldic devices, but subsequently it came into domestic use. Since the period of the Oxford movement there has been an increased use of e. for the decoration of ecclesiastical vestments, altar-cloths, etc.

Kendrick's *English Embroidery*; Higgins's *Handbook of Embroidery*; Townsend's *Embroidery*, etc.

The Gold and Silver Thread used in e. and other forms of decoration has been manufactured from very early times. It is still very largely used in the ornamentation of military, naval, masonic, and other articles of dress. Gold thread ornaments are usually made of fine silver wire gilded and worked over a yellow cone of silk or cotton. In the making of silver decorations this cone is white. The cheaper kinds of gold and silver threads are made from alloys.

EMBRUN (44° 34′ N., 6° 29′ E.), town, Hautes-Alpes, France; has fine church, formerly cathedral. Pop. 3752.

EMBRYOLOGY is the study of the beginning of a living thing, of its history during the period after it has commenced to germinate, and before it is born or has assumed the definite character of its kind. The study may deal simply with the structures of the young creature (*morphological e.*), with the processes and conditions of embryonic growth (*physiological e.*), embryonic development as it occurs naturally, or it may tamper with natural development in order to observe its ways and means (*experimental e.*).

It was impossible until late in the development of science to observe the early stages of embryonic growth, for the egg or ovum (*q.v.*) is in most cases almost too minute to be seen, but there was abundance of speculation. Aristotle asserted, with marvellous insight, that 'all living creatures . . . whether they come into the world with the form of an animal or of an egg, are engendered in the same way.' But Aristotle stood alone for many centuries. Harvey, in the beginning of the XVII. cent., was an early vitalist, holding that out of a simple homogeneous egg the living soul created a perfectly formed animal; towards the end of the cent. Bonnet propounded the mechanist theory that the final product was in reality contained in miniature in the egg: that there was no generation or creation in development, which was simply an *evolutio* or unfolding of parts already existing. So false a speculation could be refuted only by close and accurate observation, and it was soon shown that in the chick at least the parts were not evolutions, but apparently actual creations.

It was not, however, until the XIX. cent. that the minute researches on which the foundations of modern embryology are laid commenced with Prévost and Dumas' description of the earliest stages in germination, and von Baer's significant comparisons of different types of embryos. The resemblance between the very early stages of creatures so different as reptiles, birds, and mammals was emphasised, and was accounted for by the theory that the embryo traced in its own development the history of the race, that in the history of a single individual from the egg the story of the evolution of its kind from earliest times was summarised. The theory holds good only in a very general way, but it emphasised the importance of the study of early stages in unravelling the relationships of animals, and thus aided indirectly in the tracing of the genealogical tree of the animal kingdom.

Later, the minuter aspects of embryonic life were investigated: the human ovum was discovered by von Baer in 1828; towards the middle of the century the function of spermatozoa and the fact that both sexual products were simple cells became gradually realised; and towards its close the fine dividing and counter-dividing of the nuclear mass, previous to fertilisation and before cell-division, were made clear. To some thinkers it has seemed that the arranging and rearranging which takes place in cell-division indicated a possible sifting of character into the resulting cells—a qualitative process which selected the potentialities of each developing unit—such is the '*mosaic*' theory of Roux and Weismann. To others cell-division is simply division and nothing more, a mere dividing up of quantities of protoplasm the subsequent qualities of which depend upon their relationships to each other and to the organism as a whole.

As distinct are the two schools of mechanists and vitalists, the former holding that, did we but know all, we should be able to explain development wholly in terms of mere physics and chemistry; the latter arguing that there would still remain an unexplained residue which can be accounted for only by assuming that the 'principle of life,' '*entelechy*,' or some such vital force guides and controls the growth of things.

E. has revealed several important general truths. It has discovered that every organism, no matter what its final size, began as a single cell (*q.v.*), which divided and redivided; that the divisions and redivisions of the primary cell or egg often follow the same plan, and result in a thimble-shaped mass of cells, two layers thick—the *gastrula*; and this simple structure was held in Haeckel's 'gastræa theory' to represent a supposed first-evolved many-celled animal, a gastræa—the ancestor of all animals other than Protozoa. The development of the two layers of the gastrula has been followed, and it has been found that in general each gives rise to a constant set of organs, so that even diverse-looking organs in different animals may have the same origin; and that the individual organs themselves are foreshadowed from an early stage. Lastly, as we have already mentioned, the early developments of animals have shed much light on the relationships of adult forms and of the animal kingdom as a whole, and experimental e. has emphasised the fact that in nature a compensatory process, no matter what difficulties lie in its way, aims at the formation of a well-balanced, perfectly formed animal. See also REPRODUCTION.

EMDEN (53° 22′ N., 7° 12′ E.), town, Hanover, Germany; connected with Ems R. by canal; herring-fishing, shipbuilding, paper manufacture; has fine town hall. Pop. (1910) 24,034.

EMERALD, precious stone and rare mineral, of same family and composition as beryl, but differing in colour; harder than quartz, but one of softest precious stones; of beautiful green colour; found principally in Colombia, S. America; value depends upon deepness and beauty of colour. E's were highly prized by the ancients, and many engraved e's have been found amongst ruins of ancient temples.

ÉMERIC-DAVID, TOUSSAINT-BERNARD (1755–1839), Fr. archæologist.

EMERITUS (adjective), retired; cf. Emeritus Prof. of Greek.

EMERSON, RALPH WALDO (1803–82), Amer. essayist, poet, and transcendental philosopher; s. of Rev. William E., Unitarian minister; b. Boston, Mass.; ed. Harvard; tried teaching for three years, then entered Unitarian ministry; received a call to his native city, which he held (1827–32). His theological views having changed, he gave up the ministry, and thenceforward devoted himself to writing and lecturing. He twice visited England, and formed friendships with Carlyle, Wordsworth, and other authors. His philosophic creed was broad, sincere, and helpful, but was suggestive rather than systematic. In prose, his style was brilliant and epigrammatic. Amongst his chief publications were: *Essays* (1841); *Essays, 2nd Series* (1844); *Representative Men, English Traits, The Conduct of Life, Society and Solitude*, etc. His verse never appealed to a wide public, for though it is full of the essence of poetry, the form is rugged and unmusical.

Life, by Woodberry (1907); *Bibliography*, by Cooke (1908).

EMERY, mineral, impure variety of corundum; colour, greyish black; dull and opaque; found in Asia Minor and Europe; best is obtained from Levant; being very hard, used for grinding glass and lenses; e. wheels used in engineering for grinding.

EMESA, ancient name for HOMS (*q.v.*).

EMETICS, substances given to produce vomiting, either by acting directly upon the stomach, or indirectly upon the brain centre in the medulla oblongata, which controls the act of vomiting. *Warm water, mustard, common salt, copper* or *zinc sulphate* act in the former manner, *apomorphine* in the latter, *tartar emetic* and *ipecacuanha* partly in one and partly in the other.

EMEU, EMU, see RUNNING BIRDS.

EMIGRATION, see IMMIGRATION.

ÉMIGRÉS, French citizens who left their country during Revolution; many settled in England; some joined foreign armies against France.

EMILIA (44° 35′ N., 11° E.), division of Central Italy, extending nearly across peninsula; has Lombardy on W., Adriatic on E., Marches and Tuscany on S., Piedmont and Liguria on W.; includes provinces of Bologna, Ferrara, Modena, Piacenza, Ravenna, Reggio nell' Emilia, Forli, Parma; area, *c.* 7900 sq. miles. E. is named after great Rom. highway, *Via Æmilia* (beginning of II. cent. B.C.), from Placentia to Ariminum. Pop. (1911) 2,667,510.

EMIN PASHA, EDUARD SCHNITZER (1840–92), Ger. traveller; ed. at Ger. Univ's; medical officer at Antivari; went to Khartum, 1875, and served in missions under General Gordon; became gov. of Equatorial Province; promised to work with Stanley, but after all returned to Ger. service, 1890; murdered by Arabs in Congo Free State during unsuccessful expedition; *Life*, by Schweitzer (1898).

EMINENCE, honorary designation now only given to cardinals of the R.C. Church.

EMINENT DOMAIN, or 'compulsory purchase,' the State right to acquire private property for public use.

EMINESCU, MICHAIL (1849–89), Rumanian poet; great lyrist.

EMIR, see AMIR.

EMLYN, THOMAS (1663–1741), Eng. Unitarian theologian; imprisoned for writing *An Humble Inquiry into the Scripture Account of Jesus Christ.*

EMMANUEL ('God is with us'), name often applied to Jesus Christ.

EMMANUEL PHILIBERT (1528–80), duke of Savoy; succ. his f., Charles III., 1552; m. Margaret, dau. of Francis I. of France; thoroughly reformed and reorganised his duchy, becoming absolute. A strong Catholic, he tried to suppress his Prot. subjects, the Waldenses, but allowed them some liberty (1561).

EMMAUS, Biblical town near Jerusalem, site unknown.

EMMAUS-NICOPOLIS (31° 31′ N., 35° 1′ E.), town, Palestine (modern Amwas).

EMMENDINGEN (48° 6′ N., 7° 51′ E.), town, Baden, Germany. Pop. (1910) 8378.

EMMERICH (51° 51′ N., 6° 15′ E.), town, Rhine province, Germany; has large shipping trade. Pop. (1910) 13,428.

EMMET, ROBERT (1778–1803), Irish rebel; ed. Trinity Coll., Dublin; joined United Irishmen, and plotted with them on Continent; went to Dublin, 1802; planned Irish rebellion in July 1803; rebels being quite undisciplined, the only result was a riot; E. escaped, but later was arrested, tried, and hanged, Sept. 20; a noble, but unpractical character.

EMMET, THOMAS ADDIS (1764–1827), Irish lawyer and politician; bro. of Robert E.; joined United Irishmen; imprisoned, 1802; joined American bar; attorney-general of New York.

EMMITSBURG (39° 40′ N., 77° 27′ W.), town, Maryland, U.S.A. Pop. (1910) 1054.

EMMIUS, UBBO (1547–1625), Dutch geographer and historian; pub. *Rerum Frisicarum historiæ decades* (1616), *Opus Chronologicum* (1619), *Historia temporis nostri*, etc.

EMMONS, NATHANIEL (1745–1849), Amer. divine; constructed a theological system sometimes called *Emmonsism*, somewhat differing from the Calvinism of his day.

EMOTIONS, see PSYCHOLOGY.

EMPEDOCLES OF AGRIGENTUM (probably *c.* 490–30 B.C.), democrat, philosopher, physician, and magician; exiled, he wandered through Gk. cities, preaching the ascetic life. He is said to have claimed divinity, and also (falsely) to have jumped into the crater of Etna to prove the claim. He regarded all things as composed of earth, air, fire, and water, which are in alternate stages of the world's history mingled by Love, and separated out again by Strife. His biological teaching contains some curious, but accidental, anticipations of the notion of Evolution.

EMPEROR BUTTERFLY (*Apatura iris*), large Brit. butterfly, purple coloured, with white markings; lives on decaying organic matter.

EMPEROR MOTH (*Saturnia carpini*), large Brit. moth closely allied to *Bombycina*; male is orange-brown, female grey; wings marked with rings.

EMPHYSEMA, a condition of the lungs in which (*a*) the air-cells are over-distended, *vesicular* e., or (*b*) the air has infiltrated into the connective tissue between the air-cells and the pleura or membrane covering the lung, *interstitial* e. A portion of the lung may be expanded to take the place of a portion collapsed, *e.g.* in catarrhal pneumonia; the walls of the air-cells may atrophy through lack of nutrition in old age; or there may be both distention of the cells and atrophy of the walls, usually caused by blowing on wind instruments, continuous coughing, *e.g.* in chronic bronchitis, or by certain occupations, *e.g.* glass-blowing, coal-mining, the chest becoming barrel-shaped.

EMPIRE, BRITISH, see BRITISH EMPIRE.

EMPIRE DAY, anniversary of Queen Victoria's birthday, May 24, originally called VICTORIA DAY; inaugurated, 1902, to encourage imperialism.

EMPIRE, THE HOLY ROMAN, came into being when on Christmas Day, 800, Pope Leo III. crowned Charlemagne (*q.v.*) emperor of the Romans in the Basilica of St. Peter's. Since 476 there had been no emperor in the West, which owed nominal allegiance to the Byzantine emperor at Constantinople. Charles the Frank, who had crossed the Alps to protect the Pope against the Lombards, was a fitting recipient of the Imperial title, for the memory of empire had never quite died away. The splendour and dignity of a Rom. emperor were now granted to a barbarian king, and the union of the two positions in one man was to have important results throughout the Middle Ages. After Charles's death (814) his vast dominions were subdivided, and the line of the Karlings came to an end with Charles the Fat in 888. During IX. cent. government had become anarchic and civilisation had deteriorated. Meanwhile the nationalities we call French and German were beginning to emerge, and an Empire like that of Charles the Great was now impossible. In Germany Henry the Fowler had consolidated a national kingship, and his s., Otto, was crowned emperor by the Pope in Rome in 962.

The Empire of Otto I. was more Ger. and less Rom. than that of Charles, and henceforward the Ger. kingship and the Imperial title (Holy Roman Emperor of the German People) were united. Otto's was a strong Empire. Otto II. (973–83) was a mystical enthusiast; but his imitation of Byzantine splendour and his noble dreams were out of touch with the turbulence of his time. Otto III. died young and disappointed in 1002. In 1024 with Conrad II. began the strong dynasty of Franconian emperors, under whom the mediæval Empire increased in power. But the Papacy, which had done so much to create the Holy Empire, came into conflict with it, and the end of the XI. cent. saw the humiliation of Henry IV. by Gregory VII. (Hildebrand). The climax of the struggle (which began with the Investiture contest) was reached under the Hohenstaufen dynasty, of which Frederick I., called Barbarossa (1152–89), was the most brilliant monarch. After the short reign of Henry VI. the strife continued under Frederick II., 1212–50.

The greatest days of the Empire were over, and in 1273 Rudolf I., the first of the House of Hapsburg, was elected. Germany became more and more split up among a mass of princes, great and small, and henceforth the monarch's real strength lay in his personal territories rather than in the Ger. kingship itself, which was now weaker than the national monarchies of France or England. The feudal nobles and princes of Germany now became practically supreme in their own dominions. The constitution of the Empire was defined by the *Golden Bull* of Charles IV. in 1356. 'He legalised anarchy and called it a constitution,' is Mr. Bryce's much disputed epigram. By degrees seven, a sacred number, came to be recognised as the number of the electoral college; the members were defined by the Golden Bull as the Abp's of Köln, Mainz, and Trier, the King of Bohemia, the Count Palatine, the Duke of Saxony, and the Margrave of Brandenburg (two others were added later). The practical independence of the Ger. princes was now legally recognised.

By the end of the Middle Ages the Empire had not only ceased to be more than Germany practically, but it no longer had a hold over men's minds. The Renaissance destroyed its mediæval glamour; at the Reformation it was naturally committed to the Catholic side, and could claim less than ever to be universal. After the religious strife which culminated in the Thirty Years War had been ended by the peace of Westphalia, Prot. lawyers openly asserted the Empire was merely a Ger. monarchy. The Empire, however, dragged on a nominal existence for another cent. and a half; convulsions of the Fr. Revolution were the beginning of the end; in Napoleonic Europe it had no place; on Aug. 6, 1806, Francis Joseph (Francis II.) resigned the title of Elect Emperor of the Romans. Germany, Austria, and Russia may each be said in a sense to carry on the Imperial tradition as their monarchs bear the once solitary title, Emperor.

The Empire was a noble ideal, inspiring the statesmanship of Charles the Great and the genius of Dante. 'The Holy Roman Empire was none other than the ghost of the old Roman Empire sitting crowned on the tomb thereof.'

Bryce, *The Holy Roman Empire*; Fisher, *The Mediæval Empire*; Dante, *De Monarchia*; Cambridge, *Mediæval* and *Modern Histories* (*passim*).

EMPIRICISM, doctrine that all truth is derived from immediate sense experience.

EMPLOYERS' LIABILITY ACTS.—The law

relating to Employers' Liability and Workmen's Compensation in the U.K. has to be sought under three heads: (1) COMMON LAW; (2) EMPLOYERS' LIABILITY ACT OF 1880, modifying this; (3) WORKMEN'S COMPENSATION ACTS OF 1897, 1900, 1906. By (1), unless there be special agreement, the master is not liable for injuries caused by servants' own negligence. It came to be established as a principle that the master was not responsible for injury caused to one servant by negligence of another. Generally, therefore, the master was not liable at all. To remedy injustices to servants was passed (2) the *Employers' Liability Act*. By this the servant had the same rights against his master as a stranger would have; masters become liable for injuries in certain cases, if, *e.g.*, the injury is caused by a servant acting under his orders. The Act applies to all engaged in manual work—labourers, railway servants, etc., but not to seamen or domestic servants. (3) *The Workmen's Compensation Act* of 1897 much widened the scope of compensation, making it applicable to all injuries, whether caused by negligence or not. By Act of 1900 agricultural labourers also became entitled to compensation. The Act of 1906 goes further, and includes domestic servants and practically all employees whose incomes are under £250, except soldiers, sailors, policemen, or those of the family of their employer. Compensation is only given for injury, disablement, or death, caused in employment, or by disease resulting from employment. In cases of death compensation is given to dependants. The amount of compensation may be three years' wages, or a sum not exceeding £300. During partial disablement 50 % of wages can be given. The employer's liability is not changed by the Insurance Act (1912), but the compensation recovered will be taken into account in apportioning sickness or disablement benefit under the Insurance Act; so that if the maximum benefit allowed by the Act is being received as compensation nothing may be claimed for the Insurance Commissioners. Most European countries now have insurance schemes on similar lines. Germany has perhaps led the way.

EMPOLI (43° 43′ N., 10° 57′ E.), town, Tuscany, Italy. Pop. 20,301.

EMPORIA (38° 24′ N., 96° 10′ W.), town, Kansas, U.S.A. Pop. (1910) 9058.

EMPSON, SIR RICHARD (d. 1510), Eng. statesman; associated with Edmund Dudley in a vigorous system of taxation under Henry VII.; charged with constructive treason by Henry VIII., and beheaded.

EMPYEMA, collection of purulent fluid in the space between the outer and inner layer of the lining of the lung, or pleura, caused by infection by various organisms, usually after pleurisy, pneumonia, by the bursting of an abscess or a tuberculous cavity. The temperature goes up, there are rigors and profuse night sweats, the individual does not improve as in ordinary *Pleurisy* (q.v.). The treatment is to effect drainage by a slight surgical operation.

EMS (53° 23′ N., 6° 57′ E.), navigable river, Germany; enters North Sea by two mouths; connected with Rhine, Dortmund, and Emden by canals.

EMS (50° 20′ N., 7° 42′ E.), town, Hesse-Nassau, Germany; health-resort; thermal springs. Pop. (1910) 6777.

EMSER, JEROME, or HIERONYMUS (1477–1527), Ger. Catholic theologian; engaged in violent controversy with Luther and Zwingli; wrote *Annotationes* to Luther's Ger. New Testament, and himself made a trans. from Vulgate.

EMU, see RUNNING BIRDS.

ENAMEL is a vitreous substance or glass, coloured if necessary by the admixture of earths or metallic oxides before fusion, used as a surface for porcelain or metal, for decorative or useful purposes. *Cloisonné* e. is applied to a surface divided into a pattern of compartments by fine partitions, each compartment containing a distinct colour; *champlevé* e. is placed upon a hollowed ground, and is largely used in jewellery; *surface* e. forms a uniform coating like the white e. face of a clock. E's for art work may be had in sticks. These are powdered and applied to the surface and then baked until the powder fuses and adheres.

Cunynghame, *Art of Enamelling on Metals* (1906).

ENCÆNIA, church dedication festival; also the proper name for Oxford 'Commemoration week,' held yearly in June.

ENCAUSTIC.—(1) Name given to a method of painting in wax frequently employed by ancient Egyptians, Greeks, and Romans, but little used by moderns. (2) Name given to tiles of very close texture much used in mosaic pavements. The fine texture is secured by means of very heavy pressure before the tiles are dried and fired.

ENCEINTE (Fr.), term used in fortification for innermost line of defences; of a woman, pregnant.

ENCINA, JUAN DEL (1469–1533), Span. poet and dramatist; generally called father of Span. drama.

ENCLAVE, detached tract of one country or State enclosed by the territory of another; the detached portion is an *exclave* from the point of view of the country to which it belongs, an *enclave* from that of the surrounding country.

ENCRINITES, see under ECHINODERMATA.

ENCYCLICAL, papal letter issued to public.

ENCYCLOPÆDIA, CYCLOPÆDIA, a work covering the entire circle of the arts and sciences; a comprehensive survey of human knowledge, or any particular branch of it, and usually arranged in alphabetical order. The earliest extant work of an encyclopædic character is the *Natural History* of the 'elder' Pliny (23–79 A.D.), in which he treats of a great variety of subjects, including geography, med., astron., bot., fine arts, mineralogy, etc. Two famous e's of the Middle Ages were the *Bibliotheca Mundi* of Vincent of Beauvais (1190–1264), and the comprehensive *Livres dou Tresor* of Brunetto Latini (1230–94), a Florentine, well known for his association with Dante. The *De Proprietatibus rerum*, written in Latin by Bartholomeus de Glanville, an Eng. Franciscan, was trans. by John Trevisa (1398), and met with much success. The name *cyclopædia* was first used in connection with a work pub. by Ringelberg, at Basel, in 1541, and thereafter that, or *encyclopædia*, became the general name for such works. Other famous early e's were the compilations of Antonio Zara (1615); Johann Heinrich Alstead (1630); Louis Moréri's *Le Grande Dictionnaire Historique* (1674); Johann Jacob Hofmann's *Lexicon Universale* (1677); Étienne Chauvin's *Lexicon rationale* (1692); Pierre Bayle's *Dictionnaire Historique et Critique* (1697); and the *Bibliotica Universale*, by Vincenzio Maria Coronelli, an Ital. Franciscan (1650–1718), of which only seven out of forty vol's projected were pub. before his death.

The earliest Eng. e. of importance was the *Lexicon Technicum* (1704) compiled by the Rev. John Harris, Sec. to the Royal Society. This was followed by Ephraim Chambers' *Cyclopædia, or Universal Dictionary of the Arts and Sciences* (1728), which met with immense success, succeeding editions being revised and enlarged by Abraham Rees and others. This work also served as the basis upon which Diderot and his associates built their famous *Encyclopédie* (thirty-three vol's, 1751–80).

The most famous of later publications of this kind is the *Encyclopædia Britannica*, originally pub. by A. Bell and Colin Macfarquhar, of Edinburgh, with William Smellie as editor. It was first issued in sixpenny parts, the earliest appearing in Dec. 1768, and finally completed in three vol's in 1771. A second edit.—the first including hist. and biographical articles—was issued in ten vol's in 1784, a third edit., in eighteen vol's, appearing in 1797; also numerous edit's since, through various firms. The *Edinburgh Encyclopædia*, edit. by Sir David Brewster, in eighteen vol's, was issued 1810–30; the *Penny Encyclopædia*, edit. by Charles Knight, twenty-nine vol's, 1833–46; the *English Encyclopædia*, twenty-three vol's, 1853–61; *Chambers's*

Encyclopædia, ten vol's, 1860–68 (several revised edit's since); the *Harmsworth Encyclopædia*, ten vol's, 1906, which reappeared as *Nelson's Encyclopædia* in 25 smaller vol's in 1911. Besides the works named there are innumerable Eng. publications of an encyclopædic character upon a great variety of subjects.

Amongst foreign e's may be named, in French, Larousse's *Le Grand Dictionnaire Universal* (fifteen vol's), *La Grande Encyclopédie* (thirty-one vol's), and *Petit Larousse Illustré* (one vol.); in Ger., Brockhaus's *Konversations-Lexikon*, Meyer's *Konversations-Lexikon*, and Gruber's *Allgemeine Encyklopädie*. Important Amer. works are *The New International Encyclopædia*, and Johnson's *Universal Cyclopædia*.

ENDECOTT, JOHN (*c.* 1588–1665), gov. of Massachusetts Bay Colony, 1629–30; deputy-gov. and gov. at intervals from 1644; a zealous puritan.

ENDEMIC, see EPIDEMIC.

ENDERBY LAND (67° 21′ S., 49° 40′ E.), district, in Antarctic, discovered by Captain John Briscoe, 1831; he named it after his master, Samuel Enderby, grandfather of General Gordon.

ENDIVE (*Cichorium Endivia*), plant of order Compositæ; cultivated as vegetable; resembles Chicory (*q.v.*).

ENDOCARDITIS, see HEART.

ENDOGAMY, marriage only within a particular clan or community; found in primitive races; obtains in parts of Central America, Africa, India; some races in India are compelled to marry in the tribe but the wife must not belong to the husband's clan; a Hottentot generally marries in his own kraal. (Cf. intermarriage current in Scot. fishing villages, where numbers bear the same name.) For *Exogamy*, see FAMILY.

ENDOGENS, name given by Lindley to monocotyledons on incorrect assumption that growth of stem came from within (Gk. *endo*, within).

ENDOMORPH, a mineral enclosed within another —the *Perimorph*.

ENDOPROCTA, a class of Polyzoa (*q.v.*).

ENDOR (32° 38′ N., 35° 25′ E.), ancient town, Palestine, where Saul visited witch on eve of battle of Gilboa.

ENDOSPERM, see FLOWER.

ENDOSPOREA, see SPOROZOA.

ENDOTHERMIC, see CHEMISTRY.

ENDYMION (classical myth.), beautiful shepherd youth who dwelt on Mount Latmus, and was beloved by Selene (Luna), queen of the night. He received from Zeus the gift of perpetual youth and the power of sleeping at will; subject of poem by Keats.

ENEMA, injection of fluid into rectum through the anus. E. may be (1) *Purgative*,—cold or lukewarm water containing soap, olive oil, castor oil, or salts; should be used seldom, as it distends the intestine; (2) *Nutrient*,—peptonised beef-tea, eggs, milk, etc.; given in case of stomach's inability to retain food, *e.g.* after surgical operation; (3) *Astringent*,—cold water containing zinc or copper sulphate, tannic acid; used for checking diarrhœa or internal hæmorrhage; (4) *Healing*,—salt and water, laudanum, starch, silver nitrate; for hæmorrhage of lower bowel; (5) *E. for worms*,—strong solution of common salt and water.

ENERGICI, ENERGUMENS, the diseased or insane in the early Church, believed to be afflicted with evil spirits.

ENERGY is the capacity of a body or system to do work. For the purpose of measuring the quantity of work the system is capable of performing, the unit used is either a *foot-pound* (the work done in moving a pound weight through a vertical distance of one foot) or an *erg* (a gramme moved through a centimetre). The energy of a body may be due either (1) to its position, as in the case of a raised weight or a deformed spring, or (2) to the momentum it possesses when in motion. In the first case the e. is *Potential*; in the second, *Kinetic*.

Energy may take different forms, and any one form may change into another. For example, the *radiant* e. from the sun stored in coal is changed into *chemical* e. in burning, which in turn is transformed into *heat* e.; this can be converted into *mechanical* e. from which may be obtained *electrical* e., and so on. During all these changes, however, no energy is destroyed although a great deal is wasted. *Energy, like matter, is indestructible.* This principle is known as the Conservation of E. All the e. in the world is originally obtained from the sun. Another law: 'Whenever mechanical e. is converted into heat or *vice versa*, the ratio of the mechanical e. to the heat is constant.' This ratio was first investigated by Joule, and is called Joule's Mechanical Equivalent of Heat. It is equal to 42,000,000 ergs.

Clerk Maxwell, *Matter and Motion*; and text-books on General Physics.

Energetics.—Quite early in the XIX. cent. experimental investigation pointed to a direct connection between heat and mechanical energy. This resulted in the rejection of the caloric theory of heat, the formulation of the first law of thermodynamics (*q.v.*), and the development of the study of energetics, the principles of which have helped to co-ordinate and explain phenomena and causes previously considered far removed from each other.

Energy cannot be destroyed; it may undergo many changes, but the total energy in the universe must always remain the same. This summarises the principles of Conservation and Transformation of Energy, applications of which, by mathematicians, to statical and dynamical problems have yielded many important results.

In 1824, Carnot conceived the notion of a theoretically perfect heat engine in which a gas undergoes a reversible cycle of operations. A reversible cycle is one in which a substance after undergoing a series of operations is brought back to its initial state as regards volume and temperature, and is such that if the operations were reversed the results would be reversed. (Where friction enters as a factor in any operation, the cycle cannot be a reversible one.) Carnot's cycle consists of four operations: 1. Work is done *on* the substance, and its temperature thus raised (substance undergoes an *adiabatic* compression). 2. Work is done *by* the substance, but its temperature is not permitted to alter (*isothermal* expansion), heat being supplied by some source at the temperature to which the substance has been raised in the first operation. 3. Work is done *by* the substance, accompanied by a fall of temperature (*adiabatic* expansion). 4. Work is done *on* the substance until it regains its initial state, but its temperature is not permitted to alter (*isothermal* compression), heat being given out to some *sink*, called a condenser.

If the heat absorbed at the higher temperature during operation 2 is greater than that given out at the lower temperature during operation 4, the excess can be utilised to do external work. Consideration of Carnot's cycle, and deductions therefrom, form the basis of energetics and thermodynamics, and have resulted in the evolution of the modern heat engine.

Kelvin's Principle of Dissipation of Energy.—Although energy cannot be destroyed, yet in every transformation a certain quantity appears as heat which is diffused and becomes unavailable for use. All natural phenomena are of such a kind as to tend towards this degradation of energy, and permanent equilibrium of any system will only be attained when the limit of minimum available energy has been reached. This principle has been very usefully applied to the problems of solution, fusion, solidification, osmosis, etc.; it provides an explanation of the phenomenon of chemical combination in definite proportions,—combination only taking place if, as a result, the available energy is diminished,—and it is the basis of the prediction that ultimately no energy will be available and the universe become a uniformly hot, inert mass. See HEAT and THERMODYNAMICS.

ENFANTIN, BARTHÉLEMY PROSPER (1796–

1864), Fr. social reformer; became follower of Saint-Simon; advocated communism, 'woman suffrage,' and other innovations; with others sent to prison for a year (1832) for offence against 'morality'; became railway director (1845); also a journalist and author.

ENFIDAVILLE (*c.* 36° N., 10° 20′ E.), town, Tunisia, N. Africa; produces cereals.

ENFIELD (51° 40′ N., 0° 6′ W.), town, Middlesex, England; small-arms factory. Pop. (1911) 56,344.

ENFIELD (41° 58′ N., 72° 35′ W.), town, Connecticut, U.S.A. Pop. (1910) 9719.

ENFILADE, military term meaning to rake with shot the full length of a line; in general, a raking fire.

ENGADINE (Upper, 46° 33′ N., 9° 55′ E.; Lower, 46° 48′ N., 10° 17′ E.), upper valley of Inn, in Grisons Canton, Switzerland, amidst Alps (Rhætian group, etc.); divided into *Upper* E., towards S.W., with Lakes Sils, Silvaplana, and St. Moritz, and *Lower* E., towards N.W., with mineral springs at Schuls; length about 65 miles; elevation, 4000–6000 ft.; chief town, St. Moritz, 6070 ft.; Austrian possession, 1622–24; Swiss, 1652. Pop. (1910) Upper, 8652; Lower, 7852.

ENGEL, ERNST (1821–96), Ger. statistician and economist; prolific writer in *Preuss. Statistik*, etc.

ENGEL, JOHANN JAKOB (1741–1802), Ger. dramatist and writer on æsthetics.

ENGELBERG (46° 49′ N., 8° 24′ E.), village, Switzerland; famous Benedictine monastery.

ENGELBRECHTSDATTER, DORTHE (1634–1716), Norweg. poetess and hymnologist.

ENGELHARDT, JOHANN GEORG VEIT (1791–1855), Ger. theologist; prof. of Theol. at Erlangen.

ENGHIEN (50° 42′ N., 4° 2′ E.), town, Hainault, Belgium; lace and linen industries. Pop. 4541.

ENGHIEN, LOUIS ANTOINE HENRI DE BOURBON CONDÉ, DUC D' (1772–1804), only s. of last Prince of Condé; left France at Revolution, and later served against France; seized in foreign territory by Napoleon's order, court-martialled on trumped-up charge and shot at Vincennes.

ENGINE, a term now used loosely for a locomotive, in its strictest sense is a machine making use of power to perform work. In this sense a crowbar used to raise a weight is an e. More generally term is applied to prime movers, machines of some complexity producing mechanical effects by means of some motive power, chemical (such as explosion, as in gas e's), or physical (such as expansion, *e.g.* steam e's). E's may be differentiated by their motion, which is either *reciprocating* or *rotatory*. The latter describes e's in which the motion is directly rotatory, the piston being so made that it moves round without a crank; reciprocating e's are those which induce a backwards-and-forwards motion to the piston, whether this is a simple to-and-fro motion or is converted by a crank into rotatory motion, and whether the reciprocation is induced by admitting the motive power alternately to both sides of the piston (as in *double-acting* e's) or the return motion is induced by condensation when the atmospheric pressure on the reverse side drives it back (as in *single-acting* e's). Where the motive power is produced in the cylinder (as by explosion, in *gas* e's), the e. is an *internal combustion* e.; when outside, an *external combustion* e. Steam, oil, and gas e's are all *heat* e's. The only other prime movers are *electric* e's.

Air Engine, a reciprocating engine (which may be connected with machinery) in which the piston is driven by the expansion and contraction of air, produced by applying and withdrawing heat. As the heat is generated outside the cylinder, it may be termed an external combustion engine. They are now mainly used for low-power purposes, as for high power the waste of heat and their comparative bulk have caused them to be superseded by the more economical and effective gas or internal combustion engines.

Gas Engine, a form of heat engine using combustible gas as fuel; an internal combustion engine. In most engines the combustion of the fuel takes place outside the container of the working substance, as, for instance, in the steam engine, where coal is the fuel burnt in the furnace outside the boiler. In gas e's, however, the working substance is also the fuel, and is mixed with air so as to be rendered explosive. By this method it is possible to turn more heat into power than with the former (see THERMODYNAMICS), and in addition less attendance on the engine is necessary. Once started, the gas e. may run for hours without attention; a regular supply of fuel being arranged, together with automatic lubrication. On the other hand, with the steam engine constant attention to the plant and furnaces is required.

In 1823 Samuel Brown invented and patented an internal combustion engine which, it is said, successfully drove a boat on the Thames, a carriage on the road, and worked a pump. In 1833 L. W. Wright improved upon it, and used a water-jacket for cooling; explosions in his engine took place at both sides of the piston. Until 1860, however, the gas e. was entirely in an experimental state, but in that year E. Lenoir invented the first gas e. of practical commercial value, and 400 of this type were manufactured and sold in 1865. It was found, however, that their consumption of gas was very heavy, for they used about 100 cubic feet per indicated H.P. per hour. In 1867 Dr. N. A. Otto and Mr. Langen brought out an improved gas e. with double-acting pistons, in which the consumption of gas was only 40 cubic feet per brake H.P. per hour, and some thousands of this type of machine were turned out.

Rochas, a Frenchman, invented a cycle—the 'Otto'—of operations which was discovered independently by Dr. Otto in 1876. In 1876 Otto applied it to his engine and it surpassed all previous machines. It had four operations, viz. induction, compression, explosion, and exhaust. The gas e's of to-day use this cycle, and are practically of the same design as the earlier models, except that many improvements have been added, electrical ignition almost universally adopted, water cooling, and a far higher compression ratio is used than formerly. This not only gives greater power, but is more economical.

Oil Engine, an internal combustion engine similar in its action to a gas engine, except that the explosions for motor power are obtained from oil. Petrol engines come under this heading.

The principle of the oil engine was first proposed by Street (1794). A practical petroleum engine was first made in 1870, but the advantages of high compression and larger expansion recognised by Beau de Rochas led the way for Otto to produce (1876) his successful engine, the main features of which are still essential in modern designs. This was followed by an engine using gasolene as fuel. Daimler (in 1883) conceived a light engine to run at high speeds—800 to 1000 revolutions per minute. The successful application of this engine to a motor-cycle in 1886, and in 1887 to a carriage, brings us by definite steps to the present perfection of motor vehicles, with which are connected the names of the great manufacturing firms, Panhard-Levasseur, Peugeot, de Dion, Napier, Benz, Renault, Lanchester, Rolls-Royce, Austin, etc.

Engines using heavy oils are, with the exception of the apparatus for vaporising the oil, similar to gas engines. The oil, converted into spray with a current of air in a spraying nozzle, enters a vaporiser, a vessel heated externally either by a lamp, or a steam jacket through which the exhaust passes. During the suction stroke the air supply enters vaporiser and the charge is drawn into cylinder, where it is compressed and ignited by electric spark or ignition tube, doing work as it expands.

Diesel Engine.—An engine which in its modern form has attained a very high efficiency was invented by Diesel. It differs in its cycle of operations from the Otto engine. Air is highly compressed (to about 35 atmospheres per sq. inch) in the engine cylinder before oil is admitted at all. At the end of the piston stroke oil is injected by a separate pump and air reservoir into the cylinder, and immediately burns away,

owing to the high temperature of the compressed air. *No explosion occurs*, but the oil *burns* while it is pumped in during a part of the next forward stroke of the piston. The supply of oil is cut off, and a prolonged expansion follows until release at end of stroke. From the thermodynamic point of view the combustion of the working substance while comparatively cold is regarded as a serious defect. The Diesel engine overcomes this drawback by an attempt to attain the temperature of combustion before combustion commences by compressing the air in cylinder to a very high degree before fuel is admitted. In 1912 the first ocean-going vessel driven by oil engines (the *Selandia*, 7400 tons) completed a journey of 20,000 miles at an average speed of 10 knots an hour. Each of the twin screws were driven by an eight-cylinder motor giving 1250 I.H.P.

Steam Engine.—The first steam engine was described by Hero of Alexandria, 120 B.C.—essentially a turbine working by reaction of steam jets discharged from orifices formed in a wheel, free to rotate, by impinging on vanes set on its rim; a similar machine was used by Branca (1629). No serious efforts were made before XVII. cent. to apply steam to any useful purpose. In 1698 Captain Savery invented a machine to pump water from mines. The essence of his invention was a boiler; this was fitted to two vessels; steam was pumped into one vessel and condensed by cooling action of a jet sprayed on outside; condensation of steam resulting in a vacuum, water was forced up by atmospheric pressure. The vessels acted alternately, emptying and filling. Denis Papin (1690) introduced piston and cylinder into same machine, the pressure of steam on piston forcing water out at either end.

Newcomen, Savery, and Cawley (1705) produced a similar machine, but with a rocking beam. This was connected at one end by a chain to a piston, at the other end was suspended the pump rod and a weight or counterpoise to bring piston to top of stroke on admission of steam from boiler. Steam being cut off, a jet of cold water was sprayed on outside of cylinder, forming a vacuum within. Atmospheric pressure forced down piston and lifted pump rod at other end of beam.

The present perfection of the steam engine is due to the inventions, patented between 1763–69, of James Watt of Glasgow. His inventions were based upon the following main principles: (1) that the cylinder be kept as warm as possible; (2) to obtain the above the steam should be condensed in a separate vessel or condenser; (3) that steam be used expansively to press on the piston; (4) the use of oil, animal fats, etc., to render the piston and other engine parts water- and air-tight. Watt did not use high pressures, and to Trevithick is due the high-pressure engine. His production—the Cornish engine—was provided with a single cylinder and condenser, steam being used expansively.

In 1782 Hornblower patented the first compound engine. Two cylinders were used; the steam after doing work in one cylinder passed into the other to continue its action. Through the use of a condenser infringing Watt's patents the invention fell through, to be revived later by Woolf in 1800 and MacNaught in 1845 for marine purposes. Symington ran the first steamboat—the *Charlotte Dundas*, with one paddle-wheel at the stern—on the Forth and Clyde Canal (1802). Fulton (1807) in America ran the *Clermont* with engines by Boulton and Watt. The *Comet*, constructed on the Clyde in 1812 by Henry Bell, was also successful. The invention of the screw by Ericsson came later.

In 1802 Trevithick and Vivian patented the first steam carriage to run successfully, and in 1829 the Stephensons, by the trials of the 'Rocket,' ensured the adoption of locomotive traction.

THERMODYNAMICS.—In nearly every form of heat engine mechanical work is obtained by means of the expansive force of an elastic fluid acting usually on a piston travelling in a cylinder. It is essential that there should be (1) a working fluid; (2) a source of heat; (3) a receptacle for unexpended heat. In operation there must be a reception of heat by the working fluid, a conversion of heat into work, and a discharge of heat at a lower temperature than it was received. Steam starts as cold water in the boiler, is converted into steam, and, after use in the cylinder, is condensed back to water again. Heat is supplied to cause expansion; of this, part is lost by conduction from the cylinder walls, part escapes to the air or condenser at end of stroke, and part disappears. This third part is the exact equivalent of the work done by the elastic fluid in driving the piston. The ratio of this third part, converted into actual work, to the heat originally supplied determines the efficiency of the engine. One must guard against the idea that the mechanism has more serious connection with the waste of energy in any engine other than the unavoidable frictional resistances. Condensation of steam in the cylinder is the most important cause of waste in engines. The use of jacketing by Watt to prevent this has been superseded latterly by superheated steam at a high temperature and pressure. Steam in contact with the water from which it has been formed is said to be 'saturated.' Addition of heat at constant pressure, provided that no water is present, produces a rise of temperature. The steam is then said to be superheated.

Important Definitions.—Work is said to be done when a force acts through a distance overcoming resistance. The unit of work is the foot-pound, being the energy expended when a force of one pound acts through a distance of one foot. Power is the rate of doing work. The unit of power is the Horse-Power, and is the rate of doing work so that 33,000 foot-pounds are performed in one minute. Heat is a form of energy; it requires for its production and produces by its disappearance 774 ft. lb. (Joule's equivalent) of energy for each thermal unit lost or produced, the latter being defined as the amount of heat necessary to raise one pound of water through one degree Fahrenheit. Indicated Horse-Power is the power which the engine should deliver by reason of the pressure of steam on the piston, but a considerable part of this is not available for driving machinery. From 5 % to 20 % is used in overcoming frictional resistances. To obtain an estimate of the power an engine can deliver, the energy may be absorbed by a brake mounted on the fly-wheel. By calculation an estimate is arrived at, called the Brake Horse-Power. The ratio of Brake Horse-Power to Indicated Horse-Power is called the mechanical efficiency.

ENGINE DETAILS.—Fig. 1 shows the direct acting engine in its simplest form; B is the cast-iron

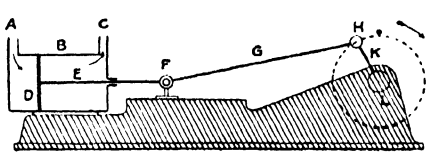


FIG. 1.

cylinder, D the piston sliding within it; E and G are respectively a piston-rod and connecting-rod to couple the piston to the crank K mounted on the crank-shaft L. The sliding motion of the piston induces rotation of the crank-shaft. By ports or openings A and C steam is admitted to each side of the piston alternately, the other side of the piston in each case being in communication with the exhaust part, by which steam is exhausted into the atmosphere (*non-condensing engine*) or into the condenser (*condensing engine*) after the piston has completed its stroke.

The distribution of steam is effected by a slide driven by an eccentric (*q.v.*) from the crank-shaft. There are many varieties. The usual device is shown in Fig. 2 for movement of piston to the right; Fig. 3

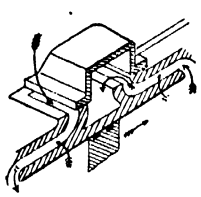

FIG. 2.

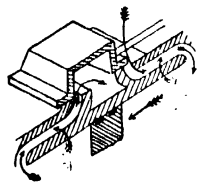

FIG. 3.

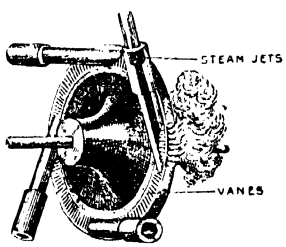
the position for the return stroke. Steadiness of rotation is ensured by two means: (1) a heavy fly-wheel mounted on the crank-shaft; (2) a governor of some sort driven by the engine to adjust the supply of steam to meet the demand. Steam is raised in a vessel called a boiler, built of cylindrical plates riveted together, and fitted with a furnace at one end and a chimney at the other. The furnace gases are led through a number of tubes, fitted between the end of the boiler and the furnace, giving up their heat to the surrounding water. This is called a fire-tube boiler. In a water-tube boiler the water occupies the pipes while the gases circulate round them.

Compound Engines.—The use of steam at high initial pressures with a large ratio of expansion increases the efficiency of the steam engine, but is impossible with a single-cylinder engine. It is customary to admit steam to one cylinder and then to exhaust it into the next one to continue the expansion. Triple expansion engines possess three cylinders. Quadruple expansion engines with four cylinders are also in use.

STATIONARY ENGINES.—These are used in commercial concerns, for driving machinery in mills, workshops, electric light and power stations. They vary in size and type according to the work for which they are required.

LOCOMOTIVES.—Locomotives are of two kinds—for rail and road work. Railway locomotives consist in general of an engine with two cylinders, carried forward, whose cranks drive two axles. There may be four, six, or even ten driving-wheels mounted on axles in pairs, one axle being driven direct, the others being connected by coupling-rods and cranks placed at right angles. The locomotives are said to be four-, six-, or eight-coupled according to the number of driving-wheels; the engines are mounted on a frame carried on springs.



The great scope for railways in America has its natural sequence in locomotives of enormous size, weight, and speed, overshadowing British productions which are designed to suit the conditions of the country. Compound engines have been tried with some success by the North-Western, the North-Eastern, and Great Eastern Railways. Cylinders are placed both inside and outside the frame; the latter, an American practice, is being generally adopted. To give ease in rounding curves, engines of great wheel-base have the front carried on a bogie or truck on four wheels. Locomotives fitted for the consumption of oil fuel have been tried with success by the Great Eastern Railway.

There are many varieties of locomotives in use on ordinary roads for traction purposes, using oil or coal for fuel. The road locomotive capable of fair speeds dates from the removal of legal restrictions in 1898. In the type generally the engine is placed over the boiler and geared to the wheels.

MARINE ENGINES.—Since 1885 the use of triple expansion engines has become common practice. Quadruple expansion engines are confined to the mercantile marine, where economy of space is not essential. Conditions of service in warships render it desirable to have special means of forcing boilers when full speed is required. The introduction of forced draught has accomplished this, and has reduced the weight of machinery. The important feature of the last decade is the great increase in propelling power. Competition has resulted in high speeds. In 1845 the *Terrible*, the finest warship of the day, was driven by 2000-horse-power engines. The engines of the battleships and transatlantic liners of the day are of 75,000 to 80,000 horse-power, capable of speeds of 28 knots per hour, while in the case of smaller craft, destroyers, etc., a speed of 36 knots per hour has been obtained. It will be understood that but for the advent of the Parsons turbine this immense power could not conveniently have been generated. The latest battleships are fitted for the consumption of oil fuel as well as coal. The shipbuilding world is passing through a crisis in mechanical propulsion. Whether the future lies with the steam turbine or the oil engine is difficult to foresee. The former is in a position of proved efficiency, while the latter is merely an experimental success.

TURBINES.—A turbine is a non-reciprocating engine. The working fluid gives up its energy to rotating wheels in flowing past blades or buckets fixed to rim, being conducted by fixed blades so as to come into contact with the moving blades with the minimum of shock.

There are two types: (1) *Impulse turbines*, in which the energy of the fluid is used in its kinetic form; (2)

SKETCH SHOWING PRINCIPLE OF TURBINE ACTION.

Pressure turbines, where the energy of the fluid is of the pressure form.

De Laval turbines are of the first type. Steam is blown through nozzles, so constructed as to permit steam to be completely expanded, against the vanes of a revolving wheel. The pressure of the steam being low, the velocity and weight are high. The nozzle being short, there is little waste, the conversion of the energy is almost perfect. The velocity of the steam being high, the speed of the wheel is consequently high, being between 500 to 1400 feet per second, or 30,000 to 10,000 revolutions per minute. This speed, too high for direct use, is reduced by gearing in transmission. The speed of the wheel is kept uniform by a governor.

The Curtis turbine is a compound turbine of the same type, the steam acting on several wheels to reduce the velocity gradually.

The *Parsons turbine*, made under patents by the Hon. Charles Parsons, C.B., is a parallel-flow turbine, the steam passing through parallel to the axis of rotation. The turbine consists of a rotating shaft carrying a large number of bladed rings gradually increasing in diameter, corresponding bladed rings being attached to the casing to come between the rotating rings. Steam enters at the smaller end, and flowing among the blades to the larger end expands, falling in pressure in doing so. Each pair of fixed and rotating blades is called a stage, and at each stage the steam falls slightly in pressure and grows in volume, while a part is taken up by the rotating rings and so transmitted to the shaft.

The Westinghouse turbine is a combination of the Curtis and Parsons turbines.

MOTOR-CAR ENGINES.—Steam has been applied with success to pleasure vehicles. Fuel, either oil or paraffin, is burnt outside the cylinder, and imparts heat to water in a boiler, the steam raised there being used as a motive agent. Several firms, such as the White Steam Car Co. and Stanley's, have cars on the market.

The effect of a *tax* on engines of high power has been the production of an efficient car of medium power (15·9 H.P.) at a moderate price. Improvements have been mainly in the quality of the metals used, in coach work and body-building, and in silence of running.

Sleeve Valve.—To effect silence of running in motor-car engines, a new device, the 'Sleeve' valve, has been fitted by several of the leading makers, and varieties patented by the firms of Daimler, Argyll, etc. Briefly, a sliding sleeve or sleeves are fitted between the piston and the cylinders wall to shut and close the parts for the admission and exhaust of the charge.

AEROPLANE ENGINES.—These are petrol motors of two kinds, stationary and rotary. The prototype of the latter was the famous 'Gnome' engine. In the *Gnome* engine several cylinders are arranged star fashion round a crank-shaft of special shape. To ensure uniform rotation the explosions must succeed one another at regular intervals, so that the cylinders are always odd in number with a minimum of five. This arrangement is economical, since the rotating cylinders serve as a fly-wheel, which is dispensed with. These engines are invariably fitted in light machines. Stationary engines with several cylinders are used for heavy machines. The important problems with regard to aerial engines are lubrication and carburation. The horse-power of these engines varies from 25 H.P. to 200 H.P.

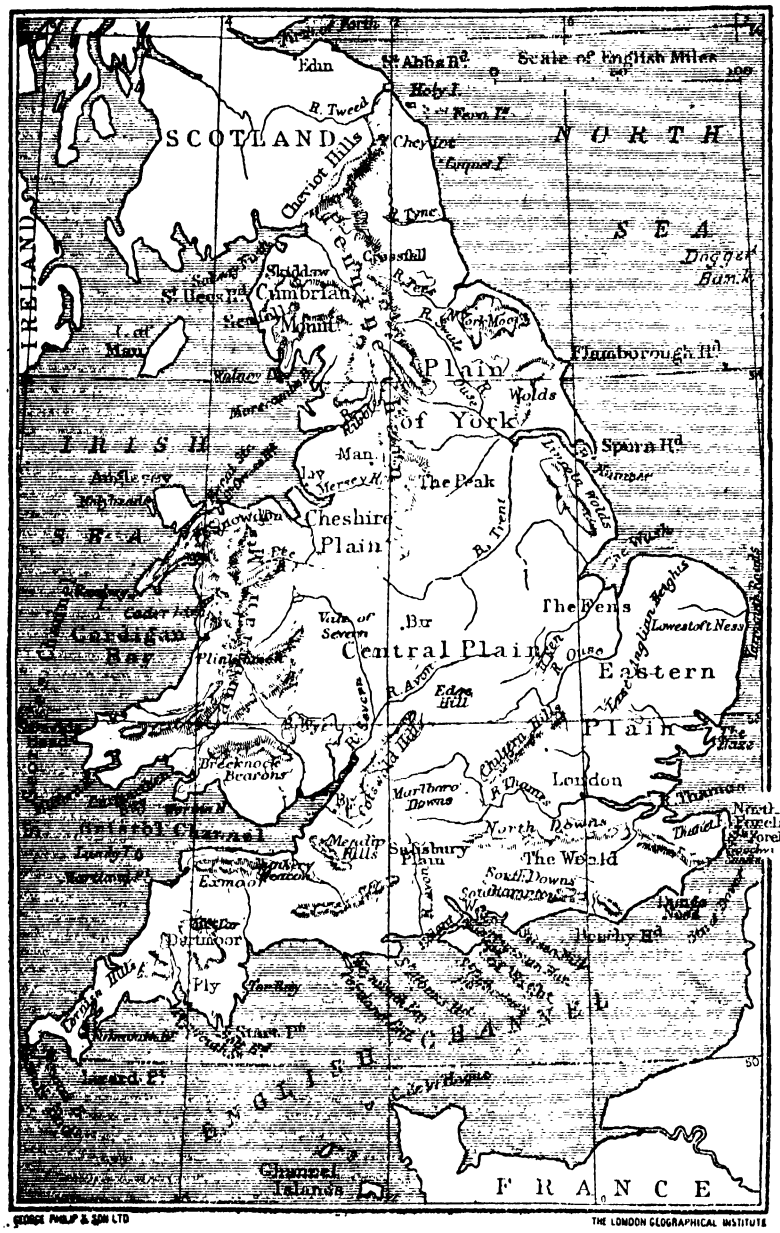
ENGINEERING, a term originally applied to the construction and management of military machines and defences, later to the construction of canals, roads, and other public works, hence the term '*civil*' *engineer*. In its modern sense it is the art or skill to use natural sources of power for the use and convenience of man. With the multiplication of modern inventions the science divided itself into special branches. First came mechanical engineering, then in natural sequence mining engineering, naval architecture (marine engineering), sanitary engineering, electrical engineering, and aerial engineering.

Engineers, Military, first corps founded 1772; styled 'Royal Engineers' since 1787; consists of about 10,000 officers and men (officers trained at Woolwich). On service a field company of R.E. is attached to every infantry division; undertakes field-engineering, fortifications, bridge-building, railway work, and demolition.

Engineers, Naval, are first examined by Civil Service Commission; curriculum includes five years' training at Devonport.

ENGIS (50° 34′ N., 5° 24′ E.), cave, on banks of Meuse, near Liége, Belgium.

ENGLAND, with the addition of Wales (*q.v.*) is the S. part of GREAT BRITAIN (*q.v.*). The area of England is 50,890 sq. miles; the greatest length (from Berwick to Lizard Point) is 420 miles, the greatest breadth (Lowestoft Ness to Land's End), 360 miles. No point is more than 60 miles from the coast. It is separated from Scotland by natural boundaries, the river Liddel, the Cheviot Hills (highest point, 2422 ft.), and the Tweed, although until the XVI. cent. there was a strip of 'Debateable Land' between the Esk and the Sark. The Severn used to form part of boundary of Wales, but this has long been constituted by the Eng. counties of Cheshire, Shropshire, Herefordshire, and Monmouthshire.



Physical Features.—Deep bays on E. and W. coasts, with good harbours, cut into the country at nearly opposite points, making horizontal divisions, sometimes almost peninsulas; thus Tynemouth faces Solway Firth, the wide mouth of the Tees Morecambe Bay, the Humber the mouth of the Mersey, which descends from same watershed as tributaries of the eastern stream; the Wash corresponds to Cardigan Bay, the Thames to the Bristol Channel, close to which it rises. The chief headlands on these coasts are: E. Flamborough Head and Spurn Head (Yorks), the slight projection of Lowestoft Ness (most E. point), Suffolk, the Naze (Essex), North Foreland and South Foreland (Kent); W., St. Bees Head (Cumberland), Birkenhead (Cheshire), Hartland Point (Devonshire), Land's End (Cornwall). The S. coast runs with tilt to N.E. in series of gentle bays of which chief are Mount's Bay, Falmouth Harbour, Cornwall, Plymouth Sound, Lyme Bay (with Tor Bay), Weymouth Harbour, Poole Bay, and, between Hampshire and the I. of Wight, the Solent and Spithead, with Southampton Water and Portsmouth Harbour (headquarters of Brit. fleet) running up into the land.

Islands are Holy Island and Farne Islands (off Northumberland), the Channel Islands, the Isle of Wight (Hampshire), the Scilly Isles (Cornwall), Lundy Isle (Devon), Walney (Lancs), and Man (midway between England and Ireland; the Channel Islands (*q.v.*) and Isle of Man (*q.v.*) do not form part of England.

England is divided as to physical characteristics into two clearly distinct parts, by a line of hills known to geologists as the Oolitic Escarpment, running from the lower Tees S.W. to the Exe mouth; the N.W. portion thus formed is of older geological character than rest of country, and contains its mountain systems, of Palæozoic rocks with coal measures in the Carboniferous strata. The Old Rock systems may be divided into (1) the mountains of northern England, composed of (*a*) the Pennine Chain, the chief geological feature of the north, stretching S. from the N. boundary, the Cheviots. It attains chief height in Cross Fell (2892 ft.), at the meeting-place of the five northernmost counties; other heights in the chain are Whernside, Ingleborough, and Penygant, and its southern culmination, the Peak, Derbyshire; (*b*) the Cumbrian mountains of the Lake District, where Scaw Fell (3210 ft.), Skiddaw, and Helvellyn are highest summits. They extend into N. Lancs (Pendle Hill, 1831 ft.). The chief lakes are Windermere, Ulleswater, Derwentwater, Buttermere, Coniston, and Thirlmere. (2) The Welsh mountains. (3) The S.W. mountains, comprising (*a*) the high tablelands of Exmoor and Dartmoor in Somerset, Devon, and Cornwall, with chief heights at Dunkery Beacon (1770 ft.), Yes Tor (2050 ft.), and Brown Willy (1370 ft.); (*b*) the Mendip Hills, Somerset; (*c*) the Malvern Hills, Worcestershire, rising to 1395 ft. at Worcester Beacon; (*d*) the Clee Hills and Wrekin, Shropshire. The newer S.E. portion of England may be divided into the Chalk Ridge and the Roe-Stone Ridge. The Roe-Stone Ridge commences south of the Oolitic Escarpment, in the moors of Cleveland, Yorks, forms the Lincoln Heights, Edge Hill (Warwickshire), the Cotswolds (Gloucestershire), the Western Downs (Dorset), and the Blackdown Hills (Devon). The Chalk Ridge runs S. from the bold chalk cliffs of Flamborough as the Wolds of the East Riding of Yorks and of Lincs, the E. Anglian Heights, the Chiltern Hills, the Marlborough Downs, and ends with the tableland of Salisbury Plains, from which the North and South Downs extend E. to Dover Cliffs and Beachy Head respectively, and form district known as the Weald. The highest point of this S.E. moiety of England, which belongs geologically to the Great Plain of Europe, is 1489 ft., in N.E. Yorks.

A system of plains unites all parts of E., and has enabled roads, railways, and canals to be readily constructed. The chief plains are the Midland Plain, which divides the older from the newer rocks, the Plain of Lancs and Cheshire, the Vale of York, and the Eastern Plain. The Fens are a marshy district round the Wash; many of its towns, like Ely, were islands in Saxon times. Above the chalk there

stretches from Thames along E. coast to N. of Norfolk a tract of clay known as the London Basin, and round Portsmouth another tract known as the Hampshire Basin. From the Pennine Range the Tyne, Wear, Tees, Ouse, most of its tributaries, Trent and Witham, flow from E. slopes of Pennines into N. Sea; the Lune, Ribble, and Mersey from W. slopes into Irish Sea. The two longest rivers of England are the Severn (200 miles), which receives the Teme, Avon, and Wye, and flows into the Bristol Channel, and the Thames (210 miles), which rises in the Cotswolds and flows E. to the N. Sea, receiving (left) the Cherwell, Thame, Colne, Lea, and Roding, and (right) the Kennet, Wey, Mole, and Medway. The streams which enter the Eng. Channel from the S. coast are all short.

Counties.—The forty old counties of England are: 1. (N.) Northumberland, Cumberland, Westmorland, Durham, Yorkshire, Lancashire; 2. (Midland) Derbyshire, Northamptonshire, Nottinghamshire, Staffordshire, Leicestershire, Rutlandshire, Warwickshire, Worcestershire, Oxfordshire, Buckinghamshire, Bedfordshire, Hertfordshire, Middlesex; 3. (W.) Cheshire, Shropshire, Herefordshire, Monmouthshire, Gloucestershire; 4. (E.) Lincolnshire, Norfolk, Cambridgeshire, Huntingdonshire, Suffolk, Essex; 5. (S.E.) Kent, Sussex, Surrey, Berkshire, Hampshire; 6. (S.W.) Dorsetshire, Devonshire, Cornwall, Wiltshire, Somersetshire; under the Local Government Act of 1888, the number of 'Administrative Counties' was raised to 50.

Communications.—The total mileage of RAILWAYS in England and Wales exceeds 16,000 miles. The chief lines are the London and North-Western, the Midland, and the Great Northern, which run from London to Scotland; other lines include the Great Eastern, Great Western, London, Brighton, and South Coast, South-Eastern, Chatham, and Dover. London has an elaborate system of underground railways. There are, approximately, 2000 miles of CANALS, which with canalised and navigable rivers make a total of about 4100 miles of waterways open for traffic. There are about 151,000 miles of principal ROADS in England and Wales, kept in repair and improved partly by profit on motor-spirit duties, carriage licences, etc. Increased motor traffic has led to the laying down of many miles of roadway covered with a bituminous preparation calculated better to withstand wear and tear.

Resources and Industries.—England owes its pre-eminence in Europe, only dating from middle of XVIII. cent., to COAL, which has enormously facilitated the working of its other mineral treasures (chiefly iron and stone), and its manufactures. The coal-fields, except for two small outbreaks in the Midland Plain, belong to the geological system of the N. and W. That of Northumberland and Durham, at the mouth of the Tyne, which has made Newcastle, Gateshead, Sunderland, Hartlepool, etc., busy commercial centres, was already worked in the XIII. cent.; in this district, iron, steel, chemicals, machinery, and ships are manufactured. The Cumberland Field, between Maryport and Whitehaven, exports coal and limestone, produces iron and steel, and carries on shipbuilding at Barrow-in-Furness. The moorland villages of West Riding of Yorks Field have become thickly populated manufacturing towns; weaving always flourished in this grazing district, and now the Lancs and Yorks Railway brings further wool,

linen, and cotton material from Liverpool. The chief towns are Leeds, which possesses university, and cloth, iron, and machinery manufactures, the clothing towns of Bradford, Halifax, Huddersfield, Keighley, etc., and Sheffield with its cutlery industry.

The S. Lancs coal-field has turned Manchester in a cent. from a large but agreeable manufacturing town, to the growing commercial centre of the most densely populated district in the world. Owing to its damp climate, it was an early centre of the cotton manufacture, moisture being advantageous, particularly to the original hand-looms. In its immediate neighbourhood, Arkwright of Preston invented the first mechanical spinning-frame, 1768; the cotton industry is still to some extent carried on, but chief importance of Manchester now is as commercial centre and seaport at terminus of Ship Canal from Liverpool. The other manufacturing towns are the contiguous Salford, and Blackburn, Bolton, Oldham, Preston, Rochdale, Warrington, Wigan, headquarters of the coal-mines, Macclesfield, where silks are made up, Runcorn, Widnes, St. Helens, all noted for soap and chemicals, and Norwich, Middlewich, and Nantwich, where there are salt works. Other seaports are Liverpool, which imports raw cotton, wool, grain, provisions, and tobacco from Australia, New Zealand, South Africa, Egypt, India, the Argentine, Brazil, etc., and exports cotton goods and machinery, and Birkenhead, which carries on shipbuilding. N.W. is the Whitehaven coal-field, of which seaports are Whitehaven and Barrow, whose principal trade is with Isle of Man and Ireland. The manufacturing towns are Barrow (iron and shipbuilding), Workington, Millom, and Carnforth (iron).

The coal-fields of N. and S. Staffordshire lie respectively in the Potteries and the Black Country. The Potteries import china-clay from Cornwall and flint from Kent and Sussex, and their 'Five Towns,' Burslem, Hanley, Langton, Newcastle-under-Lyme, and Stoke, are chief seat of Eng. earthenware industry. The Black Country, in the heart of the Midlands, has both coal and iron ore. Its chief towns are Birmingham, which manufactures hardware of all kinds for all parts of the world, Wednesbury (hardware), Wolverhampton (locks), Dudley (nails), Redditch (needles), Coventry (bicycles and motor-cars). The coal-fields of the Forest of Dean, Gloucestershire, and of Bristol have decayed in importance since working of richest Brit. field, that of S. Wales; and the ancient port of Bristol has been superseded to a large extent by Newport and Cardiff on opposite bank of Severn. Bristol still, however, imports provisions, fruit, and tobacco from Ireland, the West Indies, and S. America, and is now in the line of traffic between the S. Wales coal-field and London, and southern ports generally, through the Severn Tunnel (4½ miles long; completed 1886).

After coal, IRON is the most important mineral product; it is often found near the coal, but besides N. Lancs and N. Staffordshire it is largely obtained in the Cleveland district of Yorks, and in Lincs, Northants, and Leicestershire. Middlesbrough, since the discovery of the peculiarly valuable iron ore of Cleveland (*c.* 1840), has developed from a fishing village into a town of over 100,000 inhabitants nearly all maintained by industries connected with the great iron and steel works which crowd the district with furnaces. Lincs, Northants, and Leicestershire are less important for iron; [illegible] principal industry, Northampton boots and shoes. [illegible]incs, besides its cathedral city, once a Roman town, on the Wytham, possesses Boston, on the Wash, formerly an important port, but now silted up, and the large fishing centre of Grimsby on the Humber. Other important minerals are tin (Cornwall), lead (Durham, Yorks, Cumberland, Westmorland, Derby, Shropshire), copper (Cornwall and Devon), gypsum (Cumberland, Notts, Staffordshire, Sussex, and Derby), stone (worked in most parts of the country).

Local architecture generally indicates nature of subsoil; brick is everywhere to be found in the London and Hampshire basins; slate roofs are common in West Riding of Yorks, tiles on E. coast of same county. The excellent building stone of E. coast of Yorks was used for present Houses of Parliament, London Bridge, etc., and alum and jet workings were once thriving industries there. Whitby still manufactures jet as it did in days of ancient Britons, but the material is now imported from Spain. Slate is obtained from Cornwall, Devon, Lancs, Yorks, Westmorland, Cumberland; chalk from Kent (chiefly), Essex, Hants, Sussex, Surrey. Fireclays are got in Durham, Yorks, Lancs, and Staffordshire coal-fields; china-clay (taken to the Potteries, Worcester, etc., for manufacture), in Cornwall and Devon; salt, besides being obtained from valley of the Weaver, Cheshire, in Worcestershire and N. Lancs. Barnsley is noted for linens; Derbyshire and N. Staffordshire manufacture silk; Nottingham, lace; Bedford, Luton, and Dunstable, straw hats; Kent, paper.

Besides the hilly grazing grounds of the country there remain considerable tracts for agriculture. Lincoln, Leicester, and the N. and S. Downs are famous for sheep, Yorks and E. counties for horses; wheat is chiefly grown in S.E. counties, barley in E. and Midlands, oats in N., N. Midlands, W., and S.W., rye in inferior ground everywhere. Hops grow in S., especially Kent, and also in Herefordshire. Fruit, grown widely, abounds in Kent, Herefordshire (both called the 'garden of England'), and S.W. generally; cider is made in Somerset, Devon, etc.

The old towns of the E. coast, Tynemouth, Hartlepool, Middlesbrough, Whitby, Scarborough, Bridlington, Hull, Grimsby, Boston, Yarmouth, Lowestoft, and Harwich all prospered either on wool trade with Netherlands or on the fisheries; herring and other fish used to visit this coast in far greater shoals than at present, and the fisher folk cruise out along the Dogger Bank (36 miles from Flamborough Head) in the summer for the cod fishery. Mackerel and pilchards are caught on S. and W. coasts. Fishing employs about 40,000 men and boys. London (*q.v.*) has from prehistoric times enjoyed international trade, and is commercial centre of the world.

Haughton, *A Descriptive, Physical, Industrial, and Historical Geography of England and Wales* (1893); Escott, *Social Transformations of the Victorian Age* (1897); Avebury, *The Scenery of England and the Causes to which it is due* (1902); Meredith, *Outlines of the Economic History of England*; Ashby, *British Industries* (1903); Shadwell, *Industrial Efficiency* (1909); Innes, *England's Industrial Development* (1912).

Finance.—The financial system of England in the Middle Ages was very different from that of to-day. A clear line between Crown and State did not exist; still, so far as his own household was concerned, the king was supposed to live 'of his own,' *i.e.* on the proceeds of the royal *demesne*. Besides this, revenue was drawn from various feudal rights, and from judicial administration; revenues of vacant benefices were appropriated, and wretched Jews were harried and tormented by kings and nobles to give up their stores of gold; this source of wealth, however, owing to continual squeezing, tended after a time to run dry. In the XII. cent. the notable fiscal change is the gradual commutation for money of payments in kind. The Jews were ejected in 1290; *tenths* and *fifteenths* were granted, though these came to be mere names for fixed sums. A *poll-tax* was instituted in 1377; the value of the various feudal dues was now less than formerly. *Benevolences*, *i.e.* grants to the king, nominally voluntary, but practically compulsory, were begun in the reign of Edward IV. In Tudor times certain revenues were granted to the sovereign for life; despite their despotism the Tudors were treated generously by Parliament. Much of the money raised, however, was wasted in the collecting—probably about a sixth of the total. With the beginning of the

XVII. cent. came the increased exactions which helped to bring on the Civil War. Elizabeth had introduced *monopolies*, but gave way when complaints were made. Parliament now insisted on the legality of methods of taxation employed, and of the use of the money procured. The chief grievance was the raising of funds, *e.g.* by *ship money*, without consent of Parliament; all these were declared illegal.

The Commonwealth forms a dividing line in English constitutional history, and there were permanent changes at the Restoration, which were carried further in the Revolution of 1688; there was definite appropriation of funds, and the *National Debt* began. The *Civil List* was begun under William III. Walpole and Pitt were great finance ministers. More and more articles were taxed as time went on; the process reached a climax in the Napoleonic wars, when England's financial resources were strained to breaking point. The lower classes had more than their fair share of the burden. In the XIX. cent. some important changes of financial policy took place. The *Income Tax* (begun previously and dropped) has existed since 1842; its highest rate during the Crimean War was 1s. 4d.; in 1894, only 8d.; now never less than 1s. in the £. A *super-tax* was imposed in 1909. The system of estate duties, too, has been extended. Direct taxation is now a much larger proportion of the whole. The institution of Free Trade and the present Fiscal controversy are likewise of fundamental importance.

Cunningham, *Growth of English Industry and Commerce*; Meredith, *Economic History of England*.

Local Government.—The township was the unit of civil life until 1782, when civil parishes were established; these may or may not coincide with the township or ecclesiastical parish, and where, as in Yorks, they coincide with the township it is generally found that several of them are located in the ecclesiastical parish. The civil parishes were formed into Poor Law (*q.v.*) Unions under Poor Law Amendment Act, 1834, and in 1871 the central Local Government Board was established. Corresponding to the civil parish, administrative counties were set up, 1888. See also Macmorran and Dill, *The Local Government Act*, 1888; *The Local Government Act*, 1894; S. and B. Webb, *Eng. Local Government*.

Local Government is administered by County Councils, Parish Councils, Municipal Corporations, etc., consisting of members elected by ratepayers. These fix local rates and taxes and deal with minor matters, and are controlled in matters of Public Health, Poor Law, etc., by the Local Government Board. The London County Council is an amalgamation of various lesser bodies, and has jurisdiction over London and its environs.

Odgers, *Local Government*; Shaw, *Municipal Government*.

Education is compulsory, and provided free of charge for poor children; it is locally administered by County Councils, etc., and supervised by the Board of Education. In 1910 there were 6,071,000 pupils in elementary government schools, while more than 12,500 religious schools have about 3,100,000 scholars in their care. See EDUCATION, UNIVERSITIES.

Religion.—The State religion is Prot. Episcopalian (see ENGLAND, CHURCH OF); the country is divided into the two ecclesiastical provinces of—(1) Canterbury and (2) York, each under an abp.; under the abp's are 76 bp's (of whom 33 are suffragan, 8 assistant); the Convocation of bp's and representatives of inferior clergy in each province is held whenever Parliament is assembled. Anglican communicants in 1910 numbered 2,231,375, those of the Free Churches, taken together, 2,082,047. The chief Free or Nonconformist persuasions are Methodists (Wesleyan, Primitive, Calvinistic, Independent, and United), who number over 1,000,000, Baptists, Congregationalists, Presbytorians, Quakers, Free Church of ——, Reformed Episcopal, Moravians, Countess of Huntingdon's Connexion. There are about 1,700,000 Roman Catholics, with a cardinal abp. of Westminster, abp. of Birmingham, and abp. of Liverpool, 16 bp's, and nearly 4000 priests. Jews number *c.* 200,000.

Population.—In 1911 the population of England was 34,043,076; previous censuses—30,807,310 (1901); 24,614,001 (1881); 16,921,972 (1851); 11,281,957 (1821). By the 1911 census it was shown that in England and Wales there were 1068 females for every 1000 males.

HISTORY.

Archæology.—From remains discovered in gravel-pits and caves it has been found that England was inhabited by man at the same time as it was tenanted by the mammoth and reindeer. This was the paleolithic or 'Old Stone' period, when chipped flint implements were used. Important paleolithic discoveries have been made in the S. of England, 1912–13, and a skull unearthed which is claimed to be the oldest in existence.

Many specimens of neolithic ('New Stone') art have been discovered; polished stone implements characterise this epoch. The dead were buried in stone chambers covered with earth ('long barrows'); cremation sometimes preceded burial. Stonehenge and other ruins of solar temples belong to this age. The tide of immigration from the East (1800 B.C.) brought the use of metal. Axes and other implements of bronze are to be found in abundance in England. Burial took place in 'round barrows'; cremation was common.

The Iron Age in England preceded the Christian by about 700 years. There was commerce between the early Britons and their kinsmen in western France, while the Phœnicians made frequent voyages to Cornwall for the purpose of obtaining tin. The island was visited (*c.* 300 B.C.) by the geographer Pytheas (*q.v.*) of Massilia (Marseilles).

Roman Occupation.—The recorded history of England begins with a visit paid to it by JULIUS CÆSAR in 55 B.C. Cæsar found it occupied by Celtic tribes, akin to the peoples of Gaul, still primitive in civilisation and with a somewhat mystical religion associated with the priesthood called *Druids*, a religion which practised human sacrifices. Cæsar made no attempt to conquer Britain, a business which was undertaken a hundred years later (41 A.D.) under the Emperor Claudius. By the end of the I. cent. A.D. the Roman legions occupied the country up to the Tyne; in what was afterwards called Scotland they never seem to have held more than mere garrisons. In what is now England a regular Roman government was established. The Britons lost their originally warlike character. Rome withdrew her legions in 406, having to guard her continental frontiers against Teutonic and Mongolian invaders. The Britons were fiercely attacked by the Picts and Scots from the N., and to repel these onslaughts tradition says they called in to their assistance the Teutonic pirates of the North Sea. This opened the floodgates of the English invasion.

English Conquest.—Between the middle of the V. (449) and the middle of the VI. cent's Jutes, Saxons, and Angles swarmed into the country, pushing their conquests inland until the Britons were driven into the moorlands and highlands of the W.; and their prospects of recovery were finally destroyed when Saxons and Angles drove wedges up to the sea on the N. and also on the S. of Wales about the beginning of the VII. cent. It was about the same date, 596, that Augustine's mission from Rome introduced Christianity among the English, though the Celtic Church of Ireland had already begun missionary work in the N.

The Eng. conquest extended as far north as the river Forth, and the conquerors gradually organised themselves into several kingdoms, of which there were at one time seven, whence the period is commonly known as the *Heptarchy* (q.v.). As a rule, whichever of these kingdoms was strongest compelled the rest to recognise its general overlordship. The supremacy lay

first for a short time with *Kent*, then with *Northumbria*, then with the Midland kingdom of *Mercia*, and finally passed at the beginning of the IX. cent. to the southern kingdom of *Wessex*.

Danish Invasions.—But now began incursions of a fresh group of Teutonic invaders, the Northmen, or Danes, and Norsemen. They threatened a conquest of the island, but were checked by ALFRED THE GREAT (871–901), king of Wessex. Alfred's son and grandsons brought all England under their dominion, but in the miserable reign of Ethelred the Redeless the Danes conquered the country at the beginning of the XI. cent. (1013). Knut or Canute ruled wisely for eighteen years, but seven years after his death the English recalled Edward the Confessor (1042), s. of Ethelred, from Normandy.

Norman Conquest.—On Edward's death, WILLIAM, DUKE OF NORMANDY, claimed the crown, which was bestowed by election upon the great Earl Harold. William invaded England, overthrew and slew Harold at the battle of *Senlac* or *Hastings* (1066), and procured his own election to the throne.

Under the Saxon system the king ruled by advice and consent of a council of magnates, lay and clerical, called the *Witan*, which bears traces of having been at one time, at least for certain purposes, a survival of a General Council which might be attended by all freemen or landholders. It was already an established custom at the time of the Norman Conquest that the majority of the small occupiers of the soil held their land from some overlord on condition of service. They remained, however, freemen, with the right of attending the local assemblies which generally conducted local affairs and administered justice. Theoretically the Norman Conquest maintained the old system; but actually nearly all the 'manors' of the landowners were forfeited and bestowed upon Normans, with the result that the small occupiers really became the serfs of the new overlords. Moreover the new overlords received their estates in *feudal* tenure from the king, that is on conditions of military service. The peculiar feature of the Norman feudalism was that no one of the tenants-in-chief, or barons, who held their land direct from the king, not from some intermediate overlord, combined contiguous estates extensive enough to make him dangerously powerful.

The Conqueror was followed by two sons in succession. The first, William Rufus (1087), was an evil and tyrannical ruler, but an able soldier who held the greater barons in check. The second, HENRY I. (1100), not only proved himself the master of his barons, but did much towards organising the administration of justice throughout the kingdom, so that the king's courts could counteract and repress maladministration and high-handed overriding of the law by local magnates, who were now practically all Normans. But he left no son, and although the throne was claimed on behalf of his dau., Maud, widow of the Emperor Henry V. and wife of the Count of Anjou, the Great Council which of old had been the Witan gave it to her cousin, Stephen (1135). There followed a period of appalling anarchy, since neither Stephen nor Maud exercised any effective control, and every one of the great barons did that which was right in his own eyes and foul wrong in the eyes of everybody else. But when Maud's young son, Henry, Count of Anjou, reached man's estate he wedded Eleanor, Duchess of Aquitaine, thus becoming lord of the western half of France, including Normandy from the English Channel to the Pyrenees, although he was nominally vassal to the king of France. An agreement was arrived at between Henry and Stephen that Stephen should reign for the rest of his life and should then be succeeded by Henry, who became king of England in 1154.

The Plantagenets.—HENRY II. was the first king of the Angevin or Plantagenet dynasty, and every king of England for three hundred and thirty years was a Plantagenet. Although the male descent was then broken, each successive dynasty has been of Plantagenet blood, having come into the line of succession through the marriage of a princess of the blood royal. Moreover, since Henry I. married a Scot. princess whose mother and bro's were representatives of the House of Wessex, all the monarchs of England and of Scotland since that time have been descendants of Alfred the Great. Henry himself was a great continental potentate, but his business in England was to organise a powerful Central Government under the king's control, and to establish order. The country was sick of anarchy, and the greater barons generally co-operated with Henry; those who attempted to resist were promptly quelled. In his reign there was the great contest in which the king endeavoured to assert the control of the State over the Church, for which Thomas Becket, abp. of Canterbury, claimed independent jurisdiction. The murder of the abp. (1170) practically gave the victory to the Church. But Henry's great work was the reorganisation of the administration of justice on the foundations laid by his grandfather; and with that, the assertion of the royal authority and [illegible] ght them to be the supporters instead of the enemies of law.

Magna Carta.—Henry's successor, the famous Crusader, Richard *Cœur de Lion* (1189), spent only a few weeks of his ten years' reign in England. His brother John (1199), who followed him, exercised the royal power with gross tyranny. Philip Augustus, king of France, used his opportunity to deprive the detested king of England of Normandy and of the greater part of the Angevin inheritance (1204), with the beneficial result for England that the barons of England, parted from their continental estates, became definitely English. But John's tyranny had the further effect of driving the barons to combine and to take their stand against the king in the name of the law. Under the wise influence of the abp. of Canterbury, Stephen Langton, they extorted from the king the GREAT CHARTER (*Magna Carta*), 1215, which laid down the fundamental principles of Eng. liberty: that taxation may not be imposed without the assent of the National Council, that no man may be imprisoned without fair trial, and that generally there is no power in the land which may override the law. John attempted to repudiate the Charter, and died while at war with a faction of the barons who, in desperation, intended to depose him and make the Fr. Dauphin king of England.

Within a few months of John's death (1216) this unpatriotic plan was dropped, and John's young son Henry was accepted as king. During his minority the country was well governed, first by William Marshal and then by Hubert de Burgh. But when Henry came of age (1227) he took the reigns of government into his own hands, and placed himself in the hands of foreign favourites. One group was expelled only to have its place taken by another, until the barons combined in effect to demand that the administration of the country should be placed in their hands.

Barons' War.—But their great leader, Simon de Montfort, was equally determined that the rights of the humbler classes should not be ignored by the barons. The king was compelled by the Great Council to accept a provisional constitution known as the *Provisions of Oxford* (1258). This he sought to repudiate, but was defeated in the first Barons' War, which virtually made Montfort Dictator. It was at this time (1265) that Montfort called a Great Council, to which for the first time were summoned representatives of the boroughs as well as of the landowners or knights of the shire. Divisions among the barons brought about the overthrow and death of Montfort in the same year, but under the influence of Prince Edward the misrule ceased.

National Progress.—EDWARD I. came to the throne in 1272, when he was actually absent on crusade. On his return to England he established for all time his claim to be the first really national king of England. The organisation and consolidation of his kingdom

was his first aim. Included in this was his conception of bringing the entire island, together with IRELAND, under one sceptre. Ireland had been annexed in the reign of Henry II. (1169), and a Norman colony planted there, but nothing effective had been done to establish a well-ordered government. Edward's desire was excellent, but his method was fatal. He succeeded in conquering WALES; but when his first plan for uniting the crowns of England and Scotland by marriage failed owing to the death of the young queen of Scotland (1290), he attempted to assert the Eng. supremacy over that country at the sword's point (1295), claiming that the kings of England had always been overlords of the kings of Scotland. The later years of his reign were marked by repeated conquests of Scotland followed by repeated insurrections. He was actually on his way to crush the insurrection headed by Robert Bruce when he died, and his whole scheme was brought to nought in the reign of his son. But the great work of Edward was in his legislation, which was not so much the making of new laws as the establishment of uniform and definite laws in the place of varying and indefinite customs. Finally he created the *Model Parliament* (1295), based on that of Simon de Montfort, which was attended by a group of hereditary peers, by the higher clergy, and also by two representative knights from each shire and two representative citizens from each borough, as well as by representatives of the lower clergy. Later the lower clergy ceased to attend, and the higher clergy sat with the lay peers in one Chamber, while the representative members sat together in what then became known as the *House of Commons*. The principle was laid down again that the assent of Parliament was necessary to taxation, and that what touches all should be deliberated upon by all.

Scottish Independence.—Edward I. was followed by his incompetent and foolish son, Edward II. (1307). The government fell into complete disorder, since the king was ruled by favourites, and the barons, lacking any leader of statesmanship, sought little but their own selfish interest. Robert Bruce in Scotland by degrees expelled one after another of the Eng. garrisons, till at last, when Stirling alone was left, Edward marched into Scotland with a great host to recover what had been lost. At the battle of *Bannockburn* (1314) the great host was utterly shattered, and the independence of Scotland was decisively secured. In England baronial combinations were formed, the most notable being that of the *Lords Ordainers* (1310), which endeavoured to secure for themselves the control of the administration, while periodically the king and his favourites temporarily recovered the upper hand. Finally, however, Edward was overthrown, deposed, and then murdered by his wife and her accomplice, Roger Mortimer, who seized the regency while the boy EDWARD III. was proclaimed king (1327). Misrule continued unabated until a party of the nobles joined with the young king in a *coup d'état* (1330). Mortimer was put to death, and the queen dowager Isabella was obliged to retire into privacy.

During the brief regency the independence of Scotland had been formally recognised by a treaty (1328), but Robert Bruce was now dead, his son David was a child, and Edward III. endeavoured to place another claimant on the throne as his own vassal. Edward, however, gave up the useless attempt when he found a field more attractive to his ambitions in France.

War with France.—The Plantagenets had kept their hold on the duchy of Aquitaine, while Fr. kings had continued to try to filch it from them piecemeal. Edward wished to put an end to these troubles by getting rid of the Fr. king's overlordship. Also he wanted to ensure the very valuable trade in wool and woollens between England and Flanders against interference on the part of the Count of Flanders and the king of France. A pretext was found for picking a quarrel with France when Edward put forward a claim to the Fr. crown through his mother, the sister of the three last kings, whose cousin, Philip of Valois, had been set on the Fr. throne on the principle that the crown descended only through males. Edward's claim to the crown, however, was not the real motive, but really a pretext for beginning (1338) what is called the HUNDRED YEARS WAR. With intervals of truce, during which some excuse was habitually found for keeping up the fighting between English and French, the war went on through the rest of the reign of Edward III. Its first stage was marked by the great naval victory of *Sluys* (1340), the complete overthrow of the French chivalry by the Eng. archers at *Crécy* (1346), and the capture of *Calais* (1347). Nine years after Calais a brilliant victory was won by the Black Prince, Edward, Prince of Wales, at *Poitiers* (1356); and this was followed in 1360 by the *Peace of Bretigny*, which gave Edward a quarter of France as an independent principality. The war, however, broke out again, and before the end of the reign (1377) nothing remained in Edward's possession except Calais and a part of Guienne. The reign was further marked by constitutional struggles between the king and Parliament, which ended in the complete recognition of the exclusive right of Parliament to vote supplies, and finally the Parliament asserted its rights to a voice in the administration of the country by impeaching (1376) some of the king's ministers.

Labour Revolution.—Just after the capture of Calais, England was visited (1348) by the tremendous scourge called the *Black Death*, which killed off at least one-third of the population. Agricultural labour was thereby completely disorganised, the demand for labour was greater than the supply, and the Government tried to enforce 'fair' wages and 'fair' prices by the *Statute of Labourers* (1351). A bitter hostility was engendered between the landlords and the *villeins*—that is to say, roughly, the labouring class and the class which occupied land under conditions of serfdom. These troubles came to a head in the great Peasant Revolt (1381), called *Wat Tyler's*, very soon after the accession (1377) of Edward's young grandson, Richard II. The insurgents were persuaded to disperse by promises that their demands should be met; but the promises were broken, and the insurgents themselves punished with a heavy hand. Still the conditions of serfdom practically vanished during the next fifty years. They had already been disappearing when the Black Death for the time being changed the economic conditions, which were leading to the substitution of rent and wages for forced services. With a return to normal conditions, the old forces came into play again and serfdom disappeared.

Struggles between the king and some of the great nobles for the control of administration culminated when the king succeeded in crushing or banishing the most dangerous of the nobles and procuring from a subservient Parliament a completely despotic authority for himself (1398). Yet this only led to the return to England of his cousin, Henry of Lancaster, his own overthrow and deposition, and the elevation of Henry IV. (1399) to the throne.

France Won and Lost.—The reign of Henry of Lancaster was troubled by a series of insurrections; but his son HENRY V. (1413), who succeeded to the throne, resolved to revive the Eng. claim to the Fr. crown. France being torn between two rival factions of the nobility, while the crazy Charles VI. was king. Henry invaded Normandy, captured Harfleur, and, marching from Harfleur to Calais, won at *Agincourt* (1415) the most astonishing of all the Eng. victories in France. Two years later he returned, set about a systematic conquest of N. France, and by the *Treaty of Troyes* (1420) procured his own recognition as heir to the Fr. throne. But his death (1422) left the baby Henry VI. on the throne of England, and the further progress of the Eng. arms was checked by the sudden appearance of JOAN OF ARC (1429), and, although she was captured and burnt for heresy and witchcraft,

the tide of success turned steadily in the favour of the French. The war was conducted without energy or skill, and in 1450, thirty years after the treaty of Troyes, all Normandy was lost. Three years later, Calais was the only portion of Fr. soil still held by the English.

Wars of the Roses.—Meanwhile faction and misgovernment ruled in England under the pious but imbecile Henry VI. At last his cousin, Richard of York, who, so far as descent was concerned, had a better claim to the throne than the king, insisted on taking a share in the government. This led to the outbreak of hostilities between his faction and that of the queen, and then Richard put forward his own claim to the Crown. The struggle which began in 1455 is called the *Wars of the Roses*, the Red and White Roses being the badges respectively of the houses of LANCASTER and YORK. Richard was killed, but the victory of *Towton* (1461) made his son, EDWARD IV., king of England—a position which he owed mainly to his cousin Richard, Earl of Warwick, called the *Kingmaker*. The luckless Henry was still alive; Edward quarrelled with Warwick, and did not finally secure the throne until Warwick, Henry, and Henry's son were all killed at or after the battles of *Barnet* and *Tewkesbury* (1471). Then for twelve years Edward reigned undisturbed, practically as an absolute monarch. On his death his bro., Richard III. (1483) of Gloucester, seized the Crown, and murdered the young Edward V., whom he had robbed of it. The usurper tried to secure himself by a merciless tyranny, but was overthrown and killed by Henry Tudor, Earl of Richmond, whom the Lancastrians had chosen as their representative.

The Tudors.—HENRY VII. (1485) established the Tudor dynasty, and to some extent reconciled the factions of Lancaster and York by marrying (1486) the dau. of Edward IV. The reconciliation, however, was not completed till the accession of their son, Henry VIII., whose title to the throne neither Yorkist nor Lancastrian could reasonably dispute. The old nobility had been almost wiped out during the Wars of the Roses, and Henry VII. was careful to repress what remained of it, and to keep down the new nobles, who had been brought into existence by the same wars, not by execution, but by great confiscations. He began the intervention of England in continental politics by means not of the sword, but of diplomacy; and he made it his business to strengthen the Crown by ingenious devices for filling the treasury, so that when he died he was probably the richest prince in Europe, and his son began his reign free from any necessity of relying upon Parliament for supplies. For many years of HENRY VIII.'s reign (1509–47) public affairs were managed mainly by his great minister, CARDINAL WOLSEY, a diplomatist of very great ability, whose main object was to hold the balance between France and Charles V., who was at once Holy Rom. emperor, Lord of the Netherlands, and king of Spain. But during Wolsey's ascendancy, Luther fired the revolt which divided Western Christendom into *Protestants* and *Papists* (1517). Henry had no sort of desire to be a Protestant, but he developed a private quarrel with the Papacy, because he wished to get rid of his wife, Katharine of Aragon, and to marry Anne Boleyn. Since Wolsey failed to obtain the papal sanction for this course, the cardinal was disgraced (1529), and Henry set the papal authority at defiance. He procured his recognition as 'Supreme Head' of the Church of England (*Act of Supremacy*, 1534), put to death numbers of prominent men, lay and clerical, who refused to acknowledge his title, appropriated the clerical taxes which had hitherto gone to Rome, and turned upon the estates of the Church, dissolved the monasteries, and seized their property (1536–39). In other respects, however, he refused to admit the Reformed doctrines into England, though he authorised the translation of the Bible into the Eng. tongue. His second great minister, Thomas Cromwell, had used Parliament to provide a popular sanction for these proceedings, and finally to confer absolute powers upon the monarch, so that, when Henry died, he was the most unqualified despot in Europe.

Protestantism and Catholicism.—Henry was succeeded in turn by the son and two dau's of three different wives. During the reign of the boy EDWARD VI. (1547) the government was in the hands of a Council controlled first by the Protector Somerset and then (1549) by the Earl of Warwick, who became Duke of Northumberland. The spoliation of the Church was continued, and two new prayer books (1549, 1552) in succession transformed the Church of England first into a comprehensive Body which still admitted without enjoining Romanist doctrines, and then into a Church definitely Protestant in the ordinary acceptance of the term, though it retained its 'Catholicism' in the theological sense by preserving the Apostolic Succession through Ordination. The country had long been suffering from agricultural depression, chiefly due to the diminution of rural labour by the systematic conversion of arable land into pasture. The religious changes and agricultural depression, independently or in combination, brought about popular insurrections which were sternly repressed. See ENGLAND, CHURCH OF.

After the fall of Somerset, Northumberland tried to perpetuate his own power by securing the succession of LADY JANE GREY, his dau.-in-law, who in England stood next in succession to the throne after Henry VIII.'s two dau's. But the attempt failed ignominiously and the Romanist queen, MARY, ascended the throne on Edward's death (1553). There followed a violent Romanist reaction, intensified by the marriage of the queen to Philip, the Crown Prince of Spain, and the persecution of the Protestants was set on foot (1555). The finances, the army, and the navy had all been falling into decay for the past decade, England was dragged into a Fr. war by her connection with Spain, and Calais was lost (1558).

Elizabethan Age.—Mary's death placed on the throne QUEEN ELIZABETH (1558), the dau. of Henry VIII. and Anne Boleyn. The circumstances of her mother's marriage made her legitimacy questionable, while from the Romanist point of view there was no doubt at all that the legitimate heir to the throne was MARY, QUEEN OF SCOTS, the granddaughter of the elder sister of Henry VIII. Elizabeth and her ministers settled the ecclesiastical question by giving the Church of England the form which has remained practically unchanged ever since. Conformity was secured by often overlooked severity. The queen of necessity relied on her Prot. subjects, and could ignore the dictation of Philip of Spain because, in his own interest, he was bound to keep her on the throne in preference to Mary Stuart because of that queen's close connection with France. Eng. Protestantism and Eng. maritime expansion together made it practically certain that sooner or later there would be a struggle for supremacy between England and Spain. Both Philip and Elizabeth wished to defer the struggle as long as possible, and in the meantime to do each other as much harm as possible. The flight of Queen Mary from Scotland (1568) and her detention in England made her the figure-head of a series of conspiracies for the overthrow of Elizabeth. At last, when the struggle between England and Spain could no longer be deferred, Mary, Queen of Scots, was executed (1587), and Philip of Spain sent his GREAT ARMADA for the conquest of England. The Armada was harried by the Eng. fleet as it sailed up the Channel, and was then thoroughly beaten in a fight off Gravelines (1588) before it fled up the North Sea and round Scotland for the tempests to complete the work of the Eng. seamen. The great victory at once set England in the forefront of the maritime nations. The destruction of the Armada marks almost the precise moment when English lit. also suddenly sprang into the front rank of the literatures of the world with its list of great names headed by SHAKESPEARE and SPENSER.

The Stewarts.—Since each of Henry's children had died childless, his elder sister's great-grandson, JAMES VI. of Scotland, now (1603) came to the throne as JAMES I. and inaugurated the Stewart dynasty, of which four generations numbering six monarchs occupied the throne. James believed himself, and taught his son, Charles I., to believe, in the *divine right* of kings. The doctrine was new in England, and the king's prerogatives as James conceived them were soon in collision with the rights of Parliament as Parliament conceived them. The king's claims to certain powers of taxation were disputed by Parliament but supported by the Law Courts, and the Parliament's right to freedom of discussion was asserted by it and disputed by the king. The royal claims to control the forms of State religion began to be questioned, though on none of these points did a really serious breach occur during the reign of King James, for the king tried as much as possible to manage without Parliament at all. But at the close of his reign England was drawn into a very ill-directed participation in the *Thirty Years War* (1618-48) then raging in Europe. This involved application to Parliament (1621) for supplies.

King and Parliament.—The mismanagement was mainly due to the king's favourite, the Duke of Buckingham, who continued to be paramount with his son, CHARLES I. (1625). Hence Charles called Parliaments together (1625, 1626, 1628) in the hope of extracting supplies from them, while they responded by formulating grievances and attacking Buckingham. In the intervals, after dissolving his Parliaments, Charles experimented in forms of taxation of dubious legality, while the steadily increasing *Puritan* spirit was generally irritated by the ascendancy in the Church of the high *Anglican* school represented by Laud, who afterwards became abp. The climax was reached in 1628 when Parliament presented the *Petition of Right*, reasserting the principles of taxation through Parliament only, and of the right of persons who are arrested to trial. Buckingham was assassinated. There was a hot disagreement between king and Parliament on the interpretation of the Petition of Right and on the respective rights of Crown and Parliament to control the Church. Parliament was dissolved (1629), and for eleven years the king made shift to govern without calling a new one, again resorting to every means of raising money which the judges could be induced to sanction as legal.

But in his other kingdom of Scotland Charles's attempt to enforce Anglican forms upon a nation which preferred the *Presbyterian* model caused almost the whole Scot. people to rise in arms. That he might obtain an army in order to bring them into subjection Charles again had to summon a Parliament (1640). But the new Parliament proved his master. It compelled the king to accept an *Act of Attainder* against his great minister Strafford, who was beheaded (1641), abolished the arbitrary courts on which the king had relied for the punishment of offenders, and all those rights of taxation which the king had been asserting. Charles did not dare to refuse assent; but when the Puritan element attacked the Anglican system of Church government, Parliament ceased to be unanimous and a new Royalist party was formed.

The result was the outbreak of the CIVIL WAR (*q.v.*) in 1642. The balance of success at first lay with the king, but the tide turned when the Parliament's victory at *Marston Moor* (1644) brought OLIVER CROMWELL into the front rank. Under his supervision the parliamentary army was reorganised and the Royalists were crushed at *Naseby* (1645). The grand desire of Cromwell's army was for the toleration of all forms of Protestant religion. The Parliament wished to enforce Presbyterianism. The king intrigued in the hope of recovering his own authority through the dissensions of his opponents. The discovery of these intrigues made Cromwell turn republican, with the result that all but a few members were excluded from the House of Commons, which assumed authority as the sovereign body of the realm and instituted a court for the trial of King Charles, who was beheaded (Jan. 1649).

The Commonwealth.—The Commonwealth was proclaimed. Government was carried on by the *Rump Parliament* and a Council of State, while Cromwell suppressed insurrection in Ireland and overcame the Scots who had acknowledged Charles II. as their king. The Rump then tried to make itself a permanent oligarchy; Cromwell ejected it (1653), and for five years ruled England as *Protector*, making sundry vain attempts to procure a Parliament which would work in harmony with him. Under what was practically a military dictatorship England forced the European Powers to recognise her military and naval strength, the latter having already been displayed before the Protectorate in a stubborn naval war with the Dutch (1653), at that time the greatest maritime power. But Cromwell's personality alone made such military rule tolerable, and twenty months after his death (1658) Charles I.'s son was recalled to the Eng. throne.

The Restoration.—CHARLES II. (1660) was determined not to 'go on his travels again,' and to let nothing interfere with his own amusement. These conditions being laid down, he proposed to make himself absolute and to reinstate Roman Catholicism. He dropped the second object when events taught him that the nation at large, including the Anglicans, had a terror of popery. In the former object he succeeded, by becoming a pensioner of the king of France—which finally relieved him of all dependence on Parliament for supplies (1681). But while this object was ultimately achieved for a short time, throughout the greater part of the reign the theoretical supremacy of Parliament was hardly challenged. The king usually got his way, but it was usually by skilfully blinding Parliament to the real course of events. Twice England fought in Dutch wars, not suspecting that her policy was being manipulated in the interests of France. It was the Parliament with its now dominant element of *Cavaliers* which passed severe restrictive measures upon Nonconformity (1661-65) of every kind (the *Act of Uniformity*, 1662, as in reigns of Elizabeth and Edward VI., imposing use of Book of Common Prayer on all ministers, and enjoining uniform Episcopal religious observance), and in consequence of the monstrous scare of the *Popish plot* (1678) stiffened the penal laws against Romanism.

What Charles won by sheer cleverness combined with a total absence of principle his bro., JAMES II. 1685), lost mainly through sheer stupidity and an obstinate adherence to principle. He strained the royal prerogatives violently in order to reinstate Romanism. The result was that the leaders of both political parties, now known as *Whigs* and *Tories*, combined to bring into England his Prot. son-in-law and nephew, WILLIAM OF ORANGE.

The Revolution.—James fled. William and his wife, MARY, were made king and queen (1689) on their acceptance of the Declaration of Right, which once more defined the limitations of the royal prerogative. It was William's principle to rule with as little regard as possible to parties, to act with justice all round, to establish toleration (by *Toleration Act*, 1689, Protestant Nonconformists were granted freedom of worship), and generally to give effect to the wishes of the nation. In the last resort he could impose his own will by the threat of going back to Holland. William, however, learnt that the best way of avoiding deadlocks and working harmoniously with Parliament was to select his ministers from the party predominant in the House of Commons; thus his reign saw the beginning of *Party* and *Cabinet Government*. The great business of his life was the formation of European coalitions including England to hold in check the aggression of Louis XIV. of France. The French bid for naval supremacy was shattered at the great battle of *La Hogue* (1692); while Holland dropped gradually but decisively to a position second to that of England.

By the *Act of Settlement* (1701) the succession to the Eng. throne was fixed upon the second dau. of the exiled King James, and failing heirs of her body upon the nearest Prot. representative of the royal house, the electress of Hanover, granddau. of James I. England was finally brought decisively into the coalition against France when Louis promised the dying James to recognise his son as the lawful king of England. Hence on QUEEN ANNE'S accession (1702) England plunged into Marlborough's war, the *War of the Spanish Succession.*

Great Britain.—Marlborough's brilliant campaigns almost ruined France. But when the war was brought to an end by a Tory Administration (1713) France obtained the establishment of the Bourbon family on the Span. throne, the prevention of which had been the theoretical object of the coalition against her. England, however, secured commercial advantages, together with the cession of the Rock of Gibraltar and of Nova Scotia. The greatest event of the reign, however, was the Legislative Union of England and Scotland as the single State of Great Britain (*Act of Union*, 1707). Henceforth it is not England but Great Britain which plays an international part and builds up the British Empire.

House of Hanover.—Intrigues to restore the exiled Stewarts on the death of Queen Anne were frustrated by the Whig leaders. The House of Hanover succeeded (1714) to the throne of Great Britain. The two first GEORGES were Germans; they reigned on sufferance, not because there was any sentiment of loyalty to them, but because while they were kept on the throne the Stewarts were kept out. The practical result was that one party, the Tories, were virtually identified with *Jacobitism* and the Whigs remained in power for fifty years. The supremacy of Parliament became fully established because the Hanoverian kings would at once have been turned out if they had attempted to challenge it. From 1721–39 Brit. policy was controlled by SIR ROBERT WALPOLE, who had before him three great objects: keeping the mass of the nation contented with the Government, increasing its material wealth by the development of commerce, and avoiding war while most of the European nations were exhausting themselves. His control broke down in 1739. Britain plunged into a war with Spain, and was soon involved in the general European conflagration called the *War of the Austrian Succession* (1740–48). In the course of that war the Brit. dynastic question was finally got rid of by the destruction of Jacobitism at the battle of *Culloden* in 1746.

Colonial Expansion.—Not less momentous was the opening of the struggle (1746) in INDIA between the Fr. and Eng. Trading Companies for an ascendant influence in the native states. The struggle ended with the complete overthrow of the French (1760), but incidentally it led to a quarrel between the British and the Nawab of Bengal, the issue of which was that Bengal itself passed under Brit. control (1757), and the Brit. East India Company became one of the territorial powers in India. Before this result was achieved another great European conflagration, the *Seven Years War* (1756–63), had broken out. In this great struggle the genius of WILLIAM PITT THE ELDER, afterwards Earl of Chatham, directed the energies of the nation to the development of an overwhelming naval supremacy and the demolition of Fr. rivalry in America as well as in India. The Fr. fleets were annihilated and the great prize of CANADA, the Fr. colony in North America, was won for the Brit. Empire by Wolfe on the *Heights of Abraham* (1759).

American Independence.—The young king, GEORGE III. (1760), was already on the throne before the Seven Years War was brought to an end. The third of the Hanoverian kings was not like his predecessors an alien stopgap for the exclusion of a Romanist Stewart. He was a Brit. king of the Brit. nation, and his great object was to recover the royal ascendancy, which had been in practical abeyance for more than half a century. His method was to break up the ascendancy of the great Whig families, which now practically formed a dominant oligarchy. The Tories having emerged from their long period of depression to transfer their loyalty from the Stewarts to a Brit. king, George succeeded in creating in both Houses of Parliament a predominant party of his own. But while this was going on the causes of disagreement between the Mother Country and the AMERICAN COLONIES came to a head, nominally over the right of the Parliament at Westminster to impose taxation (1765) on the unrepresented Colonies. Colonial grievances had been held in abeyance hitherto because the Colonies had been dependent on the support of the mother country to enable them to resist the aggressive rivalry of France on the North American continent. The last chance of reconciliation disappeared with the establishment of the king's complete ascendancy in Parliament (1770). The Americans took up arms to maintain their liberties, and the war which broke out (1775) developed into one for their complete independence. France threw her sword into the scale on their side. American independence was won (1783), but the naval ascendancy of Britain, which at one stage of the war seemed almost to have been lost, was in the long run successfully asserted (1782); while in India, Warren Hastings (1770–84) established the territorial dominion which had been won by Robert Clive.
